- [Deprecated](#)

- [Pending Removal in Python 3.12](#)

- [Removed](#)

- Notable Changes in 3.11.4

- tarfile

- What's New In Python 3.10

- Summary – Release highlights

- New Features

- Parenthesized context managers

- Better error messages

- SyntaxErrors

- IndentationErrors

- AttributeErrors

- NameErrors

- PEP 626: Precise line numbers for debugging and other tools

- PEP 634: Structural Pattern Matching

- Syntax and operations

- Declarative approach

- Simple pattern: match to a literal

- Behavior without the wildcard

- Patterns with a literal and variable

- Patterns and classes

- Patterns with positional parameters

- Nested patterns

- Complex patterns and the wildcard

- Guard

- Other Key Features

- Optional **EncodingWarning** and **encoding="locale"** option

- New Features Related to Type Hints

- [PEP 604: New Type Union Operator](#)
- [PEP 612: Parameter Specification Variables](#)
- [PEP 613: TypeAlias](#)
- [PEP 647: User-Defined Type Guards](#)
- [Other Language Changes](#)
- [New Modules](#)
- [Improved Modules](#)
  - [asyncio](#)
  - [argparse](#)
  - [array](#)
  - [asynchat, asyncore, smtpd](#)
  - [base64](#)
  - [bdb](#)
  - [bisect](#)
  - [codecs](#)
  - [collections.abc](#)
  - [contextlib](#)
  - [curses](#)

- Optimizations
- Deprecated
- Removed
- Porting to Python 3.10

- Changes in the Python syntax
- Changes in the Python API
- Changes in the C API

- CPython bytecode changes
- Build Changes
- C API Changes

- PEP 652: Maintaining the Stable ABI
- New Features
- Porting to Python 3.10
- Deprecated
- Removed

## ○ What's New In Python 3.9

- Summary – Release highlights
- You should check for DeprecationWarning in your code
- New Features
  - Dictionary Merge & Update Operators
  - New String Methods to Remove Prefixes and Suffixes
  - Type Hinting Generics in Standard Collections
  - New Parser
- Other Language Changes
- New Modules
  - zoneinfo
  - graphlib
- Improved Modules
  - ast
  - asyncio
  - compileall
  - concurrent.futures
  - curses
  - datetime
  - distutils
  - fcntl
  - ftplib
  - gc
  - hashlib
  - http
  - IDLE and idlelib
  - imaplib
  - importlib
  - inspect
  - ipaddress
  - math
  - multiprocessing

- [nntplib](#)
- [os](#)
- [pathlib](#)
- [pdb](#)
- [poplib](#)
- [pprint](#)
- [pydoc](#)
- [random](#)
- [signal](#)
- [smtplib](#)
- [socket](#)
- [time](#)
- [sys](#)
- [tracemalloc](#)
- [typing](#)
- [unicodedata](#)
- [venv](#)
- [xml](#)

- [Optimizations](#)
- [Deprecated](#)
- [Removed](#)
- [Porting to Python 3.9](#)

- [Changes in the Python API](#)
- [Changes in the C API](#)
- [CPython bytecode changes](#)

- [Build Changes](#)
- [C API Changes](#)

- [New Features](#)
- [Porting to Python 3.9](#)
- [Removed](#)

- [Notable changes in Python 3.9.1](#)

- [typing](#)
- [macOS 11.0 \(Big Sur\) and Apple Silicon Mac support](#)

- Notable changes in Python 3.9.2

- collections.abc
- urllib.parse

- What's New In Python 3.8

- Summary – Release highlights
- New Features

- Assignment expressions
- Positional-only parameters
- Parallel filesystem cache for compiled bytecode files
- Debug build uses the same ABI as release build
- f-strings support `=` for self-documenting expressions and debugging
- PEP 578: Python Runtime Audit Hooks
- PEP 587: Python Initialization Configuration
- PEP 590: Vectorcall: a fast calling protocol for CPython
- Pickle protocol 5 with out-of-band data buffers

- Other Language Changes
- New Modules
- Improved Modules

- ast
- asyncio
- builtins
- collections
- cProfile
- csv
- curses
- ctypes
- datetime
- functools
- gc

- [gettext](#)
- [gzip](#)
- [IDLE and idlelib](#)
- [inspect](#)
- [io](#)
- [itertools](#)
- [json.tool](#)
- [logging](#)
- [math](#)
- [mmap](#)
- [multiprocessing](#)
- [os](#)
- [os.path](#)
- [pathlib](#)
- [pickle](#)
- [plistlib](#)
- [pprint](#)
- [py\\_compile](#)
- [shlex](#)
- [shutil](#)
- [socket](#)
- [ssl](#)
- [statistics](#)
- [sys](#)
- [tarfile](#)
- [threading](#)
- [tokenize](#)
- [tkinter](#)
- [time](#)
- [typing](#)
- [unicodedata](#)
- [unittest](#)
- [venv](#)
- [weakref](#)
- [xml](#)
- [xmlrpc](#)

- [Optimizations](#)
- [Build and C API Changes](#)
- [Deprecated](#)

- API and Feature Removals
- Porting to Python 3.8
  - Changes in Python behavior
  - Changes in the Python API
  - Changes in the C API
  - CPython bytecode changes
  - Demos and Tools
- Notable changes in Python 3.8.1
- Notable changes in Python 3.8.8
- Notable changes in Python 3.8.12

## ○ What's New In Python 3.7

- Summary – Release Highlights
- New Features
  - PEP 563: Postponed Evaluation of Annotations
  - PEP 538: Legacy C Locale Coercion
  - PEP 540: Forced UTF-8 Runtime Mode
  - PEP 553: Built-in **breakpoint()**
  - PEP 539: New C API for Thread-Local Storage
  - PEP 562: Customization of Access to Module Attributes
  - PEP 564: New Time Functions With Nanosecond Resolution
  - PEP 565: Show DeprecationWarning in **\_\_main\_\_**
  - PEP 560: Core Support for **typing** module and Generic Types
  - PEP 552: Hash-based .pyc Files
  - PEP 545: Python Documentation Translations
  - Python Development Mode (-X dev)
- Other Language Changes
- New Modules

- `contextvars`
- `dataclasses`
- `importlib.resources`

## ■ Improved Modules

- `argparse`
- `asyncio`
- `binascii`
- `calendar`
- `collections`
- `compileall`
- `concurrent.futures`
- `contextlib`
- `cProfile`
- `crypt`
- `datetime`
- `dbm`
- `decimal`
- `dis`
- `distutils`
- `enum`
- `functools`
- `gc`
- `hmac`
- `http.client`
- `http.server`
- `idlelib` and `IDLE`
- `importlib`
- `io`
- `ipaddress`
- `itertools`
- `locale`
- `logging`
- `math`
- `mimetypes`
- `msilib`
- `multiprocessing`
- `os`
- `pathlib`

- `pdb`
- `py_compile`
- `pydoc`
- `queue`
- `re`
- `signal`
- `socket`
- `socketserver`
- `sqlite3`
- `ssl`
- `string`
- `subprocess`
- `sys`
- `time`
- `tkinter`
- `tracemalloc`
- `types`
- `unicodedata`
- `unittest`
- `unittest.mock`
- `urllib.parse`
- `uu`
- `uuid`
- `warnings`
- `xml.etree`
- `xmlrpc.server`
- `zipapp`
- `zipfile`

- C API Changes
- Build Changes
- Optimizations
- Other CPython Implementation Changes
- Deprecated Python Behavior
- Deprecated Python modules, functions and methods

- `aifc`
- `asyncio`
- `collections`

- dbm
- enum
- gettext
- importlib
- locale
- macpath
- threading
- socket
- ssl
- sunau
- sys
- wave

- Deprecated functions and types of the C API
- Platform Support Removals
- API and Feature Removals
- Module Removals
- Windows-only Changes
- Porting to Python 3.7

- Changes in Python Behavior
- Changes in the Python API
- Changes in the C API
- CPython bytecode changes
- Windows-only Changes
- Other CPython implementation changes

- Notable changes in Python 3.7.1
- Notable changes in Python 3.7.2
- Notable changes in Python 3.7.6
- Notable changes in Python 3.7.10

## ○ What's New In Python 3.6

- Summary – Release highlights
- New Features
  - PEP 498: Formatted string literals
  - PEP 526: Syntax for variable annotations
  - PEP 515: Underscores in Numeric Literals
  - PEP 525: Asynchronous Generators

- PEP 530: Asynchronous Comprehensions
- PEP 487: Simpler customization of class creation
- PEP 487: Descriptor Protocol Enhancements
- PEP 519: Adding a file system path protocol
- PEP 495: Local Time Disambiguation
- PEP 529: Change Windows filesystem encoding to UTF-8
- PEP 528: Change Windows console encoding to UTF-8
- PEP 520: Preserving Class Attribute Definition Order
- PEP 468: Preserving Keyword Argument Order
- New dict implementation
- PEP 523: Adding a frame evaluation API to CPython
- PYTHONMALLOC environment variable
- DTrace and SystemTap probing support
- Other Language Changes
- New Modules
  - secrets
- Improved Modules
  - array
  - ast
  - asyncio
  - binascii
  - cmath
  - collections
  - concurrent.futures
  - contextlib
  - datetime
  - decimal
  - distutils
  - email

- [encodings](#)
- [enum](#)
- [faulthandler](#)
- [fileinput](#)
- [hashlib](#)
- [http.client](#)
- [idlelib](#) and [IDLE](#)
- [importlib](#)
- [inspect](#)
- [json](#)
- [logging](#)
- [math](#)
- [multiprocessing](#)
- [os](#)
- [pathlib](#)
- [pdb](#)
- [pickle](#)
- [pickletools](#)
- [pydoc](#)
- [random](#)
- [re](#)
- [readline](#)
- [rlcompleter](#)
- [shlex](#)
- [site](#)
- [sqlite3](#)
- [socket](#)
- [socketserver](#)
- [ssl](#)
- [statistics](#)
- [struct](#)
- [subprocess](#)
- [sys](#)
- [telnetlib](#)
- [time](#)
- [timeit](#)
- [tkinter](#)
- [traceback](#)
- [tracemalloc](#)
- [typing](#)

- unicodedata
- unittest.mock
- urllib.request
- urllib.robotparser
- venv
- warnings
- winreg
- winsound
- xmlrpc.client
- zipfile
- zlib

- Optimizations
- Build and C API Changes
- Other Improvements
- Deprecated

- New Keywords
- Deprecated Python behavior
- Deprecated Python modules, functions and methods

- asynchat
- asyncore
- dbm
- distutils
- grp
- importlib
- os
- re
- ssl
- tkinter
- venv

- Deprecated functions and types of the C API
- Deprecated Build Options

- Removed

- API and Feature Removals

## ■ Porting to Python 3.6

- Changes in 'python' Command Behavior
- Changes in the Python API
- Changes in the C API
- CPython bytecode changes

## ■ Notable changes in Python 3.6.2

- New **make regen-all** build target
- Removal of **make touch** build target

## ■ Notable changes in Python 3.6.4

## ■ Notable changes in Python 3.6.5

## ■ Notable changes in Python 3.6.7

## ■ Notable changes in Python 3.6.10

## ■ Notable changes in Python 3.6.13

## ○ What's New In Python 3.5

### ■ Summary – Release highlights

### ■ New Features

- PEP 492 - Coroutines with `async` and `await` syntax
- PEP 465 - A dedicated infix operator for matrix multiplication
- PEP 448 - Additional Unpacking Generalizations
- PEP 461 - percent formatting support for bytes and bytearray
- PEP 484 - Type Hints
- PEP 471 - `os.scandir()` function – a better and faster directory iterator
- PEP 475: Retry system calls failing with `EINTR`
- PEP 479: Change `StopIteration` handling inside generators
- PEP 485: A function for testing approximate equality
- PEP 486: Make the Python Launcher aware

of virtual environments

- PEP 488: Elimination of PYO files
- PEP 489: Multi-phase extension module initialization

## ■ Other Language Changes

### ■ New Modules

- typing
- zipapp

### ■ Improved Modules

- argparse
- asyncio
- bz2
- cgi
- cmath
- code
- collections
- collections.abc
- compileall
- concurrent.futures

- Removed
  - API and Feature Removals
  
- Porting to Python 3.5
  - Changes in Python behavior
  - Changes in the Python API
  - Changes in the C API
  
- Notable changes in Python 3.5.4
  - New **make regen-all** build target
  - Removal of **make touch** build target

## ○ What's New In Python 3.4

- Summary – Release Highlights

- New Features

- PEP 453: Explicit Bootstrapping of PIP in Python Installations

- Bootstrapping pip By Default

- Documentation Changes

- PEP 446: Newly Created File Descriptors Are Non-Inheritable

- Improvements to Codec Handling

- PEP 451: A ModuleSpec Type for the Import System

- Other Language Changes

- New Modules

- asyncio

- ensurepip

- enum

- pathlib

- selectors

- statistics

- tracemalloc

- Improved Modules

- abc

- aifc

- argparse

- audioop

- base64

- collections

- colorsys

- contextlib

- dbm

- dis

- doctest

- email

- filecmp

- `functools`
- `gc`
- `glob`
- `hashlib`
- `hmac`
- `html`
- `http`
- `idlelib` and `IDLE`
- `importlib`
- `inspect`
- `ipaddress`
- `logging`
- `marshal`
- `mmap`
- `multiprocessing`
- `operator`
- `os`
- `pdb`
- `pickle`
- `plistlib`
- `poplib`
- `pprint`
- `pty`
- `pydoc`
- `re`
- `resource`
- `select`
- `shelve`
- `shutil`
- `smtpd`
- `smtplib`
- `socket`
- `sqlite3`
- `ssl`
- `stat`
- `struct`
- `subprocess`
- `sunau`
- `sys`
- `tarfile`

- [textwrap](#)
- [threading](#)
- [traceback](#)
- [types](#)

## ■ [CPython Implementation Changes](#)

- [PEP 445: Customization of CPython Memory Allocators](#)
- [PEP 442: Safe Object Finalization](#)
- [PEP 456: Secure and Interchangeable Hash Algorithm](#)
- [PEP 436: Argument Clinic](#)
- [Other Build and C API Changes](#)
- [Other Improvements](#)
- [Significant Optimizations](#)

## ■ [Deprecated](#)

- [Deprecations in the Python API](#)
- [Deprecated Features](#)

## ■ [Removed](#)

- [Operating Systems No Longer Supported](#)
- [API and Feature Removals](#)
- [Code Cleanups](#)

## ■ [Porting to Python 3.4](#)

- [Changes in ‘python’ Command Behavior](#)
- [Changes in the Python API](#)
- [Changes in the C API](#)

- Changed in 3.4.3

- PEP 476: Enabling certificate verification by default for stdlib http clients

- What's New In Python 3.3

- Summary – Release highlights
  - PEP 405: Virtual Environments
  - PEP 420: Implicit Namespace Packages
  - PEP 3118: New memoryview implementation and buffer protocol documentation

- Features
    - API changes

- PEP 393: Flexible String Representation

- Functionality
  - Performance and resource usage

- PEP 397: Python Launcher for Windows
- PEP 3151: Reworking the OS and IO exception hierarchy
- PEP 380: Syntax for Delegating to a Subgenerator
- PEP 409: Suppressing exception context
- PEP 414: Explicit Unicode literals
- PEP 3155: Qualified name for classes and functions
- PEP 412: Key-Sharing Dictionary
- PEP 362: Function Signature Object
- PEP 421: Adding sys.implementation

- SimpleNamespace

- Using importlib as the Implementation of Import

- New APIs
  - Visible Changes

- Other Language Changes
- A Finer-Grained Import Lock

- Builtin functions and types

- New Modules

- `faulthandler`
- `ipaddress`
- `lzma`

- Improved Modules

- `abc`
- `array`
- `base64`
- `binascii`
- `bz2`
- `codecs`
- `collections`
- `contextlib`
- `crypt`
- `curses`
- `datetime`
- `decimal`

- Features

- API changes

- `email`

- Policy Framework

- Provisional Policy with New Header API

- Other API Changes

- `ftplib`
- `functools`
- `gc`
- `hmac`
- `http`
- `html`
- `imaplib`
- `inspect`
- `io`

- `itertools`
- `logging`
- `math`
- `mmap`
- `multiprocessing`
- `nntplib`
- `os`
- `pdb`
- `pickle`
- `pydoc`
- `re`
- `sched`
- `select`
- `shlex`
- `shutil`
- `signal`
- `smtpd`
- `smtplib`
- `socket`
- `socketserver`
- `sqlite3`
- `ssl`
- `stat`
- `struct`
- `subprocess`
- `sys`
- `tarfile`
- `tempfile`
- `textwrap`
- `threading`
- `time`
- `types`
- `unittest`
- `urllib`
- `webbrowser`
- `xml.etree.ElementTree`
- `zlib`

- Optimizations
- Build and C API Changes

## ■ Deprecated

- Unsupported Operating Systems
- Deprecated Python modules, functions and methods
- Deprecated functions and types of the C API
- Deprecated features

## ■ Porting to Python 3.3

- Porting Python code
- Porting C code
- Building C extensions
- Command Line Switch Changes

## ○ What's New In Python 3.2

- PEP 384: Defining a Stable ABI
- PEP 389: Argparse Command Line Parsing Module
- PEP 391: Dictionary Based Configuration for Logging
- PEP 3148: The **concurrent.futures** module
- PEP 3147: PYC Repository Directories
- PEP 3149: ABI Version Tagged .so Files
- PEP 3333: Python Web Server Gateway Interface v1.0.1
- Other Language Changes
- New, Improved, and Deprecated Modules
  - email
  - elementtree
  - functools
  - itertools
  - collections
  - threading
  - datetime and time
  - math
  - abc
  - io

- reprlib
- logging
- csv
- contextlib
- decimal and fractions
- ftp
- popen
- select
- gzip and zipfile
- tarfile
- hashlib
- ast
- os
- shutil
- sqlite3
- html
- socket
- ssl
- nntp
- certificates
- imaplib
- http.client
- unittest
- random
- poplib
- asyncore
- tempfile
- inspect
- pydoc
- dis
- dbm
- ctypes
- site
- sysconfig
- pdb
- configparser
- urllib.parse
- mailbox
- turtle demo

- Multi-threading
- Optimizations
- Unicode
- Codecs
- Documentation
- IDLE
- Code Repository
- Build and C API Changes
- Porting to Python 3.2

## ○ What's New In Python 3.1

- PEP 372: Ordered Dictionaries
- PEP 378: Format Specifier for Thousands Separator
- Other Language Changes
- New, Improved, and Deprecated Modules
- Optimizations
- IDLE
- Build and C API Changes
- Porting to Python 3.1

## ○ What's New In Python 3.0

- Common Stumbling Blocks
  - Print Is A Function
  - Views And Iterators Instead Of Lists
  - Ordering Comparisons
  - Integers
  - Text Vs. Data Instead Of Unicode Vs. 8-bit
- Overview Of Syntax Changes
  - New Syntax
  - Changed Syntax
  - Removed Syntax
- Changes Already Present In Python 2.6
- Library Changes
- **PEP 3101: A New Approach To String Formatting**

- Changes To Exceptions
- Miscellaneous Other Changes
  - Operators And Special Methods
  - Builtins
- Build and C API Changes
- Performance
- Porting To Python 3.0

## ○ What's New in Python 2.7

- The Future for Python 2.x
- Changes to the Handling of Deprecation Warnings
- Python 3.1 Features
- PEP 372: Adding an Ordered Dictionary to collections
- PEP 378: Format Specifier for Thousands Separator
- PEP 389: The argparse Module for Parsing Command Lines
- PEP 391: Dictionary-Based Configuration For Logging
- PEP 3106: Dictionary Views
- PEP 3137: The memoryview Object
- Other Language Changes
  - Interpreter Changes
  - Optimizations
- New and Improved Modules
  - New module: importlib
  - New module: sysconfig
  - ttk: Themed Widgets for Tk
  - Updated module: unittest
  - Updated module: ElementTree 1.3
- Build and C API Changes

- Capsules
  - Port-Specific Changes: Windows
  - Port-Specific Changes: Mac OS X
  - Port-Specific Changes: FreeBSD
- Other Changes and Fixes
- Porting to Python 2.7
- New Features Added to Python 2.7 Maintenance Releases
  - Two new environment variables for debug mode
  - PEP 434: IDLE Enhancement Exception for All Branches
  - PEP 466: Network Security Enhancements for Python 2.7
  - PEP 477: Backport ensurepip (PEP 453) to Python 2.7
    - Bootstrapping pip By Default
    - Documentation Changes
  - PEP 476: Enabling certificate verification by default for stdlib http clients
  - PEP 493: HTTPS verification migration tools for Python 2.7
  - New **make regen-all** build target
  - Removal of **make touch** build target
- Acknowledgements
- What's New in Python 2.6
  - Python 3.0
  - Changes to the Development Process
    - New Issue Tracker: Roundup
    - New Documentation Format: reStructuredText Using Sphinx
  - PEP 343: The 'with' statement

- Writing Context Managers
- The `contextlib` module
- PEP 366: Explicit Relative Imports From a Main Module
- PEP 370: Per-user `site-packages` Directory
- PEP 371: The `multiprocessing` Package
- PEP 3101: Advanced String Formatting
- PEP 3105: `print` As a Function
- PEP 3110: Exception-Handling Changes
- PEP 3112: Byte Literals
- PEP 3116: New I/O Library
- PEP 3118: Revised Buffer Protocol
- PEP 3119: Abstract Base Classes
- PEP 3127: Integer Literal Support and Syntax
- PEP 3129: Class Decorators
- PEP 3141: A Type Hierarchy for Numbers
- The `fractions` Module
- Other Language Changes
  - Optimizations
  - Interpreter Changes
- New and Improved Modules
  - The `ast` module
  - The `future_builtins` module
  - The `json` module: JavaScript Object Notation
  - The `plistlib` module: A Property-List Parser
  - `ctypes` Enhancements
  - Improved SSL Support
- Deprecations and Removals
- Build and C API Changes
  - Port-Specific Changes: Windows
  - Port-Specific Changes: Mac OS X

- Port-Specific Changes: IRIX
- Porting to Python 2.6

- What's New in Python 2.5
  - PEP 308: Conditional Expressions
  - PEP 309: Partial Function Application
  - PEP 314: Metadata for Python Software Packages v1.1
  - PEP 328: Absolute and Relative Imports
  - PEP 338: Executing Modules as Scripts
  - PEP 341: Unified try/except/finally
  - PEP 342: New Generator Features
  - PEP 343: The 'with' statement
    - Writing Context Managers
    - The contextlib module
  - PEP 352: Exceptions as New-Style Classes
  - PEP 353: Using ssize\_t as the index type
  - PEP 357: The '\_index\_' method
  - Other Language Changes
    - Interactive Interpreter Changes
    - Optimizations
  - New, Improved, and Removed Modules
    - The ctypes package
    - The ElementTree package
    - The hashlib package
    - The sqlite3 package
    - The wsgiref package
  - Build and C API Changes
    - Port-Specific Changes
  - Porting to Python 2.5
  - Acknowledgements

## ○ What's New in Python 2.4

- PEP 218: Built-In Set Objects
- PEP 237: Unifying Long Integers and Integers
- PEP 289: Generator Expressions
- PEP 292: Simpler String Substitutions
- PEP 318: Decorators for Functions and Methods
- PEP 322: Reverse Iteration
- PEP 324: New subprocess Module
- PEP 327: Decimal Data Type

- Why is Decimal needed?
- The **Decimal** type
- The **Context** type

- PEP 328: Multi-line Imports
- PEP 331: Locale-Independent Float/String Conversions
- Other Language Changes

- Optimizations

- New, Improved, and Deprecated Modules

- cookielib
- doctest

- Build and C API Changes

- Port-Specific Changes

- Porting to Python 2.4
- Acknowledgements

## ○ What's New in Python 2.3

- PEP 218: A Standard Set Datatype
- PEP 255: Simple Generators
- PEP 263: Source Code Encodings
- PEP 273: Importing Modules from ZIP Archives
- PEP 277: Unicode file name support for Windows NT

- PEP 278: Universal Newline Support
- PEP 279: enumerate()
- PEP 282: The logging Package
- PEP 285: A Boolean Type
- PEP 293: Codec Error Handling Callbacks
- PEP 301: Package Index and Metadata for Distutils
- PEP 302: New Import Hooks
- PEP 305: Comma-separated Files
- PEP 307: Pickle Enhancements
- Extended Slices
- Other Language Changes
  - String Changes
  - Optimizations
- New, Improved, and Deprecated Modules
  - Date/Time Type
  - The optparse Module
- Pymalloc: A Specialized Object Allocator
- Build and C API Changes
  - Port-Specific Changes
- Other Changes and Fixes
- Porting to Python 2.3
- Acknowledgements

## ○ What's New in Python 2.2

- Introduction
- PEPs 252 and 253: Type and Class Changes
  - Old and New Classes
  - Descriptors
  - Multiple Inheritance: The Diamond Rule
  - Attribute Access
  - Related Links
- PEP 234: Iterators

- PEP 255: Simple Generators
- PEP 237: Unifying Long Integers and Integers
- PEP 238: Changing the Division Operator
- Unicode Changes
- PEP 227: Nested Scopes
- New and Improved Modules
- Interpreter Changes and Fixes
- Other Changes and Fixes
- Acknowledgements

## ○ What's New in Python 2.1

- Introduction
- PEP 227: Nested Scopes
- PEP 236: `_future_` Directives
- PEP 207: Rich Comparisons
- PEP 230: Warning Framework
- PEP 229: New Build System
- PEP 205: Weak References
- PEP 232: Function Attributes
- PEP 235: Importing Modules on Case-Insensitive Platforms
- PEP 217: Interactive Display Hook
- PEP 208: New Coercion Model
- PEP 241: Metadata in Python Packages
- New and Improved Modules
- Other Changes and Fixes
- Acknowledgements

## ○ What's New in Python 2.0

- Introduction
- What About Python 1.6?
- New Development Process
- Unicode
- List Comprehensions
- Augmented Assignment
- String Methods
- Garbage Collection of Cycles
- Other Core Changes

- Minor Language Changes
- Changes to Built-in Functions
- Porting to 2.0
- Extending/Embedding Changes
- Distutils: Making Modules Easy to Install
- XML Modules
  - SAX2 Support
  - DOM Support
  - Relationship to PyXML
- Module changes
- New modules
- IDLE Improvements
- Deleted and Deprecated Modules
- Acknowledgements

## • The Python Tutorial

- 1. Whetting Your Appetite
- 2. Using the Python Interpreter

### ■ 2.1. Invoking the Interpreter

- 2.1.1. Argument Passing
- 2.1.2. Interactive Mode

### ■ 2.2. The Interpreter and Its Environment

- 2.2.1. Source Code Encoding

- 3. An Informal Introduction to Python

- 3.1. Using Python as a Calculator

- 3.1.1. Numbers

- 3.1.2. Strings

- 3.1.3. Lists

- 3.2. First Steps Towards Programming

- 4. More Control Flow Tools

- 4.1. **if** Statements

- 4.2. **for** Statements

- 4.3. The **range()** Function

- 4.4. **break** and **continue** Statements, and **else** Clauses on Loops

- 4.5. **pass** Statements

- 4.6. **match** Statements

- 4.7. Defining Functions

- 4.8. More on Defining Functions

- 4.8.1. Default Argument Values

- 4.8.2. Keyword Arguments

- 4.8.3. Special parameters

- 4.8.3.1. Positional-or-Keyword Arguments

- 4.8.3.2. Positional-Only Parameters

- 4.8.3.3. Keyword-Only Arguments

- 4.8.3.4. Function Examples

- 4.8.3.5. Recap

- 4.8.4. Arbitrary Argument Lists

- 4.8.5. Unpacking Argument Lists

- 4.8.6. Lambda Expressions

- 4.8.7. Documentation Strings

- 4.8.8. Function Annotations

- 4.9. Intermezzo: Coding Style

- 5. Data Structures

## ■ 5.1. More on Lists

- 5.1.1. Using Lists as Stacks
- 5.1.2. Using Lists as Queues
- 5.1.3. List Comprehensions
- 5.1.4. Nested List Comprehensions

## ■ 5.2. The `del` statement

## ■ 5.3. Tuples and Sequences

## ■ 5.4. Sets

## ■ 5.5. Dictionaries

## ■ 5.6. Looping Techniques

## ■ 5.7. More on Conditions

## ■ 5.8. Comparing Sequences and Other Types

# ○ 6. Modules

## ■ 6.1. More on Modules

- 6.1.1. Executing modules as scripts
- 6.1.2. The Module Search Path
- 6.1.3. “Compiled” Python files

## ■ 6.2. Standard Modules

## ■ 6.3. The `dir()` Function

## ■ 6.4. Packages

- 6.4.1. Importing `*` From a Package
- 6.4.2. Intra-package References
- 6.4.3. Packages in Multiple Directories

# ○ 7. Input and Output

## ■ 7.1. Fancier Output Formatting

- 7.1.1. Formatted String Literals
- 7.1.2. The String `format()` Method
- 7.1.3. Manual String Formatting
- 7.1.4. Old string formatting

## ■ 7.2. Reading and Writing Files

- 7.2.1. Methods of File Objects
- 7.2.2. Saving structured data with `json`

## ○ 8. Errors and Exceptions

- 8.1. Syntax Errors
- 8.2. Exceptions
- 8.3. Handling Exceptions
- 8.4. Raising Exceptions
- 8.5. Exception Chaining
- 8.6. User-defined Exceptions
- 8.7. Defining Clean-up Actions
- 8.8. Predefined Clean-up Actions
- 8.9. Raising and Handling Multiple Unrelated Exceptions
- 8.10. Enriching Exceptions with Notes

## ○ 9. Classes

- 9.1. A Word About Names and Objects
- 9.2. Python Scopes and Namespaces
  - 9.2.1. Scopes and Namespaces Example
- 9.3. A First Look at Classes
  - 9.3.1. Class Definition Syntax
  - 9.3.2. Class Objects
  - 9.3.3. Instance Objects
  - 9.3.4. Method Objects
  - 9.3.5. Class and Instance Variables
- 9.4. Random Remarks
- 9.5. Inheritance
  - 9.5.1. Multiple Inheritance
- 9.6. Private Variables
- 9.7. Odds and Ends
- 9.8. Iterators
- 9.9. Generators
- 9.10. Generator Expressions

- 10. Brief Tour of the Standard Library
  - 10.1. Operating System Interface
  - 10.2. File Wildcards
  - 10.3. Command Line Arguments
  - 10.4. Error Output Redirection and Program Termination
  - 10.5. String Pattern Matching
  - 10.6. Mathematics
  - 10.7. Internet Access
  - 10.8. Dates and Times
  - 10.9. Data Compression
  - 10.10. Performance Measurement
  - 10.11. Quality Control
  - 10.12. Batteries Included
- 11. Brief Tour of the Standard Library — Part II
  - 11.1. Output Formatting
  - 11.2. Templating
  - 11.3. Working with Binary Data Record Layouts
  - 11.4. Multi-threading
  - 11.5. Logging
  - 11.6. Weak References
  - 11.7. Tools for Working with Lists
  - 11.8. Decimal Floating Point Arithmetic
- 12. Virtual Environments and Packages
  - 12.1. Introduction
  - 12.2. Creating Virtual Environments
  - 12.3. Managing Packages with pip
- 13. What Now?
- 14. Interactive Input Editing and History Substitution
  - 14.1. Tab Completion and History Editing
  - 14.2. Alternatives to the Interactive Interpreter
- 15. Floating Point Arithmetic: Issues and Limitations

- 15.1. Representation Error
- 16. Appendix
  - 16.1. Interactive Mode
    - 16.1.1. Error Handling
    - 16.1.2. Executable Python Scripts
    - 16.1.3. The Interactive Startup File
    - 16.1.4. The Customization Modules
- Python Setup and Usage
  - 1. Command line and environment
    - 1.1. Command line
      - 1.1.1. Interface options
      - 1.1.2. Generic options
      - 1.1.3. Miscellaneous options
      - 1.1.4. Options you shouldn't use
    - 1.2. Environment variables
      - 1.2.1. Debug-mode variables
  - 2. Using Python on Unix platforms
    - 2.1. Getting and installing the latest version of Python
      - 2.1.1. On Linux
      - 2.1.2. On FreeBSD and OpenBSD
      - 2.1.3. On OpenSolaris
    - 2.2. Building Python
    - 2.3. Python-related paths and files
    - 2.4. Miscellaneous
    - 2.5. Custom OpenSSL
  - 3. Configure Python

## ■ 3.1. Configure Options

- 3.1.1. General Options
- 3.1.2. WebAssembly Options
- 3.1.3. Install Options
- 3.1.4. Performance options
- 3.1.5. Python Debug Build
- 3.1.6. Debug options
- 3.1.7. Linker options
- 3.1.8. Libraries options
- 3.1.9. Security Options
- 3.1.10. macOS Options
- 3.1.11. Cross Compiling Options

## ■ 3.2. Python Build System

- 3.2.1. Main files of the build system
- 3.2.2. Main build steps
- 3.2.3. Main Makefile targets
- 3.2.4. C extensions

## ■ 3.3. Compiler and linker flags

- 3.3.1. Preprocessor flags
- 3.3.2. Compiler flags
- 3.3.3. Linker flags

## ○ 4. Using Python on Windows

### ■ 4.1. The full installer

- 4.1.1. Installation steps
- 4.1.2. Removing the MAX\_PATH Limitation
- 4.1.3. Installing Without UI
- 4.1.4. Installing Without Downloading
- 4.1.5. Modifying an install

### ■ 4.2. The Microsoft Store package

- 4.2.1. Known issues
  - 4.2.1.1. Redirection of local data,

registry, and temporary paths

- 4.3. The nuget.org packages
- 4.4. The embeddable package
  - 4.4.1. Python Application
  - 4.4.2. Embedding Python
- 4.5. Alternative bundles
- 4.6. Configuring Python
  - 4.6.1. Excursus: Setting environment variables
  - 4.6.2. Finding the Python executable
- 4.7. UTF-8 mode
- 4.8. Python Launcher for Windows
  - 4.8.1. Getting started
    - 4.8.1.1. From the command-line
    - 4.8.1.2. Virtual environments
    - 4.8.1.3. From a script
    - 4.8.1.4. From file associations
  - 4.8.2. Shebang Lines
  - 4.8.3. Arguments in shebang lines
  - 4.8.4. Customization
    - 4.8.4.1. Customization via INI files
    - 4.8.4.2. Customizing default Python versions
  - 4.8.5. Diagnostics
  - 4.8.6. Dry Run
  - 4.8.7. Install on demand
  - 4.8.8. Return codes
- 4.9. Finding modules
- 4.10. Additional modules
  - 4.10.1. PyWin32

- 4.10.2. cx\_Freeze
- 4.11. Compiling Python on Windows
- 4.12. Other Platforms
- 5. Using Python on a Mac
  - 5.1. Getting and Installing MacPython
    - 5.1.1. How to run a Python script
    - 5.1.2. Running scripts with a GUI
    - 5.1.3. Configuration
  - 5.2. The IDE
  - 5.3. Installing Additional Python Packages
  - 5.4. GUI Programming on the Mac
  - 5.5. Distributing Python Applications on the Mac
  - 5.6. Other Resources
- 6. Editors and IDEs
- The Python Language Reference
  - 1. Introduction
    - 1.1. Alternate Implementations
    - 1.2. Notation
  - 2. Lexical analysis
    - 2.1. Line structure
      - 2.1.1. Logical lines
      - 2.1.2. Physical lines
      - 2.1.3. Comments
      - 2.1.4. Encoding declarations
      - 2.1.5. Explicit line joining
      - 2.1.6. Implicit line joining
      - 2.1.7. Blank lines
      - 2.1.8. Indentation
      - 2.1.9. Whitespace between tokens

- 2.2. Other tokens
- 2.3. Identifiers and keywords
  - 2.3.1. Keywords
  - 2.3.2. Soft Keywords
  - 2.3.3. Reserved classes of identifiers

- 2.4. Literals

- 2.4.1. String and Bytes literals
  - 2.4.2. String literal concatenation
  - 2.4.3. Formatted string literals
  - 2.4.4. Numeric literals
  - 2.4.5. Integer literals
  - 2.4.6. Floating point literals
  - 2.4.7. Imaginary literals

- 2.5. Operators

- 2.6. Delimiters

- 3. Data model

- 3.1. Objects, values and types
- 3.2. The standard type hierarchy
- 3.3. Special method names
  - 3.3.1. Basic customization
  - 3.3.2. Customizing attribute access
    - 3.3.2.1. Customizing module attribute access
    - 3.3.2.2. Implementing Descriptors
    - 3.3.2.3. Invoking Descriptors
    - 3.3.2.4. `__slots__`
      - 3.3.2.4.1. Notes on using `__slots__`
  - 3.3.3. Customizing class creation
    - 3.3.3.1. Metaclasses
    - 3.3.3.2. Resolving MRO entries

- 3.3.3.3. Determining the appropriate metaclass
- 3.3.3.4. Preparing the class namespace
- 3.3.3.5. Executing the class body
- 3.3.3.6. Creating the class object
- 3.3.3.7. Uses for metaclasses
- 3.3.4. Customizing instance and subclass checks
- 3.3.5. Emulating generic types
  - 3.3.5.1. The purpose of `__class_getitem__`
  - 3.3.5.2. `__class_getitem__` versus `__getitem__`
- 3.3.6. Emulating callable objects
- 3.3.7. Emulating container types
- 3.3.8. Emulating numeric types
- 3.3.9. With Statement Context Managers
- 3.3.10. Customizing positional arguments in class pattern matching
- 3.3.11. Special method lookup
- 3.4. Coroutines
  - 3.4.1. Awaitable Objects
  - 3.4.2. Coroutine Objects
  - 3.4.3. Asynchronous Iterators
  - 3.4.4. Asynchronous Context Managers

## ○ 4. Execution model

- 4.1. Structure of a program
- 4.2. Naming and binding
  - 4.2.1. Binding of names
  - 4.2.2. Resolution of names
  - 4.2.3. Builtins and restricted execution
  - 4.2.4. Interaction with dynamic features

- 4.3. Exceptions
- 5. The import system
  - 5.1. `importlib`
  - 5.2. Packages
    - 5.2.1. Regular packages
    - 5.2.2. Namespace packages
  - 5.3. Searching
    - 5.3.1. The module cache
    - 5.3.2. Finders and loaders
    - 5.3.3. Import hooks
    - 5.3.4. The meta path
  - 5.4. Loading
    - 5.4.1. Loaders
    - 5.4.2. Submodules
    - 5.4.3. Module spec
    - 5.4.4. Import-related module attributes
    - 5.4.5. `module._path_`
    - 5.4.6. Module reprs
    - 5.4.7. Cached bytecode invalidation
  - 5.5. The Path Based Finder
    - 5.5.1. Path entry finders
    - 5.5.2. Path entry finder protocol
  - 5.6. Replacing the standard import system
  - 5.7. Package Relative Imports
  - 5.8. Special considerations for `_main_`
    - 5.8.1. `_main_. _spec_`
  - 5.9. References
- 6. Expressions

- 6.1. Arithmetic conversions
- 6.2. Atoms
  - 6.2.1. Identifiers (Names)
  - 6.2.2. Literals
  - 6.2.3. Parenthesized forms
  - 6.2.4. Displays for lists, sets and dictionaries
  - 6.2.5. List displays
  - 6.2.6. Set displays
  - 6.2.7. Dictionary displays
  - 6.2.8. Generator expressions
  - 6.2.9. Yield expressions
    - 6.2.9.1. Generator-iterator methods
    - 6.2.9.2. Examples
    - 6.2.9.3. Asynchronous generator functions
    - 6.2.9.4. Asynchronous generator-iterator methods
- 6.3. Primaries
  - 6.3.1. Attribute references
  - 6.3.2. Subscriptions
  - 6.3.3. Slicings
  - 6.3.4. Calls
- 6.4. Await expression
- 6.5. The power operator
- 6.6. Unary arithmetic and bitwise operations
- 6.7. Binary arithmetic operations
- 6.8. Shifting operations
- 6.9. Binary bitwise operations
- 6.10. Comparisons
  - 6.10.1. Value comparisons
  - 6.10.2. Membership test operations
  - 6.10.3. Identity comparisons
- 6.11. Boolean operations

- 6.12. Assignment expressions
- 6.13. Conditional expressions
- 6.14. Lambdas
- 6.15. Expression lists
- 6.16. Evaluation order
- 6.17. Operator precedence

## ○ 7. Simple statements

- 7.1. Expression statements
- 7.2. Assignment statements
  - 7.2.1. Augmented assignment statements
  - 7.2.2. Annotated assignment statements
- 7.3. The **assert** statement
- 7.4. The **pass** statement
- 7.5. The **del** statement
- 7.6. The **return** statement
- 7.7. The **yield** statement
- 7.8. The **raise** statement
- 7.9. The **break** statement
- 7.10. The **continue** statement
- 7.11. The **import** statement
  - 7.11.1. Future statements
- 7.12. The **global** statement
- 7.13. The **nonlocal** statement

## ○ 8. Compound statements

- 8.1. The **if** statement
- 8.2. The **while** statement
- 8.3. The **for** statement
- 8.4. The **try** statement
  - 8.4.1. **except** clause
  - 8.4.2. **except\*** clause
  - 8.4.3. **else** clause
  - 8.4.4. **finally** clause

- 8.5. The **with** statement
- 8.6. The **match** statement

- 8.6.1. Overview
- 8.6.2. Guards
- 8.6.3. Irrefutable Case Blocks
- 8.6.4. Patterns

- 8.6.4.1. OR Patterns
- 8.6.4.2. AS Patterns
- 8.6.4.3. Literal Patterns
- 8.6.4.4. Capture Patterns
- 8.6.4.5. Wildcard Patterns
- 8.6.4.6. Value Patterns
- 8.6.4.7. Group Patterns
- 8.6.4.8. Sequence Patterns
- 8.6.4.9. Mapping Patterns
- 8.6.4.10. Class Patterns

- 8.7. Function definitions
- 8.8. Class definitions
- 8.9. Coroutines

- 8.9.1. Coroutine function definition
- 8.9.2. The **async for** statement
- 8.9.3. The **async with** statement

- 9. Top-level components

- 9.1. Complete Python programs
- 9.2. File input
- 9.3. Interactive input
- 9.4. Expression input

- 10. Full Grammar specification

- The Python Standard Library

- Introduction

- Notes on availability

- WebAssembly platforms

- Built-in Functions
- Built-in Constants

- Constants added by the `site` module

- Built-in Types

- Truth Value Testing
- Boolean Operations — `and`, `or`, `not`
- Comparisons
- Numeric Types — `int`, `float`, `complex`

- Bitwise Operations on Integer Types
- Additional Methods on Integer Types
- Additional Methods on Float
- Hashing of numeric types

- Iterator Types

- Generator Types

- Sequence Types — `list`, `tuple`, `range`

- Common Sequence Operations
- Immutable Sequence Types
- Mutable Sequence Types
- Lists
- Tuples
- Ranges

- Text Sequence Type — `str`

- String Methods
- `printf`-style String Formatting

- Binary Sequence Types — `bytes`, `bytearray`, `memoryview`

- Bytes Objects
- Bytearray Objects

- Bytes and Bytearray Operations
- `printf`-style Bytes Formatting
- Memory Views
  
- Set Types — `set`, `frozenset`
- Mapping Types — `dict`
  - Dictionary view objects
  
- Context Manager Types
- Type Annotation Types — Generic Alias, Union
  - Generic Alias Type
    - Standard Generic Classes
    - Special Attributes of `GenericAlias` objects
  - Union Type
  
- Other Built-in Types
  - Modules
  - Classes and Class Instances
  - Functions
  - Methods
  - Code Objects
  - Type Objects
  - The Null Object
  - The Ellipsis Object
  - The NotImplemented Object
  - Boolean Values
  - Internal Objects
  
- Special Attributes
- Integer string conversion length limitation
  - Affected APIs
  - Configuring the limit
  - Recommended configuration

○ Built-in Exceptions

- Exception context
- Inheriting from built-in exceptions
- Base classes
- Concrete exceptions
  - OS exceptions
- Warnings
- Exception groups
- Exception hierarchy

## ○ Text Processing Services

- **string** — Common string operations
  - String constants
  - Custom String Formatting
  - Format String Syntax
    - Format Specification Mini-Language
    - Format examples
  - Template strings
  - Helper functions
- **re** — Regular expression operations
  - Regular Expression Syntax
  - Module Contents
    - Flags
    - Functions
    - Exceptions
  - Regular Expression Objects
  - Match Objects
  - Regular Expression Examples
    - Checking for a Pair
    - Simulating scanf()
    - search() vs. match()
    - Making a Phonebook

- Text Munging
- Finding all Adverbs
- Finding all Adverbs and their Positions
- Raw String Notation
- Writing a Tokenizer

■ **difflib** — Helpers for computing deltas

- SequenceMatcher Objects
- SequenceMatcher Examples
- Differ Objects
- Differ Example
- A command-line interface to difflib

■ **textwrap** — Text wrapping and filling

■ **unicodedata** — Unicode Database

■ **stringprep** — Internet String Preparation

■ **readline** — GNU readline interface

- Init file
- Line buffer
- History file
- History list
- Startup hooks
- Completion
- Example

■ **rlcompleter** — Completion function for GNU readline

- Completer Objects

○ Binary Data Services

■ **struct** — Interpret bytes as packed binary data

- Functions and Exceptions
- Format Strings
  - Byte Order, Size, and Alignment
  - Format Characters

- Examples
- Applications
  - Native Formats
  - Standard Formats
- Classes
- **codecs** — Codec registry and base classes
  - Codec Base Classes
    - Error Handlers
    - Stateless Encoding and Decoding
    - Incremental Encoding and Decoding
      - IncrementalEncoder Objects
      - IncrementalDecoder Objects
  - Stream Encoding and Decoding
    - StreamWriter Objects
    - StreamReader Objects
    - StreamReaderWriter Objects
    - StreamRecoder Objects
- Encodings and Unicode
- Standard Encodings
- Python Specific Encodings
  - Text Encodings
  - Binary Transforms
  - Text Transforms
- **encodings.idna** — Internationalized Domain Names in Applications
- **encodings.mbc**s — Windows ANSI codepage
- **encodings.utf\_8\_sig** — UTF-8 codec with BOM signature

## ○ Data Types

- **datetime** — Basic date and time types
  - Aware and Naive Objects
  - Constants
  - Available Types
    - Common Properties
    - Determining if an Object is Aware or Naive
- **timedelta** Objects
  - Examples of usage: **timedelta**
- **date** Objects
  - Examples of Usage: **date**
- **datetime** Objects
  - Examples of Usage: **datetime**
- **time** Objects
  - Examples of Usage: **time**
- **tzinfo** Objects
- **timezone** Objects
- **strptime()** and **strftime()** Behavior
  - **strftime()** and **strptime()** Format Codes
  - Technical Detail
- **zoneinfo** — IANA time zone support
  - Using **ZoneInfo**
  - Data sources
    - Configuring the data sources

- Compile-time configuration
- Environment configuration
- Runtime configuration
- The **ZoneInfo** class
  - String representations
  - Pickle serialization
- Functions
- Globals
- Exceptions and warnings
- **calendar** — General calendar-related functions
- **collections** — Container datatypes
  - **ChainMap** objects
    - **ChainMap** Examples and Recipes
  - **Counter** objects
  - **deque** objects
    - **deque** Recipes
  - **defaultdict** objects
    - **defaultdict** Examples
  - **namedtuple()** Factory Function for Tuples with Named Fields
  - **OrderedDict** objects
    - **OrderedDict** Examples and Recipes
  - **UserDict** objects
  - **UserList** objects
  - **UserString** objects
- **collections.abc** — Abstract Base Classes for Containers

- Collections Abstract Base Classes
- Collections Abstract Base Classes – Detailed Descriptions
- Examples and Recipes
  
- **heapq** — Heap queue algorithm
  - Basic Examples
  - Priority Queue Implementation Notes
  - Theory
  
- **bisect** — Array bisection algorithm
  - Performance Notes
  - Searching Sorted Lists
  - Examples
  
- **array** — Efficient arrays of numeric values
- **weakref** — Weak references
  - Weak Reference Objects
  - Example
  - Finalizer Objects
  - Comparing finalizers with `__del__()` methods
  
- **types** — Dynamic type creation and names for built-in types
  - Dynamic Type Creation
  - Standard Interpreter Types
  - Additional Utility Classes and Functions
  - Coroutine Utility Functions
  
- **copy** — Shallow and deep copy operations
- **pprint** — Data pretty printer
  - PrettyPrinter Objects
  - Example
  
- **reprlib** — Alternate `repr()` implementation

- Repr Objects
  - Subclassing Repr Objects
- **enum** — Support for enumerations
  - Module Contents
  - Data Types
    - Supported `__dunder__` names
    - Supported `_sunder_` names
  - Utilities and Decorators
  - Notes
- **graphlib** — Functionality to operate with graph-like structures
  - Exceptions
- Numeric and Mathematical Modules
  - **numbers** — Numeric abstract base classes
    - The numeric tower
    - Notes for type implementors
      - Adding More Numeric ABCs
      - Implementing the arithmetic operations
  - **math** — Mathematical functions
    - Number-theoretic and representation functions
    - Power and logarithmic functions
    - Trigonometric functions
    - Angular conversion
    - Hyperbolic functions
    - Special functions
    - Constants
  - **cmath** — Mathematical functions for complex

## numbers

- Conversions to and from polar coordinates
  - Power and logarithmic functions
  - Trigonometric functions
  - Hyperbolic functions
  - Classification functions
  - Constants
- 
- **decimal** — Decimal fixed point and floating point arithmetic
    - Quick-start Tutorial
    - Decimal objects
      - Logical operands
    - Context objects
    - Constants
    - Rounding modes
    - Signals
    - Floating Point Notes
      - Mitigating round-off error with increased precision
      - Special values
    - Working with threads
    - Recipes
    - Decimal FAQ
- 
- **fractions** — Rational numbers
  - **random** — Generate pseudo-random numbers
    - Bookkeeping functions
    - Functions for bytes
    - Functions for integers
    - Functions for sequences
    - Real-valued distributions
    - Alternative Generator
    - Notes on Reproducibility

- Examples
- Recipes

- **statistics** — Mathematical statistics functions

- Averages and measures of central location
- Measures of spread
- Statistics for relations between two inputs
- Function details
- Exceptions
- **NormalDist** objects

- **NormalDist** Examples and Recipes

- Functional Programming Modules

- **itertools** — Functions creating iterators for efficient looping

- Itertool functions
- Itertools Recipes

- **functools** — Higher-order functions and operations on callable objects

- **partial** Objects

- **operator** — Standard operators as functions

- Mapping Operators to Functions
- In-place Operators

- File and Directory Access

- **pathlib** — Object-oriented filesystem paths

- Basic use
- Pure paths
  - General properties
  - Operators
  - Accessing individual parts

- Methods and properties
  - Concrete paths
    - Methods
  - Correspondence to tools in the `os` module
- `os.path` — Common pathname manipulations
- `fileinput` — Iterate over lines from multiple input streams
- `stat` — Interpreting `stat()` results
- `filecmp` — File and Directory Comparisons
  - The `dircmp` class
- `tempfile` — Generate temporary files and directories
  - Examples
  - Deprecated functions and variables
- `glob` — Unix style pathname pattern expansion
- `fnmatch` — Unix filename pattern matching
- `linecache` — Random access to text lines
- `shutil` — High-level file operations
  - Directory and files operations
    - Platform-dependent efficient copy operations
    - `copytree` example
    - `rmtree` example
  - Archiving operations
    - Archiving example
    - Archiving example with `base_dir`
- Querying the size of the output terminal

## ○ Data Persistence

- **pickle** — Python object serialization
  - Relationship to other Python modules
    - Comparison with **marshal**
    - Comparison with **json**
  - Data stream format
  - Module Interface
  - What can be pickled and unpickled?
  - Pickling Class Instances
    - Persistence of External Objects
    - Dispatch Tables
    - Handling Stateful Objects
  - Custom Reduction for Types, Functions, and Other Objects
  - Out-of-band Buffers
    - Provider API
    - Consumer API
    - Example
  - Restricting Globals
  - Performance
  - Examples
- **copyreg** — Register **pickle** support functions
  - Example
- **shelve** — Python object persistence
  - Restrictions
  - Example
- **marshal** — Internal Python object serialization
- **dbm** — Interfaces to Unix “databases”
  - **dbm.gnu** — GNU’s reinterpretation of dbm
  - **dbm.ndbm** — Interface based on ndbm

- **dbm.dumb** — Portable DBM implementation
- **sqlite3** — DB-API 2.0 interface for SQLite databases
  - Tutorial
  - Reference
    - Module functions
    - Module constants

    - How to use placeholders to bind values in SQL queries
    - How to adapt custom Python types to SQLite values
      - How to write adaptable objects
      - How to register adapter callables
    - How to convert SQLite values to custom Python types
    - Adapter and converter recipes
    - How to use connection shortcut methods
    - How to use the connection context manager
    - How to work with SQLite URIs
    - How to create and use row factories

- Explanation
  - Transaction control
- Data Compression and Archiving
  - **zlib** — Compression compatible with **gzip**
  - **gzip** — Support for **gzip** files
    - Examples of usage
    - Command Line Interface
      - Command line options
  - **bz2** — Support for **bzip2** compression
    - (De)compression of files
    - Incremental (de)compression
    - One-shot (de)compression
    - Examples of usage
  - **lzma** — Compression using the LZMA algorithm
    - Reading and writing compressed files
    - Compressing and decompressing data in memory
    - Miscellaneous
    - Specifying custom filter chains
    - Examples
  - **zipfile** — Work with ZIP archives
    - ZipFile Objects
    - Path Objects
    - PyZipFile Objects
    - ZipInfo Objects
    - Command-Line Interface
      - Command-line options
    - Decompression pitfalls

- From file itself
- File System limitations
- Resources limitations
- Interruption
- Default behaviors of extraction

## ■ **tarfile** — Read and write tar archive files

- TarFile Objects
- TarInfo Objects
- Extraction filters
  - Default named filters
  - Filter errors
  - Hints for further verification
  - Supporting older Python versions
  - Stateful extraction filter example
- Command-Line Interface
  - Command-line options
- Examples
- Supported tar formats
- Unicode issues

## ○ File Formats

### ■ **csv** — CSV File Reading and Writing

- Module Contents
- Dialects and Formatting Parameters
- Reader Objects
- Writer Objects
- Examples

### ■ **configparser** — Configuration file parser

- Quick Start
- Supported Datatypes
- Fallback Values
- Supported INI File Structure

- Interpolation of values
- Mapping Protocol Access
- Customizing Parser Behaviour
- Legacy API Examples
- ConfigParser Objects
- RawConfigParser Objects
- Exceptions

## ■ **tomllib** — Parse TOML files

- Examples
- Conversion Table

## ■ **netrc** — netrc file processing

- netrc Objects

## ■ **plistlib** — Generate and parse Apple **.plist** files

- Examples

## ○ Cryptographic Services

### ■ **hashlib** — Secure hashes and message digests

- Hash algorithms
- Usage
- Constructors
- Attributes
- Hash Objects
- SHAKE variable length digests
- File hashing
- Key derivation
- BLAKE2

- Creating hash objects
- Constants
- Examples

- Simple hashing
- Using different digest sizes

- Keyed hashing
- Randomized hashing
- Personalization
- Tree mode

- Credits

- **hmac** — Keyed-Hashing for Message Authentication
- **secrets** — Generate secure random numbers for managing secrets

- Random numbers
- Generating tokens

- How many bytes should tokens use?

- Other functions
- Recipes and best practices

- Generic Operating System Services

- **os** — Miscellaneous operating system interfaces

- File Names, Command Line Arguments, and Environment Variables
- Python UTF-8 Mode
- Process Parameters
- File Object Creation
- File Descriptor Operations

- Querying the size of a terminal
- Inheritance of File Descriptors

- Files and Directories

- Linux extended attributes

- Process Management
- Interface to the scheduler
- Miscellaneous System Information
- Random numbers

## ■ **io** — Core tools for working with streams

### ■ Overview

- Text I/O
- Binary I/O
- Raw I/O

### ■ Text Encoding

- Opt-in EncodingWarning

### ■ High-level Module Interface

### ■ Class hierarchy

- I/O Base Classes
- Raw File I/O
- Buffered Streams
- Text I/O

### ■ Performance

- Binary I/O
- Text I/O
- Multi-threading
- Reentrancy

## ■ **time** — Time access and conversions

- Functions
- Clock ID Constants
- Timezone Constants

## ■ **argparse** — Parser for command-line options, arguments and sub-commands

- Core Functionality
- Quick Links for `add_argument()`
- Example
  - Creating a parser
  - Adding arguments

- Parsing arguments

- ArgumentParser objects

- prog
- usage
- description
- epilog
- parents
- formatter\_class
- prefix\_chars
- fromfile\_prefix\_chars
- argument\_default
- allow\_abbrev
- conflict\_handler
- add\_help
- exit\_on\_error

- The add\_argument() method

- name or flags
- action
- nargs
- const
- default
- type
- choices
- required
- help
- metavar
- dest
- Action classes

- The parse\_args() method

- Option value syntax
- Invalid arguments
- Arguments containing –
- Argument abbreviations (prefix matching)
- Beyond **sys.argv**

- The Namespace object
- Other utilities
  - Sub-commands
  - FileType objects
  - Argument groups
  - Mutual exclusion
  - Parser defaults
  - Printing help
  - Partial parsing
  - Customizing file parsing
  - Exiting methods
  - Intermixed parsing
- Upgrading optparse code
- Exceptions
- **getopt** — C-style parser for command line options
- **logging** — Logging facility for Python
  - Logger Objects
  - Logging Levels
  - Handler Objects
  - Formatter Objects
  - Filter Objects
  - LogRecord Objects
  - LogRecord attributes
  - LoggerAdapter Objects
  - Thread Safety
  - Module-Level Functions
  - Module-Level Attributes
  - Integration with the warnings module
- **logging.config** — Logging configuration
  - Configuration functions
  - Security considerations
  - Configuration dictionary schema

- Dictionary Schema Details
- Incremental Configuration
- Object connections
- User-defined objects
- Handler configuration order
- Access to external objects
- Access to internal objects
- Import resolution and custom importers

- Configuration file format

## ■ **logging.handlers** — Logging handlers

- StreamHandler
- FileHandler
- NullHandler
- WatchedFileHandler
- BaseRotatingHandler
- RotatingFileHandler
- TimedRotatingFileHandler
- SocketHandler
- DatagramHandler
- SysLogHandler
- NTEventLogHandler
- SMTPHandler
- MemoryHandler
- HTTPHandler
- QueueHandler
- QueueListener

## ■ **getpass** — Portable password input

## ■ **curses** — Terminal handling for character-cell displays

- Functions
- Window Objects
- Constants

## ■ **curses.textpad** — Text input widget for curses programs

- **Textbox objects**
- **`curses.ascii`** — Utilities for ASCII characters
- **`curses.panel`** — A panel stack extension for `curses`
  - **Functions**
  - **Panel Objects**
- **`platform`** — Access to underlying platform's identifying data
  - **Cross Platform**
  - **Java Platform**
  - **Windows Platform**
  - **macOS Platform**
  - **Unix Platforms**
  - **Linux Platforms**
- **`errno`** — Standard `errno` system symbols
- **`ctypes`** — A foreign function library for Python
  - **`ctypes` tutorial**
    - Loading dynamic link libraries
    - Accessing functions from loaded dlls
    - Calling functions
    - Fundamental data types
    - Calling functions, continued
    - Calling variadic functions
    - Calling functions with your own custom data types
    - Specifying the required argument types (function prototypes)
    - Return types
    - Passing pointers (or: passing parameters by reference)
    - Structures and unions
    - Structure/union alignment and byte order
    - Bit fields in structures and unions

- Arrays
- Pointers
- Type conversions
- Incomplete Types
- Callback functions
- Accessing values exported from dlls
- Surprises
- Variable-sized data types

- **ctypes** reference

- Finding shared libraries
- Loading shared libraries
- Foreign functions
- Function prototypes
- Utility functions
- Data types
- Fundamental data types
- Structured data types
- Arrays and pointers

- Concurrent Execution

- **threading** — Thread-based parallelism

- Thread-Local Data
- Thread Objects
- Lock Objects
- RLock Objects
- Condition Objects
- Semaphore Objects

- **Semaphore** Example

- Event Objects
- Timer Objects
- Barrier Objects
- Using locks, conditions, and semaphores in the **with** statement

- **multiprocessing** — Process-based parallelism

## ■ Introduction

- The **Process** class
- Contexts and start methods
- Exchanging objects between processes
- Synchronization between processes
- Sharing state between processes
- Using a pool of workers

## ■ Reference

- **Process** and exceptions
- Pipes and Queues
- Miscellaneous
- Connection Objects
- Synchronization primitives
- Shared **ctypes** Objects
  - The **multiprocessing.sharedctypes** module
- Managers
  - Customized managers
  - Using a remote manager
- Proxy Objects
  - Cleanup
- Process Pools
- Listeners and Clients
  - Address Formats
- Authentication keys
- Logging
- The **multiprocessing.dummy** module

- Programming guidelines
  - All start methods
  - The *spawn* and *forkserver* start methods
- Examples
- **multiprocessing.shared\_memory** — Shared memory for direct access across processes
- The **concurrent** package
- **concurrent.futures** — Launching parallel tasks
  - Executor Objects
  - ThreadPoolExecutor
    - ThreadPoolExecutor Example
  - ProcessPoolExecutor
    - ProcessPoolExecutor Example
  - Future Objects
  - Module Functions
  - Exception classes
- **subprocess** — Subprocess management
  - Using the **subprocess** Module
    - Frequently Used Arguments
    - Popen Constructor
    - Exceptions
  - Security Considerations
  - Popen Objects
  - Windows Popen Helpers
    - Windows Constants
  - Older high-level API

- Replacing Older Functions with the **subprocess** Module

- Replacing **/bin/sh** shell command substitution
- Replacing shell pipeline
- Replacing **os.system()**
- Replacing the **os.spawn** family
- Replacing **os.popen()**, **os.popen2()**, **os.popen3()**
- Replacing functions from the **popen2** module

- Legacy Shell Invocation Functions

- Notes

- Converting an argument sequence to a string on Windows
- Disabling use of **vfork()** or **posix\_spawn()**

- **sched** — Event scheduler

- Scheduler Objects

- **queue** — A synchronized queue class

- Queue Objects
- SimpleQueue Objects

- **contextvars** — Context Variables

- Context Variables
- Manual Context Management
- asyncio support

- **\_thread** — Low-level threading API

- Networking and Interprocess Communication

- **asyncio** — Asynchronous I/O

## ■ Runners

- Running an asyncio Program
- Runner context manager
- Handling Keyboard Interruption

## ■ Coroutines and Tasks

- Coroutines
- Awaitables
- Creating Tasks
- Task Cancellation
- Task Groups
- Sleeping
- Running Tasks Concurrently
- Shielding From Cancellation
- Timeouts
- Waiting Primitives
- Running in Threads
- Scheduling From Other Threads
- Introspection
- Task Object

## ■ Streams

- StreamReader
- StreamWriter
- Examples
  - TCP echo client using streams
  - TCP echo server using streams
  - Get HTTP headers
  - Register an open socket to wait for data using streams

## ■ Synchronization Primitives

- Lock
- Event
- Condition
- Semaphore

- BoundedSemaphore
- Barrier
- Subprocesses
  - Creating Subprocesses
  - Constants
  - Interacting with Subprocesses
    - Subprocess and Threads
    - Examples
- Queues
  - Queue
  - Priority Queue
  - LIFO Queue
  - Exceptions
  - Examples
- Exceptions
- Event Loop
  - Event Loop Methods
    - Running and stopping the loop
    - Scheduling callbacks
    - Scheduling delayed callbacks
    - Creating Futures and Tasks
    - Opening network connections
    - Creating network servers
    - Transferring files
    - TLS Upgrade
    - Watching file descriptors
    - Working with socket objects directly
    - DNS
    - Working with pipes
    - Unix signals
    - Executing code in thread or process pools

- Error Handling API
- Enabling debug mode
- Running Subprocesses
- Callback Handles
- Server Objects
- Event Loop Implementations
- Examples
  - Hello World with `call_soon()`
  - Display the current date with `call_later()`
  - Watch a file descriptor for read events
  - Set signal handlers for `SIGINT` and `SIGTERM`
- Futures
  - Future Functions
  - Future Object
- Transports and Protocols
  - Transports
    - Transports Hierarchy
    - Base Transport
    - Read-only Transports
    - Write-only Transports
    - Datagram Transports
    - Subprocess Transports
  - Protocols
    - Base Protocols
    - Base Protocol
    - Streaming Protocols
    - Buffered Streaming Protocols
    - Datagram Protocols
    - Subprocess Protocols

## ■ Examples

- TCP Echo Server
- TCP Echo Client
- UDP Echo Server
- UDP Echo Client
- Connecting Existing Sockets
- `loop.subprocess_exec()` and `SubprocessProtocol`

## ■ Policies

- Getting and Setting the Policy
- Policy Objects
- Process Watchers
- Custom Policies

## ■ Platform Support

- All Platforms
- Windows
  - Subprocess Support on Windows
- macOS

## ■ Extending

- Writing a Custom Event Loop
- Future and Task private constructors
- Task lifetime support

## ■ High-level API Index

- Tasks
- Queues
- Subprocesses
- Streams
- Synchronization
- Exceptions

## ■ Low-level API Index

- Obtaining the Event Loop
- Event Loop Methods
- Transports
- Protocols
- Event Loop Policies

## ■ Developing with asyncio

- Debug Mode
- Concurrency and Multithreading
- Running Blocking Code
- Logging
- Detect never-awaited coroutines
- Detect never-retrieved exceptions

## ■ **socket** — Low-level networking interface

- Socket families
- Module contents

- Exceptions
- Constants
- Functions

- Creating sockets
- Other functions

- Socket Objects
- Notes on socket timeouts

- Timeouts and the **connect** method
- Timeouts and the **accept** method

- Example

## ■ **ssl** — TLS/SSL wrapper for socket objects

- Functions, Constants, and Exceptions
- Socket creation

- Context creation
- Exceptions
- Random generation
- Certificate handling
- Constants
- SSL Sockets
- SSL Contexts
- Certificates
  - Certificate chains
  - CA certificates
  - Combined key and certificate
  - Self-signed certificates
- Examples
  - Testing for SSL support
  - Client-side operation
  - Server-side operation
- Notes on non-blocking sockets
- Memory BIO Support
- SSL session
- Security considerations
  - Best defaults
  - Manual settings
    - Verifying certificates
    - Protocol versions
    - Cipher selection
  - Multi-processing
- TLS 1.3
- **select** — Waiting for I/O completion
  - **/dev/poll** Polling Objects
  - Edge and Level Trigger Polling (epoll) Objects

- Polling Objects
- Kqueue Objects
- Kevent Objects
- **selectors** — High-level I/O multiplexing
  - Introduction
  - Classes
  - Examples
- **signal** — Set handlers for asynchronous events
  - General rules
    - Execution of Python signal handlers
    - Signals and threads
  - Module contents
  - Examples
  - Note on SIGPIPE
  - Note on Signal Handlers and Exceptions
- **mmap** — Memory-mapped file support
  - MADV\_\* Constants
  - MAP\_\* Constants
- Internet Data Handling
  - **email** — An email and MIME handling package
    - **email.message**: Representing an email message
    - **email.parser**: Parsing email messages
      - FeedParser API
      - Parser API
      - Additional notes
    - **email.generator**: Generating MIME documents
    - **email.policy**: Policy Objects

- **email.errors**: Exception and Defect classes
- **email.headerregistry**: Custom Header Objects
- **email.contentmanager**: Managing MIME Content
  - Content Manager Instances
- **email**: Examples
- **email.message.Message**: Representing an email message using the **compat32** API
- **email.mime**: Creating email and MIME objects from scratch
- **email.header**: Internationalized headers
- **email.charset**: Representing character sets
- **email.encoders**: Encoders
- **email.utils**: Miscellaneous utilities
- **email.iterators**: Iterators
- **json** — JSON encoder and decoder
  - Basic Usage
  - Encoders and Decoders
  - Exceptions
  - Standard Compliance and Interoperability
    - Character Encodings
    - Infinite and NaN Number Values
    - Repeated Names Within an Object
    - Top-level Non-Object, Non-Array Values
    - Implementation Limitations
  - Command Line Interface
    - Command line options
- **mailbox** — Manipulate mailboxes in various formats

- **Mailbox** objects

- **Maildir**
- **mbox**
- **MH**
- **Babyl**
- **MMDF**

- **Message** objects

- **MaildirMessage**
- **mboxMessage**
- **MHMessage**
- **BabylMessage**
- **MMDFMessage**

- **Exceptions**
- **Examples**

- **mimetypes** — Map filenames to MIME types

- **MimeTypes** Objects

- **base64** — Base16, Base32, Base64, Base85 Data Encodings

- **Security** Considerations

- **binascii** — Convert between binary and ASCII

- **quopri** — Encode and decode MIME quoted-printable data

- **Structured Markup Processing Tools**

- **html** — HyperText Markup Language support

- **html.parser** — Simple HTML and XHTML parser

- **Example** HTML Parser Application
- **HTMLParser** Methods
- **Examples**

- **html.entities** — Definitions of HTML general entities
- XML Processing Modules
  - XML vulnerabilities
  - The **defusedxml** Package
- **xml.etree.ElementTree** — The ElementTree XML API
  - Tutorial
    - XML tree and elements
    - Parsing XML
    - Pull API for non-blocking parsing
    - Finding interesting elements
    - Modifying an XML File
    - Building XML documents
    - Parsing XML with Namespaces
  - XPath support
    - Example
    - Supported XPath syntax
  - Reference
    - Functions
  - XInclude support
    - Example
  - Reference
    - Functions
    - Element Objects
    - ElementTree Objects
    - QName Objects
    - TreeBuilder Objects
    - XMLParser Objects
    - XMLPullParser Objects

- Exceptions

- **xml.dom** — The Document Object Model API

- Module Contents

- Objects in the DOM

- DOMImplementation Objects

- Node Objects

- NodeList Objects

- DocumentType Objects

- Document Objects

- Element Objects

- Attr Objects

- NamedNodeMap Objects

- Comment Objects

- Text and CDATASection Objects

- ProcessingInstruction Objects

- Exceptions

- Conformance

- Type Mapping

- Accessor Methods

- **xml.dom.minidom** — Minimal DOM implementation

- DOM Objects

- DOM Example

- minidom and the DOM standard

- **xml.dom.pulldom** — Support for building partial DOM trees

- DOMEventStream Objects

- **xml.sax** — Support for SAX2 parsers

- SAXException Objects

- **xml.sax.handler** — Base classes for SAX

## handlers

- `ContentHandler` Objects
- `DTDHandler` Objects
- `EntityResolver` Objects
- `ErrorHandler` Objects
- `LexicalHandler` Objects

- **`xml.sax.saxutils`** — SAX Utilities
- **`xml.sax.xmlreader`** — Interface for XML parsers

- `XMLReader` Objects
- `IncrementalParser` Objects
- `Locator` Objects
- `InputSource` Objects
- The **`Attributes`** Interface
- The **`AttributesNS`** Interface

- **`xml.parsers.expat`** — Fast XML parsing using Expat

- `XMLParser` Objects
- `ExpatriError` Exceptions
- Example
- Content Model Descriptions
- Expat error constants

## ○ Internet Protocols and Support

- **`webbrowser`** — Convenient web-browser controller

- `BrowserController` Objects

- **`wsgiref`** — WSGI Utilities and Reference Implementation

- **`wsgiref.util`** – WSGI environment utilities
- **`wsgiref.headers`** – WSGI response header tools

- **wsgiref.simple\_server** – a simple WSGI HTTP server
- **wsgiref.validate** — WSGI conformance checker
- **wsgiref.handlers** – server/gateway base classes
- **wsgiref.types** – WSGI types for static type checking
- Examples
  
- **urllib** — URL handling modules
- **urllib.request** — Extensible library for opening URLs
  - Request Objects
  - OpenerDirector Objects
  - BaseHandler Objects
  - HTTPRedirectHandler Objects
  - HTTPCookieProcessor Objects
  - ProxyHandler Objects
  - HTTPPasswordMgr Objects
  - HTTPPasswordMgrWithPriorAuth Objects
  - AbstractBasicAuthHandler Objects
  - HTTPBasicAuthHandler Objects
  - ProxyBasicAuthHandler Objects
  - AbstractDigestAuthHandler Objects
  - HTTPDigestAuthHandler Objects
  - ProxyDigestAuthHandler Objects
  - HTTPHandler Objects
  - HTTPSHandler Objects
  - FileHandler Objects
  - DataHandler Objects
  - FTPHandler Objects
  - CacheFTPHandler Objects
  - UnknownHandler Objects
  - HTTPErrorProcessor Objects
  - Examples
  - Legacy interface
  - **urllib.request** Restrictions

- **urllib.response** — Response classes used by urllib
- **urllib.parse** — Parse URLs into components
  - URL Parsing
  - URL parsing security
  - Parsing ASCII Encoded Bytes
  - Structured Parse Results
  - URL Quoting
- **urllib.error** — Exception classes raised by urllib.request
- **urllib.robotparser** — Parser for robots.txt
- **http** — HTTP modules
  - HTTP status codes
  - HTTP methods
- **http.client** — HTTP protocol client
  - HTTPConnection Objects
  - HTTPResponse Objects
  - Examples
  - HTTPMessage Objects
- **ftplib** — FTP protocol client
  - FTP Objects
  - FTP\_TLS Objects
- **poplib** — POP3 protocol client
  - POP3 Objects
  - POP3 Example
- **imaplib** — IMAP4 protocol client
  - IMAP4 Objects
  - IMAP4 Example
- **smtplib** — SMTP protocol client

- SMTP Objects
- SMTP Example
- **uuid** — UUID objects according to RFC 4122
  - Example
- **socketserver** — A framework for network servers
  - Server Creation Notes
  - Server Objects
  - Request Handler Objects
  - Examples
    - **socketserver.TCPServer** Example
    - **socketserver.UDPServer** Example
    - Asynchronous Mixins
- **http.server** — HTTP servers
  - Security Considerations
- **http.cookies** — HTTP state management
  - Cookie Objects
  - Morsel Objects
  - Example
- **http.cookiejar** — Cookie handling for HTTP clients
  - CookieJar and FileCookieJar Objects
  - FileCookieJar subclasses and co-operation with web browsers
  - CookiePolicy Objects
  - DefaultCookiePolicy Objects
  - Cookie Objects
  - Examples

■ **xmlrpc** — XMLRPC server and client modules

■ **xmlrpc.client** — XML-RPC client access

■ ServerProxy Objects

■ DateTime Objects

■ Binary Objects

■ Fault Objects

■ ProtocolError Objects

■ MultiCall Objects

■ Convenience Functions

■ Example of Client Usage

■ Example of Client and Server Usage

■ **xmlrpc.server** — Basic XML-RPC servers

■ SimpleXMLRPCServer Objects

■ SimpleXMLRPCServer Example

■ CGIXMLRPCRequestHandler

■ Documenting XMLRPC server

■ DocXMLRPCServer Objects

■ DocCGIXMLRPCRequestHandler

■ **ipaddress** — IPv4/IPv6 manipulation library

■ Convenience factory functions

■ IP Addresses

■ Address objects

■ Conversion to Strings and Integers

■ Operators

■ Comparison operators

■ Arithmetic operators

■ IP Network definitions

■ Prefix, net mask and host mask

■ Network objects

■ Operators

- Logical operators
  - Iteration
  - Networks as containers of addresses
- Interface objects
  - Operators
    - Logical operators
  - Other Module Level Functions
  - Custom Exceptions
- Multimedia Services
  - **wave** — Read and write WAV files
    - Wave\_read Objects
    - Wave\_write Objects
  - **colorsys** — Conversions between color systems
- Internationalization
  - **gettext** — Multilingual internationalization services
    - GNU **gettext** API
    - Class-based API
      - The **NullTranslations** class
      - The **GNUTranslations** class
      - Solaris message catalog support
      - The Catalog constructor
  - Internationalizing your programs and modules
    - Localizing your module
    - Localizing your application
    - Changing languages on the fly

- Deferred translations
- Acknowledgements
- **locale** — Internationalization services
  - Background, details, hints, tips and caveats
  - For extension writers and programs that embed Python
  - Access to message catalogs
- Program Frameworks
  - **turtle** — Turtle graphics
    - Introduction
    - Overview of available Turtle and Screen methods
      - Turtle methods
      - Methods of TurtleScreen/Screen
    - Methods of RawTurtle/Turtle and corresponding functions
      - Turtle motion
      - Tell Turtle's state
      - Settings for measurement
      - Pen control
        - Drawing state
        - Color control
        - Filling
        - More drawing control
    - Turtle state
      - Visibility
      - Appearance
    - Using events
    - Special Turtle methods

- Compound shapes
- Methods of TurtleScreen/Screen and corresponding functions
  - Window control
  - Animation control

## ○ Debugging and Profiling

- Audit events table
- **bdb** — Debugger framework
- **faulthandler** — Dump the Python traceback
  - Dumping the traceback
  - Fault handler state
  - Dumping the tracebacks after a timeout
  - Dumping the traceback on a user signal
  - Issue with file descriptors
  - Example
- **pdb** — The Python Debugger
  - Debugger Commands
- The Python Profilers
  - Introduction to the profilers
  - Instant User's Manual
  - **profile** and **cProfile** Module Reference
  - The **Stats** Class
  - What Is Deterministic Profiling?
  - Limitations
  - Calibration
  - Using a custom timer

- **timeit** — Measure execution time of small code snippets
  - Basic Examples
  - Python Interface
  - Command-Line Interface
  - Examples
- **trace** — Trace or track Python statement execution
  - Command-Line Usage
    - Main options
    - Modifiers
    - Filters
  - Programmatic Interface
- **tracemalloc** — Trace memory allocations
  - Examples
    - Display the top 10
    - Compute differences
    - Get the traceback of a memory block
    - Pretty top
      - Record the current and peak size of all traced memory blocks
  - API
    - Functions
    - DomainFilter
    - Filter
    - Frame
    - Snapshot
    - Statistic
    - StatisticDiff
    - Trace

- **Traceback**

- **Software Packaging and Distribution**

- **distutils** — Building and installing Python modules

- **ensurepip** — Bootstrapping the **pip** installer

- Command line interface

- Module API

- **venv** — Creation of virtual environments

- Creating virtual environments

- How venvs work

- API

- An example of extending **EnvBuilder**

- **zipapp** — Manage executable Python zip archives

- Basic Example

- Command-Line Interface

- Python API

- Examples

- Specifying the Interpreter

- Creating Standalone Applications with zipapp

- Making a Windows executable

- Caveats

- The Python Zip Application Archive Format

- **Python Runtime Services**

- **sys** — System-specific parameters and functions

- **sysconfig** — Provide access to Python's configuration information

- Configuration variables

- Installation paths

- Other functions
- Using **sysconfig** as a script
- **builtins** — Built-in objects
- **\_\_main\_\_** — Top-level code environment
  - **\_\_name\_\_ == '\_\_main\_\_'**
    - What is the “top-level code environment”?
    - Idiomatic Usage
    - Packaging Considerations
  - **\_\_main\_\_.py** in Python Packages
    - Idiomatic Usage
  - **import \_\_main\_\_**
- **warnings** — Warning control
  - Warning Categories
  - The Warnings Filter
    - Describing Warning Filters
    - Default Warning Filter
    - Overriding the default filter
  - Temporarily Suppressing Warnings
  - Testing Warnings
  - Updating Code For New Versions of Dependencies
  - Available Functions
  - Available Context Managers
- **dataclasses** — Data Classes
  - Module contents
  - Post-init processing
  - Class variables
  - Init-only variables
  - Frozen instances

- Inheritance
- Re-ordering of keyword-only parameters in `__init__()`
- Default factory functions
- Mutable default values
- Descriptor-typed fields
- **contextlib** — Utilities for **with**-statement contexts
  - Utilities
  - Examples and Recipes
    - Supporting a variable number of context managers
    - Catching exceptions from `__enter__` methods
    - Cleaning up in an `__enter__` implementation
    - Replacing any use of **try-finally** and flag variables
    - Using a context manager as a function decorator
  - Single use, reusable and reentrant context managers
    - Reentrant context managers
    - Reusable context managers
- **abc** — Abstract Base Classes
- **atexit** — Exit handlers
  - **atexit** Example
- **traceback** — Print or retrieve a stack traceback
  - **TracebackException** Objects
  - **StackSummary** Objects
  - **FrameSummary** Objects
  - Traceback Examples

- **\_\_future\_\_** — Future statement definitions
- **gc** — Garbage Collector interface
- **inspect** — Inspect live objects
  - Types and members
  - Retrieving source code
  - Introspecting callables with the Signature object
  - Classes and functions
  - The interpreter stack
  - Fetching attributes statically
  - Current State of Generators and Coroutines
  - Code Objects Bit Flags
  - Command Line Interface
- **site** — Site-specific configuration hook
  - Readline configuration
  - Module contents
  - Command Line Interface

○ Custom Python Interpreters

- **code** — Interpreter base classes
  - Interactive Interpreter Objects
  - Interactive Console Objects
- **codeop** — Compile Python code

○ Importing Modules

- **zipimport** — Import modules from Zip archives
  - zipimporter Objects
  - Examples
- **pkgutil** — Package extension utility
- **modulefinder** — Find modules used by a script
  - Example usage of **ModuleFinder**

- **runpy** — Locating and executing Python modules
- **importlib** — The implementation of **import**
  - Introduction
  - Functions
  - **importlib.abc** – Abstract base classes related to import
  - **importlib.machinery** – Importers and path hooks
  - **importlib.util** – Utility code for importers
  - Examples
    - Importing programmatically
    - Checking if a module can be imported
    - Importing a source file directly
    - Implementing lazy imports
    - Setting up an importer
    - Approximating `importlib.import_module()`
- **importlib.resources** – Resources
- Deprecated functions
- **importlib.resources.abc** – Abstract base classes for resources
- Using **importlib.metadata**
  - Overview
  - Functional API
    - Entry points
    - Distribution metadata
    - Distribution versions
    - Distribution files
    - Distribution requirements
    - Mapping import to distribution packages
- Distributions

- Distribution Discovery
  - Extending the search algorithm
- The initialization of the `sys.path` module search path
  - Virtual environments
  - `_pth` files
  - Embedded Python
- Python Language Services
  - **ast** — Abstract Syntax Trees
    - Abstract Grammar
    - Node classes
      - Root nodes
      - Literals
      - Variables
      - Expressions
        - Subscripting
        - Comprehensions
    - Statements
      - Imports
    - Control flow
    - Pattern matching
    - Function and class definitions
    - Async and await
  - **ast** Helpers
  - Compiler Flags
  - Command-Line Usage
- **symtable** — Access to the compiler's symbol tables
  - Generating Symbol Tables

- Examining Symbol Tables

- **token** — Constants used with Python parse trees
- **keyword** — Testing for Python keywords
- **tokenize** — Tokenizer for Python source

- Tokenizing Input
- Command-Line Usage
- Examples

- **tabnanny** — Detection of ambiguous indentation
- **pyclbr** — Python module browser support
  - Function Objects
  - Class Objects

- **py\_compile** — Compile Python source files
  - Command-Line Interface

- **compileall** — Byte-compile Python libraries
  - Command-line use
  - Public functions

- **dis** — Disassembler for Python bytecode
  - Bytecode analysis
  - Analysis functions
  - Python Bytecode Instructions
  - Opcode collections

- **pickletools** — Tools for pickle developers
  - Command line usage
    - Command line options
  - Programmatic Interface

- MS Windows Specific Services

- **msvcrt** — Useful routines from the MS VC++ runtime
  - File Operations
  - Console I/O
  - Other Functions
- **winreg** — Windows registry access
  - Functions
  - Constants
    - HKEY\_\* Constants
    - Access Rights
  - 64-bit Specific
  - Value Types
  - Registry Handle Objects
- **winsound** — Sound-playing interface for Windows

○ Unix Specific Services

- **posix** — The most common POSIX system calls
  - Large File Support
  - Notable Module Contents
- **pwd** — The password database
- **grp** — The group database
- **termios** — POSIX style tty control
  - Example
- **tty** — Terminal control functions
- **pty** — Pseudo-terminal utilities
  - Example
- **fcntl** — The **fcntl** and **ioctl** system calls

- **resource** — Resource usage information

- Resource Limits

- Resource Usage

- **syslog** — Unix syslog library routines

- Examples

- Simple example

- Superseded Modules

- **aifc** — Read and write AIFF and AIFC files

- **asynchat** — Asynchronous socket command/response handler

- asynchat Example

- **asyncore** — Asynchronous socket handler

- asyncore Example basic HTTP client

- asyncore Example basic echo server

- **audioop** — Manipulate raw audio data

- **cgi** — Common Gateway Interface support

- Introduction

- Using the cgi module

- Higher Level Interface

- Functions

- Caring about security

- Installing your CGI script on a Unix system

- Testing your CGI script

- Debugging CGI scripts

- Common problems and solutions

- **cgitb** — Traceback manager for CGI scripts

- **chunk** — Read IFF chunked data

- **crypt** — Function to check Unix passwords

- Hashing Methods

- Module Attributes
- Module Functions
- Examples
- **imghdr** — Determine the type of an image
- **imp** — Access the import internals
  - Examples
- **mailcap** — Mailcap file handling
- **msilib** — Read and write Microsoft Installer files
  - Database Objects
  - View Objects
  - Summary Information Objects
  - Record Objects
  - Errors
  - CAB Objects
  - Directory Objects
  - Features
  - GUI classes
  - Precomputed tables
- **nis** — Interface to Sun's NIS (Yellow Pages)
- **nntplib** — NNTP protocol client
  - NNTP Objects
    - Attributes
    - Methods
  - Utility functions
- **optparse** — Parser for command line options
  - Background
    - Terminology
    - What are options for?
    - What are positional arguments for?

## ■ Tutorial

- Understanding option actions
- The store action
- Handling boolean (flag) options
- Other actions
- Default values
- Generating help

### ■ Grouping Options

- Printing a version string
- How **optparse** handles errors
- Putting it all together

## ■ Reference Guide

- Creating the parser
- Populating the parser
- Defining options
- Option attributes
- Standard option actions
- Standard option types
- Parsing arguments
- Querying and manipulating your option parser
- Conflicts between options
- Cleanup
- Other methods

## ■ Option Callbacks

- Defining a callback option
- How callbacks are called
- Raising errors in a callback
- Callback example 1: trivial callback
- Callback example 2: check option order
- Callback example 3: check option order (generalized)
- Callback example 4: check arbitrary

condition

- Callback example 5: fixed arguments
- Callback example 6: variable arguments

## ■ Extending **optparse**

- Adding new types
- Adding new actions

## ■ Exceptions

## ■ **ossaudiodev** — Access to OSS-compatible audio devices

- Audio Device Objects
- Mixer Device Objects

## ■ **pipes** — Interface to shell pipelines

- Template Objects

## ■ **smtpd** — SMTP Server

- SMTPServer Objects
- DebuggingServer Objects
- PureProxy Objects
- SMTPChannel Objects

## ■ **sndhdr** — Determine type of sound file

## ■ **spwd** — The shadow password database

## ■ **sunau** — Read and write Sun AU files

- AU\_read Objects
- AU\_write Objects

## ■ **telnetlib** — Telnet client

- Telnet Objects
- Telnet Example

## ■ **uu** — Encode and decode uuencode files

- **xdrlib** — Encode and decode XDR data
  - Packer Objects
  - Unpacker Objects
  - Exceptions
- Security Considerations
- Extending and Embedding the Python Interpreter
  - Recommended third party tools
  - Creating extensions without third party tools

- PyStatus
- PyPreConfig
- Preinitialize Python with PyPreConfig
- PyConfig
- Initialization with PyConfig
- Isolated Configuration
- Python Configuration
- Python Path Configuration
- Py\_RunMain()
- Py\_GetArgcArgv()
- Multi-Phase Initialization Private Provisional API

- Memory Management

- Overview
- Allocator Domains
- Raw Memory Interface
- Memory Interface
- Object allocators
- Default Memory Allocators
- Customize Memory Allocators
- Debug hooks on the Python memory allocators
- The pymalloc allocator

- Customize pymalloc Arena Allocator

- tracemalloc C API
- Examples

- Object Implementation Support

- Allocating Objects on the Heap
- Common Object Structures

- Base object types and macros
  - Implementing functions and methods
  - Accessing attributes of extension types
- Type Objects
  - Quick Reference
    - “tp slots”
    - sub-slots
    - slot typedefs
  - PyTypeObject Definition
  - PyObject Slots
  - PyVarObject Slots
  - PyTypeObject Slots
  - Static Types
  - Heap Types
- Number Object Structures
- Mapping Object Structures
- Sequence Object Structures
- Buffer Object Structures
- Async Object Structures
- Slot Type typedefs
- Examples
- Supporting Cyclic Garbage Collection
- Controlling the Garbage Collector State
- API and ABI Versioning
- Distributing Python Modules
  - Key terms
  - Open source licensing and collaboration
  - Installing the tools
  - Reading the Python Packaging User Guide
  - How do I...?
    - ... choose a name for my project?
    - ... create and distribute binary extensions?

- Installing Python Modules

- Key terms
- Basic usage
- How do I ...?
  - ... install **pip** in versions of Python prior to Python 3.4?
  - ... install packages just for the current user?
  - ... install scientific Python packages?
  - ... work with multiple versions of Python installed in parallel?
- Common installation issues
  - Installing into the system Python on Linux
  - Pip not installed
  - Installing binary extensions

- Python HOWTOs

- Porting Python 2 Code to Python 3
  - The Short Explanation
  - Details
    - Drop support for Python 2.6 and older
    - Make sure you specify the proper version support in your **setup.py** file
    - Have good test coverage
    - Learn the differences between Python 2 & 3
    - Update your code
      - Division
      - Text versus binary data
      - Use feature detection instead of version detection
    - Prevent compatibility regressions
    - Check which dependencies block your transition
    - Update your **setup.py** file to denote

## Python 3 compatibility

- Use continuous integration to stay compatible
- Consider using optional static type checking

## ○ Porting Extension Modules to Python 3

## ○ Curses Programming with Python

### ■ What is curses?

#### ■ The Python curses module

### ■ Starting and ending a curses application

#### ■ Windows and Pads

#### ■ Displaying Text

#### ■ Attributes and Color

### ■ User Input

### ■ For More Information

## ○ Descriptor HowTo Guide

### ■ Primer

#### ■ Simple example: A descriptor that returns a constant

#### ■ Dynamic lookups

#### ■ Managed attributes

#### ■ Customized names

#### ■ Closing thoughts

### ■ Complete Practical Example

#### ■ Validator class

#### ■ Custom validators

#### ■ Practical application

### ■ Technical Tutorial

#### ■ Abstract

- Definition and introduction
- Descriptor protocol
- Overview of descriptor invocation
- Invocation from an instance
- Invocation from a class
- Invocation from super
- Summary of invocation logic
- Automatic name notification
- ORM example

## ■ Pure Python Equivalents

- Properties
- Functions and methods
- Kinds of methods
- Static methods
- Class methods
- Member objects and `__slots__`

## ○ Enum HOWTO

- Programmatic access to enumeration members and their attributes
- Duplicating enum members and values
- Ensuring unique enumeration values
- Using automatic values
- Iteration
- Comparisons
- Allowed members and attributes of enumerations
- Restricted Enum subclassing
- Pickling
- Functional API
- Derived Enumerations
  - IntEnum
  - StrEnum
  - IntFlag
  - Flag
  - Others

- When to use `__new__()` vs. `__init__()`

## ■ **Finer Points**

- Supported **\_\_dunder\_\_** names
- Supported **\_sunder\_** names
- **\_Private\_names**
- **Enum** member type
- Creating members that are mixed with other data types
- Boolean value of **Enum** classes and members
- **Enum** classes with methods
- Combining members of **Flag**
- **Flag** and **IntFlag** minutia

## ■ **How are Enums and Flags different?**

- Enum Classes
- Flag Classes
- Enum Members (aka instances)
- Flag Members

## ■ **Enum Cookbook**

### ■ **Omitting values**

- Using **auto**
- Using **object**
- Using a descriptive string
- Using a custom **\_\_new\_\_()**

- **OrderedEnum**
- **DuplicateFreeEnum**
- **Planet**
- **TimePeriod**

## ■ **Subclassing EnumType**

## ○ **Functional Programming HOWTO**

### ■ **Introduction**

- **Formal provability**

- Modularity
- Ease of debugging and testing
- Composability
- Iterators
  - Data Types That Support Iterators
- Generator expressions and list comprehensions
- Generators
  - Passing values into a generator
- Built-in functions
- The itertools module
  - Creating new iterators
  - Calling functions on elements
  - Selecting elements
  - Combinatoric functions
  - Grouping elements
- The functools module
  - The operator module
- Small functions and the lambda expression

- Logging HOWTO
  - Basic Logging Tutorial
    - When to use logging
    - A simple example
    - Logging to a file
    - Logging from multiple modules

- Logging variable data
- Changing the format of displayed messages
- Displaying the date/time in messages
- Next Steps

## ■ Advanced Logging Tutorial

- Logging Flow
- Loggers
- Handlers
- Formatters
- Configuring Logging
- What happens if no configuration is provided
- Configuring Logging for a Library

## ■ Logging Levels

- Custom Levels

- Useful Handlers
- Exceptions raised during logging
- Using arbitrary objects as messages
- Optimization

## ○ Logging Cookbook

- Using logging in multiple modules
- Logging from multiple threads
- Multiple handlers and formatters
- Logging to multiple destinations
- Custom handling of levels
- Configuration server example
- Dealing with handlers that block
- Sending and receiving logging events across a network
  - Running a logging socket listener in production
- Adding contextual information to your logging

output

- Using `LoggerAdapters` to impart contextual information
  - Using objects other than dicts to pass contextual information
- Using Filters to impart contextual information
- Use of **`contextvars`**
- Imparting contextual information in handlers
- Logging to a single file from multiple processes
  - Using `concurrent.futures.ProcessPoolExecutor`
  - Deploying Web applications using Gunicorn and uWSGI
- Using file rotation
- Use of alternative formatting styles
- Customizing **`LogRecord`**
- Subclassing `QueueHandler` - a ZeroMQ example
- Subclassing `QueueListener` - a ZeroMQ example
- An example dictionary-based configuration
- Using a rotator and namer to customize log rotation processing
- A more elaborate multiprocessing example
- Inserting a BOM into messages sent to a `SysLogHandler`
- Implementing structured logging
- Customizing handlers with **`dictConfig()`**
- Using particular formatting styles throughout your application
  - Using `LogRecord` factories
  - Using custom message objects
- Configuring filters with **`dictConfig()`**
- Customized exception formatting

- Speaking logging messages
- Buffering logging messages and outputting them conditionally
- Sending logging messages to email, with buffering
- Formatting times using UTC (GMT) via configuration
- Using a context manager for selective logging
- A CLI application starter template
- A Qt GUI for logging
- Logging to syslog with RFC5424 support
- How to treat a logger like an output stream
- Patterns to avoid
  - Opening the same log file multiple times
  - Using loggers as attributes in a class or passing them as parameters
  - Adding handlers other than **NullHandler** to a logger in a library
  - Creating a lot of loggers

  - Design and History FAQ
    - Why does Python use indentation for grouping of statements?
    - Why am I getting strange results with simple arithmetic operations?
    - Why are floating-point calculations so inaccurate?
    - Why are Python strings immutable?
    - Why must 'self' be used explicitly in method

definitions and calls?

- Why can't I use an assignment in an expression?
- Why does Python use methods for some functionality (e.g. `list.index()`) but functions for other (e.g. `len(list)`)?
- Why is `join()` a string method instead of a list or tuple method?
- How fast are exceptions?
- Why isn't there a switch or case statement in Python?
- Can't you emulate threads in the interpreter instead of relying on an OS-specific thread implementation?
- Why can't lambda expressions contain statements?
- Can Python be compiled to machine code, C or some other language?
- How does Python manage memory?
- Why doesn't CPython use a more traditional garbage collection scheme?
- Why isn't all memory freed when CPython exits?
- Why are there separate tuple and list data types?
- How are lists implemented in CPython?
- How are dictionaries implemented in CPython?
- Why must dictionary keys be immutable?
- Why doesn't `list.sort()` return the sorted list?
- How do you specify and enforce an interface spec in Python?
- Why is there no `goto`?
- Why can't raw strings (r-strings) end with a backslash?
- Why doesn't Python have a "with" statement for attribute assignments?
- Why don't generators support the with statement?
- Why are colons required for the `if/while/def/` class statements?
- Why does Python allow commas at the end of lists and tuples?

# What's New In Python 3.11

## Release

3.11.4

## Date

July 04, 2023

## Editor

Pablo Galindo Salgado

This article explains the new features in Python 3.11, compared to 3.10.

For full details, see the [changelog](#).

## Summary – Release highlights

- Python 3.11 is between 10-60% faster than Python 3.10. On average, we measured a 1.25x speedup on the standard benchmark suite. See [Faster CPython](#) for details.

New syntax features:

- [PEP 654: Exception Groups and except\\*](#)

New built-in features:

- [PEP 678: Exceptions can be enriched with notes](#)

New standard library modules:

- [PEP 680](#) [<https://peps.python.org/pep-0680/>]: [tomllib](#) — Support for parsing [TOML](#) [<https://toml.io/>] in the Standard Library

Interpreter improvements:

- [PEP 657: Fine-grained error locations in tracebacks](#)
- New `-P` command line option and `PYTHONSAFEPATH`

environment variable to [disable automatically prepending potentially unsafe paths](#) to `sys.path`

New typing features:

- [PEP 646: Variadic generics](#)
- [PEP 655: Marking individual TypedDict items as required or not-required](#)
- [PEP 673: Self type](#)
- [PEP 675: Arbitrary literal string type](#)
- [PEP 681: Data class transforms](#)

Important deprecations, removals and restrictions:

- [PEP 594](#) [<https://peps.python.org/pep-0594/>]: [Many legacy standard library modules have been deprecated](#) and will be removed in Python 3.13
- [PEP 624](#) [<https://peps.python.org/pep-0624/>]: [Py\\_UNICODE encoder APIs have been removed](#)
- [PEP 670](#) [<https://peps.python.org/pep-0670/>]: [Macros converted to static inline functions](#)

## New Features

### PEP 657: Fine-grained error locations in tracebacks

When printing tracebacks, the interpreter will now point to the exact expression that caused the error, instead of just the line. For example:

```
Traceback (most recent call last):
  File "distance.py", line 11, in <module>
    print(manhattan_distance(p1, p2))
    ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
  File "distance.py", line 6, in manhattan_distance
    return abs(point_1.x - point_2.x) + abs(point_1.y -
           ^^^^^^^^^^^
AttributeError: 'NoneType' object has no attribute 'x'
```

Previous versions of the interpreter would point to just the line,

making it ambiguous which object was `None`. These enhanced errors can also be helpful when dealing with deeply nested `dict` objects and multiple function calls:

```
Traceback (most recent call last):
  File "query.py", line 37, in <module>
    magic_arithmetic('foo')
  File "query.py", line 18, in magic_arithmetic
    return add_counts(x) / 25
           ^^^^^^^^^^^^^^^
  File "query.py", line 24, in add_counts
    return 25 + query_user(user1) + query_user(user2)
           ^^^^^^^^^^^^^^^^^^^^^
  File "query.py", line 32, in query_user
    return 1 + query_count(db, response['a']['b']['c'])
                                   ~~~~~~^
TypeError: 'NoneType' object is not subscriptable
```

As well as complex arithmetic expressions:

```
Traceback (most recent call last):
  File "calculation.py", line 54, in <module>
    result = (x / y / z) * (a / b / c)
             ~~~~~^~~
ZeroDivisionError: division by zero
```

Additionally, the information used by the enhanced traceback feature is made available via a general API, that can be used to correlate `bytecode instructions` with source code location. This information can be retrieved using:

- The `codeobject.co_positions()` method in Python.
- The `PyCode_Addr2Location()` function in the C API.

See [PEP 657](https://peps.python.org/pep-0657/) [https://peps.python.org/pep-0657/] for more details.  
(Contributed by Pablo Galindo, Batuhan Taskaya and Ammar Askar in [bpo-43950](https://bugs.python.org/issue?@action=redirect&bpo=43950) [https://bugs.python.org/issue?@action=redirect&bpo=43950].)

## Note

This feature requires storing column positions in [Code Objects](#), which may result in a small increase in interpreter memory usage and disk usage for compiled Python files. To avoid storing the extra information and deactivate printing the extra traceback information, use the `-X no_debug_ranges` command line option or the `PYTHONNODEBUGRANGES` environment variable.

## PEP 654: Exception Groups and `except*`

[PEP 654](#) [https://peps.python.org/pep-0654/] introduces language features that enable a program to raise and handle multiple unrelated exceptions simultaneously. The builtin types `ExceptionGroup` and `BaseExceptionGroup` make it possible to group exceptions and raise them together, and the new `except*` syntax generalizes `except` to match subgroups of exception groups.

See [PEP 654](#) [https://peps.python.org/pep-0654/] for more details.

(Contributed by Irit Katriel in [bpo-45292](#) [https://bugs.python.org/issue?@action=redirect&bpo=45292]. PEP written by Irit Katriel, Yuri Selivanov and Guido van Rossum.)

## PEP 678: Exceptions can be enriched with notes

The `add_note()` method is added to `BaseException`. It can be used to enrich exceptions with context information that is not available at the time when the exception is raised. The added notes appear in the default traceback.

See [PEP 678](#) [https://peps.python.org/pep-0678/] for more details.

(Contributed by Irit Katriel in [bpo-45607](#) [https://bugs.python.org/issue?@action=redirect&bpo=45607]. PEP written by Zac Hatfield-Dodds.)

## Windows `py.exe` launcher improvements

The copy of the [Python Launcher for Windows](#) included with Python 3.11 has been significantly updated. It now supports `company/tag` syntax as defined in [PEP 514](#) [https://peps.python.org/

pep-0514/] using the `-V:<company>/<tag>` argument instead of the limited `-<major>.<minor>`. This allows launching distributions other than `PythonCore`, the one hosted on [python.org](https://www.python.org) [https://www.python.org].

When using `-V:` selectors, either company or tag can be omitted, but all installs will be searched. For example, `-V:OtherPython/` will select the “best” tag registered for `OtherPython`, while `-V:3.11` or `-V:/3.11` will select the “best” distribution with tag `3.11`.

When using the legacy `-<major>`, `-<major>.<minor>`, `-<major>-<bitness>` or `-<major>.<minor>-<bitness>` arguments, all existing behaviour should be preserved from past versions, and only releases from `PythonCore` will be selected. However, the `-64` suffix now implies “not 32-bit” (not necessarily `x86-64`), as there are multiple supported 64-bit platforms. 32-bit runtimes are detected by checking the runtime’s tag for a `-32` suffix. All releases of Python since 3.5 have included this in their 32-bit builds.

## New Features Related to Type Hints

This section covers major changes affecting [PEP 484](https://peps.python.org/pep-0484/) [https://peps.python.org/pep-0484/] type hints and the [typing](#) module.

### PEP 646: Variadic generics

[PEP 484](https://peps.python.org/pep-0484/) [https://peps.python.org/pep-0484/] previously introduced [TypeVar](#), enabling creation of generics parameterised with a single type. [PEP 646](https://peps.python.org/pep-0646/) [https://peps.python.org/pep-0646/] adds [TypeVarTuple](#), enabling parameterisation with an *arbitrary* number of types. In other words, a [TypeVarTuple](#) is a *variadic* type variable, enabling *variadic* generics.

This enables a wide variety of use cases. In particular, it allows the type of array-like structures in numerical computing libraries such as `NumPy` and `TensorFlow` to be parameterised with the array *shape*. Static type checkers will now be able to catch shape-related bugs in code that uses these libraries.

See [PEP 646](https://peps.python.org/pep-0646/) [https://peps.python.org/pep-0646/] for more details.

(Contributed by Matthew Rahtz in [bpo-43224](https://bugs.python.org/issue?@action=redirect&bpo=43224) [https://bugs.python.org/issue?@action=redirect&bpo=43224], with contributions by Serhiy Storchaka and Jelle Zijlstra. PEP written by Mark Mendoza, Matthew Rahtz, Pradeep Kumar Srinivasan, and Vincent Siles.)

## PEP 655: Marking individual `TypedDict` items as required or not-required

[Required](#) and [NotRequired](#) provide a straightforward way to mark whether individual items in a `TypedDict` must be present. Previously, this was only possible using inheritance.

All fields are still required by default, unless the *total* parameter is set to `False`, in which case all fields are still not-required by default. For example, the following specifies a `TypedDict` with one required and one not-required key:

```
class Movie(TypedDict):
    title: str
    year: NotRequired[int]

m1: Movie = {"title": "Black Panther", "year": 2018} # OK
m2: Movie = {"title": "Star Wars"} # OK (year is not required)
m3: Movie = {"year": 2022} # ERROR (missing required field)
```

The following definition is equivalent:

```
class Movie(TypedDict, total=False):
    title: Required[str]
    year: int
```

See [PEP 655](https://peps.python.org/pep-0655/) [https://peps.python.org/pep-0655/] for more details.

(Contributed by David Foster and Jelle Zijlstra in [bpo-47087](https://bugs.python.org/issue?@action=redirect&bpo=47087) [https://bugs.python.org/issue?@action=redirect&bpo=47087]. PEP written by David Foster.)

## PEP 673: `Self` type

The new **Self** annotation provides a simple and intuitive way to annotate methods that return an instance of their class. This behaves the same as the **TypeVar**-based approach **specified in PEP 484** [<https://peps.python.org/pep-0484/#annotating-instance-and-class-methods>], but is more concise and easier to follow.

Common use cases include alternative constructors provided as **classmethods**, and **\_\_enter\_\_()** methods that return `self`:

```
class MyLock:
    def __enter__(self) -> Self:
        self.lock()
        return self

    ...

class MyInt:
    @classmethod
    def fromhex(cls, s: str) -> Self:
        return cls(int(s, 16))

    ...
```

**Self** can also be used to annotate method parameters or attributes of the same type as their enclosing class.

See **PEP 673** [<https://peps.python.org/pep-0673/>] for more details.

(Contributed by James Hilton-Balfe in **bpo-46534** [<https://bugs.python.org/issue?@action=redirect&bpo=46534>]. PEP written by Pradeep Kumar Srinivasan and James Hilton-Balfe.)

## PEP 675: Arbitrary literal string type

The new **LiteralString** annotation may be used to indicate that a function parameter can be of any literal string type. This allows a function to accept arbitrary literal string types, as well as strings created from other literal strings. Type checkers can then enforce that sensitive functions, such as those that execute SQL statements or shell commands, are called only with static arguments, providing

protection against injection attacks.

For example, a SQL query function could be annotated as follows:

```
def run_query(sql: LiteralString) -> ...
    ...

def caller(
    arbitrary_string: str,
    query_string: LiteralString,
    table_name: LiteralString,
) -> None:
    run_query("SELECT * FROM students")           # ok
    run_query(query_string)                       # ok
    run_query("SELECT * FROM " + table_name)      # ok
    run_query(arbitrary_string)                   # type che
    run_query(                                     # type che
        f"SELECT * FROM students WHERE name = {arbitrary
    )
```

See [PEP 675](https://peps.python.org/pep-0675/) [https://peps.python.org/pep-0675/] for more details.

(Contributed by Jelle Zijlstra in [bpo-47088](https://bugs.python.org/issue?@action=redirect&bpo=47088) [https://bugs.python.org/issue?@action=redirect&bpo=47088]. PEP written by Pradeep Kumar Srinivasan and Graham Bleaney.)

## PEP 681: Data class transforms

[dataclass\\_transform](#) may be used to decorate a class, metaclass, or a function that is itself a decorator. The presence of `@dataclass_transform()` tells a static type checker that the decorated object performs runtime “magic” that transforms a class, giving it [dataclass](#)-like behaviors.

For example:

```
# The create_model decorator is defined by a library.
@typing.dataclass_transform()
def create_model(cls: Type[T]) -> Type[T]:
    cls.__init__ = ...
```

```
cls.__eq__ = ...
cls.__ne__ = ...
return cls
```

```
# The create_model decorator can now be used to create models
@create_model
class CustomerModel:
    id: int
    name: str
```

```
c = CustomerModel(id=327, name="Eric Idle")
```

See [PEP 681](https://peps.python.org/pep-0681/) [https://peps.python.org/pep-0681/] for more details.

(Contributed by Jelle Zijlstra in [gh-91860](https://github.com/python/cpython/issues/91860) [https://github.com/python/cpython/issues/91860]. PEP written by Erik De Bonte and Eric Traut.)

## PEP 563 may not be the future

[PEP 563](https://peps.python.org/pep-0563/) [https://peps.python.org/pep-0563/] Postponed Evaluation of Annotations (the `from __future__ import annotations` [future statement](#)) that was originally planned for release in Python 3.10 has been put on hold indefinitely. See [this message from the Steering Council](https://mail.python.org/archives/list/python-dev@python.org/message/VIZEBX5EYMSYIJNDBF6DMUMZOCWHARSO/) [https://mail.python.org/archives/list/python-dev@python.org/message/VIZEBX5EYMSYIJNDBF6DMUMZOCWHARSO/] for more information.

## Other Language Changes

- Starred unpacking expressions can now be used in [for](#) statements. (See [bpo-46725](https://bugs.python.org/issue?@action=redirect&bpo=46725) [https://bugs.python.org/issue?@action=redirect&bpo=46725] for more details.)
- Asynchronous [comprehensions](#) are now allowed inside comprehensions in [asynchronous functions](#). Outer comprehensions implicitly become asynchronous in this case. (Contributed by Serhiy Storchaka in [bpo-33346](https://bugs.python.org/issue?@action=redirect&bpo=33346) [https://bugs.python.org/issue?@action=redirect&bpo=33346].)
- A [TypeError](#) is now raised instead of an [AttributeError](#) in [with](#) statements and

`contextlib.ExitStack.enter_context()` for objects that do not support the `context manager` protocol, and in `async with` statements and `contextlib.AsyncExitStack.enter_async_context()` for objects not supporting the `asynchronous context manager` protocol. (Contributed by Serhiy Storchaka in [bpo-12022](https://bugs.python.org/issue?@action=redirect&bpo=12022) [<https://bugs.python.org/issue?@action=redirect&bpo=12022>] and [bpo-44471](https://bugs.python.org/issue?@action=redirect&bpo=44471) [<https://bugs.python.org/issue?@action=redirect&bpo=44471>].)

- Added `object.__getstate__()`, which provides the default implementation of the `__getstate__()` method. `copying` and `pickle`ing instances of subclasses of builtin types `bytearray`, `set`, `frozenset`, `collections.OrderedDict`, `collections.deque`, `weakref.WeakSet`, and `datetime.tzinfo` now copies and pickles instance attributes implemented as `slots`. (Contributed by Serhiy Storchaka in [bpo-26579](https://bugs.python.org/issue?@action=redirect&bpo=26579) [<https://bugs.python.org/issue?@action=redirect&bpo=26579>].)
- Added a `-P` command line option and a `PYTHONSAFEPATH` environment variable, which disable the automatic prepending to `sys.path` of the script's directory when running a script, or the current directory when using `-c` and `-m`. This ensures only stdlib and installed modules are picked up by `import`, and avoids unintentionally or maliciously shadowing modules with those in a local (and typically user-writable) directory. (Contributed by Victor Stinner in [gh-57684](https://github.com/python/cpython/issues/57684) [<https://github.com/python/cpython/issues/57684>].)
- A `"z"` option was added to the `Format Specification Mini-Language` that coerces negative to positive zero after rounding to the format precision. See [PEP 682](https://peps.python.org/pep-0682/) [<https://peps.python.org/pep-0682/>] for more details. (Contributed by John Belmonte in [gh-90153](https://github.com/python/cpython/issues/90153) [<https://github.com/python/cpython/issues/90153>].)
- Bytes are no longer accepted on `sys.path`. Support broke sometime between Python 3.2 and 3.6, with no one noticing until after Python 3.10.0 was released. In addition, bringing back support would be problematic due to interactions between `-b` and `sys.path_importer_cache` when there is a mixture of `str` and `bytes` keys. (Contributed by

Thomas Grainger in [gh-91181](https://github.com/python/cpython/issues/91181) [https://github.com/python/cpython/issues/91181].)

## Other CPython Implementation Changes

- The special methods `__complex__()` for `complex` and `__bytes__()` for `bytes` are implemented to support the `typing.SupportsComplex` and `typing.SupportsBytes` protocols. (Contributed by Mark Dickinson and Dong-hee Na in [bpo-24234](https://bugs.python.org/issue?@action=redirect&bpo=24234) [https://bugs.python.org/issue?@action=redirect&bpo=24234].)
- `siphash13` is added as a new internal hashing algorithm. It has similar security properties as `siphash24`, but it is slightly faster for long inputs. `str`, `bytes`, and some other types now use it as the default algorithm for `hash()`. [PEP 552](https://peps.python.org/pep-0552/) [https://peps.python.org/pep-0552/] `hash-based .pyc files` now use `siphash13` too. (Contributed by Inada Naoki in [bpo-29410](https://bugs.python.org/issue?@action=redirect&bpo=29410) [https://bugs.python.org/issue?@action=redirect&bpo=29410].)
- When an active exception is re-raised by a `raise` statement with no parameters, the traceback attached to this exception is now always `sys.exc_info()[1].__traceback__`. This means that changes made to the traceback in the current `except` clause are reflected in the re-raised exception. (Contributed by Irit Katriel in [bpo-45711](https://bugs.python.org/issue?@action=redirect&bpo=45711) [https://bugs.python.org/issue?@action=redirect&bpo=45711].)
- The interpreter state's representation of handled exceptions (aka `exc_info` or `_PyErr_StackItem`) now only has the `exc_value` field; `exc_type` and `exc_traceback` have been removed, as they can be derived from `exc_value`. (Contributed by Irit Katriel in [bpo-45711](https://bugs.python.org/issue?@action=redirect&bpo=45711) [https://bugs.python.org/issue?@action=redirect&bpo=45711].)
- A new `command line option`, `AppendPath`, has been added for the Windows installer. It behaves similarly to `PrependPath`, but appends the install and scripts directories instead of prepending them. (Contributed by Bastian Neuburger in [bpo-44934](https://bugs.python.org/issue?@action=redirect&bpo=44934) [https://bugs.python.org/issue?@action=redirect&bpo=44934].)
- The `PyConfig.module_search_paths_set` field must

now be set to 1 for initialization to use

`PyConfig.module_search_paths` to initialize `sys.path`. Otherwise, initialization will recalculate the path and replace any values added to `module_search_paths`.

- The output of the `--help` option now fits in 50 lines/80 columns. Information about [Python environment variables](#) and `-x` options is now available using the respective `--help-env` and `--help-xoptions` flags, and with the new `--help-all`. (Contributed by Éric Araujo in [bpo-46142](#) [<https://bugs.python.org/issue?@action=redirect&bpo=46142>].)
- Converting between `int` and `str` in bases other than 2 (binary), 4, 8 (octal), 16 (hexadecimal), or 32 such as base 10 (decimal) now raises a `ValueError` if the number of digits in string form is above a limit to avoid potential denial of service attacks due to the algorithmic complexity. This is a mitigation for [CVE-2020-10735](#) [<https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2020-10735>]. This limit can be configured or disabled by environment variable, command line flag, or `sys` APIs. See the [integer string conversion length limitation](#) documentation. The default limit is 4300 digits in string form.

## New Modules

- `tomllib`: For parsing [TOML](#) [<https://toml.io/>]. See [PEP 680](#) [<https://peps.python.org/pep-0680/>] for more details. (Contributed by Taneli Hukkinen in [bpo-40059](#) [<https://bugs.python.org/issue?@action=redirect&bpo=40059>].)
- `wsgiref.types`: [WSGI](#) [<https://peps.python.org/pep-3333/>]-specific types for static type checking. (Contributed by Sebastian Rittau in [bpo-42012](#) [<https://bugs.python.org/issue?@action=redirect&bpo=42012>].)

## Improved Modules

### `asyncio`

- Added the `TaskGroup` class, an [asynchronous context manager](#) holding a group of tasks that will wait for all of them upon exit. For new code this is recommended over using

- `create_task()` and `gather()` directly. (Contributed by Yury Selivanov and others in [gh-90908](https://github.com/python/cpython/issues/90908) [https://github.com/python/cpython/issues/90908].)
- Added `timeout()`, an asynchronous context manager for setting a timeout on asynchronous operations. For new code this is recommended over using `wait_for()` directly. (Contributed by Andrew Svetlov in [gh-90927](https://github.com/python/cpython/issues/90927) [https://github.com/python/cpython/issues/90927].)
  - Added the `Runner` class, which exposes the machinery used by `run()`. (Contributed by Andrew Svetlov in [gh-91218](https://github.com/python/cpython/issues/91218) [https://github.com/python/cpython/issues/91218].)
  - Added the `Barrier` class to the synchronization primitives in the `asyncio` library, and the related `BrokenBarrierError` exception. (Contributed by Yves Duprat and Andrew Svetlov in [gh-87518](https://github.com/python/cpython/issues/87518) [https://github.com/python/cpython/issues/87518].)
  - Added keyword argument `all_errors` to `asyncio.loop.create_connection()` so that multiple connection errors can be raised as an `ExceptionGroup`.
  - Added the `asyncio.StreamWriter.start_tls()` method for upgrading existing stream-based connections to TLS. (Contributed by Ian Good in [bpo-34975](https://bugs.python.org/issue?@action=redirect&bpo=34975) [https://bugs.python.org/issue?@action=redirect&bpo=34975].)
  - Added raw datagram socket functions to the event loop: `sock_sendto()`, `sock_recvfrom()` and `sock_recvfrom_into()`. These have implementations in `SelectorEventLoop` and `ProactorEventLoop`. (Contributed by Alex Grönholm in [bpo-46805](https://bugs.python.org/issue?@action=redirect&bpo=46805) [https://bugs.python.org/issue?@action=redirect&bpo=46805].)
  - Added `cancelling()` and `uncancel()` methods to `Task`. These are primarily intended for internal use, notably by `TaskGroup`.

## contextlib

- Added non parallel-safe `chdir()` context manager to change the current working directory and then restore it on exit. Simple wrapper around `chdir()`. (Contributed by Filipe Laíns in [bpo-25625](https://bugs.python.org/issue?@action=redirect&bpo=25625) [https://bugs.python.org/issue?@action=redirect&bpo=25625])

## dataclasses

- Change field default mutability check, allowing only defaults which are `hashable` instead of any object which is not an instance of `dict`, `list` or `set`. (Contributed by Eric V. Smith in [bpo-44674](https://bugs.python.org/issue?@action=redirect&bpo=44674) [https://bugs.python.org/issue?@action=redirect&bpo=44674].)

## datetime

- Add `datetime.UTC`, a convenience alias for `datetime.timezone.utc`. (Contributed by Kabir Kwatra in [gh-91973](https://github.com/python/cpython/issues/91973) [https://github.com/python/cpython/issues/91973].)
- `datetime.date.fromisoformat()`, `datetime.time.fromisoformat()` and `datetime.datetime.fromisoformat()` can now be used to parse most ISO 8601 formats (barring only those that support fractional hours and minutes). (Contributed by Paul Ganssle in [gh-80010](https://github.com/python/cpython/issues/80010) [https://github.com/python/cpython/issues/80010].)

## enum

- Renamed `EnumMeta` to `EnumType` (`EnumMeta` kept as an alias).
- Added `StrEnum`, with members that can be used as (and must be) strings.
- Added `ReprEnum`, which only modifies the `__repr__()` of members while returning their literal values (rather than names) for `__str__()` and `__format__()` (used by `str()`, `format()` and f-strings).
- Changed `Enum.__format__()` (the default for `format()`, `str.format()` and f-strings) to always produce the same result as `Enum.__str__()`: for enums inheriting from `ReprEnum` it will be the member's value; for all other enums it will be the enum and member name (e.g. `Color.RED`).
- Added a new *boundary* class parameter to `Flag` enums and the `FlagBoundary` enum with its options, to control how to handle out-of-range flag values.
- Added the `verify()` enum decorator and the `EnumCheck`

enum with its options, to check enum classes against several specific constraints.

- Added the `member()` and `nonmember()` decorators, to ensure the decorated object is/is not converted to an enum member.
- Added the `property()` decorator, which works like `property()` except for enums. Use this instead of `types.DynamicClassAttribute()`.
- Added the `global_enum()` enum decorator, which adjusts `__repr__()` and `__str__()` to show values as members of their module rather than the enum class. For example, `'re.ASCII'` for the `ASCII` member of `re.RegexFlag` rather than `'RegexFlag.ASCII'`.
- Enhanced `Flag` to support `len()`, iteration and `in/not in` on its members. For example, the following now works: `len(AFlag(3)) == 2` and `list(AFlag(3)) == (AFlag.ONE, AFlag.TWO)`
- Changed `Enum` and `Flag` so that members are now defined before `__init_subclass__()` is called; `dir()` now includes methods, etc., from mixed-in data types.
- Changed `Flag` to only consider primary values (power of two) canonical while composite values (3, 6, 10, etc.) are considered aliases; inverted flags are coerced to their positive equivalent.

## fcntl

- On FreeBSD, the `F_DUP2FD` and `F_DUP2FD_CLOEXEC` flags respectively are supported, the former equals to `dup2` usage while the latter set the `FD_CLOEXEC` flag in addition.

## fractions

- Support [PEP 515](https://peps.python.org/pep-0515/) [https://peps.python.org/pep-0515/] -style initialization of `Fraction` from string. (Contributed by Sergey B Kirpichev in [bpo-44258](https://bugs.python.org/issue?@action=redirect&bpo=44258) [https://bugs.python.org/issue?@action=redirect&bpo=44258].)
- `Fraction` now implements an `__int__` method, so that an `isinstance(some_fraction, typing.SupportsInt)` check passes. (Contributed by Mark Dickinson in [bpo-44547](https://bugs.python.org/issue?@action=redirect&bpo=44547) [https://bugs.python.org/issue?@action=redirect&bpo=44547].)

[<https://bugs.python.org/issue?@action=redirect&bpo=44547>].)

## functools

- `functools.singledispatch()` now supports `types.UnionType` and `typing.Union` as annotations to the dispatch argument.:

```
>>> from functools import singledispatch
>>> @singledispatch
... def fun(arg, verbose=False):
...     if verbose:
...         print("Let me just say,", end=" ")
...     print(arg)
...
>>> @fun.register
... def _(arg: int | float, verbose=False):
...     if verbose:
...         print("Strength in numbers, eh?", end=" ")
...     print(arg)
...
>>> from typing import Union
>>> @fun.register
... def _(arg: Union[list, set], verbose=False):
...     if verbose:
...         print("Enumerate this:")
...     for i, elem in enumerate(arg):
...         print(i, elem)
...
```

(Contributed by Yurii Karabas in [bpo-46014](https://bugs.python.org/issue?@action=redirect&bpo=46014) [<https://bugs.python.org/issue?@action=redirect&bpo=46014>].)

## hashlib

- `hashlib.blake2b()` and `hashlib.blake2s()` now prefer [libb2](https://www.blake2.net/) [<https://www.blake2.net/>] over Python's vendored copy. (Contributed by Christian Heimes in [bpo-47095](https://bugs.python.org/issue?@action=redirect&bpo=47095) [<https://bugs.python.org/issue?@action=redirect&bpo=47095>].)

- The internal `_sha3` module with SHA3 and SHAKE algorithms now uses *tiny\_sha3* instead of the *Keccak Code Package* to reduce code and binary size. The **hashlib** module prefers optimized SHA3 and SHAKE implementations from OpenSSL. The change affects only installations without OpenSSL support. (Contributed by Christian Heimes in [bpo-47098](https://bugs.python.org/issue?@action=redirect&bpo=47098) [https://bugs.python.org/issue?@action=redirect&bpo=47098].)
- Add **hashlib.file\_digest()**, a helper function for efficient hashing of files or file-like objects. (Contributed by Christian Heimes in [gh-89313](https://github.com/python/cpython/issues/89313) [https://github.com/python/cpython/issues/89313].)

## IDLE and idlelib

- Apply syntax highlighting to `.pyi` files. (Contributed by Alex Waygood and Terry Jan Reedy in [bpo-45447](https://bugs.python.org/issue?@action=redirect&bpo=45447) [https://bugs.python.org/issue?@action=redirect&bpo=45447].)
- Include prompts when saving Shell with inputs and outputs. (Contributed by Terry Jan Reedy in [gh-95191](https://github.com/python/cpython/issues/95191) [https://github.com/python/cpython/issues/95191].)

## inspect

- Add **getmembers\_static()** to return all members without triggering dynamic lookup via the descriptor protocol. (Contributed by Weipeng Hong in [bpo-30533](https://bugs.python.org/issue?@action=redirect&bpo=30533) [https://bugs.python.org/issue?@action=redirect&bpo=30533].)
- Add **ismethodwrapper()** for checking if the type of an object is a **MethodWrapperType**. (Contributed by Hakan Çelik in [bpo-29418](https://bugs.python.org/issue?@action=redirect&bpo=29418) [https://bugs.python.org/issue?@action=redirect&bpo=29418].)
- Change the frame-related functions in the **inspect** module to return new **FrameInfo** and **Traceback** class instances (backwards compatible with the previous **named tuple**-like interfaces) that includes the extended **PEP 657** [https://peps.python.org/pep-0657/] position information (end line number, column and end column). The affected functions are:

- `inspect.getframeinfo()`
- `inspect.getouterframes()`
- `inspect.getinnerframes()`,
- `inspect.stack()`
- `inspect.trace()`

(Contributed by Pablo Galindo in [gh-88116](https://github.com/python/cpython/issues/88116) [https://github.com/python/cpython/issues/88116].)

## locale

- Add `locale.getencoding()` to get the current locale encoding. It is similar to `locale.getpreferredencoding(False)` but ignores the [Python UTF-8 Mode](#).

## logging

- Added `getLevelNamesMapping()` to return a mapping from logging level names (e.g. 'CRITICAL') to the values of their corresponding [Logging Levels](#) (e.g. 50, by default). (Contributed by Andrei Kulakovin in [gh-88024](https://github.com/python/cpython/issues/88024) [https://github.com/python/cpython/issues/88024].)
- Added a `createSocket()` method to `SysLogHandler`, to match `SocketHandler.createSocket()`. It is called automatically during handler initialization and when emitting an event, if there is no active socket. (Contributed by Kirill Pinchuk in [gh-88457](https://github.com/python/cpython/issues/88457) [https://github.com/python/cpython/issues/88457].)

## math

- Add `math.exp2()`: return 2 raised to the power of x. (Contributed by Gideon Mitchell in [bpo-45917](https://bugs.python.org/issue?@action=redirect&bpo=45917) [https://bugs.python.org/issue?@action=redirect&bpo=45917].)
- Add `math.cbrt()`: return the cube root of x. (Contributed by Ajith Ramachandran in [bpo-44357](https://bugs.python.org/issue?@action=redirect&bpo=44357) [https://bugs.python.org/issue?@action=redirect&bpo=44357].)
- The behaviour of two `math.pow()` corner cases was changed, for consistency with the IEEE 754 specification. The

operations `math.pow(0.0, -math.inf)` and `math.pow(-0.0, -math.inf)` now return `inf`. Previously they raised `ValueError`. (Contributed by Mark Dickinson in [bpo-44339](https://bugs.python.org/issue?@action=redirect&bpo=44339) [https://bugs.python.org/issue?@action=redirect&bpo=44339].)

- The `math.nan` value is now always available. (Contributed by Victor Stinner in [bpo-46917](https://bugs.python.org/issue?@action=redirect&bpo=46917) [https://bugs.python.org/issue?@action=redirect&bpo=46917].)

## operator

- A new function `operator.call` has been added, such that `operator.call(obj, *args, **kwargs) == obj(*args, **kwargs)`. (Contributed by Antony Lee in [bpo-44019](https://bugs.python.org/issue?@action=redirect&bpo=44019) [https://bugs.python.org/issue?@action=redirect&bpo=44019].)

## os

- On Windows, `os.urandom()` now uses `BCryptGenRandom()`, instead of `CryptGenRandom()` which is deprecated. (Contributed by Dong-hee Na in [bpo-44611](https://bugs.python.org/issue?@action=redirect&bpo=44611) [https://bugs.python.org/issue?@action=redirect&bpo=44611].)

## pathlib

- `glob()` and `rglob()` return only directories if *pattern* ends with a pathname components separator: `sep` or `altsep`. (Contributed by Eisuke Kawasima in [bpo-22276](https://bugs.python.org/issue?@action=redirect&bpo=22276) [https://bugs.python.org/issue?@action=redirect&bpo=22276] and [bpo-33392](https://bugs.python.org/issue?@action=redirect&bpo=33392) [https://bugs.python.org/issue?@action=redirect&bpo=33392].)

## re

- Atomic grouping (`(?>...)`) and possessive quantifiers (`*+, ++, ?+, {m,n}+`) are now supported in regular expressions. (Contributed by Jeffrey C. Jacobs and Serhiy Storchaka in [bpo-433030](https://bugs.python.org/issue?@action=redirect&bpo=433030) [https://bugs.python.org/issue?@action=redirect&bpo=433030].)

@action=redirect&bpo=433030].)

## shutil

- Add optional parameter *dir\_fd* in `shutil.rmtree()`. (Contributed by Serhiy Storchaka in [bpo-46245](https://bugs.python.org/issue?@action=redirect&bpo=46245) [https://bugs.python.org/issue?@action=redirect&bpo=46245].)

## socket

- Add CAN Socket support for NetBSD. (Contributed by Thomas Klausner in [bpo-30512](https://bugs.python.org/issue?@action=redirect&bpo=30512) [https://bugs.python.org/issue?@action=redirect&bpo=30512].)
- `create_connection()` has an option to raise, in case of failure to connect, an `ExceptionGroup` containing all errors instead of only raising the last error. (Contributed by Irit Katriel in [bpo-29980](https://bugs.python.org/issue?@action=redirect&bpo=29980) [https://bugs.python.org/issue?@action=redirect&bpo=29980].)

## sqlite3

- You can now disable the authorizer by passing `None` to `set_authorizer()`. (Contributed by Erlend E. Aasland in [bpo-44491](https://bugs.python.org/issue?@action=redirect&bpo=44491) [https://bugs.python.org/issue?@action=redirect&bpo=44491].)
- Collation name `create_collation()` can now contain any Unicode character. Collation names with invalid characters now raise `UnicodeEncodeError` instead of `sqlite3.ProgrammingError`. (Contributed by Erlend E. Aasland in [bpo-44688](https://bugs.python.org/issue?@action=redirect&bpo=44688) [https://bugs.python.org/issue?@action=redirect&bpo=44688].)
- `sqlite3` exceptions now include the SQLite extended error code as `sqlite_errorcode` and the SQLite error name as `sqlite_errormsg`. (Contributed by Aviv Palivoda, Daniel Shahaf, and Erlend E. Aasland in [bpo-16379](https://bugs.python.org/issue?@action=redirect&bpo=16379) [https://bugs.python.org/issue?@action=redirect&bpo=16379] and [bpo-24139](https://bugs.python.org/issue?@action=redirect&bpo=24139) [https://bugs.python.org/issue?@action=redirect&bpo=24139].)
- Add `setlimit()` and `getlimit()` to `sqlite3.Connection` for setting and getting SQLite limits by connection basis. (Contributed by Erlend E. Aasland in

[bpo-45243](https://bugs.python.org/issue?@action=redirect&bpo=45243) [https://bugs.python.org/issue?

@action=redirect&bpo=45243].)

- **sqlite3** now sets **sqlite3.threadsafety** based on the default threading mode the underlying SQLite library has been compiled with. (Contributed by Erlend E. Aasland in [bpo-45613](https://bugs.python.org/issue?@action=redirect&bpo=45613) [https://bugs.python.org/issue?@action=redirect&bpo=45613].)
- **sqlite3** C callbacks now use unraisable exceptions if callback tracebacks are enabled. Users can now register an **unraisable hook handler** to improve their debug experience. (Contributed by Erlend E. Aasland in [bpo-45828](https://bugs.python.org/issue?@action=redirect&bpo=45828) [https://bugs.python.org/issue?@action=redirect&bpo=45828].)
- Fetch across rollback no longer raises **InterfaceError**. Instead we leave it to the SQLite library to handle these cases. (Contributed by Erlend E. Aasland in [bpo-44092](https://bugs.python.org/issue?@action=redirect&bpo=44092) [https://bugs.python.org/issue?@action=redirect&bpo=44092].)
- Add **serialize()** and **deserialize()** to **sqlite3.Connection** for serializing and deserializing databases. (Contributed by Erlend E. Aasland in [bpo-41930](https://bugs.python.org/issue?@action=redirect&bpo=41930) [https://bugs.python.org/issue?@action=redirect&bpo=41930].)
- Add **create\_window\_function()** to **sqlite3.Connection** for creating aggregate window functions. (Contributed by Erlend E. Aasland in [bpo-34916](https://bugs.python.org/issue?@action=redirect&bpo=34916) [https://bugs.python.org/issue?@action=redirect&bpo=34916].)
- Add **blobopen()** to **sqlite3.Connection**. **sqlite3.Blob** allows incremental I/O operations on blobs. (Contributed by Aviv Palivoda and Erlend E. Aasland in [bpo-24905](https://bugs.python.org/issue?@action=redirect&bpo=24905) [https://bugs.python.org/issue?@action=redirect&bpo=24905].)

## string

- Add **get\_identifiers()** and **is\_valid()** to **string.Template**, which respectively return all valid placeholders, and whether any invalid placeholders are present. (Contributed by Ben Kehoe in [gh-90465](https://github.com/python/cpython/issues/90465) [https://github.com/python/cpython/issues/90465].)

## sys

- `sys.exc_info()` now derives the `type` and `traceback` fields from the `value` (the exception instance), so when an exception is modified while it is being handled, the changes are reflected in the results of subsequent calls to `exc_info()`. (Contributed by Irit Katriel in [bpo-45711](https://bugs.python.org/issue?@action=redirect&bpo=45711) [<https://bugs.python.org/issue?@action=redirect&bpo=45711>].)
- Add `sys.exception()` which returns the active exception instance (equivalent to `sys.exc_info()[1]`). (Contributed by Irit Katriel in [bpo-46328](https://bugs.python.org/issue?@action=redirect&bpo=46328) [<https://bugs.python.org/issue?@action=redirect&bpo=46328>].)
- Add the `sys.flags.safe_path` flag. (Contributed by Victor Stinner in [gh-57684](https://github.com/python/cpython/issues/57684) [<https://github.com/python/cpython/issues/57684>].)

## sysconfig

- Three new [installation schemes](#) (`posix_venv`, `nt_venv` and `venv`) were added and are used when Python creates new virtual environments or when it is running from a virtual environment. The first two schemes (`posix_venv` and `nt_venv`) are OS-specific for non-Windows and Windows, the `venv` is essentially an alias to one of them according to the OS Python runs on. This is useful for downstream distributors who modify `sysconfig.get_preferred_scheme()`. Third party code that creates new virtual environments should use the new `venv` installation scheme to determine the paths, as does `venv`. (Contributed by Miro Hrončok in [bpo-45413](https://bugs.python.org/issue?@action=redirect&bpo=45413) [<https://bugs.python.org/issue?@action=redirect&bpo=45413>].)

## tempfile

- `SpooledTemporaryFile` objects now fully implement the methods of `io.BufferedIOBase` or `io.TextIOBase` (depending on file mode). This lets them work correctly with APIs that expect file-like objects, such as compression modules. (Contributed by Carey Metcalfe in [gh-70363](https://github.com/python/cpython/issues/70363) [<https://github.com/python/cpython/issues/70363>].)

## threading

- On Unix, if the `sem_clockwait()` function is available in the C library (glibc 2.30 and newer), the `threading.Lock.acquire()` method now uses the monotonic clock (`time.CLOCK_MONOTONIC`) for the timeout, rather than using the system clock (`time.CLOCK_REALTIME`), to not be affected by system clock changes. (Contributed by Victor Stinner in [bpo-41710](https://bugs.python.org/issue?@action=redirect&bpo=41710) [<https://bugs.python.org/issue?@action=redirect&bpo=41710>].)

## time

- On Unix, `time.sleep()` now uses the `clock_nanosleep()` or `nanosleep()` function, if available, which has a resolution of 1 nanosecond ( $10^{-9}$  seconds), rather than using `select()` which has a resolution of 1 microsecond ( $10^{-6}$  seconds). (Contributed by Benjamin Szőke and Victor Stinner in [bpo-21302](https://bugs.python.org/issue?@action=redirect&bpo=21302) [<https://bugs.python.org/issue?@action=redirect&bpo=21302>].)
- On Windows 8.1 and newer, `time.sleep()` now uses a waitable timer based on [high-resolution timers](https://docs.microsoft.com/en-us/windows-hardware/drivers/kernel/high-resolution-timers) [<https://docs.microsoft.com/en-us/windows-hardware/drivers/kernel/high-resolution-timers>] which has a resolution of 100 nanoseconds ( $10^{-7}$  seconds). Previously, it had a resolution of 1 millisecond ( $10^{-3}$  seconds). (Contributed by Benjamin Szőke, Dong-hee Na, Eryk Sun and Victor Stinner in [bpo-21302](https://bugs.python.org/issue?@action=redirect&bpo=21302) [<https://bugs.python.org/issue?@action=redirect&bpo=21302>] and [bpo-45429](https://bugs.python.org/issue?@action=redirect&bpo=45429) [<https://bugs.python.org/issue?@action=redirect&bpo=45429>].)

## tkinter

- Added method `info_patchlevel()` which returns the exact version of the Tcl library as a named tuple similar to `sys.version_info`. (Contributed by Serhiy Storchaka in [gh-91827](https://github.com/python/cpython/issues/91827) [<https://github.com/python/cpython/issues/91827>].)

## traceback

- Add `traceback.StackSummary.format_frame_summary()` to allow users to override which frames appear in the

traceback, and how they are formatted. (Contributed by Ammar Askar in [bpo-44569](https://bugs.python.org/issue?@action=redirect&bpo=44569) [https://bugs.python.org/issue?@action=redirect&bpo=44569].)

- Add `traceback.TracebackException.print()`, which prints the formatted `TracebackException` instance to a file. (Contributed by Irit Katriel in [bpo-33809](https://bugs.python.org/issue?@action=redirect&bpo=33809) [https://bugs.python.org/issue?@action=redirect&bpo=33809].)

## typing

For major changes, see [New Features Related to Type Hints](#).

- Add `typing.assert_never()` and `typing.Never`. `typing.assert_never()` is useful for asking a type checker to confirm that a line of code is not reachable. At runtime, it raises an `AssertionError`. (Contributed by Jelle Zijlstra in [gh-90633](https://github.com/python/cpython/issues/90633) [https://github.com/python/cpython/issues/90633].)
- Add `typing.reveal_type()`. This is useful for asking a type checker what type it has inferred for a given expression. At runtime it prints the type of the received value. (Contributed by Jelle Zijlstra in [gh-90572](https://github.com/python/cpython/issues/90572) [https://github.com/python/cpython/issues/90572].)
- Add `typing.assert_type()`. This is useful for asking a type checker to confirm that the type it has inferred for a given expression matches the given type. At runtime it simply returns the received value. (Contributed by Jelle Zijlstra in [gh-90638](https://github.com/python/cpython/issues/90638) [https://github.com/python/cpython/issues/90638].)
- `typing.TypedDict` types can now be generic. (Contributed by Samodya Abeysiriwardane in [gh-89026](https://github.com/python/cpython/issues/89026) [https://github.com/python/cpython/issues/89026].)
- `NamedTuple` types can now be generic. (Contributed by Serhiy Storchaka in [bpo-43923](https://bugs.python.org/issue?@action=redirect&bpo=43923) [https://bugs.python.org/issue?@action=redirect&bpo=43923].)
- Allow subclassing of `typing.Any`. This is useful for avoiding type checker errors related to highly dynamic class, such as mocks. (Contributed by Shantanu Jain in [gh-91154](https://github.com/python/cpython/issues/91154) [https://github.com/python/cpython/issues/91154].)
- The `typing.final()` decorator now sets the `__final__` attributed on the decorated object. (Contributed by Jelle

Zijlstra in [gh-90500](https://github.com/python/cpython/issues/90500) [https://github.com/python/cpython/issues/90500].)

- The `typing.get_overloads()` function can be used for introspecting the overloads of a function. `typing.clear_overloads()` can be used to clear all registered overloads of a function. (Contributed by Jelle Zijlstra in [gh-89263](https://github.com/python/cpython/issues/89263) [https://github.com/python/cpython/issues/89263].)
- The `__init__()` method of `Protocol` subclasses is now preserved. (Contributed by Adrian Garcia Badarasco in [gh-88970](https://github.com/python/cpython/issues/88970) [https://github.com/python/cpython/issues/88970].)
- The representation of empty tuple types (`Tuple[()]`) is simplified. This affects introspection, e.g. `get_args(Tuple[()])` now evaluates to `()` instead of `((),)`. (Contributed by Serhiy Storchaka in [gh-91137](https://github.com/python/cpython/issues/91137) [https://github.com/python/cpython/issues/91137].)
- Loosen runtime requirements for type annotations by removing the callable check in the private `typing._type_check` function. (Contributed by Gregory Beauregard in [gh-90802](https://github.com/python/cpython/issues/90802) [https://github.com/python/cpython/issues/90802].)
- `typing.get_type_hints()` now supports evaluating strings as forward references in [PEP 585 generic aliases](https://peps.python.org/pep-0585/). (Contributed by Niklas Rosenstein in [gh-85542](https://github.com/python/cpython/issues/85542) [https://github.com/python/cpython/issues/85542].)
- `typing.get_type_hints()` no longer adds `Optional` to parameters with `None` as a default. (Contributed by Nikita Sobolev in [gh-90353](https://github.com/python/cpython/issues/90353) [https://github.com/python/cpython/issues/90353].)
- `typing.get_type_hints()` now supports evaluating bare stringified `ClassVar` annotations. (Contributed by Gregory Beauregard in [gh-90711](https://github.com/python/cpython/issues/90711) [https://github.com/python/cpython/issues/90711].)
- `typing.no_type_check()` no longer modifies external classes and functions. It also now correctly marks classmethods as not to be type checked. (Contributed by Nikita Sobolev in [gh-90729](https://github.com/python/cpython/issues/90729) [https://github.com/python/cpython/issues/90729].)

**unicodedata**

- The Unicode database has been updated to version 14.0.0. (Contributed by Benjamin Peterson in [bpo-45190](https://bugs.python.org/issue?@action=redirect&bpo=45190) [https://bugs.python.org/issue?@action=redirect&bpo=45190]).

## unittest

- Added methods `enterContext()` and `enterClassContext()` of class `TestCase`, method `enterAsyncContext()` of class `IsolatedAsyncioTestCase` and function `unittest.enterModuleContext()`. (Contributed by Serhiy Storchaka in [bpo-45046](https://bugs.python.org/issue?@action=redirect&bpo=45046) [https://bugs.python.org/issue?@action=redirect&bpo=45046]).

## venv

- When new Python virtual environments are created, the `venv sysconfig installation scheme` is used to determine the paths inside the environment. When Python runs in a virtual environment, the same installation scheme is the default. That means that downstream distributors can change the default sysconfig install scheme without changing behavior of virtual environments. Third party code that also creates new virtual environments should do the same. (Contributed by Miro Hrončok in [bpo-45413](https://bugs.python.org/issue?@action=redirect&bpo=45413) [https://bugs.python.org/issue?@action=redirect&bpo=45413]).

## warnings

- `warnings.catch_warnings()` now accepts arguments for `warnings.simplefilter()`, providing a more concise way to locally ignore warnings or convert them to errors. (Contributed by Zac Hatfield-Dodds in [bpo-47074](https://bugs.python.org/issue?@action=redirect&bpo=47074) [https://bugs.python.org/issue?@action=redirect&bpo=47074]).

## zipfile

- Added support for specifying member name encoding for reading metadata in a `ZipFile`'s directory and file headers.

(Contributed by Stephen J. Turnbull and Serhiy Storchaka in [bpo-28080](https://bugs.python.org/issue?@action=redirect&bpo=28080) [https://bugs.python.org/issue?@action=redirect&bpo=28080].)

- Added `ZipFile.mkdir()` for creating new directories inside ZIP archives. (Contributed by Sam Ezeh in [gh-49083](https://github.com/python/cpython/issues/49083) [https://github.com/python/cpython/issues/49083].)
- Added `stem`, `suffix` and `suffixes` to `zipfile.Path`. (Contributed by Miguel Brito in [gh-88261](https://github.com/python/cpython/issues/88261) [https://github.com/python/cpython/issues/88261].)

## Optimizations

This section covers specific optimizations independent of the [Faster CPython](#) project, which is covered in its own section.

- The compiler now optimizes simple `printf`-style `%` formatting on string literals containing only the format codes `%s`, `%r` and `%a` and makes it as fast as a corresponding `f-string` expression. (Contributed by Serhiy Storchaka in [bpo-28307](https://bugs.python.org/issue?@action=redirect&bpo=28307) [https://bugs.python.org/issue?@action=redirect&bpo=28307].)
- Integer division (`//`) is better tuned for optimization by compilers. It is now around 20% faster on x86-64 when dividing an `int` by a value smaller than `2**30`. (Contributed by Gregory P. Smith and Tim Peters in [gh-90564](https://github.com/python/cpython/issues/90564) [https://github.com/python/cpython/issues/90564].)
- `sum()` is now nearly 30% faster for integers smaller than `2**30`. (Contributed by Stefan Behnel in [gh-68264](https://github.com/python/cpython/issues/68264) [https://github.com/python/cpython/issues/68264].)
- Resizing lists is streamlined for the common case, speeding up `list.append()` by  $\approx 15\%$  and simple `list comprehensions` by up to 20-30% (Contributed by Dennis Sweeney in [gh-91165](https://github.com/python/cpython/issues/91165) [https://github.com/python/cpython/issues/91165].)
- Dictionaries don't store hash values when all keys are Unicode objects, decreasing `dict` size. For example, `sys.getsizeof(dict.fromkeys("abcdefg"))` is reduced from 352 bytes to 272 bytes (23% smaller) on 64-bit platforms. (Contributed by Inada Naoki in [bpo-46845](https://bugs.python.org/issue?@action=redirect&bpo=46845) [https://bugs.python.org/issue?@action=redirect&bpo=46845].)
- Using `asyncio.DatagramProtocol` is now orders of magnitude faster when transferring large files over UDP, with

speeds over 100 times higher for a  $\approx 60$  MiB file.

(Contributed by msoxzw in [gh-91487](https://github.com/python/cpython/issues/91487) [https://github.com/python/cpython/issues/91487].)

- **math** functions **comb()** and **perm()** are now  $\approx 10$  times faster for large arguments (with a larger speedup for larger  $k$ ). (Contributed by Serhiy Storchaka in [bpo-37295](https://bugs.python.org/issue/?@action=redirect&bpo=37295) [https://bugs.python.org/issue/?@action=redirect&bpo=37295].)
- The **statistics** functions **mean()**, **variance()** and **stdev()** now consume iterators in one pass rather than converting them to a **list** first. This is twice as fast and can save substantial memory. (Contributed by Raymond Hettinger in [gh-90415](https://github.com/python/cpython/issues/90415) [https://github.com/python/cpython/issues/90415].)
- **unicodedata.normalize()** now normalizes pure-ASCII strings in constant time. (Contributed by Dong-hee Na in [bpo-44987](https://bugs.python.org/issue/?@action=redirect&bpo=44987) [https://bugs.python.org/issue/?@action=redirect&bpo=44987].)

## Faster CPython

CPython 3.11 is an average of **25% faster** [https://github.com/faster-cpython/ideas#published-results] than CPython 3.10 as measured with the **pyperformance** [https://github.com/python/pyperformance] benchmark suite, when compiled with GCC on Ubuntu Linux. Depending on your workload, the overall speedup could be 10-60%.

This project focuses on two major areas in Python: **Faster Startup** and **Faster Runtime**. Optimizations not covered by this project are listed separately under **Optimizations**.

### Faster Startup

#### Frozen imports / Static code objects

Python caches **bytecode** in the **\_\_pycache\_\_** directory to speed up module loading.

Previously in 3.10, Python module execution looked like this:

```
Read __pycache__ -> Unmarshal -> Heap allocated code ob
```

In Python 3.11, the core modules essential for Python startup are “frozen”. This means that their [Code Objects](#) (and bytecode) are statically allocated by the interpreter. This reduces the steps in module execution process to:

Statically allocated code object -> Evaluate

Interpreter startup is now 10-15% faster in Python 3.11. This has a big impact for short-running programs using Python.

(Contributed by Eric Snow, Guido van Rossum and Kumar Aditya in many issues.)

## Faster Runtime

### Cheaper, lazy Python frames

Python frames, holding execution information, are created whenever Python calls a Python function. The following are new frame optimizations:

- Streamlined the frame creation process.
- Avoided memory allocation by generously re-using frame space on the C stack.
- Streamlined the internal frame struct to contain only essential information. Frames previously held extra debugging and memory management information.

Old-style [frame objects](#) are now created only when requested by debuggers or by Python introspection functions such as [sys.\\_getframe\(\)](#) and [inspect.currentframe\(\)](#). For most user code, no frame objects are created at all. As a result, nearly all Python functions calls have sped up significantly. We measured a 3-7% speedup in pyperformance.

(Contributed by Mark Shannon in [bpo-44590](#) [<https://bugs.python.org/issue?@action=redirect&bpo=44590>].)

### Inlined Python function calls

During a Python function call, Python will call an evaluating C function to interpret that function's code. This effectively limits pure Python recursion to what's safe for the C stack.

In 3.11, when CPython detects Python code calling another Python function, it sets up a new frame, and “jumps” to the new code inside the new frame. This avoids calling the C interpreting function altogether.

Most Python function calls now consume no C stack space, speeding them up. In simple recursive functions like fibonacci or factorial, we observed a 1.7x speedup. This also means recursive functions can recurse significantly deeper (if the user increases the recursion limit with `sys.setrecursionlimit()`). We measured a 1-3% improvement in performance.

(Contributed by Pablo Galindo and Mark Shannon in [bpo-45256](https://bugs.python.org/issue?@action=redirect&bpo=45256) [<https://bugs.python.org/issue?@action=redirect&bpo=45256>].)

## PEP 659: Specializing Adaptive Interpreter

**PEP 659** [<https://peps.python.org/pep-0659/>] is one of the key parts of the Faster CPython project. The general idea is that while Python is a dynamic language, most code has regions where objects and types rarely change. This concept is known as *type stability*.

At runtime, Python will try to look for common patterns and type stability in the executing code. Python will then replace the current operation with a more specialized one. This specialized operation uses fast paths available only to those use cases/types, which generally outperform their generic counterparts. This also brings in another concept called *inline caching*, where Python caches the results of expensive operations directly in the [bytecode](#).

The specializer will also combine certain common instruction pairs into one superinstruction, reducing the overhead during execution.

Python will only specialize when it sees code that is “hot” (executed multiple times). This prevents Python from wasting time on run-once code. Python can also de-specialize when code is too dynamic or when the use changes. Specialization is attempted periodically,

and specialization attempts are not too expensive, allowing specialization to adapt to new circumstances.

(PEP written by Mark Shannon, with ideas inspired by Stefan Brunthaler. See [PEP 659](https://peps.python.org/pep-0659/) [https://peps.python.org/pep-0659/] for more information. Implementation by Mark Shannon and Brandt Bucher, with additional help from Irit Katriel and Dennis Sweeney.)

### Specialization (speedup (up to)

**Mark Shannon, Irit Katriel, and Brandt Bucher, Dtypes Subclass**

`int`, `float` and `str` take custom fast paths for their underlying types.

**PEP 659** with Mark Shannon types such as `list`, `tuple` and `dict` directly index the underlying data structures.

Subscripting custom `__getitem__()` is also inlined similar to [Inlined Python function calls](#).

**PEP 659** (describes specializing specialization above.

**Mark Shannon, Kenilim (C) functions and types such as `len()` and `str`** directly call their underlying C version. This avoids going through the internal calling convention.

**Mark Shannon** the globals/builtins namespace is cached. Loading globals and builtins require zero namespace lookups.

**Mark Shannon** loading global variables. The attribute's index inside the class/object's namespace is cached. In most cases, attribute loading will require zero namespace lookups.

**PEP 659** (describes the method is cached. Method loading now has no namespace lookups – even for classes with long inheritance chains.

**Mark Shannon** attribute optimization.

**PEP 659** for common containers such as `list` and `tuple`.

Avoids internal calling convention.

1

A similar optimization already existed since Python 3.8. 3.11 specializes for more forms and reduces some overhead.

2

A similar optimization already existed since Python 3.10. 3.11 specializes for more forms. Furthermore, all attribute loads should be sped up by [bpo-45947](https://bugs.python.org/issue/45947) [https://bugs.python.org/issue/

@action=redirect&bpo=45947].

## Misc

- Objects now require less memory due to lazily created object namespaces. Their namespace dictionaries now also share keys more freely. (Contributed Mark Shannon in [bpo-45340](https://bugs.python.org/issue?@action=redirect&bpo=45340) [https://bugs.python.org/issue?@action=redirect&bpo=45340] and [bpo-40116](https://bugs.python.org/issue?@action=redirect&bpo=40116) [https://bugs.python.org/issue?@action=redirect&bpo=40116].)
- “Zero-cost” exceptions are implemented, eliminating the cost of `try` statements when no exception is raised. (Contributed by Mark Shannon in [bpo-40222](https://bugs.python.org/issue?@action=redirect&bpo=40222) [https://bugs.python.org/issue?@action=redirect&bpo=40222].)
- A more concise representation of exceptions in the interpreter reduced the time required for catching an exception by about 10%. (Contributed by Irit Katriel in [bpo-45711](https://bugs.python.org/issue?@action=redirect&bpo=45711) [https://bugs.python.org/issue?@action=redirect&bpo=45711].)
- `re`’s regular expression matching engine has been partially refactored, and now uses computed gotos (or “threaded code”) on supported platforms. As a result, Python 3.11 executes the [pyperformance regular expression benchmarks](https://pyperformance.readthedocs.io/benchmarks.html#regex-dna) [https://pyperformance.readthedocs.io/benchmarks.html#regex-dna] up to 10% faster than Python 3.10. (Contributed by Brandt Bucher in [gh-91404](https://github.com/python/cpython/issues/91404) [https://github.com/python/cpython/issues/91404].)

## FAQ

### How should I write my code to utilize these speedups?

Write Pythonic code that follows common best practices; you don’t have to change your code. The Faster CPython project optimizes for common code patterns we observe.

### Will CPython 3.11 use more memory?

Maybe not; we don’t expect memory use to exceed 20% higher than 3.10. This is offset by memory optimizations for frame objects and object dictionaries as mentioned above.

## I don't see any speedups in my workload. Why?

Certain code won't have noticeable benefits. If your code spends most of its time on I/O operations, or already does most of its computation in a C extension library like NumPy, there won't be significant speedups. This project currently benefits pure-Python workloads the most.

Furthermore, the pyperformance figures are a geometric mean. Even within the pyperformance benchmarks, certain benchmarks have slowed down slightly, while others have sped up by nearly 2x!

## Is there a JIT compiler?

No. We're still exploring other optimizations.

## About

Faster CPython explores optimizations for [CPython](#). The main team is funded by Microsoft to work on this full-time. Pablo Galindo Salgado is also funded by Bloomberg LP to work on the project part-time. Finally, many contributors are volunteers from the community.

## CPython bytecode changes

The bytecode now contains inline cache entries, which take the form of the newly-added [CACHE](#) instructions. Many opcodes expect to be followed by an exact number of caches, and instruct the interpreter to skip over them at runtime. Populated caches can look like arbitrary instructions, so great care should be taken when reading or modifying raw, adaptive bytecode containing quickened data.

## New opcodes

- [ASYNC\\_GEN\\_WRAP](#), [RETURN\\_GENERATOR](#) and [SEND](#), used in generators and co-routines.
- [COPY\\_FREE\\_VARS](#), which avoids needing special caller-side

code for closures.

- **JUMP\_BACKWARD\_NO\_INTERRUPT**, for use in certain loops where handling interrupts is undesirable.
- **MAKE\_CELL**, to create **Cell Objects**.
- **CHECK\_EG\_MATCH** and **PREP\_RERAISE\_STAR**, to handle the new exception groups and **except\*** added in **PEP 654** [<https://peps.python.org/pep-0654/>].
- **PUSH\_EXC\_INFO**, for use in exception handlers.
- **RESUME**, a no-op, for internal tracing, debugging and optimization checks.

## Replaced opcodes

### ~~Not Opcodes(s)~~

~~Replace all numeric binary/in-place opcodes with a single~~

~~INPLACE\_\*~~

~~Decorate function shifting for methods from handling of keyword arguments, allows better specialization of calls~~

~~PRECALLMETHOD~~

~~PUSH\_NULL~~

~~Stack manipulation instructions~~

~~BURP\_TOP\_TWO~~

~~ROT\_TWO~~

~~ROT\_THREE~~

~~ROT\_FOUR~~

~~ROT\_N~~

~~Now perform **CHECK\_MATCH** doesn't jump~~

~~See **PREP\_RERAISE**, **FALSE**, **NONE** and **NOT\_NONE** variants for each~~

~~direction **JUMP\_BACKWARD\_IF\_\***~~

~~**POP\_JUMP\_FORWARD\_IF\_\***~~

~~**SETUP\_BLOCK** setup~~

~~**SETUP\_ASYNC\_WITH**~~

### 3

All jump opcodes are now relative, including the existing **JUMP\_IF\_TRUE\_OR\_POP** and **JUMP\_IF\_FALSE\_OR\_POP**. The argument is now an offset from the current instruction rather than an absolute location.

## Changed/removed opcodes

- Changed `MATCH_CLASS` and `MATCH_KEYS` to no longer push an additional boolean value to indicate success/failure. Instead, `None` is pushed on failure in place of the tuple of extracted values.
- Changed opcodes that work with exceptions to reflect them now being represented as one item on the stack instead of three (see [gh-89874](https://github.com/python/cpython/issues/89874) [https://github.com/python/cpython/issues/89874]).
- Removed `COPY_DICT_WITHOUT_KEYS`, `GEN_START`, `POP_BLOCK`, `SETUP_FINALLY` and `YIELD_FROM`.

## Deprecated

This section lists Python APIs that have been deprecated in Python 3.11.

Deprecated C APIs are [listed separately](#).

## Language/Builtins

- Chaining `classmethod` descriptors (introduced in [bpo-19072](https://bugs.python.org/issue?@action=redirect&bpo=19072) [https://bugs.python.org/issue?@action=redirect&bpo=19072]) is now deprecated. It can no longer be used to wrap other descriptors such as `property`. The core design of this feature was flawed and caused a number of downstream problems. To “pass-through” a `classmethod`, consider using the `__wrapped__` attribute that was added in Python 3.10. (Contributed by Raymond Hettinger in [gh-89519](https://github.com/python/cpython/issues/89519) [https://github.com/python/cpython/issues/89519].)
- Octal escapes in string and bytes literals with values larger than `0o377` (255 in decimal) now produce a `DeprecationWarning`. In a future Python version, they will raise a `SyntaxWarning` and eventually a `SyntaxError`. (Contributed by Serhiy Storchaka in [gh-81548](https://github.com/python/cpython/issues/81548) [https://github.com/python/cpython/issues/81548].)
- The delegation of `int()` to `__trunc__()` is now

deprecated. Calling `int(a)` when `type(a)` implements `__trunc__()` but not `__int__()` or `__index__()` now raises a **DeprecationWarning**. (Contributed by Zackery Spytz in [bpo-44977](https://bugs.python.org/issue?@action=redirect&bpo=44977) [https://bugs.python.org/issue?@action=redirect&bpo=44977].)

## Modules

- **PEP 594** [https://peps.python.org/pep-0594/] led to the deprecations of the following modules slated for removal in Python 3.13:

~~**pprintlib**~~

~~**reprlib**~~

~~**reprlib**~~

~~**reprlibdev**~~

(Contributed by Brett Cannon in [bpo-47061](https://bugs.python.org/issue?@action=redirect&bpo=47061) [https://bugs.python.org/issue?@action=redirect&bpo=47061] and Victor Stinner in [gh-68966](https://github.com/python/cpython/issues/68966) [https://github.com/python/cpython/issues/68966].)

- The **asynchat**, **asyncore** and **smtpd** modules have been deprecated since at least Python 3.6. Their documentation and deprecation warnings have now been updated to note they will be removed in Python 3.12. (Contributed by Hugo van Kemenade in [bpo-47022](https://bugs.python.org/issue?@action=redirect&bpo=47022) [https://bugs.python.org/issue?@action=redirect&bpo=47022].)
- The **lib2to3** package and **2to3** tool are now deprecated and may not be able to parse Python 3.10 or newer. See **PEP 617** [https://peps.python.org/pep-0617/], introducing the new PEG parser, for details. (Contributed by Victor Stinner in [bpo-40360](https://bugs.python.org/issue?@action=redirect&bpo=40360) [https://bugs.python.org/issue?@action=redirect&bpo=40360].)
- Undocumented modules **sre\_compile**, **sre\_constants** and **sre\_parse** are now deprecated. (Contributed by Serhiy Storchaka in [bpo-47152](https://bugs.python.org/issue?@action=redirect&bpo=47152) [https://bugs.python.org/issue?@action=redirect&bpo=47152].)

## Standard Library

- The following have been deprecated in [configparser](#) since Python 3.2. Their deprecation warnings have now been updated to note they will be removed in Python 3.12:

- the `configparser.SafeConfigParser` class
- the `configparser.ParsingError.filename` property
- the `configparser.RawConfigParser.readfp()` method

(Contributed by Hugo van Kemenade in [bpo-45173](#) [<https://bugs.python.org/issue/?@action=redirect&bpo=45173>].)

- `configparser.LegacyInterpolation` has been deprecated in the docstring since Python 3.2, and is not listed in the [configparser](#) documentation. It now emits a [DeprecationWarning](#) and will be removed in Python 3.13. Use [configparser.BasicInterpolation](#) or [configparser.ExtendedInterpolation](#) instead.

(Contributed by Hugo van Kemenade in [bpo-46607](#) [<https://bugs.python.org/issue/?@action=redirect&bpo=46607>].)

- The older set of [importlib.resources](#) functions were deprecated in favor of the replacements added in Python 3.9 and will be removed in a future Python version, due to not supporting resources located within package subdirectories:

- [importlib.resources.contents\(\)](#)
- [importlib.resources.is\\_resource\(\)](#)
- [importlib.resources.open\\_binary\(\)](#)
- [importlib.resources.open\\_text\(\)](#)
- [importlib.resources.read\\_binary\(\)](#)
- [importlib.resources.read\\_text\(\)](#)
- [importlib.resources.path\(\)](#)

- The [locale.getdefaultlocale\(\)](#) function is deprecated and will be removed in Python 3.13. Use [locale.setlocale\(\)](#), [locale.getpreferredencoding\(False\)](#) and

`locale.getlocale()` functions instead. (Contributed by Victor Stinner in [gh-90817](https://github.com/python/cpython/issues/90817) [https://github.com/python/cpython/issues/90817].)

- The `locale.resetlocale()` function is deprecated and will be removed in Python 3.13. Use `locale.setlocale(locale.LC_ALL, "")` instead. (Contributed by Victor Stinner in [gh-90817](https://github.com/python/cpython/issues/90817) [https://github.com/python/cpython/issues/90817].)
- Stricter rules will now be applied for numerical group references and group names in [regular expressions](#). Only sequences of ASCII digits will now be accepted as a numerical reference, and the group name in [bytes](#) patterns and replacement strings can only contain ASCII letters, digits and underscores. For now, a deprecation warning is raised for syntax violating these rules. (Contributed by Serhiy Storchaka in [gh-91760](https://github.com/python/cpython/issues/91760) [https://github.com/python/cpython/issues/91760].)
- In the `re` module, the `re.template()` function and the corresponding `re.TEMPLATE` and `re.T` flags are deprecated, as they were undocumented and lacked an obvious purpose. They will be removed in Python 3.13. (Contributed by Serhiy Storchaka and Miro Hrončok in [gh-92728](https://github.com/python/cpython/issues/92728) [https://github.com/python/cpython/issues/92728].)
- `turtle.settiltangle()` has been deprecated since Python 3.1; it now emits a deprecation warning and will be removed in Python 3.13. Use `turtle.tiltangle()` instead (it was earlier incorrectly marked as deprecated, and its docstring is now corrected). (Contributed by Hugo van Kemenade in [bpo-45837](https://bugs.python.org/issue?@action=redirect&bpo=45837) [https://bugs.python.org/issue?@action=redirect&bpo=45837].)
- `typing.Text`, which exists solely to provide compatibility support between Python 2 and Python 3 code, is now deprecated. Its removal is currently unplanned, but users are encouraged to use `str` instead wherever possible. (Contributed by Alex Waygood in [gh-92332](https://github.com/python/cpython/issues/92332) [https://github.com/python/cpython/issues/92332].)

- The keyword argument syntax for constructing `typing.TypedDict` types is now deprecated. Support will be removed in Python 3.13. (Contributed by Jingchen Ye in [gh-90224](https://github.com/python/cpython/issues/90224) [<https://github.com/python/cpython/issues/90224>].)
- `webbrowser.MacOSX` is deprecated and will be removed in Python 3.13. It is untested, undocumented, and not used by `webbrowser` itself. (Contributed by Dong-hee Na in [bpo-42255](https://bugs.python.org/issue?@action=redirect&bpo=42255) [<https://bugs.python.org/issue?@action=redirect&bpo=42255>].)
- The behavior of returning a value from a `TestCase` and `IsolatedAsyncioTestCase` test methods (other than the default `None` value) is now deprecated.
- Deprecated the following not-formally-documented `unittest` functions, scheduled for removal in Python 3.13:
  - `unittest.findTestCases()`
  - `unittest.makeSuite()`
  - `unittest.getTestCaseNames()`

Use `TestLoader` methods instead:

- `unittest.TestLoader.loadTestsFromModule()`
- `unittest.TestLoader.loadTestsFromTestCase()`
- `unittest.TestLoader.getTestCaseNames()`

(Contributed by Erlend E. Aasland in [bpo-5846](https://bugs.python.org/issue?@action=redirect&bpo=5846) [<https://bugs.python.org/issue?@action=redirect&bpo=5846>].)

- `usageExit()` is marked deprecated, to be removed in 3.13. (Contributed by Carlos Damázio in [gh-67048](https://github.com/python/cpython/issues/67048) [<https://github.com/python/cpython/issues/67048>].)

## Pending Removal in Python 3.12

The following Python APIs have been deprecated in earlier Python releases, and will be removed in Python 3.12.

C APIs pending removal are [listed separately](#).

- The `asynchat` module
- The `asyncore` module
- The `distutils` package
- The `imp` module
- The `typing.io` namespace
- The `typing.re` namespace
- `cgi.log()`
- `importlib.find_loader()`
- `importlib.abc.Loader.module_repr()`
- `importlib.abc.MetaPathFinder.find_module()`
- `importlib.abc.PathEntryFinder.find_loader()`
- `importlib.abc.PathEntryFinder.find_module()`
- `importlib.machinery.BuiltinImporter.find_module()`
- `importlib.machinery.BuiltinLoader.module_repr()`
- `importlib.machinery.FileFinder.find_loader()`
- `importlib.machinery.FileFinder.find_module()`
- `importlib.machinery.FrozenImporter.find_module()`
- `importlib.machinery.FrozenLoader.module_repr()`
- `importlib.machinery.PathFinder.find_module()`
- `importlib.machinery.WindowsRegistryFinder.find_modu`
- `importlib.util.module_for_loader()`
- `importlib.util.set_loader_wrapper()`

- `importlib.util.set_package_wrapper()`
- `pkgutil.ImpImporter`
- `pkgutil.ImpLoader`
- `pathlib.Path.link_to()`
- `sqlite3.enable_shared_cache()`
- `sqlite3.OptimizedUnicode()`
- `PYTHONTHREADDEBUG` environment variable
- The following deprecated aliases in `unittest`:

#### Deprecated aliases

3.1	<code>assertTrue()</code>	
3.1	<code>assertFalse()</code>	
3.1	<code>assertEqual()</code>	Equal
3.1	<code>assertNotEqual()</code>	
3.1	<code>assertAlmostEqual()</code>	Equal
3.1	<code>assertNotAlmostEqual()</code>	
3.1	<code>assertRaises()</code>	Raises
3.2	<code>assertTrue()</code>	
3.2	<code>assertEqual(\$)</code>	
3.2	<code>assertNotEqual(\$)</code>	
3.2	<code>assertAlmostEqual(\$)</code>	
3.2	<code>assertNotAlmostEqual(\$)</code>	
3.2	<code>assertRegex(\$)</code>	Matches
3.2	<code>assertRaisesRegex(\$)</code>	
3.5	<code>assertNotRegex(\$)</code>	Matches

## Removed

This section lists Python APIs that have been removed in Python 3.11.

Removed C APIs are [listed separately](#).

- Removed the `@asyncio.coroutine()` [decorator](#) enabling

legacy generator-based coroutines to be compatible with **async** / **await** code. The function has been deprecated since Python 3.8 and the removal was initially scheduled for Python 3.10. Use **async def** instead. (Contributed by Illia Volochii in [bpo-43216](https://bugs.python.org/issue?@action=redirect&bpo=43216) [https://bugs.python.org/issue?@action=redirect&bpo=43216].)

- Removed **asyncio.coroutines.CoroWrapper** used for wrapping legacy generator-based coroutine objects in the debug mode. (Contributed by Illia Volochii in [bpo-43216](https://bugs.python.org/issue?@action=redirect&bpo=43216) [https://bugs.python.org/issue?@action=redirect&bpo=43216].)
- Due to significant security concerns, the *reuse\_address* parameter of **asyncio.loop.create\_datagram\_endpoint()**, disabled in Python 3.9, is now entirely removed. This is because of the behavior of the socket option `SO_REUSEADDR` in UDP. (Contributed by Hugo van Kemenade in [bpo-45129](https://bugs.python.org/issue?@action=redirect&bpo=45129) [https://bugs.python.org/issue?@action=redirect&bpo=45129].)
- Removed the **binhex** module, deprecated in Python 3.9. Also removed the related, similarly-deprecated **binascii** functions:
  - **binascii.a2b\_hqx()**
  - **binascii.b2a\_hqx()**
  - **binascii.rlecode\_hqx()**
  - **binascii.rldecode\_hqx()**

The **binascii.crc\_hqx()** function remains available.

(Contributed by Victor Stinner in [bpo-45085](https://bugs.python.org/issue?@action=redirect&bpo=45085) [https://bugs.python.org/issue?@action=redirect&bpo=45085].)

- Removed the **distutils** `bdist_msi` command deprecated in Python 3.9. Use `bdist_wheel` (wheel packages) instead. (Contributed by Hugo van Kemenade in [bpo-45124](https://bugs.python.org/issue?@action=redirect&bpo=45124) [https://bugs.python.org/issue?@action=redirect&bpo=45124].)
- Removed the **\_\_getitem\_\_()** methods of **xml.dom.pulldom.DOMEventStream**,

`wsgiref.util.FileWrapper` and `fileinput.FileInput`, deprecated since Python 3.9.  
(Contributed by Hugo van Kemenade in [bpo-45132](https://bugs.python.org/issue?@action=redirect&bpo=45132) [https://bugs.python.org/issue?@action=redirect&bpo=45132].)

- Removed the deprecated `gettext` functions `lgettext()`, `ldgettext()`, `lngettext()` and `ldngettext()`. Also removed the `bind_textdomain_codeset()` function, the `NullTranslations.output_charset()` and `NullTranslations.set_output_charset()` methods, and the `codeset` parameter of `translation()` and `install()`, since they are only used for the `l*gettext()` functions. (Contributed by Dong-hee Na and Serhiy Storchaka in [bpo-44235](https://bugs.python.org/issue?@action=redirect&bpo=44235) [https://bugs.python.org/issue?@action=redirect&bpo=44235].)
- Removed from the `inspect` module:
  - The `getargspec()` function, deprecated since Python 3.0; use `inspect.signature()` or `inspect.getfullargspec()` instead.
  - The `formatargspec()` function, deprecated since Python 3.5; use the `inspect.signature()` function or the `inspect.Signature` object directly.
  - The undocumented `Signature.from_builtin()` and `Signature.from_function()` methods, deprecated since Python 3.5; use the `Signature.from_callable()` method instead.

(Contributed by Hugo van Kemenade in [bpo-45320](https://bugs.python.org/issue?@action=redirect&bpo=45320) [https://bugs.python.org/issue?@action=redirect&bpo=45320].)

- Removed the `__class_getitem__()` method from `pathlib.PurePath`, because it was not used and added by mistake in previous versions. (Contributed by Nikita Sobolev in [bpo-46483](https://bugs.python.org/issue?@action=redirect&bpo=46483) [https://bugs.python.org/issue?@action=redirect&bpo=46483].)
- Removed the `MailmanProxy` class in the `smtplib` module, as it is unusable without the external `mailman` package.  
(Contributed by Dong-hee Na in [bpo-35800](https://bugs.python.org/issue?@action=redirect&bpo=35800) [https://bugs.python.org/issue?@action=redirect&bpo=35800].)

bugs.python.org/issue?@action=redirect&bpo=35800].)

- Removed the deprecated **split()** method of **\_tkinter.TkappType**. (Contributed by Erlend E. Aasland in [bpo-38371](https://bugs.python.org/issue?@action=redirect&bpo=38371) [https://bugs.python.org/issue?@action=redirect&bpo=38371].)
- Removed namespace package support from **unittest** discovery. It was introduced in Python 3.4 but has been broken since Python 3.7. (Contributed by Inada Naoki in [bpo-23882](https://bugs.python.org/issue?@action=redirect&bpo=23882) [https://bugs.python.org/issue?@action=redirect&bpo=23882].)
- Removed the undocumented private **float.\_\_set\_format\_\_()** method, previously known as **float.\_\_setformat\_\_()** in Python 3.7. Its docstring said: “You probably don’t want to use this function. It exists mainly to be used in Python’s test suite.” (Contributed by Victor Stinner in [bpo-46852](https://bugs.python.org/issue?@action=redirect&bpo=46852) [https://bugs.python.org/issue?@action=redirect&bpo=46852].)
- The **--experimental-isolated-subinterpreters** configure flag (and corresponding **EXPERIMENTAL\_ISOLATED\_SUBINTERPRETERS** macro) have been removed.
- [Pynche](https://pypi.org/project/pynche/) [https://pypi.org/project/pynche/] — The Pythonically Natural Color and Hue Editor — has been moved out of **Tools/scripts** and is [being developed independently](https://gitlab.com/warsaw/pynche/-/tree/main) [https://gitlab.com/warsaw/pynche/-/tree/main] from the Python source tree.

## Porting to Python 3.11

This section lists previously described changes and other bugfixes in the Python API that may require changes to your Python code.

Porting notes for the C API are [listed separately](#).

- **open()**, **io.open()**, **codecs.open()** and **fileinput.FileInput** no longer accept 'U' (“universal

newline”) in the file mode. In Python 3, “universal newline” mode is used by default whenever a file is opened in text mode, and the 'U' flag has been deprecated since Python 3.3. The [newline parameter](#) to these functions controls how universal newlines work. (Contributed by Victor Stinner in [bpo-37330](#) [<https://bugs.python.org/issue?@action=redirect&bpo=37330>].)

- [ast.AST](#) node positions are now validated when provided to [compile\(\)](#) and other related functions. If invalid positions are detected, a [ValueError](#) will be raised. (Contributed by Pablo Galindo in [gh-93351](#) [<https://github.com/python/cpython/issues/93351>])
- Prohibited passing non-[concurrent.futures.ThreadPoolExecutor](#) executors to [asyncio.loop.set\\_default\\_executor\(\)](#) following a deprecation in Python 3.8. (Contributed by Illia Volochii in [bpo-43234](#) [<https://bugs.python.org/issue?@action=redirect&bpo=43234>].)
- [calendar](#): The [calendar.LocaleTextCalendar](#) and [calendar.LocaleHTMLCalendar](#) classes now use [locale.getlocale\(\)](#), instead of using [locale.getdefaultlocale\(\)](#), if no locale is specified. (Contributed by Victor Stinner in [bpo-46659](#) [<https://bugs.python.org/issue?@action=redirect&bpo=46659>].)
- The [pdb](#) module now reads the `.pdbrc` configuration file with the 'UTF-8' encoding. (Contributed by Srinivas Reddy Thatiparthi (శ్రీనివాస్ రెడ్డి తాటిపర్తి) in [bpo-41137](#) [<https://bugs.python.org/issue?@action=redirect&bpo=41137>].)
- The *population* parameter of [random.sample\(\)](#) must be a sequence, and automatic conversion of [sets](#) to [lists](#) is no longer supported. Also, if the sample size is larger than the population size, a [ValueError](#) is raised. (Contributed by Raymond Hettinger in [bpo-40465](#) [<https://bugs.python.org/issue?@action=redirect&bpo=40465>].)
- The *random* optional parameter of [random.shuffle\(\)](#) was removed. It was previously an arbitrary random function to use for the shuffle; now, [random.random\(\)](#) (its previous default) will always be used.
- In [re Regular Expression Syntax](#), global inline flags (e.g. `(?i)`) can now only be used at the start of regular expressions.

Using them elsewhere has been deprecated since Python 3.6. (Contributed by Serhiy Storchaka in [bpo-47066](https://bugs.python.org/issue?@action=redirect&bpo=47066) [https://bugs.python.org/issue?@action=redirect&bpo=47066].)

- In the **re** module, several long-standing bugs were fixed that, in rare cases, could cause capture groups to get the wrong result. Therefore, this could change the captured output in these cases. (Contributed by Ma Lin in [bpo-35859](https://bugs.python.org/issue?@action=redirect&bpo=35859) [https://bugs.python.org/issue?@action=redirect&bpo=35859].)

## Build Changes

- CPython now has **PEP 11** [https://peps.python.org/pep-0011/] **Tier 3 support** [https://peps.python.org/pep-0011/#tier-3] for cross compiling to the **WebAssembly** [https://webassembly.org/] platforms **Emscripten** [https://emscripten.org/] (wasm32-unknown-emscripten, i.e. Python in the browser) and **WebAssembly System Interface (WASI)** [https://wasi.dev/] (wasm32-unknown-wasi). The effort is inspired by previous work like **Pyodide** [https://pyodide.org/]. These platforms provide a limited subset of POSIX APIs; Python standard libraries features and modules related to networking, processes, threading, signals, mmap, and users/groups are not available or don't work. (Emscripten contributed by Christian Heimes and Ethan Smith in [gh-84461](https://github.com/python/cpython/issues/84461) [https://github.com/python/cpython/issues/84461] and WASI contributed by Christian Heimes in [gh-90473](https://github.com/python/cpython/issues/90473) [https://github.com/python/cpython/issues/90473]; platforms promoted in [gh-95085](https://github.com/python/cpython/issues/95085) [https://github.com/python/cpython/issues/95085])
- Building CPython now requires:
  - A **C11** [https://en.cppreference.com/w/c/11] compiler and standard library. **Optional C11 features** [https://en.wikipedia.org/wiki/C11\_(C\_standard\_revision)#Optional\_features] are not required. (Contributed by Victor Stinner in [bpo-46656](https://bugs.python.org/issue?@action=redirect&bpo=46656) [https://bugs.python.org/issue?@action=redirect&bpo=46656], [bpo-45440](https://bugs.python.org/issue?@action=redirect&bpo=45440) [https://bugs.python.org/issue?@action=redirect&bpo=45440] and [bpo-46640](https://bugs.python.org/issue?@action=redirect&bpo=46640) [https://bugs.python.org/issue?@action=redirect&bpo=46640].)

- Support for [IEEE 754](https://en.wikipedia.org/wiki/IEEE_754) [https://en.wikipedia.org/wiki/IEEE\_754] floating point numbers. (Contributed by Victor Stinner in [bpo-46917](https://bugs.python.org/issue?@action=redirect&bpo=46917) [https://bugs.python.org/issue?@action=redirect&bpo=46917].)
- The **Py\_NO\_NAN** macro has been removed. Since CPython now requires IEEE 754 floats, NaN values are always available. (Contributed by Victor Stinner in [bpo-46656](https://bugs.python.org/issue?@action=redirect&bpo=46656) [https://bugs.python.org/issue?@action=redirect&bpo=46656].)
- The **tkinter** package now requires [Tcl/Tk](https://www.tcl.tk) [https://www.tcl.tk] version 8.5.12 or newer. (Contributed by Serhiy Storchaka in [bpo-46996](https://bugs.python.org/issue?@action=redirect&bpo=46996) [https://bugs.python.org/issue?@action=redirect&bpo=46996].)
- Build dependencies, compiler flags, and linker flags for most stdlib extension modules are now detected by **configure**. libffi, libnsl, libsqlite3, zlib, bzip2, liblzma, libcrypt, Tcl/Tk, and uuid flags are detected by [pkg-config](https://www.freedesktop.org/wiki/Software/pkg-config/) [https://www.freedesktop.org/wiki/Software/pkg-config/] (when available). **tkinter** now requires a pkg-config command to detect development settings for [Tcl/Tk](https://www.tcl.tk) [https://www.tcl.tk] headers and libraries. (Contributed by Christian Heimes and Erlend Egeberg Aasland in [bpo-45847](https://bugs.python.org/issue?@action=redirect&bpo=45847) [https://bugs.python.org/issue?@action=redirect&bpo=45847], [bpo-45747](https://bugs.python.org/issue?@action=redirect&bpo=45747) [https://bugs.python.org/issue?@action=redirect&bpo=45747], and [bpo-45763](https://bugs.python.org/issue?@action=redirect&bpo=45763) [https://bugs.python.org/issue?@action=redirect&bpo=45763].)
- libpython is no longer linked against libcrypt. (Contributed by Mike Gilbert in [bpo-45433](https://bugs.python.org/issue?@action=redirect&bpo=45433) [https://bugs.python.org/issue?@action=redirect&bpo=45433].)
- CPython can now be built with the [ThinLTO](https://clang.llvm.org/docs/ThinLTO.html) [https://clang.llvm.org/docs/ThinLTO.html] option via passing **thin** to **--with-lto**, i.e. **--with-lto=thin**. (Contributed by Donghee Na and Brett Holman in [bpo-44340](https://bugs.python.org/issue?@action=redirect&bpo=44340) [https://bugs.python.org/issue?@action=redirect&bpo=44340].)
- Freelists for object structs can now be disabled. A new **configure** option **--without-freelists** can be used to disable all freelists except empty tuple singleton. (Contributed

by Christian Heimes in [bpo-45522](https://bugs.python.org/issue?@action=redirect&bpo=45522) [https://bugs.python.org/issue?@action=redirect&bpo=45522].)

- `Modules/Setup` and `Modules/makesetup` have been improved and tied up. Extension modules can now be built through `makesetup`. All except some test modules can be linked statically into a main binary or library. (Contributed by Brett Cannon and Christian Heimes in [bpo-45548](https://bugs.python.org/issue?@action=redirect&bpo=45548) [https://bugs.python.org/issue?@action=redirect&bpo=45548], [bpo-45570](https://bugs.python.org/issue?@action=redirect&bpo=45570) [https://bugs.python.org/issue?@action=redirect&bpo=45570], [bpo-45571](https://bugs.python.org/issue?@action=redirect&bpo=45571) [https://bugs.python.org/issue?@action=redirect&bpo=45571], and [bpo-43974](https://bugs.python.org/issue?@action=redirect&bpo=43974) [https://bugs.python.org/issue?@action=redirect&bpo=43974].)

## Note

Use the environment variables `TCLTK_CFLAGS` and `TCLTK_LIBS` to manually specify the location of Tcl/Tk headers and libraries. The `configure` options `--with-tcltk-includes` and `--with-tcltk-libs` have been removed.

On RHEL 7 and CentOS 7 the development packages do not provide `tcl.pc` and `tk.pc`; use `TCLTK_LIBS="-ltk8.5 -ltkstub8.5 -ltcl8.5"`. The directory `Misc/rhel7` contains `.pc` files and instructions on how to build Python with RHEL 7's and CentOS 7's Tcl/Tk and OpenSSL.

- CPython will now use 30-bit digits by default for the Python [int](https://bugs.python.org/issue?@action=redirect&bpo=45569) implementation. Previously, the default was to use 30-bit digits on platforms with `sizeof_void_p >= 8`, and 15-bit digits otherwise. It's still possible to explicitly request use of 15-bit digits via either the `--enable-big-digits` option to the configure script or (for Windows) the `PYLONG_BITS_IN_DIGIT` variable in `PC/pyconfig.h`, but this option may be removed at some point in the future. (Contributed by Mark Dickinson in [bpo-45569](https://bugs.python.org/issue?@action=redirect&bpo=45569) [https://bugs.python.org/issue?@action=redirect&bpo=45569].)

# C API Changes

## New Features

- Add a new `PyType_GetName()` function to get type's short name. (Contributed by Hai Shi in [bpo-42035](https://bugs.python.org/issue/?@action=redirect&bpo=42035) [<https://bugs.python.org/issue/?@action=redirect&bpo=42035>].)
- Add a new `PyType_GetQualName()` function to get type's qualified name. (Contributed by Hai Shi in [bpo-42035](https://bugs.python.org/issue/?@action=redirect&bpo=42035) [<https://bugs.python.org/issue/?@action=redirect&bpo=42035>].)
- Add new `PyThreadState_EnterTracing()` and `PyThreadState_LeaveTracing()` functions to the limited C API to suspend and resume tracing and profiling. (Contributed by Victor Stinner in [bpo-43760](https://bugs.python.org/issue/?@action=redirect&bpo=43760) [<https://bugs.python.org/issue/?@action=redirect&bpo=43760>].)
- Added the `Py_Version` constant which bears the same value as `PY_VERSION_HEX`. (Contributed by Gabriele N. Tortetta in [bpo-43931](https://bugs.python.org/issue/?@action=redirect&bpo=43931) [<https://bugs.python.org/issue/?@action=redirect&bpo=43931>].)
- `Py_buffer` and APIs are now part of the limited API and the stable ABI:
  - `PyObject_CheckBuffer()`
  - `PyObject_GetBuffer()`
  - `PyBuffer_GetPointer()`
  - `PyBuffer_SizeFromFormat()`
  - `PyBuffer_ToContiguous()`
  - `PyBuffer_FromContiguous()`
  - `PyBuffer_CopyData()`
  - `PyBuffer_IsContiguous()`
  - `PyBuffer_FillContiguousStrides()`
  - `PyBuffer_FillInfo()`
  - `PyBuffer_Release()`
  - `PyMemoryView_FromBuffer()`
  - `bf_getbuffer` and `bf_releasebuffer` type slots

(Contributed by Christian Heimes in [bpo-45459](https://bugs.python.org/issue/?@action=redirect&bpo=45459) [https://bugs.python.org/issue/?@action=redirect&bpo=45459].)

- Added the `PyType_GetModuleByDef` function, used to get the module in which a method was defined, in cases where this information is not available directly (via `PyCMethod`). (Contributed by Petr Viktorin in [bpo-46613](https://bugs.python.org/issue/?@action=redirect&bpo=46613) [https://bugs.python.org/issue/?@action=redirect&bpo=46613].)
- Add new functions to pack and unpack C double (serialize and deserialize): `PyFloat_Pack2()`, `PyFloat_Pack4()`, `PyFloat_Pack8()`, `PyFloat_Unpack2()`, `PyFloat_Unpack4()` and `PyFloat_Unpack8()`. (Contributed by Victor Stinner in [bpo-46906](https://bugs.python.org/issue/?@action=redirect&bpo=46906) [https://bugs.python.org/issue/?@action=redirect&bpo=46906].)
- Add new functions to get frame object attributes: `PyFrame_GetBuiltins()`, `PyFrame_GetGenerator()`, `PyFrame_GetGlobals()`, `PyFrame_GetLasti()`.
- Added two new functions to get and set the active exception instance: `PyErr_GetHandledException()` and `PyErr_SetHandledException()`. These are alternatives to `PyErr_SetExcInfo()` and `PyErr_GetExcInfo()` which work with the legacy 3-tuple representation of exceptions. (Contributed by Irit Katriel in [bpo-46343](https://bugs.python.org/issue/?@action=redirect&bpo=46343) [https://bugs.python.org/issue/?@action=redirect&bpo=46343].)
- Added the `PyConfig.safe_path` member. (Contributed by Victor Stinner in [gh-57684](https://github.com/python/cpython/issues/57684) [https://github.com/python/cpython/issues/57684].)

## Porting to Python 3.11

- Some macros have been converted to static inline functions to avoid [macro pitfalls](https://gcc.gnu.org/onlinedocs/cpp/Macro-Pitfalls.html) [https://gcc.gnu.org/onlinedocs/cpp/Macro-Pitfalls.html]. The change should be mostly transparent to users, as the replacement functions will cast their arguments to the expected types to avoid compiler warnings due to static type checks. However, when the limited C API is set to  $\geq 3.11$ , these casts are not done, and callers will need to cast

arguments to their expected types. See [PEP 670](https://peps.python.org/pep-0670/) [https://peps.python.org/pep-0670/] for more details. (Contributed by Victor Stinner and Erlend E. Aasland in [gh-89653](https://github.com/python/cpython/issues/89653) [https://github.com/python/cpython/issues/89653].)

- [`PyErr\_SetExcInfo\(\)`](#) no longer uses the `type` and `traceback` arguments, the interpreter now derives those values from the exception instance (the `value` argument). The function still steals references of all three arguments. (Contributed by Irit Katriel in [bpo-45711](https://bugs.python.org/issue?@action=redirect&bpo=45711) [https://bugs.python.org/issue?@action=redirect&bpo=45711].)
- [`PyErr\_GetExcInfo\(\)`](#) now derives the `type` and `traceback` fields of the result from the exception instance (the `value` field). (Contributed by Irit Katriel in [bpo-45711](https://bugs.python.org/issue?@action=redirect&bpo=45711) [https://bugs.python.org/issue?@action=redirect&bpo=45711].)
- [`\_frozen`](#) has a new `is_package` field to indicate whether or not the frozen module is a package. Previously, a negative value in the `size` field was the indicator. Now only non-negative values be used for `size`. (Contributed by Kumar Aditya in [bpo-46608](https://bugs.python.org/issue?@action=redirect&bpo=46608) [https://bugs.python.org/issue?@action=redirect&bpo=46608].)
- [`\_PyFrameEvalFunction\(\)`](#) now takes `_PyInterpreterFrame*` as its second parameter, instead of `PyFrameObject*`. See [PEP 523](https://peps.python.org/pep-0523/) [https://peps.python.org/pep-0523/] for more details of how to use this function pointer type.
- [`PyCode\_New\(\)`](#) and [`PyCode\_NewWithPosOnlyArgs\(\)`](#) now take an additional `exception_table` argument. Using these functions should be avoided, if at all possible. To get a custom code object: create a code object using the compiler, then get a modified version with the `replace` method.
- [`PyCodeObject`](#) no longer has the `co_code`, `co_varnames`, `co_cellvars` and `co_freevars` fields. Instead, use [`PyCode\_GetCode\(\)`](#), [`PyCode\_GetVarnames\(\)`](#), [`PyCode\_GetCellvars\(\)`](#) and [`PyCode\_GetFreevars\(\)`](#) respectively to access them via

the C API. (Contributed by Brandt Bucher in [bpo-46841](https://bugs.python.org/issue?@action=redirect&bpo=46841) [<https://bugs.python.org/issue?@action=redirect&bpo=46841>] and Ken Jin in [gh-92154](https://github.com/python/cpython/issues/92154) [<https://github.com/python/cpython/issues/92154>] and [gh-94936](https://github.com/python/cpython/issues/94936) [<https://github.com/python/cpython/issues/94936>].)

- The old trashcan macros (`Py_TRASHCAN_SAFE_BEGIN/Py_TRASHCAN_SAFE_END`) are now deprecated. They should be replaced by the new macros `Py_TRASHCAN_BEGIN` and `Py_TRASHCAN_END`.

A `tp_dealloc` function that has the old macros, such as:

```
static void
mytype_dealloc(mytype *p)
{
    PyObject_GC_UnTrack(p);
    Py_TRASHCAN_SAFE_BEGIN(p);
    ...
    Py_TRASHCAN_SAFE_END
}
```

should migrate to the new macros as follows:

```
static void
mytype_dealloc(mytype *p)
{
    PyObject_GC_UnTrack(p);
    Py_TRASHCAN_BEGIN(p, mytype_dealloc)
    ...
    Py_TRASHCAN_END
}
```

Note that `Py_TRASHCAN_BEGIN` has a second argument which should be the deallocation function it is in.

To support older Python versions in the same codebase, you can define the following macros and use them throughout the code (credit: these were copied from the `mypy` codebase):

```
#if PY_VERSION_HEX >= 0x03080000
#   define CPy_TRASHCAN_BEGIN(op, dealloc) Py_TRASHCAN_BEGIN(op, dealloc)
```

```
# define CPy_TRASHCAN_END(op) Py_TRASHCAN_END
#else
# define CPy_TRASHCAN_BEGIN(op, dealloc) Py_TRASHCAN_BEGIN
# define CPy_TRASHCAN_END(op) Py_TRASHCAN_SAFE_END
#endif
```

- The `PyType_Ready()` function now raises an error if a type is defined with the `Py_TPFLAGS_HAVE_GC` flag set but has no traverse function (`PyTypeObject.tp_traverse`).

(Contributed by Victor Stinner in [bpo-44263](https://bugs.python.org/issue/?@action=redirect&bpo=44263) [https://bugs.python.org/issue/?@action=redirect&bpo=44263].)

- Heap types with the `Py_TPFLAGS_IMMUTABLETYPE` flag can now inherit the [PEP 590](https://peps.python.org/pep-0590/) [https://peps.python.org/pep-0590/] vectorcall protocol. Previously, this was only possible for [static types](https://bugs.python.org/issue/?@action=redirect&bpo=43908). (Contributed by Erlend E. Aasland in [bpo-43908](https://bugs.python.org/issue/?@action=redirect&bpo=43908) [https://bugs.python.org/issue/?@action=redirect&bpo=43908])

- Since `Py_TYPE()` is changed to an inline static function, `Py_TYPE(obj) = new_type` must be replaced with `Py_SET_TYPE(obj, new_type)`: see the [Py\\_SET\\_TYPE\(\)](https://bugs.python.org/issue/?@action=redirect&bpo=39573) function (available since Python 3.9). For backward compatibility, this macro can be used:

```
#if PY_VERSION_HEX < 0x030900A4 && !defined(Py_SET_TYPE)
static inline void _Py_SET_TYPE(PyObject *ob, PyTypeObject *type) {
    ob->ob_type = type;
}
#define Py_SET_TYPE(ob, type) _Py_SET_TYPE((PyObject *)ob, type)
#endif
```

(Contributed by Victor Stinner in [bpo-39573](https://bugs.python.org/issue/?@action=redirect&bpo=39573) [https://bugs.python.org/issue/?@action=redirect&bpo=39573].)

- Since `Py_SIZE()` is changed to an inline static function, `Py_SIZE(obj) = new_size` must be replaced with `Py_SET_SIZE(obj, new_size)`: see the [Py\\_SET\\_SIZE\(\)](https://bugs.python.org/issue/?@action=redirect&bpo=39573) function (available since Python 3.9). For backward compatibility, this macro can be used:

```
#if PY_VERSION_HEX < 0x030900A4 && !defined(Py_SET_SIZE)
static inline void _Py_SET_SIZE(PyVarObject *ob, Py_ssize_t size) {
    ob->ob_size = size;
}
#define Py_SET_SIZE(ob, size) _Py_SET_SIZE((PyVarObject *)ob, size)
#endif
```

```
{ ob->ob_size = size; }
#define Py_SET_SIZE(ob, size) _Py_SET_SIZE((PyVarOb
#endif
```

(Contributed by Victor Stinner in [bpo-39573](https://bugs.python.org/issue/?@action=redirect&bpo=39573) [https://bugs.python.org/issue/?@action=redirect&bpo=39573].)

- `<Python.h>` no longer includes the header files `<stdlib.h>`, `<stdio.h>`, `<errno.h>` and `<string.h>` when the `Py_LIMITED_API` macro is set to `0x030b0000` (Python 3.11) or higher. C extensions should explicitly include the header files after `#include <Python.h>`. (Contributed by Victor Stinner in [bpo-45434](https://bugs.python.org/issue/?@action=redirect&bpo=45434) [https://bugs.python.org/issue/?@action=redirect&bpo=45434].)
- The non-limited API files `cellobject.h`, `classobject.h`, `code.h`, `context.h`, `funcobject.h`, `genobject.h` and `longintrepr.h` have been moved to the `Include/cpython` directory. Moreover, the `eval.h` header file has been removed. These files must not be included directly, as they are already included in `Python.h`: [Include Files](#). If they have been included directly, consider including `Python.h` instead. (Contributed by Victor Stinner in [bpo-35134](https://bugs.python.org/issue/?@action=redirect&bpo=35134) [https://bugs.python.org/issue/?@action=redirect&bpo=35134].)
- The `PyUnicode_CHECK_INTERNED()` macro has been excluded from the limited C API. It was never usable there, because it used internal structures which are not available in the limited C API. (Contributed by Victor Stinner in [bpo-46007](https://bugs.python.org/issue/?@action=redirect&bpo=46007) [https://bugs.python.org/issue/?@action=redirect&bpo=46007].)
- The following frame functions and type are now directly available with `#include <Python.h>`, it's no longer needed to add `#include <frameobject.h>`:
  - `PyFrame_Check()`
  - `PyFrame_GetBack()`
  - `PyFrame_GetBuiltins()`
  - `PyFrame_GetGenerator()`

- `PyFrame_GetGlobals()`
- `PyFrame_GetLasti()`
- `PyFrame_GetLocals()`
- `PyFrame_Type`

(Contributed by Victor Stinner in [gh-93937](https://github.com/python/cpython/issues/93937) [https://github.com/python/cpython/issues/93937].)

- The `PyFrameObject` structure members have been removed from the public C API.

While the documentation notes that the `PyFrameObject` fields are subject to change at any time, they have been stable for a long time and were used in several popular extensions.

In Python 3.11, the frame struct was reorganized to allow performance optimizations. Some fields were removed entirely, as they were details of the old implementation.

`PyFrameObject` fields:

- `f_back`: use `PyFrame_GetBack()`.
- `f_blockstack`: removed.
- `f_builtins`: use `PyFrame_GetBuiltins()`.
- `f_code`: use `PyFrame_GetCode()`.
- `f_gen`: use `PyFrame_GetGenerator()`.
- `f_globals`: use `PyFrame_GetGlobals()`.
- `f_iblock`: removed.
- `f_lasti`: use `PyFrame_GetLasti()`. Code using `f_lasti` with `PyCode_Addr2Line()` should use `PyFrame_GetLineNumber()` instead; it may be faster.
- `f_lineno`: use `PyFrame_GetLineNumber()`.
- `f_locals`: use `PyFrame_GetLocals()`.
- `f_stackdepth`: removed.
- `f_state`: no public API (renamed to `f_frame.f_state`).
- `f_trace`: no public API.
- `f_trace_lines`: use `PyObject_GetAttrString((PyObject*)frame, "f_trace_lines")`.

- `f_trace_opcodes`: use `PyObject_GetAttrString((PyObject*) frame, "f_trace_opcodes")`.
- `f_localsplus`: no public API (renamed to `f_frame.localsplus`).
- `f_valuestack`: removed.

The Python frame object is now created lazily. A side effect is that the `f_back` member must not be accessed directly, since its value is now also computed lazily. The **`PyFrame_GetBack()`** function must be called instead.

Debuggers that accessed the `f_locals` directly *must* call **`PyFrame_GetLocals()`** instead. They no longer need to call **`PyFrame_FastToLocalsWithError()`** or **`PyFrame_LocalsToFast()`**, in fact they should not call those functions. The necessary updating of the frame is now managed by the virtual machine.

Code defining `PyFrame_GetCode()` on Python 3.8 and older:

```
#if PY_VERSION_HEX < 0x030900B1
static inline PyCodeObject* PyFrame_GetCode(PyFrame
{
    Py_INCREF(frame->f_code);
    return frame->f_code;
}
#endif
```

Code defining `PyFrame_GetBack()` on Python 3.8 and older:

```
#if PY_VERSION_HEX < 0x030900B1
static inline PyFrameObject* PyFrame_GetBack(PyFrame
{
    Py_XINCRREF(frame->f_back);
    return frame->f_back;
}
#endif
```

Or use the [pythoncapi\\_compat project](https://github.com/python/pythoncapi-compat) [https://github.com/python/pythoncapi-compat] to get these two functions on older Python versions.

- Changes of the **PyThreadState** structure members:
  - **frame**: removed, use **PyThreadState\_GetFrame()** (function added to Python 3.9 by [bpo-40429](https://bugs.python.org/issue?@action=redirect&bpo=40429) [https://bugs.python.org/issue?@action=redirect&bpo=40429]).  
Warning: the function returns a [strong reference](#), need to call **Py\_XDECREF()**.
  - **tracing**: changed, use **PyThreadState\_EnterTracing()** and **PyThreadState\_LeaveTracing()** (functions added to Python 3.11 by [bpo-43760](https://bugs.python.org/issue?@action=redirect&bpo=43760) [https://bugs.python.org/issue?@action=redirect&bpo=43760]).
  - **recursion\_depth**: removed, use `(tstate->recursion_limit - tstate->recursion_remaining)` instead.
  - **stackcheck\_counter**: removed.

Code defining **PyThreadState\_GetFrame()** on Python 3.8 and older:

```
#if PY_VERSION_HEX < 0x030900B1
static inline PyFrameObject* PyThreadState_GetFrame
{
    Py_XINCREf(tstate->frame);
    return tstate->frame;
}
#endif
```

Code defining **PyThreadState\_EnterTracing()** and **PyThreadState\_LeaveTracing()** on Python 3.10 and older:

```
#if PY_VERSION_HEX < 0x030B00A2
static inline void PyThreadState_EnterTracing(PyThr
{
    tstate->tracing++;
```

```

#if PY_VERSION_HEX >= 0x030A00A1
    tstate->cframe->use_tracing = 0;
#else
    tstate->use_tracing = 0;
#endif
}

static inline void PyThreadState_LeaveTracing(PyThr
{
    int use_tracing = (tstate->c_tracefunc != NULL
    tstate->tracing--;
#if PY_VERSION_HEX >= 0x030A00A1
    tstate->cframe->use_tracing = use_tracing;
#else
    tstate->use_tracing = use_tracing;
#endif
}
#endif

```

Or use [the pythoncapi-compat project](https://github.com/python/pythoncapi-compat) [https://github.com/python/pythoncapi-compat] to get these functions on old Python functions.

- Distributors are encouraged to build Python with the optimized Blake2 library [libb2](https://www.blake2.net/) [https://www.blake2.net/].
- The [PyConfig.module\\_search\\_paths\\_set](#) field must now be set to 1 for initialization to use [PyConfig.module\\_search\\_paths](#) to initialize [sys.path](#). Otherwise, initialization will recalculate the path and replace any values added to `module_search_paths`.
- [PyConfig\\_Read\(\)](#) no longer calculates the initial search path, and will not fill any values into [PyConfig.module\\_search\\_paths](#). To calculate default paths and then modify them, finish initialization and use [PySys\\_GetObject\(\)](#) to retrieve [sys.path](#) as a Python list object and modify it directly.

## Deprecated

- Deprecate the following functions to configure the Python initialization:

- `PySys_AddWarnOptionUnicode()`
- `PySys_AddWarnOption()`
- `PySys_AddXOption()`
- `PySys_HasWarnOptions()`
- `PySys_SetArgvEx()`
- `PySys_SetArgv()`
- `PySys_SetPath()`
- `Py_SetPath()`
- `Py_SetProgramName()`
- `Py_SetPythonHome()`
- `Py_SetStandardStreamEncoding()`
- `_Py_SetProgramFullPath()`

Use the new `PyConfig` API of the [Python Initialization Configuration](#) instead ([PEP 587](#) [<https://peps.python.org/pep-0587/>]). (Contributed by Victor Stinner in [gh-88279](#) [<https://github.com/python/cpython/issues/88279>].)

- Deprecate the `ob_shash` member of the `PyBytesObject`. Use `PyObject_Hash()` instead. (Contributed by Inada Naoki in [bpo-46864](#) [<https://bugs.python.org/issue?@action=redirect&bpo=46864>].)

## Pending Removal in Python 3.12

The following C APIs have been deprecated in earlier Python releases, and will be removed in Python 3.12.

- `PyUnicode_AS_DATA()`
- `PyUnicode_AS_UNICODE()`
- `PyUnicode_AsUnicodeAndSize()`
- `PyUnicode_AsUnicode()`
- `PyUnicode_FromUnicode()`
- `PyUnicode_GET_DATA_SIZE()`
- `PyUnicode_GET_SIZE()`
- `PyUnicode_GetSize()`
- `PyUnicode_IS_COMPACT()`
- `PyUnicode_IS_READY()`

- `PyUnicode_READY()`
- `Py_UNICODE_WSTR_LENGTH()`
- `_PyUnicode_AsUnicode()`
- `PyUnicode_WCHAR_KIND`
- `PyUnicodeObject`
- `PyUnicode_InternImmortal()`

## Removed

- `PyFrame_BlockSetup()` and `PyFrame_BlockPop()` have been removed. (Contributed by Mark Shannon in [bpo-40222](https://bugs.python.org/issue?@action=redirect&bpo=40222) [https://bugs.python.org/issue?@action=redirect&bpo=40222].)

- Remove the following math macros using the `errno` variable:

- `Py_ADJUST_ERANGE1()`
- `Py_ADJUST_ERANGE2()`
- `Py_OVERFLOWED()`
- `Py_SET_ERANGE_IF_OVERFLOW()`
- `Py_SET_ERRNO_ON_MATH_ERROR()`

(Contributed by Victor Stinner in [bpo-45412](https://bugs.python.org/issue?@action=redirect&bpo=45412) [https://bugs.python.org/issue?@action=redirect&bpo=45412].)

- Remove `Py_UNICODE_COPY()` and `Py_UNICODE_FILL()` macros, deprecated since Python 3.3. Use `PyUnicode_CopyCharacters()` or `memcpy()` (`wchar_t* string`), and `PyUnicode_Fill()` functions instead. (Contributed by Victor Stinner in [bpo-41123](https://bugs.python.org/issue?@action=redirect&bpo=41123) [https://bugs.python.org/issue?@action=redirect&bpo=41123].)
- Remove the `pystrhex.h` header file. It only contains private functions. C extensions should only include the main `<Python.h>` header file. (Contributed by Victor Stinner in [bpo-45434](https://bugs.python.org/issue?@action=redirect&bpo=45434) [https://bugs.python.org/issue?@action=redirect&bpo=45434].)
- Remove the `Py_FORCE_DOUBLE()` macro. It was used by the `Py_IS_INFINITY()` macro. (Contributed by Victor

Stinner in [bpo-45440](https://bugs.python.org/issue?@action=redirect&bpo=45440) [https://bugs.python.org/issue?@action=redirect&bpo=45440].)

- The following items are no longer available when **Py\_LIMITED\_API** is defined:

- **PyMarshal\_WriteLongToFile()**
- **PyMarshal\_WriteObjectToFile()**
- **PyMarshal\_ReadObjectFromString()**
- **PyMarshal\_WriteObjectToString()**
- the `Py_MARSHAL_VERSION` macro

These are not part of the **limited API**.

(Contributed by Victor Stinner in [bpo-45474](https://bugs.python.org/issue?@action=redirect&bpo=45474) [https://bugs.python.org/issue?@action=redirect&bpo=45474].)

- Exclude **PyWeakref\_GET\_OBJECT()** from the limited C API. It never worked since the **PyWeakReference** structure is opaque in the limited C API. (Contributed by Victor Stinner in [bpo-35134](https://bugs.python.org/issue?@action=redirect&bpo=35134) [https://bugs.python.org/issue?@action=redirect&bpo=35134].)
- Remove the `PyHeapType_GET_MEMBERS()` macro. It was exposed in the public C API by mistake, it must only be used by Python internally. Use the `PyTypeObject.tp_members` member instead. (Contributed by Victor Stinner in [bpo-40170](https://bugs.python.org/issue?@action=redirect&bpo=40170) [https://bugs.python.org/issue?@action=redirect&bpo=40170].)
- Remove the `HAVE_PY_SET_53BIT_PRECISION` macro (moved to the internal C API). (Contributed by Victor Stinner in [bpo-45412](https://bugs.python.org/issue?@action=redirect&bpo=45412) [https://bugs.python.org/issue?@action=redirect&bpo=45412].)
- Remove the **Py\_UNICODE** encoder APIs, as they have been deprecated since Python 3.3, are little used and are inefficient relative to the recommended alternatives.

The removed functions are:

- **PyUnicode\_Encode()**
- **PyUnicode\_EncodeASCII()**

- `PyUnicode_EncodeLatin1()`
- `PyUnicode_EncodeUTF7()`
- `PyUnicode_EncodeUTF8()`
- `PyUnicode_EncodeUTF16()`
- `PyUnicode_EncodeUTF32()`
- `PyUnicode_EncodeUnicodeEscape()`
- `PyUnicode_EncodeRawUnicodeEscape()`
- `PyUnicode_EncodeCharmap()`
- `PyUnicode_TranslateCharmap()`
- `PyUnicode_EncodeDecimal()`
- `PyUnicode_TransformDecimalToASCII()`

See [PEP 624](https://peps.python.org/pep-0624/) [https://peps.python.org/pep-0624/] for details and [migration guidance](https://peps.python.org/pep-0624/#alternative-apis) [https://peps.python.org/pep-0624/#alternative-apis]. (Contributed by Inada Naoki in [bpo-44029](https://bugs.python.org/issue?@action=redirect&bpo=44029) [https://bugs.python.org/issue?@action=redirect&bpo=44029].)

## Notable Changes in 3.11.4

### tarfile

- The extraction methods in [tarfile](#), and [shutil.unpack\\_archive\(\)](#), have a new *filter* argument that allows limiting tar features that may be surprising or dangerous, such as creating files outside the destination directory. See [Extraction filters](#) for details. In Python 3.12, use without the *filter* argument will show a [DeprecationWarning](#). In Python 3.14, the default will switch to `'data'`. (Contributed by Petr Viktorin in [PEP 706](https://peps.python.org/pep-0706/) [https://peps.python.org/pep-0706/].)

# What's New In Python 3.10

Editor

Pablo Galindo Salgado

This article explains the new features in Python 3.10, compared to 3.9. Python 3.10 was released on October 4, 2021. For full details, see the [changelog](#).

## Summary – Release highlights

New syntax features:

- [PEP 634](https://peps.python.org/pep-0634/) [https://peps.python.org/pep-0634/], Structural Pattern Matching: Specification
- [PEP 635](https://peps.python.org/pep-0635/) [https://peps.python.org/pep-0635/], Structural Pattern Matching: Motivation and Rationale
- [PEP 636](https://peps.python.org/pep-0636/) [https://peps.python.org/pep-0636/], Structural Pattern Matching: Tutorial
- [bpo-12782](https://bugs.python.org/issue?@action=redirect&bpo=12782) [https://bugs.python.org/issue?@action=redirect&bpo=12782], Parenthesized context managers are now officially allowed.

New features in the standard library:

- [PEP 618](https://peps.python.org/pep-0618/) [https://peps.python.org/pep-0618/], Add Optional Length-Checking To zip.

Interpreter improvements:

- [PEP 626](https://peps.python.org/pep-0626/) [https://peps.python.org/pep-0626/], Precise line numbers for debugging and other tools.

New typing features:

- [PEP 604](https://peps.python.org/pep-0604/) [https://peps.python.org/pep-0604/], Allow writing union

types as `X | Y`

- [PEP 612](https://peps.python.org/pep-0612/) [https://peps.python.org/pep-0612/], Parameter Specification Variables
- [PEP 613](https://peps.python.org/pep-0613/) [https://peps.python.org/pep-0613/], Explicit Type Aliases
- [PEP 647](https://peps.python.org/pep-0647/) [https://peps.python.org/pep-0647/], User-Defined Type Guards

Important deprecations, removals or restrictions:

- [PEP 644](https://peps.python.org/pep-0644/) [https://peps.python.org/pep-0644/], Require OpenSSL 1.1.1 or newer
- [PEP 632](https://peps.python.org/pep-0632/) [https://peps.python.org/pep-0632/], Deprecate `distutils` module.
- [PEP 623](https://peps.python.org/pep-0623/) [https://peps.python.org/pep-0623/], Deprecate and prepare for the removal of the `wstr` member in `PyUnicodeObject`.
- [PEP 624](https://peps.python.org/pep-0624/) [https://peps.python.org/pep-0624/], Remove `Py_UNICODE` encoder APIs
- [PEP 597](https://peps.python.org/pep-0597/) [https://peps.python.org/pep-0597/], Add optional `EncodingWarning`

## New Features

### Parenthesized context managers

Using enclosing parentheses for continuation across multiple lines in context managers is now supported. This allows formatting a long collection of context managers in multiple lines in a similar way as it was previously possible with import statements. For instance, all these examples are now valid:

```
with (CtxManager() as example):
    ...

with (
    CtxManager1(),
    CtxManager2()
):
    ...
```

```

with (CtxManager1() as example,
      CtxManager2()):
    ...

with (CtxManager1(),
      CtxManager2() as example):
    ...

with (
    CtxManager1() as example1,
    CtxManager2() as example2
):
    ...

```

it is also possible to use a trailing comma at the end of the enclosed group:

```

with (
    CtxManager1() as example1,
    CtxManager2() as example2,
    CtxManager3() as example3,
):
    ...

```

This new syntax uses the non LL(1) capacities of the new parser. Check [PEP 617](https://peps.python.org/pep-0617/) [https://peps.python.org/pep-0617/] for more details.

(Contributed by Guido van Rossum, Pablo Galindo and Lysandros Nikolaou in [bpo-12782](https://bugs.python.org/issue?@action=redirect&bpo=12782) [https://bugs.python.org/issue?@action=redirect&bpo=12782] and [bpo-40334](https://bugs.python.org/issue?@action=redirect&bpo=40334) [https://bugs.python.org/issue?@action=redirect&bpo=40334].)

## Better error messages

### SyntaxErrors

When parsing code that contains unclosed parentheses or brackets the interpreter now includes the location of the unclosed bracket of

parentheses instead of displaying *SyntaxError: unexpected EOF while parsing* or pointing to some incorrect location. For instance, consider the following code (notice the unclosed '{'):

```
expected = {9: 1, 18: 2, 19: 2, 27: 3, 28: 3, 29: 3, 36: 3,
            38: 4, 39: 4, 45: 5, 46: 5, 47: 5, 48: 5, 49: 5,
            some_other_code = foo()
```

Previous versions of the interpreter reported confusing places as the location of the syntax error:

```
File "example.py", line 3
    some_other_code = foo()
                        ^
SyntaxError: invalid syntax
```

but in Python 3.10 a more informative error is emitted:

```
File "example.py", line 1
    expected = {9: 1, 18: 2, 19: 2, 27: 3, 28: 3, 29: 3, 36: 3,
                ^
SyntaxError: '{' was never closed
```

In a similar way, errors involving unclosed string literals (single and triple quoted) now point to the start of the string instead of reporting EOF/EOL.

These improvements are inspired by previous work in the PyPy interpreter.

(Contributed by Pablo Galindo in [bpo-42864](https://bugs.python.org/issue?@action=redirect&bpo=42864) [https://bugs.python.org/issue?@action=redirect&bpo=42864] and Batuhan Taskaya in [bpo-40176](https://bugs.python.org/issue?@action=redirect&bpo=40176) [https://bugs.python.org/issue?@action=redirect&bpo=40176].)

**SyntaxError** exceptions raised by the interpreter will now highlight the full error range of the expression that constitutes the syntax error itself, instead of just where the problem is detected. In this way, instead of displaying (before Python 3.10):

```
>>> foo(x, z for z in range(10), t, w)
File "<stdin>", line 1
```

```
foo(x, z for z in range(10), t, w)
      ^
```

SyntaxError: Generator expression must be parenthesized

now Python 3.10 will display the exception as:

```
>>> foo(x, z for z in range(10), t, w)
File "<stdin>", line 1
    foo(x, z for z in range(10), t, w)
        ^^^^^^^^^^^^^^^^^^^^^^^^^^^
```

SyntaxError: Generator expression must be parenthesized

This improvement was contributed by Pablo Galindo in [bpo-43914](#)

[<https://bugs.python.org/issue?@action=redirect&bpo=43914>].

A considerable amount of new specialized messages for **SyntaxError** exceptions have been incorporated. Some of the most notable ones are as follows:

- Missing `:` before blocks:

```
>>> if rocket.position > event_horizon
    File "<stdin>", line 1
        if rocket.position > event_horizon
            ^
SyntaxError: expected ':'
```

(Contributed by Pablo Galindo in [bpo-42997](#)

[[https://bugs.python.org/issue?](https://bugs.python.org/issue?@action=redirect&bpo=42997)

[@action=redirect&bpo=42997](#)].)

- Unparenthesised tuples in comprehensions targets:

```
>>> {x,y for x,y in zip('abcd', '1234')}
    File "<stdin>", line 1
        {x,y for x,y in zip('abcd', '1234')}
            ^
SyntaxError: did you forget parentheses around
```

(Contributed by Pablo Galindo in [bpo-43017](#)

[[https://bugs.python.org/issue?](https://bugs.python.org/issue?@action=redirect&bpo=43017)

@action=redirect&bpo=43017].)

- Missing commas in collection literals and between expressions:

```
>>> items = {
... x: 1,
... y: 2
... z: 3,
    File "<stdin>", line 3
      y: 2
      ^
```

SyntaxError: invalid syntax. Perhaps you forgot

(Contributed by Pablo Galindo in [bpo-43822](https://bugs.python.org/issue?@action=redirect&bpo=43822)

[[https://bugs.python.org/issue?](https://bugs.python.org/issue?@action=redirect&bpo=43822)

@action=redirect&bpo=43822].)

- Multiple Exception types without parentheses:

```
>>> try:
...     build_dyson_sphere()
... except NotEnoughScienceError, NotEnoughRe
    File "<stdin>", line 3
        except NotEnoughScienceError, NotEnoughRe
            ^
```

SyntaxError: multiple exception types must be

(Contributed by Pablo Galindo in [bpo-43149](https://bugs.python.org/issue?@action=redirect&bpo=43149)

[[https://bugs.python.org/issue?](https://bugs.python.org/issue?@action=redirect&bpo=43149)

@action=redirect&bpo=43149].)

- Missing `:` and values in dictionary literals:

```
>>> values = {
... x: 1,
... y: 2,
... z:
... }
    File "<stdin>", line 4
      z:
```

```

      ^
SyntaxError: expression expected after dictio

>>> values = {x:1, y:2, z w:3}
      File "<stdin>", line 1
        values = {x:1, y:2, z w:3}
                        ^
SyntaxError: ':' expected after dictionary ke

```

## IndentationErrors

Many [IndentationError](#) exceptions now have more context regarding what kind of block was expecting an indentation, including the location of the statement:

```
>>> def foo():
...     if lel:
...         x = 2
      File "<stdin>", line 3
        x = 2
        ^
```

IndentationError: expected an indented block after 'if'

## AttributeErrors

When printing [AttributeError](#), `PyErr_Display()` will offer suggestions of similar attribute names in the object that the exception was raised from:

```
>>> collections.namedtoplo
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
AttributeError: module 'collections' has no attribute 'r
```

(Contributed by Pablo Galindo in [bpo-38530](https://bugs.python.org/issue?@action=redirect&bpo=38530) [\[https://bugs.python.org/issue?@action=redirect&bpo=38530\].](https://bugs.python.org/issue?@action=redirect&bpo=38530))

## Warning

Notice this won't work if `PyErr_Display()` is not called to display the error which can happen if some other custom error display function is used. This is a common scenario in some REPLs like IPython.

## NameErrors

When printing `NameError` raised by the interpreter, `PyErr_Display()` will offer suggestions of similar variable names in the function that the exception was raised from:

```
>>> schwarzschild_black_hole = None
>>> schwarzschild_black_hole
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
NameError: name 'schwarzschild_black_hole' is not defined
```

(Contributed by Pablo Galindo in [bpo-38530](https://bugs.python.org/issue?@action=redirect&bpo=38530) [https://bugs.python.org/issue?@action=redirect&bpo=38530].)

## Warning

Notice this won't work if `PyErr_Display()` is not called to display the error, which can happen if some other custom error display function is used. This is a common scenario in some REPLs like IPython.

## PEP 626: Precise line numbers for debugging and other tools

PEP 626 brings more precise and reliable line numbers for debugging, profiling and coverage tools. Tracing events, with the correct line number, are generated for all lines of code executed and only for lines of code that are executed.

The `f_lineno` attribute of frame objects will always contain the expected line number.

The `co_notab` attribute of code objects is deprecated and will be removed in 3.12. Code that needs to convert from offset to line number should use the new `co_lines()` method instead.

## PEP 634: Structural Pattern Matching

Structural pattern matching has been added in the form of a *match statement* and *case statements* of patterns with associated actions. Patterns consist of sequences, mappings, primitive data types as well as class instances. Pattern matching enables programs to extract information from complex data types, branch on the structure of data, and apply specific actions based on different forms of data.

### Syntax and operations

The generic syntax of pattern matching is:

```
match subject:
    case <pattern_1>:
        <action_1>
    case <pattern_2>:
        <action_2>
    case <pattern_3>:
        <action_3>
    case _:
        <action_wildcard>
```

A match statement takes an expression and compares its value to successive patterns given as one or more case blocks. Specifically, pattern matching operates by:

1. using data with type and shape (the `subject`)
2. evaluating the `subject` in the `match` statement
3. comparing the subject with each pattern in a

case statement from top to bottom until a match is confirmed.

4. executing the action associated with the pattern of the confirmed match
5. If an exact match is not confirmed, the last case, a wildcard `_`, if provided, will be used as the matching case. If an exact match is not confirmed and a wildcard case does not exist, the entire match block is a no-op.

## Declarative approach

Readers may be aware of pattern matching through the simple example of matching a subject (data object) to a literal (pattern) with the switch statement found in C, Java or JavaScript (and many other languages). Often the switch statement is used for comparison of an object/expression with case statements containing literals.

More powerful examples of pattern matching can be found in languages such as Scala and Elixir. With structural pattern matching, the approach is “declarative” and explicitly states the conditions (the patterns) for data to match.

While an “imperative” series of instructions using nested “if” statements could be used to accomplish something similar to structural pattern matching, it is less clear than the “declarative” approach. Instead the “declarative” approach states the conditions to meet for a match and is more readable through its explicit patterns. While structural pattern matching can be used in its simplest form comparing a variable to a literal in a case statement, its true value for Python lies in its handling of the subject’s type and shape.

## Simple pattern: match to a literal

Let’s look at this example as pattern matching in its simplest form: a value, the subject, being matched to several literals, the patterns. In the example below, `status` is the subject of the match statement. The patterns are each of the case statements, where literals represent request status codes. The associated action to the case is

executed after a match:

```
def http_error(status):  
    match status:  
        case 400:  
            return "Bad request"  
        case 404:  
            return "Not found"  
        case 418:  
            return "I'm a teapot"  
        case _:  
            return "Something's wrong with the internet"
```

If the above function is passed a `status` of 418, “I’m a teapot” is returned. If the above function is passed a `status` of 500, the case statement with `_` will match as a wildcard, and “Something’s wrong with the internet” is returned. Note the last block: the variable name, `_`, acts as a *wildcard* and insures the subject will always match. The use of `_` is optional.

You can combine several literals in a single pattern using `|` (“or”):

```
case 401 | 403 | 404:  
    return "Not allowed"
```

### Behavior without the wildcard

If we modify the above example by removing the last case block, the example becomes:

```
def http_error(status):  
    match status:  
        case 400:  
            return "Bad request"  
        case 404:  
            return "Not found"  
        case 418:  
            return "I'm a teapot"
```

Without the use of `_` in a case statement, a match may not exist. If

no match exists, the behavior is a no-op. For example, if `status` of 500 is passed, a no-op occurs.

## Patterns with a literal and variable

Patterns can look like unpacking assignments, and a pattern may be used to bind variables. In this example, a data point can be unpacked to its x-coordinate and y-coordinate:

```
# point is an (x, y) tuple
match point:
    case (0, 0):
        print("Origin")
    case (0, y):
        print(f"Y={y}")
    case (x, 0):
        print(f"X={x}")
    case (x, y):
        print(f"X={x}, Y={y}")
    case _:
        raise ValueError("Not a point")
```

The first pattern has two literals, `(0, 0)`, and may be thought of as an extension of the literal pattern shown above. The next two patterns combine a literal and a variable, and the variable *binds* a value from the subject (`point`). The fourth pattern captures two values, which makes it conceptually similar to the unpacking assignment `(x, y) = point`.

## Patterns and classes

If you are using classes to structure your data, you can use as a pattern the class name followed by an argument list resembling a constructor. This pattern has the ability to capture class attributes into variables:

```
class Point:
    x: int
    y: int
```

```
def location(point):
    match point:
        case Point(x=0, y=0):
            print("Origin is the point's location.")
        case Point(x=0, y=y):
            print(f"Y={y} and the point is on the y-axis")
        case Point(x=x, y=0):
            print(f"X={x} and the point is on the x-axis")
        case Point():
            print("The point is located somewhere else on the plane")
        case _:
            print("Not a point")
```

### Patterns with positional parameters

You can use positional parameters with some builtin classes that provide an ordering for their attributes (e.g. dataclasses). You can also define a specific position for attributes in patterns by setting the `__match_args__` special attribute in your classes. If it's set to ("x", "y"), the following patterns are all equivalent (and all bind the `y` attribute to the `var` variable):

```
Point(1, var)
Point(1, y=var)
Point(x=1, y=var)
Point(y=var, x=1)
```

### Nested patterns

Patterns can be arbitrarily nested. For example, if our data is a short list of points, it could be matched like this:

```
match points:
    case []:
        print("No points in the list.")
    case [Point(0, 0)]:
        print("The origin is the only point in the list.")
    case [Point(x, y)]:
```

```

        print(f"A single point {x}, {y} is in the list.")
    case [Point(0, y1), Point(0, y2)]:
        print(f"Two points on the Y axis at {y1}, {y2} a
    case _:
        print("Something else is found in the list.")

```

## Complex patterns and the wildcard

To this point, the examples have used `_` alone in the last case statement. A wildcard can be used in more complex patterns, such as `('error', code, _)`. For example:

```

match test_variable:
    case ('warning', code, 40):
        print("A warning has been received.")
    case ('error', code, _):
        print(f"An error {code} occurred.")

```

In the above case, `test_variable` will match for `('error', code, 100)` and `('error', code, 800)`.

## Guard

We can add an `if` clause to a pattern, known as a “guard”. If the guard is false, `match` goes on to try the next case block. Note that value capture happens before the guard is evaluated:

```

match point:
    case Point(x, y) if x == y:
        print(f"The point is located on the diagonal Y=X")
    case Point(x, y):
        print(f"Point is not on the diagonal.")

```

## Other Key Features

Several other key features:

- Like unpacking assignments, tuple and list patterns have exactly the same meaning and actually match arbitrary

sequences. Technically, the subject must be a sequence. Therefore, an important exception is that patterns don't match iterators. Also, to prevent a common mistake, sequence patterns don't match strings.

- Sequence patterns support wildcards: `[x, y, *rest]` and `(x, y, *rest)` work similar to wildcards in unpacking assignments. The name after `*` may also be `_`, so `(x, y, *_)` matches a sequence of at least two items without binding the remaining items.
- Mapping patterns: `{"bandwidth": b, "latency": l}` captures the "bandwidth" and "latency" values from a dict. Unlike sequence patterns, extra keys are ignored. A wildcard `**rest` is also supported. (But `**_` would be redundant, so is not allowed.)
- Subpatterns may be captured using the `as` keyword:

```
case (Point(x1, y1), Point(x2, y2) as p2): ...
```

This binds `x1`, `y1`, `x2`, `y2` like you would expect without the `as` clause, and `p2` to the entire second item of the subject.

- Most literals are compared by equality. However, the singletons `True`, `False` and `None` are compared by identity.
- Named constants may be used in patterns. These named constants must be dotted names to prevent the constant from being interpreted as a capture variable:

```
from enum import Enum
class Color(Enum):
    RED = 0
    GREEN = 1
    BLUE = 2

match color:
    case Color.RED:
        print("I see red!")
```

```

case Color.GREEN:
    print("Grass is green")
case Color.BLUE:
    print("I'm feeling the blues :(")

```

For the full specification see [PEP 634](https://peps.python.org/pep-0634/) [https://peps.python.org/pep-0634/]. Motivation and rationale are in [PEP 635](https://peps.python.org/pep-0635/) [https://peps.python.org/pep-0635/], and a longer tutorial is in [PEP 636](https://peps.python.org/pep-0636/) [https://peps.python.org/pep-0636/].

## Optional `EncodingWarning` and `encoding="locale"` option

The default encoding of `TextIOWrapper` and `open()` is platform and locale dependent. Since UTF-8 is used on most Unix platforms, omitting `encoding` option when opening UTF-8 files (e.g. JSON, YAML, TOML, Markdown) is a very common bug. For example:

```

# BUG: "rb" mode or encoding="utf-8" should be used.
with open("data.json") as f:
    data = json.load(f)

```

To find this type of bug, an optional `EncodingWarning` is added. It is emitted when `sys.flags.warn_default_encoding` is true and locale-specific default encoding is used.

`-X warn_default_encoding` option and `PYTHONWARNDEFAULTENCODING` are added to enable the warning.

See [Text Encoding](#) for more information.

## New Features Related to Type Hints

This section covers major changes affecting [PEP 484](https://peps.python.org/pep-0484/) [https://peps.python.org/pep-0484/] type hints and the `typing` module.

### PEP 604: New Type Union Operator

A new type union operator was introduced which enables the syntax `X | Y`. This provides a cleaner way of expressing ‘either

type X or type Y' instead of using `typing.Union`, especially in type hints.

In previous versions of Python, to apply a type hint for functions accepting arguments of multiple types, `typing.Union` was used:

```
def square(number: Union[int, float]) -> Union[int, float]:
    return number ** 2
```

Type hints can now be written in a more succinct manner:

```
def square(number: int | float) -> int | float:
    return number ** 2
```

This new syntax is also accepted as the second argument to `isinstance()` and `issubclass()`:

```
>>> isinstance(1, int | str)
True
```

See [Union Type](https://peps.python.org/pep-0604/) and [PEP 604](https://peps.python.org/pep-0604/) [https://peps.python.org/pep-0604/] for more details.

(Contributed by Maggie Moss and Philippe Prados in [bpo-41428](https://bugs.python.org/issue?@action=redirect&bpo=41428) [https://bugs.python.org/issue?@action=redirect&bpo=41428], with additions by Yurii Karabas and Serhiy Storchaka in [bpo-44490](https://bugs.python.org/issue?@action=redirect&bpo=44490) [https://bugs.python.org/issue?@action=redirect&bpo=44490].)

## PEP 612: Parameter Specification Variables

Two new options to improve the information provided to static type checkers for [PEP 484](https://peps.python.org/pep-0484/) [https://peps.python.org/pep-0484/]’s `Callable` have been added to the `typing` module.

The first is the parameter specification variable. They are used to forward the parameter types of one callable to another callable – a pattern commonly found in higher order functions and decorators. Examples of usage can be found in `typing.ParamSpec`. Previously, there was no easy way to type annotate dependency of parameter types in such a precise manner.

The second option is the new `Concatenate` operator. It's used in conjunction with parameter specification variables to type annotate a higher order callable which adds or removes parameters of another callable. Examples of usage can be found in [typing.Concatenate](#).

See [typing.Callable](#), [typing.ParamSpec](#), [typing.Concatenate](#), [typing.ParamSpecArgs](#), [typing.ParamSpecKwargs](#), and [PEP 612](#) [<https://peps.python.org/pep-0612/>] for more details.

(Contributed by Ken Jin in [bpo-41559](#) [<https://bugs.python.org/issue?@action=redirect&bpo=41559>], with minor enhancements by Jelle Zijlstra in [bpo-43783](#) [<https://bugs.python.org/issue?@action=redirect&bpo=43783>]. PEP written by Mark Mendoza.)

## PEP 613: TypeAlias

[PEP 484](#) [<https://peps.python.org/pep-0484/>] introduced the concept of type aliases, only requiring them to be top-level unannotated assignments. This simplicity sometimes made it difficult for type checkers to distinguish between type aliases and ordinary assignments, especially when forward references or invalid types were involved. Compare:

```
StrCache = 'Cache[str]' # a type alias
LOG_PREFIX = 'LOG[DEBUG]' # a module constant
```

Now the [typing](#) module has a special value **TypeAlias** which lets you declare type aliases more explicitly:

```
StrCache: TypeAlias = 'Cache[str]' # a type alias
LOG_PREFIX = 'LOG[DEBUG]' # a module constant
```

See [PEP 613](#) [<https://peps.python.org/pep-0613/>] for more details.

(Contributed by Mikhail Golubev in [bpo-41923](#) [<https://bugs.python.org/issue?@action=redirect&bpo=41923>].)

## PEP 647: User-Defined Type Guards

**TypeGuard** has been added to the **typing** module to annotate type guard functions and improve information provided to static type checkers during type narrowing. For more information, please see **TypeGuard**'s documentation, and **PEP 647** [<https://peps.python.org/pep-0647/>].

(Contributed by Ken Jin and Guido van Rossum in [bpo-43766](https://bugs.python.org/issue?@action=redirect&bpo=43766) [<https://bugs.python.org/issue?@action=redirect&bpo=43766>]. PEP written by Eric Traut.)

## Other Language Changes

- The **int** type has a new method **int.bit\_count()**, returning the number of ones in the binary expansion of a given integer, also known as the population count. (Contributed by Niklas Fiekas in [bpo-29882](https://bugs.python.org/issue?@action=redirect&bpo=29882) [<https://bugs.python.org/issue?@action=redirect&bpo=29882>].)
- The views returned by **dict.keys()**, **dict.values()** and **dict.items()** now all have a **mapping** attribute that gives a **types.MappingProxyType** object wrapping the original dictionary. (Contributed by Dennis Sweeney in [bpo-40890](https://bugs.python.org/issue?@action=redirect&bpo=40890) [<https://bugs.python.org/issue?@action=redirect&bpo=40890>].)
- **PEP 618** [<https://peps.python.org/pep-0618/>]: The **zip()** function now has an optional **strict** flag, used to require that all the iterables have an equal length.
- Builtin and extension functions that take integer arguments no longer accept **Decimals**, **Fractions** and other objects that can be converted to integers only with a loss (e.g. that have the **\_\_int\_\_()** method but do not have the **\_\_index\_\_()** method). (Contributed by Serhiy Storchaka in [bpo-37999](https://bugs.python.org/issue?@action=redirect&bpo=37999) [<https://bugs.python.org/issue?@action=redirect&bpo=37999>].)
- If **object.\_\_ipow\_\_()** returns **NotImplemented**, the operator will correctly fall back to **object.\_\_pow\_\_()** and **object.\_\_rpow\_\_()** as expected. (Contributed by Alex Shkop in [bpo-38302](https://bugs.python.org/issue?@action=redirect&bpo=38302) [<https://bugs.python.org/issue?@action=redirect&bpo=38302>].)
- Assignment expressions can now be used unparenthesized within set literals and set comprehensions, as well as in

sequence indexes (but not slices).

- Functions have a new `__builtins__` attribute which is used to look for builtin symbols when a function is executed, instead of looking into `__globals__['__builtins__']`. The attribute is initialized from `__globals__["__builtins__"]` if it exists, else from the current builtins. (Contributed by Mark Shannon in [bpo-42990](https://bugs.python.org/issue?@action=redirect&bpo=42990) [<https://bugs.python.org/issue?@action=redirect&bpo=42990>].)
- Two new builtin functions – `aiter()` and `anext()` have been added to provide asynchronous counterparts to `iter()` and `next()`, respectively. (Contributed by Joshua Bronson, Daniel Pope, and Justin Wang in [bpo-31861](https://bugs.python.org/issue?@action=redirect&bpo=31861) [<https://bugs.python.org/issue?@action=redirect&bpo=31861>].)
- Static methods (`@staticmethod`) and class methods (`@classmethod`) now inherit the method attributes (`__module__`, `__name__`, `__qualname__`, `__doc__`, `__annotations__`) and have a new `__wrapped__` attribute. Moreover, static methods are now callable as regular functions. (Contributed by Victor Stinner in [bpo-43682](https://bugs.python.org/issue?@action=redirect&bpo=43682) [<https://bugs.python.org/issue?@action=redirect&bpo=43682>].)
- Annotations for complex targets (everything beside simple name targets defined by [PEP 526](https://peps.python.org/pep-0526/) [<https://peps.python.org/pep-0526/>]) no longer cause any runtime effects with `from __future__ import annotations`. (Contributed by Batuhan Taskaya in [bpo-42737](https://bugs.python.org/issue?@action=redirect&bpo=42737) [<https://bugs.python.org/issue?@action=redirect&bpo=42737>].)
- Class and module objects now lazy-create empty annotations dicts on demand. The annotations dicts are stored in the object's `__dict__` for backwards compatibility. This improves the best practices for working with `__annotations__`; for more information, please see [Annotations Best Practices](#). (Contributed by Larry Hastings in [bpo-43901](https://bugs.python.org/issue?@action=redirect&bpo=43901) [<https://bugs.python.org/issue?@action=redirect&bpo=43901>].)
- Annotations consist of `yield`, `yield from`, `await` or named expressions are now forbidden under `from __future__ import annotations` due to their side effects. (Contributed by Batuhan Taskaya in [bpo-42725](https://bugs.python.org/issue?@action=redirect&bpo=42725) [<https://bugs.python.org/issue?@action=redirect&bpo=42725>].)

- Usage of unbound variables, `super()` and other expressions that might alter the processing of symbol table as annotations are now rendered effectless under `from __future__ import annotations`. (Contributed by Batuhan Taskaya in [bpo-42725](https://bugs.python.org/issue?@action=redirect&bpo=42725) [https://bugs.python.org/issue?@action=redirect&bpo=42725].)
- Hashes of NaN values of both `float` type and `decimal.Decimal` type now depend on object identity. Formerly, they always hashed to 0 even though NaN values are not equal to one another. This caused potentially quadratic runtime behavior due to excessive hash collisions when creating dictionaries and sets containing multiple NaNs. (Contributed by Raymond Hettinger in [bpo-43475](https://bugs.python.org/issue?@action=redirect&bpo=43475) [https://bugs.python.org/issue?@action=redirect&bpo=43475].)
- A `SyntaxError` (instead of a `NameError`) will be raised when deleting the `__debug__` constant. (Contributed by Dong-hee Na in [bpo-45000](https://bugs.python.org/issue?@action=redirect&bpo=45000) [https://bugs.python.org/issue?@action=redirect&bpo=45000].)
- `SyntaxError` exceptions now have `end_lineno` and `end_offset` attributes. They will be `None` if not determined. (Contributed by Pablo Galindo in [bpo-43914](https://bugs.python.org/issue?@action=redirect&bpo=43914) [https://bugs.python.org/issue?@action=redirect&bpo=43914].)

## New Modules

- None yet.

## Improved Modules

### asyncio

Add missing `connect_accepted_socket()` method.

(Contributed by Alex Grönholm in [bpo-41332](https://bugs.python.org/issue?@action=redirect&bpo=41332) [https://bugs.python.org/issue?@action=redirect&bpo=41332].)

### argparse

Misleading phrase “optional arguments” was replaced with “options” in `argparse` help. Some tests might require adaptation if

they rely on exact output match. (Contributed by Raymond Hettinger in [bpo-9694](https://bugs.python.org/issue?@action=redirect&bpo=9694) [https://bugs.python.org/issue?@action=redirect&bpo=9694].)

## array

The [`index\(\)`](#) method of [`array.array`](#) now has optional *start* and *stop* parameters. (Contributed by Anders Lorentsen and Zackery Spytz in [bpo-31956](https://bugs.python.org/issue?@action=redirect&bpo=31956) [https://bugs.python.org/issue?@action=redirect&bpo=31956].)

## asynchat, asyncore, smtpd

These modules have been marked as deprecated in their module documentation since Python 3.6. An import-time [`DeprecationWarning`](#) has now been added to all three of these modules.

## base64

Add [`base64.b32hexencode\(\)`](#) and [`base64.b32hexdecode\(\)`](#) to support the Base32 Encoding with Extended Hex Alphabet.

## bdb

Add [`clearBreakpoints\(\)`](#) to reset all set breakpoints. (Contributed by Irit Katriel in [bpo-24160](https://bugs.python.org/issue?@action=redirect&bpo=24160) [https://bugs.python.org/issue?@action=redirect&bpo=24160].)

## bisect

Added the possibility of providing a *key* function to the APIs in the [`bisect`](#) module. (Contributed by Raymond Hettinger in [bpo-4356](https://bugs.python.org/issue?@action=redirect&bpo=4356) [https://bugs.python.org/issue?@action=redirect&bpo=4356].)

## codecs

Add a [`codecs.unregister\(\)`](#) function to unregister a codec search function. (Contributed by Hai Shi in [bpo-41842](https://bugs.python.org/issue?@action=redirect&bpo=41842) [https://bugs.python.org/issue?@action=redirect&bpo=41842].)

[bugs.python.org/issue?@action=redirect&bpo=41842](https://bugs.python.org/issue?@action=redirect&bpo=41842).)

## **collections.abc**

The `__args__` of the [parameterized generic](#) for `collections.abc.Callable` are now consistent with `typing.Callable`. `collections.abc.Callable` generic now flattens type parameters, similar to what `typing.Callable` currently does. This means that `collections.abc.Callable[[int, str], str]` will have `__args__` of `(int, str, str)`; previously this was `([int, str], str)`. To allow this change, `types.GenericAlias` can now be subclassed, and a subclass will be returned when subscripting the `collections.abc.Callable` type. Note that a `TypeError` may be raised for invalid forms of parameterizing `collections.abc.Callable` which may have passed silently in Python 3.9. (Contributed by Ken Jin in [bpo-42195](#) [<https://bugs.python.org/issue?@action=redirect&bpo=42195>].)

## **contextlib**

Add a `contextlib.aclosing()` context manager to safely close async generators and objects representing asynchronously released resources. (Contributed by Joongi Kim and John Belmonte in [bpo-41229](#) [<https://bugs.python.org/issue?@action=redirect&bpo=41229>].)

Add asynchronous context manager support to `contextlib.nullcontext()`. (Contributed by Tom Gringauz in [bpo-41543](#) [<https://bugs.python.org/issue?@action=redirect&bpo=41543>].)

Add `AsyncContextDecorator`, for supporting usage of async context managers as decorators.

## **curses**

The extended color functions added in ncurses 6.1 will be used transparently by `curses.color_content()`, `curses.init_color()`, `curses.init_pair()`, and `curses.pair_content()`. A new function, `curses.has_extended_color_support()`, indicates whether

extended color support is provided by the underlying ncurses library. (Contributed by Jeffrey Kintscher and Hans Petter Jansson in [bpo-36982](https://bugs.python.org/issue?@action=redirect&bpo=36982) [https://bugs.python.org/issue?@action=redirect&bpo=36982].)

The `BUTTON5_*` constants are now exposed in the `curses` module if they are provided by the underlying curses library. (Contributed by Zackery Spytz in [bpo-39273](https://bugs.python.org/issue?@action=redirect&bpo=39273) [https://bugs.python.org/issue?@action=redirect&bpo=39273].)

## dataclasses

### `__slots__`

Added `slots` parameter in `dataclasses.dataclass()` decorator. (Contributed by Yurii Karabas in [bpo-42269](https://bugs.python.org/issue?@action=redirect&bpo=42269) [https://bugs.python.org/issue?@action=redirect&bpo=42269])

### Keyword-only fields

dataclasses now supports fields that are keyword-only in the generated `__init__` method. There are a number of ways of specifying keyword-only fields.

You can say that every field is keyword-only:

```
from dataclasses import dataclass

@dataclass(kw_only=True)
class Birthday:
    name: str
    birthday: datetime.date
```

Both `name` and `birthday` are keyword-only parameters to the generated `__init__` method.

You can specify keyword-only on a per-field basis:

```
from dataclasses import dataclass, field

@dataclass
```

```
class Birthday:
    name: str
    birthday: datetime.date = field(kw_only=True)
```

Here only `birthday` is keyword-only. If you set `kw_only` on individual fields, be aware that there are rules about re-ordering fields due to keyword-only fields needing to follow non-keyword-only fields. See the full dataclasses documentation for details.

You can also specify that all fields following a `KW_ONLY` marker are keyword-only. This will probably be the most common usage:

```
from dataclasses import dataclass, KW_ONLY

@dataclass
class Point:
    x: float
    y: float
    _: KW_ONLY
    z: float = 0.0
    t: float = 0.0
```

Here, `z` and `t` are keyword-only parameters, while `x` and `y` are not. (Contributed by Eric V. Smith in [bpo-43532](https://bugs.python.org/issue?@action=redirect&bpo=43532) [https://bugs.python.org/issue?@action=redirect&bpo=43532].)

## distutils

The entire `distutils` package is deprecated, to be removed in Python 3.12. Its functionality for specifying package builds has already been completely replaced by third-party packages `setuptools` and `packaging`, and most other commonly used APIs are available elsewhere in the standard library (such as [platform](#), [shutil](#), [subprocess](#) or [sysconfig](#)). There are no plans to migrate any other functionality from `distutils`, and applications that are using other functions should plan to make private copies of the code. Refer to [PEP 632](#) [https://peps.python.org/pep-0632/] for discussion.

The `bdist_wininst` command deprecated in Python 3.8 has been

removed. The `bdist_wheel` command is now recommended to distribute binary packages on Windows. (Contributed by Victor Stinner in [bpo-42802](https://bugs.python.org/issue?@action=redirect&bpo=42802) [https://bugs.python.org/issue?@action=redirect&bpo=42802].)

## doctest

When a module does not define `__loader__`, fall back to `__spec__.loader`. (Contributed by Brett Cannon in [bpo-42133](https://bugs.python.org/issue?@action=redirect&bpo=42133) [https://bugs.python.org/issue?@action=redirect&bpo=42133].)

## encodings

`encodings.normalize_encoding()` now ignores non-ASCII characters. (Contributed by Hai Shi in [bpo-39337](https://bugs.python.org/issue?@action=redirect&bpo=39337) [https://bugs.python.org/issue?@action=redirect&bpo=39337].)

## enum

`Enum.__repr__()` now returns `enum_name.member_name` and `__str__()` now returns `member_name`. Stdlib enums available as module constants have a `repr()` of `module_name.member_name`. (Contributed by Ethan Furman in [bpo-40066](https://bugs.python.org/issue?@action=redirect&bpo=40066) [https://bugs.python.org/issue?@action=redirect&bpo=40066].)

Add `enum.StrEnum` for enums where all members are strings. (Contributed by Ethan Furman in [bpo-41816](https://bugs.python.org/issue?@action=redirect&bpo=41816) [https://bugs.python.org/issue?@action=redirect&bpo=41816].)

## fileinput

Add `encoding` and `errors` parameters in `fileinput.input()` and `fileinput.FileInput`. (Contributed by Inada Naoki in [bpo-43712](https://bugs.python.org/issue?@action=redirect&bpo=43712) [https://bugs.python.org/issue?@action=redirect&bpo=43712].)

`fileinput.hook_compressed()` now returns `TextIOWrapper` object when `mode` is “r” and file is compressed, like uncompressed files. (Contributed by Inada Naoki in [bpo-5758](https://bugs.python.org/issue?@action=redirect&bpo=5758) [https://bugs.python.org/issue?@action=redirect&bpo=5758].)

## faulthandler

The **faulthandler** module now detects if a fatal error occurs during a garbage collector collection. (Contributed by Victor Stinner in [bpo-44466](https://bugs.python.org/issue?@action=redirect&bpo=44466) [https://bugs.python.org/issue?@action=redirect&bpo=44466].)

## gc

Add audit hooks for **gc.get\_objects()**, **gc.get\_referrers()** and **gc.get\_referents()**. (Contributed by Pablo Galindo in [bpo-43439](https://bugs.python.org/issue?@action=redirect&bpo=43439) [https://bugs.python.org/issue?@action=redirect&bpo=43439].)

## glob

Add the *root\_dir* and *dir\_fd* parameters in **glob()** and **iglob()** which allow to specify the root directory for searching. (Contributed by Serhiy Storchaka in [bpo-38144](https://bugs.python.org/issue?@action=redirect&bpo=38144) [https://bugs.python.org/issue?@action=redirect&bpo=38144].)

## hashlib

The hashlib module requires OpenSSL 1.1.1 or newer. (Contributed by Christian Heimes in [PEP 644](https://peps.python.org/pep-0644/) [https://peps.python.org/pep-0644/] and [bpo-43669](https://bugs.python.org/issue?@action=redirect&bpo=43669) [https://bugs.python.org/issue?@action=redirect&bpo=43669].)

The hashlib module has preliminary support for OpenSSL 3.0.0. (Contributed by Christian Heimes in [bpo-38820](https://bugs.python.org/issue?@action=redirect&bpo=38820) [https://bugs.python.org/issue?@action=redirect&bpo=38820] and other issues.)

The pure-Python fallback of **pbkdf2\_hmac()** is deprecated. In the future PBKDF2-HMAC will only be available when Python has been built with OpenSSL support. (Contributed by Christian Heimes in [bpo-43880](https://bugs.python.org/issue?@action=redirect&bpo=43880) [https://bugs.python.org/issue?@action=redirect&bpo=43880].)

## hmac

The hmac module now uses OpenSSL's HMAC implementation internally. (Contributed by Christian Heimes in [bpo-40645](https://bugs.python.org/issue?@action=redirect&bpo=40645) [https://bugs.python.org/issue?@action=redirect&bpo=40645].)

## IDLE and idlelib

Make IDLE invoke `sys.excepthook()` (when started without ‘-n’). User hooks were previously ignored. (Contributed by Ken Hilton in [bpo-43008](https://bugs.python.org/issue?@action=redirect&bpo=43008) [https://bugs.python.org/issue?@action=redirect&bpo=43008].)

Rearrange the settings dialog. Split the General tab into Windows and Shell/Ed tabs. Move help sources, which extend the Help menu, to the Extensions tab. Make space for new options and shorten the dialog. The latter makes the dialog better fit small screens.

(Contributed by Terry Jan Reedy in [bpo-40468](https://bugs.python.org/issue?@action=redirect&bpo=40468) [https://bugs.python.org/issue?@action=redirect&bpo=40468].) Move the indent space setting from the Font tab to the new Windows tab. (Contributed by Mark Roseman and Terry Jan Reedy in [bpo-33962](https://bugs.python.org/issue?@action=redirect&bpo=33962) [https://bugs.python.org/issue?@action=redirect&bpo=33962].)

The changes above were backported to a 3.9 maintenance release.

Add a Shell sidebar. Move the primary prompt (‘> > >’) to the sidebar. Add secondary prompts (‘...’) to the sidebar. Left click and optional drag selects one or more lines of text, as with the editor line number sidebar. Right click after selecting text lines displays a context menu with ‘copy with prompts’. This zips together prompts from the sidebar with lines from the selected text. This option also appears on the context menu for the text. (Contributed by Tal Einat in [bpo-37903](https://bugs.python.org/issue?@action=redirect&bpo=37903) [https://bugs.python.org/issue?@action=redirect&bpo=37903].)

Use spaces instead of tabs to indent interactive code. This makes interactive code entries ‘look right’. Making this feasible was a major motivation for adding the shell sidebar. (Contributed by Terry Jan Reedy in [bpo-37892](https://bugs.python.org/issue?@action=redirect&bpo=37892) [https://bugs.python.org/issue?@action=redirect&bpo=37892].)

Highlight the new [soft keywords](#) `match`, `case`, and `_` in pattern-matching statements. However, this highlighting is not perfect and will be incorrect in some rare cases, including some `_`-s in `case` patterns. (Contributed by Tal Einat in [bpo-44010](https://bugs.python.org/issue?@action=redirect&bpo=44010) [https://bugs.python.org/issue?@action=redirect&bpo=44010].)

New in 3.10 maintenance releases.

Apply syntax highlighting to `.pyi` files. (Contributed by Alex Waygood and Terry Jan Reedy in [bpo-45447](https://bugs.python.org/issue?@action=redirect&bpo=45447) [https://bugs.python.org/issue?@action=redirect&bpo=45447].)

Include prompts when saving Shell with inputs and outputs. (Contributed by Terry Jan Reedy in [gh-95191](https://github.com/python/cpython/issues/95191) [https://github.com/python/cpython/issues/95191].)

## **importlib.metadata**

Feature parity with `importlib_metadata` 4.6 ([history](https://importlib-metadata.readthedocs.io/en/latest/history.html) [https://importlib-metadata.readthedocs.io/en/latest/history.html]).

[importlib.metadata entry points](#) now provide a nicer experience for selecting entry points by group and name through a new **`importlib.metadata.EntryPoints`** class. See the Compatibility Note in the docs for more info on the deprecation and usage.

Added **`importlib.metadata.packages_distributions()`** for resolving top-level Python modules and packages to their **`importlib.metadata.Distribution`**.

## **inspect**

When a module does not define `__loader__`, fall back to `__spec__.loader`. (Contributed by Brett Cannon in [bpo-42133](https://bugs.python.org/issue?@action=redirect&bpo=42133) [https://bugs.python.org/issue?@action=redirect&bpo=42133].)

Add [inspect.get\\_annotations\(\)](#), which safely computes the annotations defined on an object. It works around the quirks of accessing the annotations on various types of objects, and makes very few assumptions about the object it examines.

[inspect.get\\_annotations\(\)](#) can also correctly un-stringize stringized annotations. [inspect.get\\_annotations\(\)](#) is now considered best practice for accessing the annotations dict defined on any Python object; for more information on best practices for working with annotations, please see [Annotations Best Practices](#). Relatedly, [inspect.signature\(\)](#), [inspect.Signature.from\\_callable\(\)](#), and

`inspect.Signature.from_function()` now call `inspect.get_annotations()` to retrieve annotations. This means `inspect.signature()` and `inspect.Signature.from_callable()` can also now un-stringize stringized annotations. (Contributed by Larry Hastings in [bpo-43817](https://bugs.python.org/issue?@action=redirect&bpo=43817) [https://bugs.python.org/issue?@action=redirect&bpo=43817].)

## itertools

Add `itertools.pairwise()`. (Contributed by Raymond Hettinger in [bpo-38200](https://bugs.python.org/issue?@action=redirect&bpo=38200) [https://bugs.python.org/issue?@action=redirect&bpo=38200].)

## linecache

When a module does not define `__loader__`, fall back to `__spec__.loader`. (Contributed by Brett Cannon in [bpo-42133](https://bugs.python.org/issue?@action=redirect&bpo=42133) [https://bugs.python.org/issue?@action=redirect&bpo=42133].)

## os

Add `os.cpu_count()` support for VxWorks RTOS. (Contributed by Peixing Xin in [bpo-41440](https://bugs.python.org/issue?@action=redirect&bpo=41440) [https://bugs.python.org/issue?@action=redirect&bpo=41440].)

Add a new function `os.eventfd()` and related helpers to wrap the `eventfd2` syscall on Linux. (Contributed by Christian Heimes in [bpo-41001](https://bugs.python.org/issue?@action=redirect&bpo=41001) [https://bugs.python.org/issue?@action=redirect&bpo=41001].)

Add `os.splice()` that allows to move data between two file descriptors without copying between kernel address space and user address space, where one of the file descriptors must refer to a pipe. (Contributed by Pablo Galindo in [bpo-41625](https://bugs.python.org/issue?@action=redirect&bpo=41625) [https://bugs.python.org/issue?@action=redirect&bpo=41625].)

Add `O_EVTONLY`, `O_FSYNC`, `O_SYMLINK` and `O_NOFOLLOW_ANY` for macOS. (Contributed by Dong-hee Na in [bpo-43106](https://bugs.python.org/issue?@action=redirect&bpo=43106) [https://bugs.python.org/issue?@action=redirect&bpo=43106].)

## os.path

`os.path.realpath()` now accepts a *strict* keyword-only argument. When set to `True`, `OSError` is raised if a path doesn't exist or a symlink loop is encountered. (Contributed by Barney Gale in [bpo-43757](https://bugs.python.org/issue?@action=redirect&bpo=43757) [https://bugs.python.org/issue?@action=redirect&bpo=43757].)

## pathlib

Add slice support to `PurePath.parents`. (Contributed by Joshua Cannon in [bpo-35498](https://bugs.python.org/issue?@action=redirect&bpo=35498) [https://bugs.python.org/issue?@action=redirect&bpo=35498].)

Add negative indexing support to `PurePath.parents`. (Contributed by Yaroslav Pankovych in [bpo-21041](https://bugs.python.org/issue?@action=redirect&bpo=21041) [https://bugs.python.org/issue?@action=redirect&bpo=21041].)

Add `Path.hardlink_to` method that supersedes `link_to()`. The new method has the same argument order as `symlink_to()`. (Contributed by Barney Gale in [bpo-39950](https://bugs.python.org/issue?@action=redirect&bpo=39950) [https://bugs.python.org/issue?@action=redirect&bpo=39950].)

`pathlib.Path.stat()` and `chmod()` now accept a *follow\_symlinks* keyword-only argument for consistency with corresponding functions in the `os` module. (Contributed by Barney Gale in [bpo-39906](https://bugs.python.org/issue?@action=redirect&bpo=39906) [https://bugs.python.org/issue?@action=redirect&bpo=39906].)

## platform

Add `platform.freedesktop_os_release()` to retrieve operation system identification from [freedesktop.org os-release](https://www.freedesktop.org/software/systemd/man/os-release.html) [https://www.freedesktop.org/software/systemd/man/os-release.html] standard file. (Contributed by Christian Heimes in [bpo-28468](https://bugs.python.org/issue?@action=redirect&bpo=28468) [https://bugs.python.org/issue?@action=redirect&bpo=28468].)

## pprint

`pprint.pprint()` now accepts a new `underscore_numbers` keyword argument. (Contributed by sblondon in [bpo-42914](https://bugs.python.org/issue?@action=redirect&bpo=42914) [https://bugs.python.org/issue?@action=redirect&bpo=42914].)

**pprint** can now pretty-print **dataclasses.dataclass** instances. (Contributed by Lewis Gaul in [bpo-43080](https://bugs.python.org/issue?@action=redirect&bpo=43080) [https://bugs.python.org/issue?@action=redirect&bpo=43080].)

## py\_compile

Add `--quiet` option to command-line interface of **py\_compile**. (Contributed by Gregory Schevchenko in [bpo-38731](https://bugs.python.org/issue?@action=redirect&bpo=38731) [https://bugs.python.org/issue?@action=redirect&bpo=38731].)

## pyclbr

Add an `end_lineno` attribute to the `Function` and `Class` objects in the tree returned by **pyclbr.readline()** and **pyclbr.readline\_ex()**. It matches the existing (start) `lineno`. (Contributed by Aviral Srivastava in [bpo-38307](https://bugs.python.org/issue?@action=redirect&bpo=38307) [https://bugs.python.org/issue?@action=redirect&bpo=38307].)

## shelve

The **shelve** module now uses **pickle.DEFAULT\_PROTOCOL** by default instead of **pickle** protocol 3 when creating shelves. (Contributed by Zackery Spytz in [bpo-34204](https://bugs.python.org/issue?@action=redirect&bpo=34204) [https://bugs.python.org/issue?@action=redirect&bpo=34204].)

## statistics

Add **covariance()**, Pearson's **correlation()**, and simple **linear\_regression()** functions. (Contributed by Tymoteusz Wołodźko in [bpo-38490](https://bugs.python.org/issue?@action=redirect&bpo=38490) [https://bugs.python.org/issue?@action=redirect&bpo=38490].)

## site

When a module does not define `__loader__`, fall back to `__spec__.loader`. (Contributed by Brett Cannon in [bpo-42133](https://bugs.python.org/issue?@action=redirect&bpo=42133) [https://bugs.python.org/issue?@action=redirect&bpo=42133].)

## socket

The exception `socket.timeout` is now an alias of `TimeoutError`. (Contributed by Christian Heimes in [bpo-42413](https://bugs.python.org/issue?@action=redirect&bpo=42413) [<https://bugs.python.org/issue?@action=redirect&bpo=42413>].)

Add option to create MPTCP sockets with `IPPROTO_MPTCP` (Contributed by Rui Cunha in [bpo-43571](https://bugs.python.org/issue?@action=redirect&bpo=43571) [<https://bugs.python.org/issue?@action=redirect&bpo=43571>].)

Add `IP_RECVTOS` option to receive the type of service (ToS) or DSCP/ECN fields (Contributed by Georg Sauthoff in [bpo-44077](https://bugs.python.org/issue?@action=redirect&bpo=44077) [<https://bugs.python.org/issue?@action=redirect&bpo=44077>].)

## ssl

The `ssl` module requires OpenSSL 1.1.1 or newer. (Contributed by Christian Heimes in [PEP 644](https://peps.python.org/pep-0644/) [<https://peps.python.org/pep-0644/>] and [bpo-43669](https://bugs.python.org/issue?@action=redirect&bpo=43669) [<https://bugs.python.org/issue?@action=redirect&bpo=43669>].)

The `ssl` module has preliminary support for OpenSSL 3.0.0 and new option `OP_IGNORE_UNEXPECTED_EOF`. (Contributed by Christian Heimes in [bpo-38820](https://bugs.python.org/issue?@action=redirect&bpo=38820) [<https://bugs.python.org/issue?@action=redirect&bpo=38820>], [bpo-43794](https://bugs.python.org/issue?@action=redirect&bpo=43794) [<https://bugs.python.org/issue?@action=redirect&bpo=43794>], [bpo-43788](https://bugs.python.org/issue?@action=redirect&bpo=43788) [<https://bugs.python.org/issue?@action=redirect&bpo=43788>], [bpo-43791](https://bugs.python.org/issue?@action=redirect&bpo=43791) [<https://bugs.python.org/issue?@action=redirect&bpo=43791>], [bpo-43799](https://bugs.python.org/issue?@action=redirect&bpo=43799) [<https://bugs.python.org/issue?@action=redirect&bpo=43799>], [bpo-43799](https://bugs.python.org/issue?@action=redirect&bpo=43799), [bpo-43920](https://bugs.python.org/issue?@action=redirect&bpo=43920) [<https://bugs.python.org/issue?@action=redirect&bpo=43920>], [bpo-43789](https://bugs.python.org/issue?@action=redirect&bpo=43789) [<https://bugs.python.org/issue?@action=redirect&bpo=43789>], and [bpo-43811](https://bugs.python.org/issue?@action=redirect&bpo=43811) [<https://bugs.python.org/issue?@action=redirect&bpo=43811>].)

Deprecated function and use of deprecated constants now result in a `DeprecationWarning`. `ssl.SSLContext.options` has `OP_NO_SSLv2` and `OP_NO_SSLv3` set by default and therefore cannot warn about setting the flag again. The [deprecation section](#) has a list of deprecated features. (Contributed by Christian Heimes in [bpo-43880](https://bugs.python.org/issue?@action=redirect&bpo=43880) [<https://bugs.python.org/issue?@action=redirect&bpo=43880>].)

The `ssl` module now has more secure default settings. Ciphers without forward secrecy or SHA-1 MAC are disabled by default. Security level 2 prohibits weak RSA, DH, and ECC keys with less than 112 bits of security. `SSLContext` defaults to minimum

protocol version TLS 1.2. Settings are based on Hynek Schlawack's research. (Contributed by Christian Heimes in [bpo-43998](https://bugs.python.org/issue?@action=redirect&bpo=43998) [https://bugs.python.org/issue?@action=redirect&bpo=43998].)

The deprecated protocols SSL 3.0, TLS 1.0, and TLS 1.1 are no longer officially supported. Python does not block them actively. However OpenSSL build options, distro configurations, vendor patches, and cipher suites may prevent a successful handshake.

Add a *timeout* parameter to the `ssl.get_server_certificate()` function. (Contributed by Zackery Spytz in [bpo-31870](https://bugs.python.org/issue?@action=redirect&bpo=31870) [https://bugs.python.org/issue?@action=redirect&bpo=31870].)

The `ssl` module uses heap-types and multi-phase initialization. (Contributed by Christian Heimes in [bpo-42333](https://bugs.python.org/issue?@action=redirect&bpo=42333) [https://bugs.python.org/issue?@action=redirect&bpo=42333].)

A new verify flag `VERIFY_X509_PARTIAL_CHAIN` has been added. (Contributed by l0x in [bpo-40849](https://bugs.python.org/issue?@action=redirect&bpo=40849) [https://bugs.python.org/issue?@action=redirect&bpo=40849].)

## sqlite3

Add audit events for `connect/handle()`, `enable_load_extension()`, and `load_extension()`. (Contributed by Erlend E. Aasland in [bpo-43762](https://bugs.python.org/issue?@action=redirect&bpo=43762) [https://bugs.python.org/issue?@action=redirect&bpo=43762].)

## sys

Add `sys.orig_argv` attribute: the list of the original command line arguments passed to the Python executable. (Contributed by Victor Stinner in [bpo-23427](https://bugs.python.org/issue?@action=redirect&bpo=23427) [https://bugs.python.org/issue?@action=redirect&bpo=23427].)

Add `sys.stdlib_module_names`, containing the list of the standard library module names. (Contributed by Victor Stinner in [bpo-42955](https://bugs.python.org/issue?@action=redirect&bpo=42955) [https://bugs.python.org/issue?@action=redirect&bpo=42955].)

## **`_thread`**

`_thread.interrupt_main()` now takes an optional signal number to simulate (the default is still `signal.SIGINT`). (Contributed by Antoine Pitrou in [bpo-43356](https://bugs.python.org/issue?@action=redirect&bpo=43356) [https://bugs.python.org/issue?@action=redirect&bpo=43356].)

## **`threading`**

Add `threading.gettrace()` and `threading.getprofile()` to retrieve the functions set by `threading.settrace()` and `threading.setprofile()` respectively. (Contributed by Mario Corchero in [bpo-42251](https://bugs.python.org/issue?@action=redirect&bpo=42251) [https://bugs.python.org/issue?@action=redirect&bpo=42251].)

Add `threading.__excepthook__` to allow retrieving the original value of `threading.excepthook()` in case it is set to a broken or a different value. (Contributed by Mario Corchero in [bpo-42308](https://bugs.python.org/issue?@action=redirect&bpo=42308) [https://bugs.python.org/issue?@action=redirect&bpo=42308].)

## **`traceback`**

The `format_exception()`, `format_exception_only()`, and `print_exception()` functions can now take an exception object as a positional-only argument. (Contributed by Zackery Spytz and Matthias Bussonnier in [bpo-26389](https://bugs.python.org/issue?@action=redirect&bpo=26389) [https://bugs.python.org/issue?@action=redirect&bpo=26389].)

## **`types`**

Reintroduce the `types.EllipsisType`, `types.NoneType` and `types.NotImplementedType` classes, providing a new set of types readily interpretable by type checkers. (Contributed by Bas van Beek in [bpo-41810](https://bugs.python.org/issue?@action=redirect&bpo=41810) [https://bugs.python.org/issue?@action=redirect&bpo=41810].)

## **`typing`**

For major changes, see [New Features Related to Type Hints](#).

The behavior of `typing.Literal` was changed to conform with [PEP 586](https://peps.python.org/pep-0586/) [https://peps.python.org/pep-0586/] and to match the behavior of static type checkers specified in the PEP.

1. `Literal` now de-duplicates parameters.
2. Equality comparisons between `Literal` objects are now order independent.
3. `Literal` comparisons now respect types. For example, `Literal[0] == Literal[False]` previously evaluated to `True`. It is now `False`. To support this change, the internally used type cache now supports differentiating types.
4. `Literal` objects will now raise a `TypeError` exception during equality comparisons if any of their parameters are not `hashable`. Note that declaring `Literal` with unhashable parameters will not throw an error:

```
>>> from typing import Literal
>>> Literal[{0}]
>>> Literal[{0}] == Literal[{False}]
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
TypeError: unhashable type: 'set'
```

(Contributed by Yurii Karabas in [bpo-42345](https://bugs.python.org/issue?@action=redirect&bpo=42345) [https://bugs.python.org/issue?@action=redirect&bpo=42345].)

Add new function `typing.is_typeddict()` to introspect if an annotation is a `typing.TypedDict`. (Contributed by Patrick Reader in [bpo-41792](https://bugs.python.org/issue?@action=redirect&bpo=41792) [https://bugs.python.org/issue?@action=redirect&bpo=41792].)

Subclasses of `typing.Protocol` which only have data variables declared will now raise a `TypeError` when checked with `isinstance` unless they are decorated with `runtime_checkable()`. Previously, these checks passed silently. Users should decorate their subclasses with the `runtime_checkable()` decorator if they want runtime protocols. (Contributed by Yurii Karabas in [bpo-38908](https://bugs.python.org/) [https://bugs.python.org/])

issue?@action=redirect&bpo=38908].)

Importing from the `typing.io` and `typing.re` submodules will now emit `DeprecationWarning`. These submodules have been deprecated since Python 3.8 and will be removed in a future version of Python. Anything belonging to those submodules should be imported directly from `typing` instead. (Contributed by Sebastian Rittau in [bpo-38291](https://bugs.python.org/issue?@action=redirect&bpo=38291) [https://bugs.python.org/issue?@action=redirect&bpo=38291].)

## unittest

Add new method `assertNoLogs()` to complement the existing `assertLogs()`. (Contributed by Kit Yan Choi in [bpo-39385](https://bugs.python.org/issue?@action=redirect&bpo=39385) [https://bugs.python.org/issue?@action=redirect&bpo=39385].)

## urllib.parse

Python versions earlier than Python 3.10 allowed using both `;` and `&` as query parameter separators in `urllib.parse.parse_qs()` and `urllib.parse.parse_qsl()`. Due to security concerns, and to conform with newer W3C recommendations, this has been changed to allow only a single separator key, with `&` as the default. This change also affects `cgi.parse()` and `cgi.parse_multipart()` as they use the affected functions internally. For more details, please see their respective documentation. (Contributed by Adam Goldschmidt, Senthil Kumaran and Ken Jin in [bpo-42967](https://bugs.python.org/issue?@action=redirect&bpo=42967) [https://bugs.python.org/issue?@action=redirect&bpo=42967].)

## xml

Add a `LexicalHandler` class to the `xml.sax.handler` module. (Contributed by Jonathan Gossage and Zackery Spytz in [bpo-35018](https://bugs.python.org/issue?@action=redirect&bpo=35018) [https://bugs.python.org/issue?@action=redirect&bpo=35018].)

## zipimport

Add methods related to [PEP 451](https://peps.python.org/pep-0451/) [https://peps.python.org/pep-0451/]: `find_spec()`, `zipimport.zipimporter.create_module()`,

and `zipimport.zipimporter.exec_module()`. (Contributed by Brett Cannon in [bpo-42131](https://bugs.python.org/issue?@action=redirect&bpo=42131) [https://bugs.python.org/issue?@action=redirect&bpo=42131].)

Add `invalidate_caches()` method. (Contributed by Desmond Cheong in [bpo-14678](https://bugs.python.org/issue?@action=redirect&bpo=14678) [https://bugs.python.org/issue?@action=redirect&bpo=14678].)

## Optimizations

- Constructors `str()`, `bytes()` and `bytearray()` are now faster (around 30–40% for small objects). (Contributed by Serhiy Storchaka in [bpo-41334](https://bugs.python.org/issue?@action=redirect&bpo=41334) [https://bugs.python.org/issue?@action=redirect&bpo=41334].)
- The `runpy` module now imports fewer modules. The `python3 -m module-name` command startup time is 1.4x faster in average. On Linux, `python3 -I -m module-name` imports 69 modules on Python 3.9, whereas it only imports 51 modules (-18) on Python 3.10. (Contributed by Victor Stinner in [bpo-41006](https://bugs.python.org/issue?@action=redirect&bpo=41006) [https://bugs.python.org/issue?@action=redirect&bpo=41006] and [bpo-41718](https://bugs.python.org/issue?@action=redirect&bpo=41718) [https://bugs.python.org/issue?@action=redirect&bpo=41718].)
- The `LOAD_ATTR` instruction now uses new “per opcode cache” mechanism. It is about 36% faster now for regular attributes and 44% faster for slots. (Contributed by Pablo Galindo and Yury Selivanov in [bpo-42093](https://bugs.python.org/issue?@action=redirect&bpo=42093) [https://bugs.python.org/issue?@action=redirect&bpo=42093] and Guido van Rossum in [bpo-42927](https://bugs.python.org/issue?@action=redirect&bpo=42927) [https://bugs.python.org/issue?@action=redirect&bpo=42927], based on ideas implemented originally in PyPy and MicroPython.)
- When building Python with `--enable-optimizations` now `-fno-semantic-interposition` is added to both the compile and link line. This speeds builds of the Python interpreter created with `--enable-shared` with `gcc` by up to 30%. See [this article](https://developers.redhat.com/blog/2020/06/25/red-hat-enterprise-linux-8-2-brings-faster-python-3-8-run-speeds/) [https://developers.redhat.com/blog/2020/06/25/red-hat-enterprise-linux-8-2-brings-faster-python-3-8-run-speeds/] for more details. (Contributed by Victor Stinner and Pablo Galindo in [bpo-38980](https://bugs.python.org/issue?@action=redirect&bpo=38980) [https://bugs.python.org/issue?@action=redirect&bpo=38980].)
- Use a new output buffer management code for `bz2` / `lzma` /

**zlib** modules, and add `.readall()` function to `_compression.DecompressReader` class. **bz2** decompression is now 1.09x ~ 1.17x faster, **lzma** decompression 1.20x ~ 1.32x faster, `GzipFile.read(-1)` 1.11x ~ 1.18x faster. (Contributed by Ma Lin, reviewed by Gregory P. Smith, in [bpo-41486](https://bugs.python.org/issue?@action=redirect&bpo=41486) [https://bugs.python.org/issue?@action=redirect&bpo=41486])

- When using stringized annotations, annotations dicts for functions are no longer created when the function is created. Instead, they are stored as a tuple of strings, and the function object lazily converts this into the annotations dict on demand. This optimization cuts the CPU time needed to define an annotated function by half. (Contributed by Yurii Karabas and Inada Naoki in [bpo-42202](https://bugs.python.org/issue?@action=redirect&bpo=42202) [https://bugs.python.org/issue?@action=redirect&bpo=42202].)
- Substring search functions such as `str1 in str2` and `str2.find(str1)` now sometimes use Crochemore & Perrin's "Two-Way" string searching algorithm to avoid quadratic behavior on long strings. (Contributed by Dennis Sweeney in [bpo-41972](https://bugs.python.org/issue?@action=redirect&bpo=41972) [https://bugs.python.org/issue?@action=redirect&bpo=41972])
- Add micro-optimizations to `_PyType_Lookup()` to improve type attribute cache lookup performance in the common case of cache hits. This makes the interpreter 1.04 times faster on average. (Contributed by Dino Viehland in [bpo-43452](https://bugs.python.org/issue?@action=redirect&bpo=43452) [https://bugs.python.org/issue?@action=redirect&bpo=43452].)
- The following built-in functions now support the faster [PEP 590](https://peps.python.org/pep-0590/) [https://peps.python.org/pep-0590/] `vectorcall` calling convention: `map()`, `filter()`, `reversed()`, `bool()` and `float()`. (Contributed by Dong-hee Na and Jeroen Demeyer in [bpo-43575](https://bugs.python.org/issue?@action=redirect&bpo=43575) [https://bugs.python.org/issue?@action=redirect&bpo=43575], [bpo-43287](https://bugs.python.org/issue?@action=redirect&bpo=43287) [https://bugs.python.org/issue?@action=redirect&bpo=43287], [bpo-41922](https://bugs.python.org/issue?@action=redirect&bpo=41922) [https://bugs.python.org/issue?@action=redirect&bpo=41922], [bpo-41873](https://bugs.python.org/issue?@action=redirect&bpo=41873) [https://bugs.python.org/issue?@action=redirect&bpo=41873] and [bpo-41870](https://bugs.python.org/issue?@action=redirect&bpo=41870) [https://bugs.python.org/issue?@action=redirect&bpo=41870].)
- **BZ2File** performance is improved by removing internal `RLock`. This makes **BZ2File** thread unsafe in the face of multiple simultaneous readers or writers, just like its

equivalent classes in [gzip](#) and [lzma](#) have always been. (Contributed by Inada Naoki in [bpo-43785](#) [<https://bugs.python.org/issue?@action=redirect&bpo=43785>].)

## Deprecated

- Currently Python accepts numeric literals immediately followed by keywords, for example `0in x, 1or x, 0if 1else 2`. It allows confusing and ambiguous expressions like `[0x1for x in y]` (which can be interpreted as `[0x1 for x in y]` or `[0x1f or x in y]`). Starting in this release, a deprecation warning is raised if the numeric literal is immediately followed by one of keywords [and](#), [else](#), [for](#), [if](#), [in](#), [is](#) and [or](#). In future releases it will be changed to syntax warning, and finally to syntax error. (Contributed by Serhiy Storchaka in [bpo-43833](#) [<https://bugs.python.org/issue?@action=redirect&bpo=43833>].)
- Starting in this release, there will be a concerted effort to begin cleaning up old import semantics that were kept for Python 2.7 compatibility. Specifically, [find\\_loader\(\)](#) / [find\\_module\(\)](#) (superseded by [find\\_spec\(\)](#)), [load\\_module\(\)](#) (superseded by [exec\\_module\(\)](#)), [module\\_repr\(\)](#) (which the import system takes care of for you), the `__package__` attribute (superseded by `__spec__.parent`), the `__loader__` attribute (superseded by `__spec__.loader`), and the `__cached__` attribute (superseded by `__spec__.cached`) will slowly be removed (as well as other classes and methods in [importlib](#)). [ImportWarning](#) and/or [DeprecationWarning](#) will be raised as appropriate to help identify code which needs updating during this transition.
- The entire `distutils` namespace is deprecated, to be removed in Python 3.12. Refer to the [module changes](#) section for more information.
- Non-integer arguments to [random.randrange\(\)](#) are deprecated. The [ValueError](#) is deprecated in favor of a [TypeError](#). (Contributed by Serhiy Storchaka and Raymond

Hettinger in [bpo-37319](https://bugs.python.org/issue?@action=redirect&bpo=37319) [https://bugs.python.org/issue?@action=redirect&bpo=37319].)

- The various `load_module()` methods of `importlib` have been documented as deprecated since Python 3.6, but will now also trigger a `DeprecationWarning`. Use `exec_module()` instead. (Contributed by Brett Cannon in [bpo-26131](https://bugs.python.org/issue?@action=redirect&bpo=26131) [https://bugs.python.org/issue?@action=redirect&bpo=26131].)
- `zimport.zipimporter.load_module()` has been deprecated in preference for `exec_module()`. (Contributed by Brett Cannon in [bpo-26131](https://bugs.python.org/issue?@action=redirect&bpo=26131) [https://bugs.python.org/issue?@action=redirect&bpo=26131].)
- The use of `load_module()` by the import system now triggers an `ImportWarning` as `exec_module()` is preferred. (Contributed by Brett Cannon in [bpo-26131](https://bugs.python.org/issue?@action=redirect&bpo=26131) [https://bugs.python.org/issue?@action=redirect&bpo=26131].)
- The use of `importlib.abc.MetaPathFinder.find_module()` and `importlib.abc.PathEntryFinder.find_module()` by the import system now trigger an `ImportWarning` as `importlib.abc.MetaPathFinder.find_spec()` and `importlib.abc.PathEntryFinder.find_spec()` are preferred, respectively. You can use `importlib.util.spec_from_loader()` to help in porting. (Contributed by Brett Cannon in [bpo-42134](https://bugs.python.org/issue?@action=redirect&bpo=42134) [https://bugs.python.org/issue?@action=redirect&bpo=42134].)
- The use of `importlib.abc.PathEntryFinder.find_loader()` by the import system now triggers an `ImportWarning` as `importlib.abc.PathEntryFinder.find_spec()` is preferred. You can use `importlib.util.spec_from_loader()` to help in porting. (Contributed by Brett Cannon in [bpo-43672](https://bugs.python.org/issue?@action=redirect&bpo=43672) [https://bugs.python.org/issue?@action=redirect&bpo=43672].)
- The various implementations of

```
importlib.abc.MetaPathFinder.find_module() (
importlib.machinery.BuiltinImporter.find_module(),
importlib.machinery.FrozenImporter.find_module(),
importlib.machinery.WindowsRegistryFinder.find_modu
importlib.machinery.PathFinder.find_module(),
importlib.abc.MetaPathFinder.find_module() ),
importlib.abc.PathEntryFinder.find_module() (
importlib.machinery.FileFinder.find_module() ),
and
```

```
importlib.abc.PathEntryFinder.find_loader() (
importlib.machinery.FileFinder.find_loader() )
now raise DeprecationWarning and are slated for
removal in Python 3.12 (previously they were documented as
deprecated in Python 3.4). (Contributed by Brett Cannon in
bpo-42135 [https://bugs.python.org/issue?
@action=redirect&bpo=42135].)
```

- **importlib.abc.Finder** is deprecated (including its sole method, **find\_module()**). Both **importlib.abc.MetaPathFinder** and **importlib.abc.PathEntryFinder** no longer inherit from the class. Users should inherit from one of these two classes as appropriate instead. (Contributed by Brett Cannon in **bpo-42135** [[https://bugs.python.org/issue?](https://bugs.python.org/issue?@action=redirect&bpo=42135) @action=redirect&bpo=42135].)
- The deprecations of **imp**, **importlib.find\_loader()**, **importlib.util.set\_package\_wrapper()**, **importlib.util.set\_loader\_wrapper()**, **importlib.util.module\_for\_loader()**, **pkgutil.ImpImporter**, and **pkgutil.ImpLoader** have all been updated to list Python 3.12 as the slated version of removal (they began raising **DeprecationWarning** in previous versions of Python). (Contributed by Brett Cannon in **bpo-43720** [[https://bugs.python.org/issue?](https://bugs.python.org/issue?@action=redirect&bpo=43720) @action=redirect&bpo=43720].)
- The import system now uses the **\_\_spec\_\_** attribute on modules before falling back on **module\_repr()** for a module's **\_\_repr\_\_()** method. Removal of the use of

`module_repr()` is scheduled for Python 3.12. (Contributed by Brett Cannon in [bpo-42137](https://bugs.python.org/issue?@action=redirect&bpo=42137) [https://bugs.python.org/issue?@action=redirect&bpo=42137].)

- `importlib.abc.Loader.module_repr()`, `importlib.machinery.FrozenLoader.module_repr()`, and `importlib.machinery.BuiltinLoader.module_repr()` are deprecated and slated for removal in Python 3.12. (Contributed by Brett Cannon in [bpo-42136](https://bugs.python.org/issue?@action=redirect&bpo=42136) [https://bugs.python.org/issue?@action=redirect&bpo=42136].)
- `sqlite3.OptimizedUnicode` has been undocumented and obsolete since Python 3.3, when it was made an alias to `str`. It is now deprecated, scheduled for removal in Python 3.12. (Contributed by Erlend E. Aasland in [bpo-42264](https://bugs.python.org/issue?@action=redirect&bpo=42264) [https://bugs.python.org/issue?@action=redirect&bpo=42264].)
- The undocumented built-in function `sqlite3.enable_shared_cache` is now deprecated, scheduled for removal in Python 3.12. Its use is strongly discouraged by the SQLite3 documentation. See [the SQLite3 docs](https://sqlite.org/c3ref/enable_shared_cache.html) [https://sqlite.org/c3ref/enable\_shared\_cache.html] for more details. If a shared cache must be used, open the database in URI mode using the `cache=shared` query parameter. (Contributed by Erlend E. Aasland in [bpo-24464](https://bugs.python.org/issue?@action=redirect&bpo=24464) [https://bugs.python.org/issue?@action=redirect&bpo=24464].)
- The following threading methods are now deprecated:
  - `threading.currentThread => threading.current\_thread\(\)`
  - `threading.activeCount => threading.active\_count\(\)`
  - `threading.Condition.notifyAll => threading.Condition.notify\_all\(\)`
  - `threading.Event.isSet => threading.Event.is\_set\(\)`
  - `threading.Thread.setName => threading.Thread.name`
  - `threading.thread.getName =>`

- `threading.Thread.name`
- `threading.Thread.isDaemon = >`  
`threading.Thread.daemon`
- `threading.Thread.setDaemon = >`  
`threading.Thread.daemon`

(Contributed by Jelle Zijlstra in [gh-87889](https://github.com/python/cpython/issues/87889) [https://github.com/python/cpython/issues/87889].)

- `pathlib.Path.link_to()` is deprecated and slated for removal in Python 3.12. Use `pathlib.Path.hardlink_to()` instead. (Contributed by Barney Gale in [bpo-39950](https://bugs.python.org/issue?@action=redirect&bpo=39950) [https://bugs.python.org/issue?@action=redirect&bpo=39950].)
- `cgi.log()` is deprecated and slated for removal in Python 3.12. (Contributed by Inada Naoki in [bpo-41139](https://bugs.python.org/issue?@action=redirect&bpo=41139) [https://bugs.python.org/issue?@action=redirect&bpo=41139].)
- The following `ssl` features have been deprecated since Python 3.6, Python 3.7, or OpenSSL 1.1.0 and will be removed in 3.11:
  - `OP_NO_SSLv2`, `OP_NO_SSLv3`, `OP_NO_TLSv1`, `OP_NO_TLSv1_1`, `OP_NO_TLSv1_2`, and `OP_NO_TLSv1_3` are replaced by `ssl.SSLContext.minimum_version` and `ssl.SSLContext.maximum_version`.
  - `PROTOCOL_SSLv2`, `PROTOCOL_SSLv3`, `PROTOCOL_SSLv23`, `PROTOCOL_TLSv1`, `PROTOCOL_TLSv1_1`, `PROTOCOL_TLSv1_2`, and `PROTOCOL_TLS` are deprecated in favor of `PROTOCOL_TLS_CLIENT` and `PROTOCOL_TLS_SERVER`
  - `wrap_socket()` is replaced by `ssl.SSLContext.wrap_socket()`
  - `match_hostname()`
  - `RAND_pseudo_bytes()`, `RAND_egd()`
  - NPN features like `ssl.SSLSocket.selected_npn_protocol()` and `ssl.SSLContext.set_npn_protocols()` are

replaced by ALPN.

- The threading debug (`PYTHONTHREADDEBUG` environment variable) is deprecated in Python 3.10 and will be removed in Python 3.12. This feature requires a [debug build of Python](#). (Contributed by Victor Stinner in [bpo-44584](#) [<https://bugs.python.org/issue?@action=redirect&bpo=44584>].)
- Importing from the `typing.io` and `typing.re` submodules will now emit `DeprecationWarning`. These submodules will be removed in a future version of Python. Anything belonging to these submodules should be imported directly from `typing` instead. (Contributed by Sebastian Rittau in [bpo-38291](#) [<https://bugs.python.org/issue?@action=redirect&bpo=38291>].)

## Removed

- Removed special methods `__int__`, `__float__`, `__floordiv__`, `__mod__`, `__divmod__`, `__rfloordiv__`, `__rmod__` and `__rdivmod__` of the `complex` class. They always raised a `TypeError`. (Contributed by Serhiy Storchaka in [bpo-41974](#) [<https://bugs.python.org/issue?@action=redirect&bpo=41974>].)
- The `ParserBase.error()` method from the private and undocumented `_markupbase` module has been removed. `html.parser.HTMLParser` is the only subclass of `ParserBase` and its `error()` implementation was already removed in Python 3.5. (Contributed by Berker Peksag in [bpo-31844](#) [<https://bugs.python.org/issue?@action=redirect&bpo=31844>].)
- Removed the `unicodedata.ucnhash_CAPI` attribute which was an internal PyCapsule object. The related private `_PyUnicode_Name_CAPI` structure was moved to the internal C API. (Contributed by Victor Stinner in [bpo-42157](#) [<https://bugs.python.org/issue?@action=redirect&bpo=42157>].)
- Removed the `parser` module, which was deprecated in 3.9

due to the switch to the new PEG parser, as well as all the C source and header files that were only being used by the old parser, including `node.h`, `parser.h`, `graminit.h` and `grammar.h`.

- Removed the Public C API functions `PyParser_SimpleParseStringFlags`, `PyParser_SimpleParseStringFlagsFilename`, `PyParser_SimpleParseFileFlags` and `PyNode_Compile` that were deprecated in 3.9 due to the switch to the new PEG parser.
- Removed the `formatter` module, which was deprecated in Python 3.4. It is somewhat obsolete, little used, and not tested. It was originally scheduled to be removed in Python 3.6, but such removals were delayed until after Python 2.7 EOL. Existing users should copy whatever classes they use into their code. (Contributed by Dong-hee Na and Terry J. Reedy in [bpo-42299](https://bugs.python.org/issue?@action=redirect&bpo=42299) [https://bugs.python.org/issue?@action=redirect&bpo=42299].)
- Removed the `PyModule_GetWarningsModule()` function that was useless now due to the `_warnings` module was converted to a builtin module in 2.6. (Contributed by Hai Shi in [bpo-42599](https://bugs.python.org/issue?@action=redirect&bpo=42599) [https://bugs.python.org/issue?@action=redirect&bpo=42599].)
- Remove deprecated aliases to [Collections Abstract Base Classes](#) from the `collections` module. (Contributed by Victor Stinner in [bpo-37324](https://bugs.python.org/issue?@action=redirect&bpo=37324) [https://bugs.python.org/issue?@action=redirect&bpo=37324].)
- The `loop` parameter has been removed from most of [asyncio](#)'s [high-level API](#) following deprecation in Python 3.8. The motivation behind this change is multifold:
  1. This simplifies the high-level API.
  2. The functions in the high-level API have been implicitly getting the current thread's running event loop since Python 3.7. There isn't a need to pass the event loop to the API in most normal use cases.

3. Event loop passing is error-prone especially when dealing with loops running in different threads.

Note that the low-level API will still accept `loop`. See [Changes in the Python API](#) for examples of how to replace existing code.

(Contributed by Yurii Karabas, Andrew Svetlov, Yury Selivanov and Kyle Stanley in [bpo-42392](#) [<https://bugs.python.org/issue/?@action=redirect&bpo=42392>].)

## Porting to Python 3.10

This section lists previously described changes and other bugfixes that may require changes to your code.

### Changes in the Python syntax

- Deprecation warning is now emitted when compiling previously valid syntax if the numeric literal is immediately followed by a keyword (like in `0in x`). In future releases it will be changed to syntax warning, and finally to a syntax error. To get rid of the warning and make the code compatible with future releases just add a space between the numeric literal and the following keyword. (Contributed by Serhiy Storchaka in [bpo-43833](#) [<https://bugs.python.org/issue/?@action=redirect&bpo=43833>].)

### Changes in the Python API

- The *etype* parameters of the [format\\_exception\(\)](#), [format\\_exception\\_only\(\)](#), and [print\\_exception\(\)](#) functions in the [traceback](#) module have been renamed to *exc*. (Contributed by Zackery Spytz and Matthias Bussonnier in [bpo-26389](#) [<https://bugs.python.org/issue/?@action=redirect&bpo=26389>].)
- [atexit](#): At Python exit, if a callback registered with [atexit.register\(\)](#) fails, its exception is now logged. Previously, only some exceptions were logged, and the last

exception was always silently ignored. (Contributed by Victor Stinner in [bpo-42639](https://bugs.python.org/issue?@action=redirect&bpo=42639) [https://bugs.python.org/issue?@action=redirect&bpo=42639].)

- `collections.abc.Callable` generic now flattens type parameters, similar to what `typing.Callable` currently does. This means that `collections.abc.Callable[[int, str], str]` will have `__args__` of `(int, str, str)`; previously this was `([int, str], str)`. Code which accesses the arguments via `typing.get_args()` or `__args__` need to account for this change. Furthermore, `TypeError` may be raised for invalid forms of parameterizing `collections.abc.Callable` which may have passed silently in Python 3.9. (Contributed by Ken Jin in [bpo-42195](https://bugs.python.org/issue?@action=redirect&bpo=42195) [https://bugs.python.org/issue?@action=redirect&bpo=42195].)
- `socket.htons()` and `socket.ntohs()` now raise `OverflowError` instead of `DeprecationWarning` if the given parameter will not fit in a 16-bit unsigned integer. (Contributed by Erlend E. Aasland in [bpo-42393](https://bugs.python.org/issue?@action=redirect&bpo=42393) [https://bugs.python.org/issue?@action=redirect&bpo=42393].)
- The `loop` parameter has been removed from most of `asyncio`'s [high-level API](#) following deprecation in Python 3.8.

A coroutine that currently looks like this:

```
async def foo(loop):  
    await asyncio.sleep(1, loop=loop)
```

Should be replaced with this:

```
async def foo():  
    await asyncio.sleep(1)
```

If `foo()` was specifically designed *not* to run in the current thread's running event loop (e.g. running in another thread's event loop), consider using `asyncio.run_coroutine_threadsafe()` instead.

(Contributed by Yurii Karabas, Andrew Svetlov, Yury Selivanov and Kyle Stanley in [bpo-42392](https://bugs.python.org/issue?@action=redirect&bpo=42392) [https://bugs.python.org/issue?@action=redirect&bpo=42392].)

- The `types.FunctionType` constructor now inherits the current builtins if the `globals` dictionary has no `"__builtins__"` key, rather than using `{"None": None}` as builtins: same behavior as `eval()` and `exec()` functions. Defining a function with `def function(...): ...` in Python is not affected, globals cannot be overridden with this syntax: it also inherits the current builtins. (Contributed by Victor Stinner in [bpo-42990](https://bugs.python.org/issue?@action=redirect&bpo=42990) [https://bugs.python.org/issue?@action=redirect&bpo=42990].)

## Changes in the C API

- The C API functions `PyParser_SimpleParseStringFlags`, `PyParser_SimpleParseStringFlagsFilename`, `PyParser_SimpleParseFileFlags`, `PyNode_Compile` and the type used by these functions, `struct _node`, were removed due to the switch to the new PEG parser.

Source should now be compiled directly to a code object using, for example, `Py_CompileString()`. The resulting code object can then be evaluated using, for example, `PyEval_EvalCode()`.

Specifically:

- A call to `PyParser_SimpleParseStringFlags` followed by `PyNode_Compile` can be replaced by calling `Py_CompileString()`.
- There is no direct replacement for `PyParser_SimpleParseFileFlags`. To compile code from a `FILE *` argument, you will need to read the file in C and pass the resulting buffer to `Py_CompileString()`.
- To compile a file given a `char *` filename, explicitly

open the file, read it and compile the result. One way to do this is using the `io` module with `PyImport_ImportModule()`, `PyObject_CallMethod()`, `PyBytes_AsString()` and `Py_CompileString()`, as sketched below. (Declarations and error handling are omitted.)

```
io_module = Import_ImportModule("io");
fileobject = PyObject_CallMethod(io_module, "open",
source_bytes_object = PyObject_CallMethod(fileobject, "close",
result = PyObject_CallMethod(fileobject, "close",
source_buf = PyBytes_AsString(source_bytes_object);
code = Py_CompileString(source_buf, filename, Py_COMPILE_FLAGS);
```

- For `FrameObject` objects, the `f_lasti` member now represents a wordcode offset instead of a simple offset into the bytecode string. This means that this number needs to be multiplied by 2 to be used with APIs that expect a byte offset instead (like `PyCode_Addr2Line()` for example). Notice as well that the `f_lasti` member of `FrameObject` objects is not considered stable: please use `PyFrame_GetLineNumber()` instead.

## CPython bytecode changes

- The `MAKE_FUNCTION` instruction now accepts either a dict or a tuple of strings as the function's annotations. (Contributed by Yurii Karabas and Inada Naoki in [bpo-42202](https://bugs.python.org/issue?@action=redirect&bpo=42202) [<https://bugs.python.org/issue?@action=redirect&bpo=42202>].)

## Build Changes

- [PEP 644](https://peps.python.org/pep-0644/) [<https://peps.python.org/pep-0644/>]: Python now requires OpenSSL 1.1.1 or newer. OpenSSL 1.0.2 is no longer supported. (Contributed by Christian Heimes in [bpo-43669](https://bugs.python.org/issue?@action=redirect&bpo=43669) [<https://bugs.python.org/issue?@action=redirect&bpo=43669>].)
- The C99 functions `snprintf()` and `vsnprintf()` are

now required to build Python. (Contributed by Victor Stinner in [bpo-36020](https://bugs.python.org/issue?@action=redirect&bpo=36020) [https://bugs.python.org/issue?@action=redirect&bpo=36020].)

- **sqlite3** requires SQLite 3.7.15 or higher. (Contributed by Sergey Fedoseev and Erlend E. Aasland in [bpo-40744](https://bugs.python.org/issue?@action=redirect&bpo=40744) [https://bugs.python.org/issue?@action=redirect&bpo=40744] and [bpo-40810](https://bugs.python.org/issue?@action=redirect&bpo=40810) [https://bugs.python.org/issue?@action=redirect&bpo=40810].)
- The **atexit** module must now always be built as a built-in module. (Contributed by Victor Stinner in [bpo-42639](https://bugs.python.org/issue?@action=redirect&bpo=42639) [https://bugs.python.org/issue?@action=redirect&bpo=42639].)
- Add **--disable-test-modules** option to the `configure` script: don't build nor install test modules. (Contributed by Xavier de Gaye, Thomas Petazzoni and Peixing Xin in [bpo-27640](https://bugs.python.org/issue?@action=redirect&bpo=27640) [https://bugs.python.org/issue?@action=redirect&bpo=27640].)
- Add **--with-wheel-pkg-dir=PATH** option to the `./configure` script. If specified, the **ensurepip** module looks for `setuptools` and `pip` wheel packages in this directory: if both are present, these wheel packages are used instead of `ensurepip` bundled wheel packages.

Some Linux distribution packaging policies recommend against bundling dependencies. For example, Fedora installs wheel packages in the `/usr/share/python-wheels/` directory and don't install the `ensurepip._bundled` package.

(Contributed by Victor Stinner in [bpo-42856](https://bugs.python.org/issue?@action=redirect&bpo=42856) [https://bugs.python.org/issue?@action=redirect&bpo=42856].)

- Add a new **configure --without-static-libpython** option to not build the `libpythonMAJOR.MINOR.a` static library and not install the `python.o` object file.

(Contributed by Victor Stinner in [bpo-43103](https://bugs.python.org/issue?@action=redirect&bpo=43103) [https://bugs.python.org/issue?@action=redirect&bpo=43103].)

- The `configure` script now uses the `pkg-config` utility, if available, to detect the location of Tcl/Tk headers and libraries. As before, those locations can be explicitly specified with the `--with-tcltk-includes` and `--with-tcltk-libs` configuration options. (Contributed by Manolis Stamatogiannakis in [bpo-42603](https://bugs.python.org/issue?@action=redirect&bpo=42603) [https://bugs.python.org/issue?@action=redirect&bpo=42603].)
- Add `--with-openssl-rpath` option to `configure` script. The option simplifies building Python with a custom OpenSSL installation, e.g. `./configure --with-openssl=/path/to/openssl --with-openssl-rpath=auto`. (Contributed by Christian Heimes in [bpo-43466](https://bugs.python.org/issue?@action=redirect&bpo=43466) [https://bugs.python.org/issue?@action=redirect&bpo=43466].)

## C API Changes

### PEP 652: Maintaining the Stable ABI

The Stable ABI (Application Binary Interface) for extension modules or embedding Python is now explicitly defined. [C API Stability](#) describes C API and ABI stability guarantees along with best practices for using the Stable ABI.

(Contributed by Petr Viktorin in [PEP 652](https://peps.python.org/pep-0652/) [https://peps.python.org/pep-0652/] and [bpo-43795](https://bugs.python.org/issue?@action=redirect&bpo=43795) [https://bugs.python.org/issue?@action=redirect&bpo=43795].)

### New Features

- The result of `PyNumber_Index()` now always has exact type `int`. Previously, the result could have been an instance of a subclass of `int`. (Contributed by Serhiy Storchaka in [bpo-40792](https://bugs.python.org/issue?@action=redirect&bpo=40792) [https://bugs.python.org/issue?@action=redirect&bpo=40792].)
- Add a new `orig_argv` member to the `PyConfig` structure: the list of the original command line arguments passed to the Python executable. (Contributed by Victor Stinner in

[bpo-23427](https://bugs.python.org/issue?@action=redirect&bpo=23427) [[https://bugs.python.org/issue?  
@action=redirect&bpo=23427](https://bugs.python.org/issue?@action=redirect&bpo=23427)].)

- The `PyDateTime_DATE_GET_TZINFO()` and `PyDateTime_TIME_GET_TZINFO()` macros have been added for accessing the `tzinfo` attributes of `datetime.datetime` and `datetime.time` objects. (Contributed by Zackery Spytz in [bpo-30155](https://bugs.python.org/issue?@action=redirect&bpo=30155) [<https://bugs.python.org/issue?@action=redirect&bpo=30155>].)
- Add a `PyCodec_Unregister()` function to unregister a codec search function. (Contributed by Hai Shi in [bpo-41842](https://bugs.python.org/issue?@action=redirect&bpo=41842) [<https://bugs.python.org/issue?@action=redirect&bpo=41842>].)
- The `PyIter_Send()` function was added to allow sending value into iterator without raising `StopIteration` exception. (Contributed by Vladimir Matveev in [bpo-41756](https://bugs.python.org/issue?@action=redirect&bpo=41756) [<https://bugs.python.org/issue?@action=redirect&bpo=41756>].)
- Add `PyUnicode_AsUTF8AndSize()` to the limited C API. (Contributed by Alex Gaynor in [bpo-41784](https://bugs.python.org/issue?@action=redirect&bpo=41784) [<https://bugs.python.org/issue?@action=redirect&bpo=41784>].)
- Add `PyModule_AddObjectRef()` function: similar to `PyModule_AddObject()` but don't steal a reference to the value on success. (Contributed by Victor Stinner in [bpo-1635741](https://bugs.python.org/issue?@action=redirect&bpo=1635741) [<https://bugs.python.org/issue?@action=redirect&bpo=1635741>].)
- Add `Py_NewRef()` and `Py_XNewRef()` functions to increment the reference count of an object and return the object. (Contributed by Victor Stinner in [bpo-42262](https://bugs.python.org/issue?@action=redirect&bpo=42262) [<https://bugs.python.org/issue?@action=redirect&bpo=42262>].)
- The `PyType_FromSpecWithBases()` and `PyType_FromModuleAndSpec()` functions now accept a single class as the *bases* argument. (Contributed by Serhiy Storchaka in [bpo-42423](https://bugs.python.org/issue?@action=redirect&bpo=42423) [<https://bugs.python.org/issue?@action=redirect&bpo=42423>].)
- The `PyType_FromModuleAndSpec()` function now accepts

NULL `tp_doc` slot. (Contributed by Hai Shi in [bpo-41832](https://bugs.python.org/issue?@action=redirect&bpo=41832) [<https://bugs.python.org/issue?@action=redirect&bpo=41832>].)

- The `PyType_GetSlot()` function can accept [static types](#). (Contributed by Hai Shi and Petr Viktorin in [bpo-41073](https://bugs.python.org/issue?@action=redirect&bpo=41073) [<https://bugs.python.org/issue?@action=redirect&bpo=41073>].)
- Add a new `PySet_CheckExact()` function to the C-API to check if an object is an instance of `set` but not an instance of a subtype. (Contributed by Pablo Galindo in [bpo-43277](https://bugs.python.org/issue?@action=redirect&bpo=43277) [<https://bugs.python.org/issue?@action=redirect&bpo=43277>].)
- Add `PyErr_SetInterruptEx()` which allows passing a signal number to simulate. (Contributed by Antoine Pitrou in [bpo-43356](https://bugs.python.org/issue?@action=redirect&bpo=43356) [<https://bugs.python.org/issue?@action=redirect&bpo=43356>].)
- The limited C API is now supported if [Python is built in debug mode](#) (if the `Py_DEBUG` macro is defined). In the limited C API, the `Py_INCREF()` and `Py_DECREF()` functions are now implemented as opaque function calls, rather than accessing directly the `PyObject.ob_refcnt` member, if Python is built in debug mode and the `Py_LIMITED_API` macro targets Python 3.10 or newer. It became possible to support the limited C API in debug mode because the `PyObject` structure is the same in release and debug mode since Python 3.8 (see [bpo-36465](https://bugs.python.org/issue?@action=redirect&bpo=36465) [<https://bugs.python.org/issue?@action=redirect&bpo=36465>]).

The limited C API is still not supported in the `--with-trace-refs` special build (`Py_TRACE_REFS` macro). (Contributed by Victor Stinner in [bpo-43688](https://bugs.python.org/issue?@action=redirect&bpo=43688) [<https://bugs.python.org/issue?@action=redirect&bpo=43688>].)

- Add the `Py_Is(x, y)` function to test if the `x` object is the `y` object, the same as `x is y` in Python. Add also the `Py_IsNone()`, `Py_IsTrue()`, `Py_IsFalse()` functions to test if an object is, respectively, the `None` singleton, the `True` singleton or the `False` singleton. (Contributed by Victor Stinner in [bpo-43753](https://bugs.python.org/issue?@action=redirect&bpo=43753) [<https://bugs.python.org/issue?@action=redirect&bpo=43753>].)

- Add new functions to control the garbage collector from C code: `PyGC_Enable()`, `PyGC_Disable()`, `PyGC_IsEnabled()`. These functions allow to activate, deactivate and query the state of the garbage collector from C code without having to import the `gc` module.
- Add a new `Py_TPFLAGS_DISALLOW_INSTANTIATION` type flag to disallow creating type instances. (Contributed by Victor Stinner in [bpo-43916](https://bugs.python.org/issue?@action=redirect&bpo=43916) [https://bugs.python.org/issue?@action=redirect&bpo=43916].)
- Add a new `Py_TPFLAGS_IMMUTABLETYPE` type flag for creating immutable type objects: type attributes cannot be set nor deleted. (Contributed by Victor Stinner and Erlend E. Aasland in [bpo-43908](https://bugs.python.org/issue?@action=redirect&bpo=43908) [https://bugs.python.org/issue?@action=redirect&bpo=43908].)

## Porting to Python 3.10

- The `PY_SSIZE_T_CLEAN` macro must now be defined to use `PyArg_ParseTuple()` and `Py_BuildValue()` formats which use `#`: `es#`, `et#`, `s#`, `u#`, `y#`, `z#`, `U#` and `Z#`. See [Parsing arguments and building values](https://peps.python.org/pep-0353/) and [PEP 353](https://peps.python.org/pep-0353/) [https://peps.python.org/pep-0353/]. (Contributed by Victor Stinner in [bpo-40943](https://bugs.python.org/issue?@action=redirect&bpo=40943) [https://bugs.python.org/issue?@action=redirect&bpo=40943].)
- Since `Py_REFCNT()` is changed to the inline static function, `Py_REFCNT(obj) = new_refcnt` must be replaced with `Py_SET_REFCNT(obj, new_refcnt)`: see [Py\\_SET\\_REFCNT\(\)](#) (available since Python 3.9). For backward compatibility, this macro can be used:

```
#if PY_VERSION_HEX < 0x030900A4
#   define Py_SET_REFCNT(obj, refcnt) ((Py_REFCNT(obj)
#endif
```

(Contributed by Victor Stinner in [bpo-39573](https://bugs.python.org/issue?@action=redirect&bpo=39573) [https://bugs.python.org/issue?@action=redirect&bpo=39573].)

- Calling `PyDict_GetItem()` without `GIL` held had been

allowed for historical reason. It is no longer allowed.  
(Contributed by Victor Stinner in [bpo-40839](https://bugs.python.org/issue?@action=redirect&bpo=40839) [https://bugs.python.org/issue?@action=redirect&bpo=40839].)

- `PyUnicode_FromUnicode(NULL, size)` and `PyUnicode_FromStringAndSize(NULL, size)` raise `DeprecationWarning` now. Use `PyUnicode_New()` to allocate Unicode object without initial data. (Contributed by Inada Naoki in [bpo-36346](https://bugs.python.org/issue?@action=redirect&bpo=36346) [https://bugs.python.org/issue?@action=redirect&bpo=36346].)
- The private `_PyUnicode_Name_CAPI` structure of the PyCapsule API `unicodedata.ucnhash_CAPI` has been moved to the internal C API. (Contributed by Victor Stinner in [bpo-42157](https://bugs.python.org/issue?@action=redirect&bpo=42157) [https://bugs.python.org/issue?@action=redirect&bpo=42157].)
- `Py_GetPath()`, `Py_GetPrefix()`, `Py_GetExecPrefix()`, `Py_GetProgramFullPath()`, `Py_GetPythonHome()` and `Py_GetProgramName()` functions now return `NULL` if called before `Py_Initialize()` (before Python is initialized). Use the new [Python Initialization Configuration](#) API to get the [Python Path Configuration](#). (Contributed by Victor Stinner in [bpo-42260](https://bugs.python.org/issue?@action=redirect&bpo=42260) [https://bugs.python.org/issue?@action=redirect&bpo=42260].)
- `PyList_SET_ITEM()`, `PyTuple_SET_ITEM()` and `PyCell_SET()` macros can no longer be used as l-value or r-value. For example, `x = PyList_SET_ITEM(a, b, c)` and `PyList_SET_ITEM(a, b, c) = x` now fail with a compiler error. It prevents bugs like `if (PyList_SET_ITEM(a, b, c) < 0) ... test`. (Contributed by Zackery Spytz and Victor Stinner in [bpo-30459](https://bugs.python.org/issue?@action=redirect&bpo=30459) [https://bugs.python.org/issue?@action=redirect&bpo=30459].)
- The non-limited API files `odictobject.h`, `parser_interface.h`, `picklebufobject.h`, `pyarena.h`, `pyctype.h`, `pydebug.h`, `pyfpe.h`, and `pytime.h` have been moved to the `Include/cpython`

directory. These files must not be included directly, as they are already included in `Python.h`; see [Include Files](#). If they have been included directly, consider including `Python.h` instead. (Contributed by Nicholas Sim in [bpo-35134](#) [<https://bugs.python.org/issue?@action=redirect&bpo=35134>].)

- Use the `Py_TPFLAGS_IMMUTABLETYPE` type flag to create immutable type objects. Do not rely on `Py_TPFLAGS_HEAPTYPE` to decide if a type object is mutable or not; check if `Py_TPFLAGS_IMMUTABLETYPE` is set instead. (Contributed by Victor Stinner and Erlend E. Aasland in [bpo-43908](#) [<https://bugs.python.org/issue?@action=redirect&bpo=43908>].)
- The undocumented function `Py_FrozenMain` has been removed from the limited API. The function is mainly useful for custom builds of Python. (Contributed by Petr Viktorin in [bpo-26241](#) [<https://bugs.python.org/issue?@action=redirect&bpo=26241>].)

## Deprecated

- The `PyUnicode_InternImmortal()` function is now deprecated and will be removed in Python 3.12: use [PyUnicode\\_InternInPlace\(\)](#) instead. (Contributed by Victor Stinner in [bpo-41692](#) [<https://bugs.python.org/issue?@action=redirect&bpo=41692>].)

## Removed

- Removed `Py_UNICODE_str*` functions manipulating `Py_UNICODE*` strings. (Contributed by Inada Naoki in [bpo-41123](#) [<https://bugs.python.org/issue?@action=redirect&bpo=41123>].)
  - `Py_UNICODE_strlen`: use [PyUnicode\\_GetLength\(\)](#) or [PyUnicode\\_GET\\_LENGTH](#)
  - `Py_UNICODE_strcat`: use [PyUnicode\\_CopyCharacters\(\)](#) or

- `PyUnicode_FromFormat()`
  - `Py_UNICODE_strcpy`,  
`Py_UNICODE_strncpy`: use  
`PyUnicode_CopyCharacters()` or  
`PyUnicode_Substring()`
  - `Py_UNICODE_strncmp`: use  
`PyUnicode_Compare()`
  - `Py_UNICODE_strncmp`: use  
`PyUnicode_Tailmatch()`
  - `Py_UNICODE_strchr`,  
`Py_UNICODE_strrchr`: use  
`PyUnicode_FindChar()`
- Removed `PyUnicode_GetMax()`. Please migrate to new (PEP 393 [https://peps.python.org/pep-0393/]) APIs. (Contributed by Inada Naoki in bpo-41103 [https://bugs.python.org/issue?@action=redirect&bpo=41103].)
- Removed `PyLong_FromUnicode()`. Please migrate to `PyLong_FromUnicodeObject()`. (Contributed by Inada Naoki in bpo-41103 [https://bugs.python.org/issue?@action=redirect&bpo=41103].)
- Removed `PyUnicode_AsUnicodeCopy()`. Please use `PyUnicode_AsUCS4Copy()` or `PyUnicode_AsWideCharString()` (Contributed by Inada Naoki in bpo-41103 [https://bugs.python.org/issue?@action=redirect&bpo=41103].)
- Removed `_Py_CheckRecursionLimit` variable: it has been replaced by `ceval.recursion_limit` of the `PyInterpreterState` structure. (Contributed by Victor Stinner in bpo-41834 [https://bugs.python.org/issue?@action=redirect&bpo=41834].)
- Removed undocumented macros `Py_ALLOW_RECURSION` and `Py_END_ALLOW_RECURSION` and the `recursion_critical` field of the `PyInterpreterState` structure. (Contributed by Serhiy Storchaka in bpo-41936 [https://bugs.python.org/issue?@action=redirect&bpo=41936].)

- Removed the undocumented `PyOS_InitInterrupts()` function. Initializing Python already implicitly installs signal handlers: see [PyConfig.install\\_signal\\_handlers](#). (Contributed by Victor Stinner in [bpo-41713](#) [<https://bugs.python.org/issue?@action=redirect&bpo=41713>].)
- Remove the `PyAST_Validate()` function. It is no longer possible to build a AST object (`mod_ty` type) with the public C API. The function was already excluded from the limited C API ([PEP 384](#) [<https://peps.python.org/pep-0384/>]). (Contributed by Victor Stinner in [bpo-43244](#) [<https://bugs.python.org/issue?@action=redirect&bpo=43244>].)
- Remove the `symtable.h` header file and the undocumented functions:
  - `PyST_GetScope()`
  - `PySymtable_Build()`
  - `PySymtable_BuildObject()`
  - `PySymtable_Free()`
  - `Py_SymtableString()`
  - `Py_SymtableStringObject()`

The `Py_SymtableString()` function was part the stable ABI by mistake but it could not be used, because the `symtable.h` header file was excluded from the limited C API.

Use Python [symtable](#) module instead. (Contributed by Victor Stinner in [bpo-43244](#) [<https://bugs.python.org/issue?@action=redirect&bpo=43244>].)

- Remove [PyOS\\_ReadlineFunctionPointer\(\)](#) from the limited C API headers and from `python3.dll`, the library that provides the stable ABI on Windows. Since the function takes a `FILE*` argument, its ABI stability cannot be guaranteed. (Contributed by Petr Viktorin in [bpo-43868](#) [<https://bugs.python.org/issue?@action=redirect&bpo=43868>].)
- Remove `ast.h`, `asdl.h`, and `Python-ast.h` header files. These functions were undocumented and excluded from the

limited C API. Most names defined by these header files were not prefixed by `Py` and so could create names conflicts. For example, `Python-ast.h` defined a `Yield` macro which was conflict with the `Yield` name used by the Windows `<winbase.h>` header. Use the Python [ast](#) module instead. (Contributed by Victor Stinner in [bpo-43244](#) [<https://bugs.python.org/issue/?@action=redirect&bpo=43244>].)

- Remove the compiler and parser functions using `struct _mod type`, because the public AST C API was removed:

- ☐ `PyAST_Compile()`
- ☐ `PyAST_CompileEx()`
- ☐ `PyAST_CompileObject()`
- ☐ `PyFuture_FromAST()`
- ☐ `PyFuture_FromASTObject()`
- ☐ `PyParser_ASTFromFile()`
- ☐ `PyParser_ASTFromFileObject()`
- ☐ `PyParser_ASTFromFilename()`
- ☐ `PyParser_ASTFromString()`
- ☐ `PyParser_ASTFromStringObject()`

These functions were undocumented and excluded from the limited C API. (Contributed by Victor Stinner in [bpo-43244](#) [<https://bugs.python.org/issue/?@action=redirect&bpo=43244>].)

- Remove the `pyarena.h` header file with functions:

- ☐ `PyArena_New()`
- ☐ `PyArena_Free()`
- ☐ `PyArena_Malloc()`
- ☐ `PyArena_AddPyObject()`

These functions were undocumented, excluded from the limited C API, and were only used internally by the compiler. (Contributed by Victor Stinner in [bpo-43244](#) [<https://bugs.python.org/issue/?@action=redirect&bpo=43244>].)

- The `PyThreadState.use_tracing` member has been removed to optimize Python. (Contributed by Mark Shannon in [bpo-43760](#) [<https://bugs.python.org/issue/>])

@action=redirect&bpo=43760].)

# What's New In Python 3.9

Editor

Łukasz Langa

This article explains the new features in Python 3.9, compared to 3.8. Python 3.9 was released on October 5, 2020.

For full details, see the [changelog](#).

See also

[PEP 596](#) [<https://peps.python.org/pep-0596/>] - Python 3.9 Release Schedule

## Summary – Release highlights

New syntax features:

- [PEP 584](#) [<https://peps.python.org/pep-0584/>], union operators added to `dict`;
- [PEP 585](#) [<https://peps.python.org/pep-0585/>], type hinting generics in standard collections;
- [PEP 614](#) [<https://peps.python.org/pep-0614/>], relaxed grammar restrictions on decorators.

New built-in features:

- [PEP 616](#) [<https://peps.python.org/pep-0616/>], string methods to remove prefixes and suffixes.

New features in the standard library:

- [PEP 593](#) [<https://peps.python.org/pep-0593/>], flexible function and variable annotations;

- `os.pidfd_open()` added that allows process management without races and signals.

Interpreter improvements:

- **PEP 573** [<https://peps.python.org/pep-0573/>], fast access to module state from methods of C extension types;
- **PEP 617** [<https://peps.python.org/pep-0617/>], CPython now uses a new parser based on PEG;
- a number of Python builtins (range, tuple, set, frozenset, list, dict) are now sped up using **PEP 590** [<https://peps.python.org/pep-0590/>] vectorcall;
- garbage collection does not block on resurrected objects;
- a number of Python modules (`_abc`, `audioop`, `_bz2`, `_codecs`, `_contextvars`, `_crypt`, `_functools`, `_json`, `_locale`, `math`, `operator`, `resource`, `time`, `_weakref`) now use multiphase initialization as defined by PEP 489;
- a number of standard library modules (`audioop`, `ast`, `grp`, `_hashlib`, `pwd`, `_posixsubprocess`, `random`, `select`, `struct`, `termios`, `zlib`) are now using the stable ABI defined by PEP 384.

New library modules:

- **PEP 615** [<https://peps.python.org/pep-0615/>], the IANA Time Zone Database is now present in the standard library in the `zoneinfo` module;
- an implementation of a topological sort of a graph is now provided in the new `graphlib` module.

Release process changes:

- **PEP 602** [<https://peps.python.org/pep-0602/>], CPython adopts an annual release cycle.

## You should check for DeprecationWarning in your code

When Python 2.7 was still supported, a lot of functionality in

Python 3 was kept for backward compatibility with Python 2.7. With the end of Python 2 support, these backward compatibility layers have been removed, or will be removed soon. Most of them emitted a [DeprecationWarning](#) warning for several years. For example, using `collections.Mapping` instead of `collections.abc.Mapping` emits a [DeprecationWarning](#) since Python 3.3, released in 2012.

Test your application with the `-W` default command-line option to see [DeprecationWarning](#) and [PendingDeprecationWarning](#), or even with `-W error` to treat them as errors. [Warnings Filter](#) can be used to ignore warnings from third-party code.

Python 3.9 is the last version providing those Python 2 backward compatibility layers, to give more time to Python projects maintainers to organize the removal of the Python 2 support and add support for Python 3.9.

Aliases to [Abstract Base Classes](#) in the `collections` module, like `collections.Mapping` alias to `collections.abc.Mapping`, are kept for one last release for backward compatibility. They will be removed from Python 3.10.

More generally, try to run your tests in the [Python Development Mode](#) which helps to prepare your code to make it compatible with the next Python version.

Note: a number of pre-existing deprecations were removed in this version of Python as well. Consult the [Removed](#) section.

## New Features

### Dictionary Merge & Update Operators

Merge (`|`) and update (`|=`) operators have been added to the built-in `dict` class. Those complement the existing `dict.update` and `{**d1, **d2}` methods of merging dictionaries.

Example:

```
>>> x = {"key1": "value1 from x", "key2": "value2 from x"}
>>> y = {"key2": "value2 from y", "key3": "value3 from y"}
>>> x | y
{'key1': 'value1 from x', 'key2': 'value2 from y', 'key3': 'value3 from y'}
>>> y | x
{'key2': 'value2 from x', 'key3': 'value3 from y', 'key1': 'value1 from x'}
```

See [PEP 584](https://peps.python.org/pep-0584/) [https://peps.python.org/pep-0584/] for a full description. (Contributed by Brandt Bucher in [bpo-36144](https://bugs.python.org/issue?@action=redirect&bpo=36144) [https://bugs.python.org/issue?@action=redirect&bpo=36144].)

## New String Methods to Remove Prefixes and Suffixes

[str.removeprefix\(prefix\)](#) and [str.removesuffix\(suffix\)](#) have been added to easily remove an unneeded prefix or a suffix from a string. Corresponding `bytes`, `bytearray`, and `collections.UserString` methods have also been added. See [PEP 616](https://peps.python.org/pep-0616/) [https://peps.python.org/pep-0616/] for a full description. (Contributed by Dennis Sweeney in [bpo-39939](https://bugs.python.org/issue?@action=redirect&bpo=39939) [https://bugs.python.org/issue?@action=redirect&bpo=39939].)

## Type Hinting Generics in Standard Collections

In type annotations you can now use built-in collection types such as `list` and `dict` as generic types instead of importing the corresponding capitalized types (e.g. `List` or `Dict`) from `typing`. Some other types in the standard library are also now generic, for example `queue.Queue`.

Example:

```
def greet_all(names: list[str]) -> None:
    for name in names:
        print("Hello", name)
```

See [PEP 585](https://peps.python.org/pep-0585/) [https://peps.python.org/pep-0585/] for more details. (Contributed by Guido van Rossum, Ethan Smith, and Batuhan Taşkaya in [bpo-39481](https://bugs.python.org/issue?@action=redirect&bpo=39481) [https://bugs.python.org/issue?@action=redirect&bpo=39481].)

## New Parser

Python 3.9 uses a new parser, based on [PEG](https://en.wikipedia.org/wiki/Parsing_expression_grammar) instead of [LL\(1\)](https://en.wikipedia.org/wiki/LL_parser). The new parser's performance is roughly comparable to that of the old parser, but the PEG formalism is more flexible than LL(1) when it comes to designing new language features. We'll start using this flexibility in Python 3.10 and later.

The `ast` module uses the new parser and produces the same AST as the old parser.

In Python 3.10, the old parser will be deleted and so will all functionality that depends on it (primarily the `parser` module, which has long been deprecated). In Python 3.9 *only*, you can switch back to the LL(1) parser using a command line switch (`-X oldparser`) or an environment variable (`PYTHONOLDPARSER=1`).

See [PEP 617](https://peps.python.org/pep-0617/) for more details. (Contributed by Guido van Rossum, Pablo Galindo and Lysandros Nikolaou in [bpo-40334](https://bugs.python.org/issue?@action=redirect&bpo=40334).)

## Other Language Changes

- `__import__()` now raises `ImportError` instead of `ValueError`, which used to occur when a relative import went past its top-level package. (Contributed by Ngalim Siregar in [bpo-37444](https://bugs.python.org/issue?@action=redirect&bpo=37444).)
- Python now gets the absolute path of the script filename specified on the command line (ex: `python3 script.py`): the `__file__` attribute of the `__main__` module became an absolute path, rather than a relative path. These paths now remain valid after the current directory is changed by `os.chdir()`. As a side effect, the traceback also displays the absolute path for `__main__` module frames in this case. (Contributed by Victor Stinner in [bpo-20443](https://bugs.python.org/issue?@action=redirect&bpo=20443).)

- In the [Python Development Mode](#) and in [debug build](#), the *encoding* and *errors* arguments are now checked for string encoding and decoding operations. Examples: [open\(\)](#), [str.encode\(\)](#) and [bytes.decode\(\)](#).

By default, for best performance, the *errors* argument is only checked at the first encoding/decoding error and the *encoding* argument is sometimes ignored for empty strings.

(Contributed by Victor Stinner in [bpo-37388](#) [<https://bugs.python.org/issue?@action=redirect&bpo=37388>].)

- `"".replace("", s, n)` now returns `s` instead of an empty string for all non-zero `n`. It is now consistent with `"".replace("", s)`. There are similar changes for [bytes](#) and [bytearray](#) objects. (Contributed by Serhiy Storchaka in [bpo-28029](#) [<https://bugs.python.org/issue?@action=redirect&bpo=28029>].)
- Any valid expression can now be used as a [decorator](#). Previously, the grammar was much more restrictive. See [PEP 614](#) [<https://peps.python.org/pep-0614/>] for details. (Contributed by Brandt Bucher in [bpo-39702](#) [<https://bugs.python.org/issue?@action=redirect&bpo=39702>].)
- Improved help for the [typing](#) module. Docstrings are now shown for all special forms and special generic aliases (like `Union` and `List`). Using [help\(\)](#) with generic alias like `List[int]` will show the help for the correspondent concrete type (`list` in this case). (Contributed by Serhiy Storchaka in [bpo-40257](#) [<https://bugs.python.org/issue?@action=redirect&bpo=40257>].)
- Parallel running of [aclose\(\)](#) / [asend\(\)](#) / [athrow\(\)](#) is now prohibited, and `ag_running` now reflects the actual running status of the async generator. (Contributed by Yury Selivanov in [bpo-30773](#) [<https://bugs.python.org/issue?@action=redirect&bpo=30773>].)
- Unexpected errors in calling the `__iter__` method are no longer masked by `TypeError` in the [in](#) operator and functions [contains\(\)](#), [indexOf\(\)](#) and [countOf\(\)](#) of

the **operator** module. (Contributed by Serhiy Storchaka in [bpo-40824](https://bugs.python.org/issue?@action=redirect&bpo=40824) [https://bugs.python.org/issue?@action=redirect&bpo=40824].)

- Unparenthesized lambda expressions can no longer be the expression part in an `if` clause in comprehensions and generator expressions. See [bpo-41848](https://bugs.python.org/issue?@action=redirect&bpo=41848) [https://bugs.python.org/issue?@action=redirect&bpo=41848] and [bpo-43755](https://bugs.python.org/issue?@action=redirect&bpo=43755) [https://bugs.python.org/issue?@action=redirect&bpo=43755] for details.

## New Modules

### zoneinfo

The **zoneinfo** module brings support for the IANA time zone database to the standard library. It adds **zoneinfo.ZoneInfo**, a concrete **datetime.tzinfo** implementation backed by the system's time zone data.

Example:

```
>>> from zoneinfo import ZoneInfo
>>> from datetime import datetime, timedelta

>>> # Daylight saving time
>>> dt = datetime(2020, 10, 31, 12, tzinfo=ZoneInfo("America/New_York"))
>>> print(dt)
2020-10-31 12:00:00-07:00
>>> dt.tzname()
'PDT'

>>> # Standard time
>>> dt += timedelta(days=7)
>>> print(dt)
2020-11-07 12:00:00-08:00
>>> print(dt.tzname())
PST
```

As a fall-back source of data for platforms that don't ship the IANA

database, the [tzdata](https://pypi.org/project/tzdata/) [https://pypi.org/project/tzdata/] module was released as a first-party package – distributed via PyPI and maintained by the CPython core team.

See also

[PEP 615](https://peps.python.org/pep-0615/) [https://peps.python.org/pep-0615/] – **Support for the IANA Time Zone Database in the Standard Library**  
PEP written and implemented by Paul Ganssle

## graphlib

A new module, [graphlib](#), was added that contains the [graphlib.TopologicalSorter](#) class to offer functionality to perform topological sorting of graphs. (Contributed by Pablo Galindo, Tim Peters and Larry Hastings in [bpo-17005](https://bugs.python.org/issue/?@action=redirect&bpo=17005) [https://bugs.python.org/issue/?@action=redirect&bpo=17005].)

## Improved Modules

### ast

Added the *indent* option to [dump\(\)](#) which allows it to produce a multiline indented output. (Contributed by Serhiy Storchaka in [bpo-37995](https://bugs.python.org/issue/?@action=redirect&bpo=37995) [https://bugs.python.org/issue/?@action=redirect&bpo=37995].)

Added [ast.unparse\(\)](#) as a function in the [ast](#) module that can be used to unparse an [ast.AST](#) object and produce a string with code that would produce an equivalent [ast.AST](#) object when parsed. (Contributed by Pablo Galindo and Batuhan Taskaya in [bpo-38870](https://bugs.python.org/issue/?@action=redirect&bpo=38870) [https://bugs.python.org/issue/?@action=redirect&bpo=38870].)

Added docstrings to AST nodes that contains the ASDL signature used to construct that node. (Contributed by Batuhan Taskaya in [bpo-39638](https://bugs.python.org/issue/?@action=redirect&bpo=39638) [https://bugs.python.org/issue/?@action=redirect&bpo=39638].)

### asyncio

Due to significant security concerns, the *reuse\_address* parameter of

`asyncio.loop.create_datagram_endpoint()` is no longer supported. This is because of the behavior of the socket option `SO_REUSEADDR` in UDP. For more details, see the documentation for `loop.create_datagram_endpoint()`. (Contributed by Kyle Stanley, Antoine Pitrou, and Yury Selivanov in [bpo-37228](https://bugs.python.org/issue?@action=redirect&bpo=37228) [https://bugs.python.org/issue?@action=redirect&bpo=37228].)

Added a new `coroutine shutdown_default_executor()` that schedules a shutdown for the default executor that waits on the `ThreadPoolExecutor` to finish closing. Also, `asyncio.run()` has been updated to use the new `coroutine`. (Contributed by Kyle Stanley in [bpo-34037](https://bugs.python.org/issue?@action=redirect&bpo=34037) [https://bugs.python.org/issue?@action=redirect&bpo=34037].)

Added `asyncio.PidfdChildWatcher`, a Linux-specific child watcher implementation that polls process file descriptors. ([bpo-38692](https://bugs.python.org/issue?@action=redirect&bpo=38692) [https://bugs.python.org/issue?@action=redirect&bpo=38692])

Added a new `coroutine asyncio.to_thread()`. It is mainly used for running IO-bound functions in a separate thread to avoid blocking the event loop, and essentially works as a high-level version of `run_in_executor()` that can directly take keyword arguments. (Contributed by Kyle Stanley and Yury Selivanov in [bpo-32309](https://bugs.python.org/issue?@action=redirect&bpo=32309) [https://bugs.python.org/issue?@action=redirect&bpo=32309].)

When cancelling the task due to a timeout, `asyncio.wait_for()` will now wait until the cancellation is complete also in the case when `timeout` is `<= 0`, like it does with positive timeouts. (Contributed by Elvis Pranskevichus in [bpo-32751](https://bugs.python.org/issue?@action=redirect&bpo=32751) [https://bugs.python.org/issue?@action=redirect&bpo=32751].)

`asyncio` now raises `TypeError` when calling incompatible methods with an `ssl.SSLSocket` socket. (Contributed by Ido Michael in [bpo-37404](https://bugs.python.org/issue?@action=redirect&bpo=37404) [https://bugs.python.org/issue?@action=redirect&bpo=37404].)

## compileall

Added new possibility to use hardlinks for duplicated `.pyc` files: `hardlink_dupes` parameter and `-hardlink-dupes` command line option. (Contributed by Lumír ‘Frenzy’ Balhar in [bpo-40495](https://bugs.python.org/issue?@action=redirect&bpo=40495) [https://bugs.python.org/issue?@action=redirect&bpo=40495].)

[bugs.python.org/issue?@action=redirect&bpo=40495](https://bugs.python.org/issue?@action=redirect&bpo=40495).)

Added new options for path manipulation in resulting `.pyc` files: *stripdir*, *prependdir*, *limit\_sl\_dest* parameters and `-s`, `-p`, `-e` command line options. Added the possibility to specify the option for an optimization level multiple times. (Contributed by Lumír ‘Frenzy’ Balhar in [bpo-38112](https://bugs.python.org/issue?@action=redirect&bpo=38112) [<https://bugs.python.org/issue?@action=redirect&bpo=38112>].)

## concurrent.futures

Added a new *cancel\_futures* parameter to `concurrent.futures.Executor.shutdown()` that cancels all pending futures which have not started running, instead of waiting for them to complete before shutting down the executor. (Contributed by Kyle Stanley in [bpo-39349](https://bugs.python.org/issue?@action=redirect&bpo=39349) [<https://bugs.python.org/issue?@action=redirect&bpo=39349>].)

Removed daemon threads from `ThreadPoolExecutor` and `ProcessPoolExecutor`. This improves compatibility with subinterpreters and predictability in their shutdown processes. (Contributed by Kyle Stanley in [bpo-39812](https://bugs.python.org/issue?@action=redirect&bpo=39812) [<https://bugs.python.org/issue?@action=redirect&bpo=39812>].)

Workers in `ProcessPoolExecutor` are now spawned on demand, only when there are no available idle workers to reuse. This optimizes startup overhead and reduces the amount of lost CPU time to idle workers. (Contributed by Kyle Stanley in [bpo-39207](https://bugs.python.org/issue?@action=redirect&bpo=39207) [<https://bugs.python.org/issue?@action=redirect&bpo=39207>].)

## curses

Added `curses.get_escdelay()`, `curses.set_escdelay()`, `curses.get_tabsize()`, and `curses.set_tabsize()` functions. (Contributed by Anthony Sottile in [bpo-38312](https://bugs.python.org/issue?@action=redirect&bpo=38312) [<https://bugs.python.org/issue?@action=redirect&bpo=38312>].)

## datetime

The `isocalendar()` of `datetime.date` and `isocalendar()`

of `datetime.datetime` methods now returns a `namedtuple()` instead of a `tuple`. (Contributed by Dong-hee Na in [bpo-24416](https://bugs.python.org/issue?@action=redirect&bpo=24416) [<https://bugs.python.org/issue?@action=redirect&bpo=24416>].)

## distutils

The `upload` command now creates SHA2-256 and Blake2b-256 hash digests. It skips MD5 on platforms that block MD5 digest. (Contributed by Christian Heimes in [bpo-40698](https://bugs.python.org/issue?@action=redirect&bpo=40698) [<https://bugs.python.org/issue?@action=redirect&bpo=40698>].)

## fcntl

Added constants `F_OFD_GETLK`, `F_OFD_SETLK` and `F_OFD_SETLKW`. (Contributed by Dong-hee Na in [bpo-38602](https://bugs.python.org/issue?@action=redirect&bpo=38602) [<https://bugs.python.org/issue?@action=redirect&bpo=38602>].)

## ftplib

`FTP` and `FTP_TLS` now raise a `ValueError` if the given timeout for their constructor is zero to prevent the creation of a non-blocking socket. (Contributed by Dong-hee Na in [bpo-39259](https://bugs.python.org/issue?@action=redirect&bpo=39259) [<https://bugs.python.org/issue?@action=redirect&bpo=39259>].)

## gc

When the garbage collector makes a collection in which some objects resurrect (they are reachable from outside the isolated cycles after the finalizers have been executed), do not block the collection of all objects that are still unreachable. (Contributed by Pablo Galindo and Tim Peters in [bpo-38379](https://bugs.python.org/issue?@action=redirect&bpo=38379) [<https://bugs.python.org/issue?@action=redirect&bpo=38379>].)

Added a new function `gc.is_finalized()` to check if an object has been finalized by the garbage collector. (Contributed by Pablo Galindo in [bpo-39322](https://bugs.python.org/issue?@action=redirect&bpo=39322) [<https://bugs.python.org/issue?@action=redirect&bpo=39322>].)

## hashlib

The **hashlib** module can now use SHA3 hashes and SHAKE XOF from OpenSSL when available. (Contributed by Christian Heimes in [bpo-37630](https://bugs.python.org/issue?@action=redirect&bpo=37630) [https://bugs.python.org/issue?@action=redirect&bpo=37630].)

Builtin hash modules can now be disabled with `./configure --without-builtin-hashlib-hashes` or selectively enabled with e.g. `./configure --with-builtin-hashlib-hashes=sha3,blake2` to force use of OpenSSL based implementation. (Contributed by Christian Heimes in [bpo-40479](https://bugs.python.org/issue?@action=redirect&bpo=40479) [https://bugs.python.org/issue?@action=redirect&bpo=40479])

## http

HTTP status codes `103 EARLY_HINTS`, `418 IM_A_TEAPOT` and `425 TOO_EARLY` are added to **http.HTTPStatus**. (Contributed by Dong-hee Na in [bpo-39509](https://bugs.python.org/issue?@action=redirect&bpo=39509) [https://bugs.python.org/issue?@action=redirect&bpo=39509] and Ross Rhodes in [bpo-39507](https://bugs.python.org/issue?@action=redirect&bpo=39507) [https://bugs.python.org/issue?@action=redirect&bpo=39507].)

## IDLE and idlelib

Added option to toggle cursor blink off. (Contributed by Zackery Spytz in [bpo-4603](https://bugs.python.org/issue?@action=redirect&bpo=4603) [https://bugs.python.org/issue?@action=redirect&bpo=4603].)

Escape key now closes IDLE completion windows. (Contributed by Johnny Najera in [bpo-38944](https://bugs.python.org/issue?@action=redirect&bpo=38944) [https://bugs.python.org/issue?@action=redirect&bpo=38944].)

Added keywords to module name completion list. (Contributed by Terry J. Reedy in [bpo-37765](https://bugs.python.org/issue?@action=redirect&bpo=37765) [https://bugs.python.org/issue?@action=redirect&bpo=37765].)

## New in 3.9 maintenance releases

Make IDLE invoke **sys.excepthook()** (when started without ‘-n’). User hooks were previously ignored. (Contributed by Ken Hilton in [bpo-43008](https://bugs.python.org/issue?@action=redirect&bpo=43008) [https://bugs.python.org/issue?@action=redirect&bpo=43008].)

The changes above have been backported to 3.8 maintenance releases.

Rearrange the settings dialog. Split the General tab into Windows and Shell/Ed tabs. Move help sources, which extend the Help menu, to the Extensions tab. Make space for new options and shorten the dialog. The latter makes the dialog better fit small screens.

(Contributed by Terry Jan Reedy in [bpo-40468](https://bugs.python.org/issue?@action=redirect&bpo=40468) [https://bugs.python.org/issue?@action=redirect&bpo=40468].) Move the indent space setting from the Font tab to the new Windows tab. (Contributed by Mark Roseman and Terry Jan Reedy in [bpo-33962](https://bugs.python.org/issue?@action=redirect&bpo=33962) [https://bugs.python.org/issue?@action=redirect&bpo=33962].)

Apply syntax highlighting to `.pyi` files. (Contributed by Alex Waygood and Terry Jan Reedy in [bpo-45447](https://bugs.python.org/issue?@action=redirect&bpo=45447) [https://bugs.python.org/issue?@action=redirect&bpo=45447].)

## imaplib

**IMAP4** and **IMAP4\_SSL** now have an optional *timeout* parameter for their constructors. Also, the **open()** method now has an optional *timeout* parameter with this change. The overridden methods of **IMAP4\_SSL** and **IMAP4\_stream** were applied to this change. (Contributed by Dong-hee Na in [bpo-38615](https://bugs.python.org/issue?@action=redirect&bpo=38615) [https://bugs.python.org/issue?@action=redirect&bpo=38615].)

**imaplib.IMAP4.unselect()** is added.

**imaplib.IMAP4.unselect()** frees server's resources associated with the selected mailbox and returns the server to the authenticated state. This command performs the same actions as **imaplib.IMAP4.close()**, except that no messages are permanently removed from the currently selected mailbox. (Contributed by Dong-hee Na in [bpo-40375](https://bugs.python.org/issue?@action=redirect&bpo=40375) [https://bugs.python.org/issue?@action=redirect&bpo=40375].)

## importlib

To improve consistency with import statements,

**importlib.util.resolve\_name()** now raises **ImportError** instead of **ValueError** for invalid relative import attempts.

(Contributed by Ngalim Siregar in [bpo-37444](https://bugs.python.org/issue?@action=redirect&bpo=37444) [https://bugs.python.org/issue?@action=redirect&bpo=37444].)

Import loaders which publish immutable module objects can now publish immutable packages in addition to individual modules. (Contributed by Dino Viehland in [bpo-39336](https://bugs.python.org/issue?@action=redirect&bpo=39336) [https://bugs.python.org/issue?@action=redirect&bpo=39336].)

Added `importlib.resources.files()` function with support for subdirectories in package data, matching backport in `importlib_resources` version 1.5. (Contributed by Jason R. Coombs in [bpo-39791](https://bugs.python.org/issue?@action=redirect&bpo=39791) [https://bugs.python.org/issue?@action=redirect&bpo=39791].)

Refreshed `importlib.metadata` from `importlib_metadata` version 1.6.1.

## inspect

`inspect.BoundArguments.arguments` is changed from `OrderedDict` to regular dict. (Contributed by Inada Naoki in [bpo-36350](https://bugs.python.org/issue?@action=redirect&bpo=36350) [https://bugs.python.org/issue?@action=redirect&bpo=36350] and [bpo-39775](https://bugs.python.org/issue?@action=redirect&bpo=39775) [https://bugs.python.org/issue?@action=redirect&bpo=39775].)

## ipaddress

`ipaddress` now supports IPv6 Scoped Addresses (IPv6 address with suffix `%<scope_id>`).

Scoped IPv6 addresses can be parsed using `ipaddress.IPv6Address`. If present, scope zone ID is available through the `scope_id` attribute. (Contributed by Oleksandr Pavliuk in [bpo-34788](https://bugs.python.org/issue?@action=redirect&bpo=34788) [https://bugs.python.org/issue?@action=redirect&bpo=34788].)

Starting with Python 3.9.5 the `ipaddress` module no longer accepts any leading zeros in IPv4 address strings. (Contributed by Christian Heimes in [bpo-36384](https://bugs.python.org/issue?@action=redirect&bpo=36384) [https://bugs.python.org/issue?@action=redirect&bpo=36384]).

## math

Expanded the `math.gcd()` function to handle multiple arguments.

Formerly, it only supported two arguments. (Contributed by Serhiy Storchaka in [bpo-39648](https://bugs.python.org/issue?@action=redirect&bpo=39648) [https://bugs.python.org/issue?@action=redirect&bpo=39648].)

Added `math.lcm()`: return the least common multiple of specified arguments. (Contributed by Mark Dickinson, Ananthakrishnan and Serhiy Storchaka in [bpo-39479](https://bugs.python.org/issue?@action=redirect&bpo=39479) [https://bugs.python.org/issue?@action=redirect&bpo=39479] and [bpo-39648](https://bugs.python.org/issue?@action=redirect&bpo=39648) [https://bugs.python.org/issue?@action=redirect&bpo=39648].)

Added `math.nextafter()`: return the next floating-point value after *x* towards *y*. (Contributed by Victor Stinner in [bpo-39288](https://bugs.python.org/issue?@action=redirect&bpo=39288) [https://bugs.python.org/issue?@action=redirect&bpo=39288].)

Added `math.ulp()`: return the value of the least significant bit of a float. (Contributed by Victor Stinner in [bpo-39310](https://bugs.python.org/issue?@action=redirect&bpo=39310) [https://bugs.python.org/issue?@action=redirect&bpo=39310].)

## multiprocessing

The `multiprocessing.SimpleQueue` class has a new `close()` method to explicitly close the queue. (Contributed by Victor Stinner in [bpo-30966](https://bugs.python.org/issue?@action=redirect&bpo=30966) [https://bugs.python.org/issue?@action=redirect&bpo=30966].)

## nntplib

`NNTP` and `NNTP_SSL` now raise a `ValueError` if the given timeout for their constructor is zero to prevent the creation of a non-blocking socket. (Contributed by Dong-hee Na in [bpo-39259](https://bugs.python.org/issue?@action=redirect&bpo=39259) [https://bugs.python.org/issue?@action=redirect&bpo=39259].)

## os

Added `CLD_KILLED` and `CLD_STOPPED` for `si_code`. (Contributed by Dong-hee Na in [bpo-38493](https://bugs.python.org/issue?@action=redirect&bpo=38493) [https://bugs.python.org/issue?@action=redirect&bpo=38493].)

Exposed the Linux-specific `os.pidfd_open()` ([bpo-38692](https://bugs.python.org/issue?@action=redirect&bpo=38692) [https://bugs.python.org/issue?@action=redirect&bpo=38692]) and `os.P_PIDFD` ([bpo-38713](https://bugs.python.org/issue?@action=redirect&bpo=38713) [https://bugs.python.org/issue?@action=redirect&bpo=38713])

for process management with file descriptors.

The `os.unsetenv()` function is now also available on Windows. (Contributed by Victor Stinner in [bpo-39413](https://bugs.python.org/issue?@action=redirect&bpo=39413) [https://bugs.python.org/issue?@action=redirect&bpo=39413].)

The `os.putenv()` and `os.unsetenv()` functions are now always available. (Contributed by Victor Stinner in [bpo-39395](https://bugs.python.org/issue?@action=redirect&bpo=39395) [https://bugs.python.org/issue?@action=redirect&bpo=39395].)

Added `os.waitstatus_to_exitcode()` function: convert a wait status to an exit code. (Contributed by Victor Stinner in [bpo-40094](https://bugs.python.org/issue?@action=redirect&bpo=40094) [https://bugs.python.org/issue?@action=redirect&bpo=40094].)

## pathlib

Added `pathlib.Path.readlink()` which acts similarly to `os.readlink()`. (Contributed by Girts Folkmanis in [bpo-30618](https://bugs.python.org/issue?@action=redirect&bpo=30618) [https://bugs.python.org/issue?@action=redirect&bpo=30618])

## pdb

On Windows now `Pdb` supports `~/ .pdbrc`. (Contributed by Tim Hopper and Dan Lidral-Porter in [bpo-20523](https://bugs.python.org/issue?@action=redirect&bpo=20523) [https://bugs.python.org/issue?@action=redirect&bpo=20523].)

## poplib

`POP3` and `POP3_SSL` now raise a `ValueError` if the given timeout for their constructor is zero to prevent the creation of a non-blocking socket. (Contributed by Dong-hee Na in [bpo-39259](https://bugs.python.org/issue?@action=redirect&bpo=39259) [https://bugs.python.org/issue?@action=redirect&bpo=39259].)

## pprint

`pprint` can now pretty-print `types.SimpleNamespace`. (Contributed by Carl Bordum Hansen in [bpo-37376](https://bugs.python.org/issue?@action=redirect&bpo=37376) [https://bugs.python.org/issue?@action=redirect&bpo=37376].)

## pydoc

The documentation string is now shown not only for class, function, method etc, but for any object that has its own `__doc__` attribute. (Contributed by Serhiy Storchaka in [bpo-40257](https://bugs.python.org/issue?@action=redirect&bpo=40257) [https://bugs.python.org/issue?@action=redirect&bpo=40257].)

## random

Added a new `random.Random.randbytes` method: generate random bytes. (Contributed by Victor Stinner in [bpo-40286](https://bugs.python.org/issue?@action=redirect&bpo=40286) [https://bugs.python.org/issue?@action=redirect&bpo=40286].)

## signal

Exposed the Linux-specific `signal.pidfd_send_signal()` for sending to signals to a process using a file descriptor instead of a pid. ([bpo-38712](https://bugs.python.org/issue?@action=redirect&bpo=38712) [https://bugs.python.org/issue?@action=redirect&bpo=38712])

## smtplib

`SMTP` and `SMTP_SSL` now raise a `ValueError` if the given timeout for their constructor is zero to prevent the creation of a non-blocking socket. (Contributed by Dong-hee Na in [bpo-39259](https://bugs.python.org/issue?@action=redirect&bpo=39259) [https://bugs.python.org/issue?@action=redirect&bpo=39259].)

`LMTP` constructor now has an optional *timeout* parameter. (Contributed by Dong-hee Na in [bpo-39329](https://bugs.python.org/issue?@action=redirect&bpo=39329) [https://bugs.python.org/issue?@action=redirect&bpo=39329].)

## socket

The `socket` module now exports the `CAN_RAW_JOIN_FILTERS` constant on Linux 4.1 and greater. (Contributed by Stefan Tatschner and Zackery Spytz in [bpo-25780](https://bugs.python.org/issue?@action=redirect&bpo=25780) [https://bugs.python.org/issue?@action=redirect&bpo=25780].)

The `socket` module now supports the `CAN_J1939` protocol on platforms that support it. (Contributed by Karl Ding in [bpo-40291](https://bugs.python.org/issue?@action=redirect&bpo=40291) [https://bugs.python.org/issue?@action=redirect&bpo=40291].)

The socket module now has the `socket.send_fds()` and `socket.recv_fds()` functions. (Contributed by Joanna Nanjey, Shinya Okano and Victor Stinner in [bpo-28724](https://bugs.python.org/issue?@action=redirect&bpo=28724) [https://bugs.python.org/issue?@action=redirect&bpo=28724].)

## time

On AIX, `thread_time()` is now implemented with `thread_cputime()` which has nanosecond resolution, rather than `clock_gettime(CLOCK_THREAD_CPUTIME_ID)` which has a resolution of 10 milliseconds. (Contributed by Batuhan Taskaya in [bpo-40192](https://bugs.python.org/issue?@action=redirect&bpo=40192) [https://bugs.python.org/issue?@action=redirect&bpo=40192])

## sys

Added a new `sys.platlibdir` attribute: name of the platform-specific library directory. It is used to build the path of standard library and the paths of installed extension modules. It is equal to "lib" on most platforms. On Fedora and SuSE, it is equal to "lib64" on 64-bit platforms. (Contributed by Jan Matěj, Matěj Čep, Charalampos Stratakis and Victor Stinner in [bpo-1294959](https://bugs.python.org/issue?@action=redirect&bpo=1294959) [https://bugs.python.org/issue?@action=redirect&bpo=1294959].)

Previously, `sys.stderr` was block-buffered when non-interactive. Now `stderr` defaults to always being line-buffered. (Contributed by Jendrik Seipp in [bpo-13601](https://bugs.python.org/issue?@action=redirect&bpo=13601) [https://bugs.python.org/issue?@action=redirect&bpo=13601].)

## tracemalloc

Added `tracemalloc.reset_peak()` to set the peak size of traced memory blocks to the current size, to measure the peak of specific pieces of code. (Contributed by Huon Wilson in [bpo-40630](https://bugs.python.org/issue?@action=redirect&bpo=40630) [https://bugs.python.org/issue?@action=redirect&bpo=40630].)

## typing

[PEP 593](https://peps.python.org/pep-0593/) [https://peps.python.org/pep-0593/] introduced an `typing.Annotated` type to decorate existing types with context-specific metadata and new `include_extras` parameter to

`typing.get_type_hints()` to access the metadata at runtime. (Contributed by Till Varoquaux and Konstantin Kashin.)

## unicodedata

The Unicode database has been updated to version 13.0.0. ([bpo-39926](https://bugs.python.org/issue?@action=redirect&bpo=39926) [https://bugs.python.org/issue?@action=redirect&bpo=39926]).

## venv

The activation scripts provided by `venv` now all specify their prompt customization consistently by always using the value specified by `__VENV_PROMPT__`. Previously some scripts unconditionally used `__VENV_PROMPT__`, others only if it happened to be set (which was the default case), and one used `__VENV_NAME__` instead. (Contributed by Brett Cannon in [bpo-37663](https://bugs.python.org/issue?@action=redirect&bpo=37663) [https://bugs.python.org/issue?@action=redirect&bpo=37663].)

## xml

White space characters within attributes are now preserved when serializing `xml.etree.ElementTree` to XML file. EOLNs are no longer normalized to “n”. This is the result of discussion about how to interpret section 2.11 of XML spec. (Contributed by Mefistotelis in [bpo-39011](https://bugs.python.org/issue?@action=redirect&bpo=39011) [https://bugs.python.org/issue?@action=redirect&bpo=39011].)

## Optimizations

- Optimized the idiom for assignment a temporary variable in comprehensions. Now `for y in [expr] in` comprehensions is as fast as a simple assignment `y = expr`. For example:

```
sums = [s for s in [0] for x in data for s in [s
+ x]]
```

Unlike the `:=` operator this idiom does not leak a variable to the outer scope.

(Contributed by Serhiy Storchaka in [bpo-32856](https://bugs.python.org/issue?@action=redirect&bpo=32856) [https://

[bugs.python.org/issue?@action=redirect&bpo=32856](https://bugs.python.org/issue?@action=redirect&bpo=32856).)

- Optimized signal handling in multithreaded applications. If a thread different than the main thread gets a signal, the bytecode evaluation loop is no longer interrupted at each bytecode instruction to check for pending signals which cannot be handled. Only the main thread of the main interpreter can handle signals.

Previously, the bytecode evaluation loop was interrupted at each instruction until the main thread handles signals.

(Contributed by Victor Stinner in [bpo-40010](https://bugs.python.org/issue?@action=redirect&bpo=40010) [<https://bugs.python.org/issue?@action=redirect&bpo=40010>].)

- Optimized the `subprocess` module on FreeBSD using `closefrom()`. (Contributed by Ed Maste, Conrad Meyer, Kyle Evans, Kubilay Kocak and Victor Stinner in [bpo-38061](https://bugs.python.org/issue?@action=redirect&bpo=38061) [<https://bugs.python.org/issue?@action=redirect&bpo=38061>].)
- `PyLong_FromDouble()` is now up to 1.87x faster for values that fit into long. (Contributed by Sergey Fedoseev in [bpo-37986](https://bugs.python.org/issue?@action=redirect&bpo=37986) [<https://bugs.python.org/issue?@action=redirect&bpo=37986>].)
- A number of Python builtins (`range`, `tuple`, `set`, `frozenset`, `list`, `dict`) are now sped up by using PEP 590 [<https://peps.python.org/pep-0590/>] vectorcall protocol. (Contributed by Dong-hee Na, Mark Shannon, Jeroen Demeyer and Petr Viktorin in [bpo-37207](https://bugs.python.org/issue?@action=redirect&bpo=37207) [<https://bugs.python.org/issue?@action=redirect&bpo=37207>].)
- Optimized `difference_update()` for the case when the other set is much larger than the base set. (Suggested by Evgeny Kapun with code contributed by Michele Orrù in [bpo-8425](https://bugs.python.org/issue?@action=redirect&bpo=8425) [<https://bugs.python.org/issue?@action=redirect&bpo=8425>].)
- Python's small object allocator (`obmalloc.c`) now allows (no more than) one empty arena to remain available for immediate reuse, without returning it to the OS. This prevents thrashing in simple loops where an arena could be

created and destroyed anew on each iteration. (Contributed by Tim Peters in [bpo-37257](https://bugs.python.org/issue?@action=redirect&bpo=37257) [https://bugs.python.org/issue?@action=redirect&bpo=37257].)

- [floor division](https://bugs.python.org/issue?@action=redirect&bpo=39434) of float operation now has a better performance. Also the message of [ZeroDivisionError](https://bugs.python.org/issue?@action=redirect&bpo=39434) for this operation is updated. (Contributed by Dong-hee Na in [bpo-39434](https://bugs.python.org/issue?@action=redirect&bpo=39434) [https://bugs.python.org/issue?@action=redirect&bpo=39434].)
- Decoding short ASCII strings with UTF-8 and ascii codecs is now about 15% faster. (Contributed by Inada Naoki in [bpo-37348](https://bugs.python.org/issue?@action=redirect&bpo=37348) [https://bugs.python.org/issue?@action=redirect&bpo=37348].)

Here's a summary of performance improvements from Python 3.4 through Python 3.9:

Python version	3.4	3.5	3.6
-----	---	---	---
Variable and attribute read access:			
read_local	7.1	7.1	5.4
read_nonlocal	7.1	8.1	5.8
read_global	15.5	19.0	14.3
read_builtin	21.1	21.6	18.5
read_classvar_from_class	25.6	26.5	20.7
read_classvar_from_instance	22.8	23.5	18.8
read_instancevar	32.4	33.1	28.0
read_instancevar_slots	27.8	31.3	20.8
read_namedtuple	73.8	57.5	45.0
read_boundmethod	37.6	37.9	29.6
Variable and attribute write access:			
write_local	8.7	9.3	5.5
write_nonlocal	10.5	11.1	5.6
write_global	19.7	21.2	18.0
write_classvar	92.9	96.0	104.6
write_instancevar	44.6	45.8	40.0
write_instancevar_slots	35.6	36.1	27.3

Data structure read access:

read_list	24.2	24.5	20.8
read_deque	24.7	25.5	20.2
read_dict	24.3	25.7	22.3
read_strdict	22.6	24.3	19.5

Data structure write access:

write_list	27.1	28.5	22.5
write_deque	28.7	30.1	22.7
write_dict	31.4	33.3	29.3
write_strdict	28.4	29.9	27.5

Stack (or queue) operations:

list_append_pop	93.4	112.7	75.4
deque_append_pop	43.5	57.0	49.4
deque_append_popleft	43.7	57.3	49.7

Timing loop:

loop_overhead	0.5	0.6	0.4
---------------	-----	-----	-----

These results were generated from the variable access benchmark script at: `Tools/scripts/var_access_benchmark.py`. The benchmark script displays timings in nanoseconds. The benchmarks were measured on an [Intel® Core™ i7-4960HQ processor](https://ark.intel.com/content/www/us/en/ark/products/76088/intel-core-i7-4960hq-processor-6m-cache-up-to-3-80-ghz.html) [https://ark.intel.com/content/www/us/en/ark/products/76088/intel-core-i7-4960hq-processor-6m-cache-up-to-3-80-ghz.html] running the macOS 64-bit builds found at [python.org](https://www.python.org/downloads/macos/) [https://www.python.org/downloads/macos/].

## Deprecated

- The distutils `bdist_msi` command is now deprecated, use `bdist_wheel` (wheel packages) instead. (Contributed by Hugo van Kemenade in [bpo-39586](https://bugs.python.org/issue?@action=redirect&bpo=39586) [https://bugs.python.org/issue?@action=redirect&bpo=39586].)
- Currently `math.factorial()` accepts `float` instances with non-negative integer values (like `5.0`). It raises a `ValueError` for non-integral and negative floats. It is now

deprecated. In future Python versions it will raise a **`TypeError`** for all floats. (Contributed by Serhiy Storchaka in [bpo-37315](https://bugs.python.org/issue?@action=redirect&bpo=37315) [https://bugs.python.org/issue?@action=redirect&bpo=37315].)

- The **`parser`** and **`symbol`** modules are deprecated and will be removed in future versions of Python. For the majority of use cases, users can leverage the Abstract Syntax Tree (AST) generation and compilation stage, using the **`ast`** module.
- The Public C API functions **`PyParser_SimpleParseStringFlags()`**, **`PyParser_SimpleParseStringFlagsFilename()`**, **`PyParser_SimpleParseFileFlags()`** and **`PyNode_Compile()`** are deprecated and will be removed in Python 3.10 together with the old parser.
- Using **`NotImplemented`** in a boolean context has been deprecated, as it is almost exclusively the result of incorrect rich comparator implementations. It will be made a **`TypeError`** in a future version of Python. (Contributed by Josh Rosenberg in [bpo-35712](https://bugs.python.org/issue?@action=redirect&bpo=35712) [https://bugs.python.org/issue?@action=redirect&bpo=35712].)
- The **`random`** module currently accepts any hashable type as a possible seed value. Unfortunately, some of those types are not guaranteed to have a deterministic hash value. After Python 3.9, the module will restrict its seeds to **`None`**, **`int`**, **`float`**, **`str`**, **`bytes`**, and **`bytearray`**.
- Opening the **`GzipFile`** file for writing without specifying the *mode* argument is deprecated. In future Python versions it will always be opened for reading by default. Specify the *mode* argument for opening it for writing and silencing a warning. (Contributed by Serhiy Storchaka in [bpo-28286](https://bugs.python.org/issue?@action=redirect&bpo=28286) [https://bugs.python.org/issue?@action=redirect&bpo=28286].)
- Deprecated the **`split()`** method of **`_tkinter.TkappType`** in favour of the **`splitlist()`** method which has more consistent and predicable behavior. (Contributed by Serhiy Storchaka in [bpo-38371](https://bugs.python.org/issue?@action=redirect&bpo=38371) [https://bugs.python.org/issue?@action=redirect&bpo=38371].)

[bugs.python.org/issue?@action=redirect&bpo=38371](https://bugs.python.org/issue?@action=redirect&bpo=38371).)

- The explicit passing of coroutine objects to `asyncio.wait()` has been deprecated and will be removed in version 3.11. (Contributed by Yury Selivanov and Kyle Stanley in [bpo-34790](https://bugs.python.org/issue?@action=redirect&bpo=34790) [<https://bugs.python.org/issue?@action=redirect&bpo=34790>].)

- `binhex4` and `hexbin4` standards are now deprecated. The `binhex` module and the following `binascii` functions are now deprecated:

- `b2a_hqx()`, `a2b_hqx()`
- `rlecode_hqx()`, `rledecode_hqx()`

(Contributed by Victor Stinner in [bpo-39353](https://bugs.python.org/issue?@action=redirect&bpo=39353) [<https://bugs.python.org/issue?@action=redirect&bpo=39353>].)

- `ast` classes `slice`, `Index` and `ExtSlice` are considered deprecated and will be removed in future Python versions. `value` itself should be used instead of `Index(value)`. `Tuple(slices, Load())` should be used instead of `ExtSlice(slices)`. (Contributed by Serhiy Storchaka in [bpo-34822](https://bugs.python.org/issue?@action=redirect&bpo=34822) [<https://bugs.python.org/issue?@action=redirect&bpo=34822>].)
- `ast` classes `Suite`, `Param`, `AugLoad` and `AugStore` are considered deprecated and will be removed in future Python versions. They were not generated by the parser and not accepted by the code generator in Python 3. (Contributed by Batuhan Taskaya in [bpo-39639](https://bugs.python.org/issue?@action=redirect&bpo=39639) [<https://bugs.python.org/issue?@action=redirect&bpo=39639>] and [bpo-39969](https://bugs.python.org/issue?@action=redirect&bpo=39969) [<https://bugs.python.org/issue?@action=redirect&bpo=39969>] and Serhiy Storchaka in [bpo-39988](https://bugs.python.org/issue?@action=redirect&bpo=39988) [<https://bugs.python.org/issue?@action=redirect&bpo=39988>].)
- The `PyEval_InitThreads()` and `PyEval_ThreadsInitialized()` functions are now deprecated and will be removed in Python 3.11. Calling `PyEval_InitThreads()` now does nothing. The GIL is initialized by `Py_Initialize()` since Python 3.7.

(Contributed by Victor Stinner in [bpo-39877](https://bugs.python.org/issue/?@action=redirect&bpo=39877) [https://bugs.python.org/issue/?@action=redirect&bpo=39877].)

- Passing `None` as the first argument to the `shlex.split()` function has been deprecated. (Contributed by Zackery Spytz in [bpo-33262](https://bugs.python.org/issue/?@action=redirect&bpo=33262) [https://bugs.python.org/issue/?@action=redirect&bpo=33262].)
- `smtpd.MailmanProxy()` is now deprecated as it is unusable without an external module, `mailman`. (Contributed by Samuel Colvin in [bpo-35800](https://bugs.python.org/issue/?@action=redirect&bpo=35800) [https://bugs.python.org/issue/?@action=redirect&bpo=35800].)
- The `lib2to3` module now emits a `PendingDeprecationWarning`. Python 3.9 switched to a PEG parser (see [PEP 617](https://peps.python.org/pep-0617/) [https://peps.python.org/pep-0617/]), and Python 3.10 may include new language syntax that is not parsable by `lib2to3`'s LL(1) parser. The `lib2to3` module may be removed from the standard library in a future Python version. Consider third-party alternatives such as `LibCST` [https://libcst.readthedocs.io/] or `parso` [https://parso.readthedocs.io/]. (Contributed by Carl Meyer in [bpo-40360](https://bugs.python.org/issue/?@action=redirect&bpo=40360) [https://bugs.python.org/issue/?@action=redirect&bpo=40360].)
- The `random` parameter of `random.shuffle()` has been deprecated. (Contributed by Raymond Hettinger in [bpo-40465](https://bugs.python.org/issue/?@action=redirect&bpo=40465) [https://bugs.python.org/issue/?@action=redirect&bpo=40465].)

## Removed

- The erroneous version at `unittest.mock.__version__` has been removed.
- `ntplib.NNTP`: `xpath()` and `xgtitle()` methods have been removed. These methods are deprecated since Python 3.3. Generally, these extensions are not supported or not enabled by NNTP server administrators. For `xgtitle()`, please use `ntplib.NNTP.descriptions()` or `ntplib.NNTP.description()` instead. (Contributed by Dong-hee Na in [bpo-39366](https://bugs.python.org/issue/?@action=redirect&bpo=39366) [https://bugs.python.org/issue/?@action=redirect&bpo=39366].)

@action=redirect&bpo=39366].)

- **array.array**: `tostring()` and `fromstring()` methods have been removed. They were aliases to `tobytes()` and `frombytes()`, deprecated since Python 3.2. (Contributed by Victor Stinner in [bpo-38916](https://bugs.python.org/issue?@action=redirect&bpo=38916) [https://bugs.python.org/issue?@action=redirect&bpo=38916].)
- The undocumented `sys.callstats()` function has been removed. Since Python 3.7, it was deprecated and always returned **None**. It required a special build option `CALL_PROFILE` which was already removed in Python 3.7. (Contributed by Victor Stinner in [bpo-37414](https://bugs.python.org/issue?@action=redirect&bpo=37414) [https://bugs.python.org/issue?@action=redirect&bpo=37414].)
- The `sys.getcheckinterval()` and `sys.setcheckinterval()` functions have been removed. They were deprecated since Python 3.2. Use **`sys.getswitchinterval()`** and **`sys.setswitchinterval()`** instead. (Contributed by Victor Stinner in [bpo-37392](https://bugs.python.org/issue?@action=redirect&bpo=37392) [https://bugs.python.org/issue?@action=redirect&bpo=37392].)
- The C function `PyImport_Cleanup()` has been removed. It was documented as: “Empty the module table. For internal use only.” (Contributed by Victor Stinner in [bpo-36710](https://bugs.python.org/issue?@action=redirect&bpo=36710) [https://bugs.python.org/issue?@action=redirect&bpo=36710].)
- `_dummy_thread` and `dummy_threading` modules have been removed. These modules were deprecated since Python 3.7 which requires threading support. (Contributed by Victor Stinner in [bpo-37312](https://bugs.python.org/issue?@action=redirect&bpo=37312) [https://bugs.python.org/issue?@action=redirect&bpo=37312].)
- `aifc.openfp()` alias to `aifc.open()`, `sunau.openfp()` alias to `sunau.open()`, and `wave.openfp()` alias to **`wave.open()`** have been removed. They were deprecated since Python 3.7. (Contributed by Victor Stinner in [bpo-37320](https://bugs.python.org/issue?@action=redirect&bpo=37320) [https://bugs.python.org/issue?@action=redirect&bpo=37320].)
- The **`isAlive()`** method of **`threading.Thread`** has been removed. It was deprecated since Python 3.8. Use **`is_alive()`** instead. (Contributed by Dong-hee Na in [bpo-37804](https://bugs.python.org/issue?@action=redirect&bpo=37804) [https://bugs.python.org/issue?@action=redirect&bpo=37804].)
- Methods `getchildren()` and `getiterator()` of classes

`ElementTree` and `Element` in the `ElementTree` module have been removed. They were deprecated in Python 3.2. Use `iter(x)` or `list(x)` instead of `x.getchildren()` and `x.iter()` or `list(x.iter())` instead of `x.getiterator()`. (Contributed by Serhiy Storchaka in [bpo-36543](https://bugs.python.org/issue?@action=redirect&bpo=36543) [https://bugs.python.org/issue?@action=redirect&bpo=36543].)

- The old `plistlib` API has been removed, it was deprecated since Python 3.4. Use the `load()`, `loads()`, `dump()`, and `dumps()` functions. Additionally, the `use_builtin_types` parameter was removed, standard `bytes` objects are always used instead. (Contributed by Jon Janzen in [bpo-36409](https://bugs.python.org/issue?@action=redirect&bpo=36409) [https://bugs.python.org/issue?@action=redirect&bpo=36409].)
- The C function `PyGen_NeedsFinalizing` has been removed. It was not documented, tested, or used anywhere within CPython after the implementation of [PEP 442](https://peps.python.org/pep-0442/) [https://peps.python.org/pep-0442/]. Patch by Joannah Nanjeyke. (Contributed by Joannah Nanjeyke in [bpo-15088](https://bugs.python.org/issue?@action=redirect&bpo=15088) [https://bugs.python.org/issue?@action=redirect&bpo=15088])
- `base64.encodestring()` and `base64.decodestring()`, aliases deprecated since Python 3.1, have been removed: use `base64.encodebytes()` and `base64.decodebytes()` instead. (Contributed by Victor Stinner in [bpo-39351](https://bugs.python.org/issue?@action=redirect&bpo=39351) [https://bugs.python.org/issue?@action=redirect&bpo=39351].)
- `fractions.gcd()` function has been removed, it was deprecated since Python 3.5 ([bpo-22486](https://bugs.python.org/issue?@action=redirect&bpo=22486) [https://bugs.python.org/issue?@action=redirect&bpo=22486]): use `math.gcd()` instead. (Contributed by Victor Stinner in [bpo-39350](https://bugs.python.org/issue?@action=redirect&bpo=39350) [https://bugs.python.org/issue?@action=redirect&bpo=39350].)
- The `buffering` parameter of `bz2.BZ2File` has been removed. Since Python 3.0, it was ignored and using it emitted a `DeprecationWarning`. Pass an open file object to control how the file is opened. (Contributed by Victor Stinner in [bpo-39357](https://bugs.python.org/issue?@action=redirect&bpo=39357) [https://bugs.python.org/issue?@action=redirect&bpo=39357].)
- The `encoding` parameter of `json.loads()` has been removed. As of Python 3.1, it was deprecated and ignored; using it has emitted a `DeprecationWarning` since Python 3.8. (Contributed by Inada Naoki in [bpo-39377](https://bugs.python.org/issue?@action=redirect&bpo=39377) [https://bugs.python.org/issue?@action=redirect&bpo=39377].)

- bugs.python.org/issue?@action=redirect&bpo=39377])
- `with (await asyncio.lock):` and `with (yield from asyncio.lock):` statements are no longer supported, use `async with lock` instead. The same is correct for `asyncio.Condition` and `asyncio.Semaphore`. (Contributed by Andrew Svetlov in [bpo-34793](https://bugs.python.org/issue?@action=redirect&bpo=34793) [https://bugs.python.org/issue?@action=redirect&bpo=34793].)
- The `sys.getcounts()` function, the `-X showalloccount` command line option and the `show_alloc_count` field of the C structure `PyConfig` have been removed. They required a special Python build by defining `COUNT_ALLOCS` macro. (Contributed by Victor Stinner in [bpo-39489](https://bugs.python.org/issue?@action=redirect&bpo=39489) [https://bugs.python.org/issue?@action=redirect&bpo=39489].)
- The `_field_types` attribute of the `typing.NamedTuple` class has been removed. It was deprecated since Python 3.8. Use the `__annotations__` attribute instead. (Contributed by Serhiy Storchaka in [bpo-40182](https://bugs.python.org/issue?@action=redirect&bpo=40182) [https://bugs.python.org/issue?@action=redirect&bpo=40182].)
- The `symtable.SymbolTable.has_exec()` method has been removed. It was deprecated since 2006, and only returning `False` when it's called. (Contributed by Batuhan Taskaya in [bpo-40208](https://bugs.python.org/issue?@action=redirect&bpo=40208) [https://bugs.python.org/issue?@action=redirect&bpo=40208])
- The `asyncio.Task.current_task()` and `asyncio.Task.all_tasks()` have been removed. They were deprecated since Python 3.7 and you can use `asyncio.current_task()` and `asyncio.all_tasks()` instead. (Contributed by Rémi Lapeyre in [bpo-40967](https://bugs.python.org/issue?@action=redirect&bpo=40967) [https://bugs.python.org/issue?@action=redirect&bpo=40967])
- The `unescape()` method in the `html.parser.HTMLParser` class has been removed (it was deprecated since Python 3.4). `html.unescape()` should be used for converting character references to the corresponding unicode characters.

## Porting to Python 3.9

This section lists previously described changes and other bugfixes that may require changes to your code.

## Changes in the Python API

- `__import__()` and `importlib.util.resolve_name()` now raise `ImportError` where it previously raised `ValueError`. Callers catching the specific exception type and supporting both Python 3.9 and earlier versions will need to catch both using `except (ImportError, ValueError):`.
- The `venv` activation scripts no longer special-case when `__VENV_PROMPT__` is set to `""`.
- The `select.epoll.unregister()` method no longer ignores the `EBADF` error. (Contributed by Victor Stinner in [bpo-39239](https://bugs.python.org/issue?@action=redirect&bpo=39239) [<https://bugs.python.org/issue?@action=redirect&bpo=39239>].)
- The `compresslevel` parameter of `bz2.BZ2File` became keyword-only, since the `buffering` parameter has been removed. (Contributed by Victor Stinner in [bpo-39357](https://bugs.python.org/issue?@action=redirect&bpo=39357) [<https://bugs.python.org/issue?@action=redirect&bpo=39357>].)
- Simplified AST for subscription. Simple indices will be represented by their value, extended slices will be represented as tuples. `Index(value)` will return a value itself, `ExtSlice(slices)` will return `Tuple(slices, Load())`. (Contributed by Serhiy Storchaka in [bpo-34822](https://bugs.python.org/issue?@action=redirect&bpo=34822) [<https://bugs.python.org/issue?@action=redirect&bpo=34822>].)
- The `importlib` module now ignores the `PYTHONCASEOK` environment variable when the `-E` or `-I` command line options are being used.
- The `encoding` parameter has been added to the classes `ftplib.FTP` and `ftplib.FTP_TLS` as a keyword-only parameter, and the default encoding is changed from Latin-1 to UTF-8 to follow [RFC 2640](https://datatracker.ietf.org/doc/html/rfc2640) [<https://datatracker.ietf.org/doc/html/rfc2640>].
- `asyncio.loop.shutdown_default_executor()` has been added to `AbstractEventLoop`, meaning alternative event loops that inherit from it should have this method defined. (Contributed by Kyle Stanley in [bpo-34037](https://bugs.python.org/issue?@action=redirect&bpo=34037) [<https://bugs.python.org/issue?@action=redirect&bpo=34037>].)

- The constant values of future flags in the `__future__` module is updated in order to prevent collision with compiler flags. Previously `PyCF_ALLOW_TOP_LEVEL_AWAIT` was clashing with `CO_FUTURE_DIVISION`. (Contributed by Batuhan Taskaya in [bpo-39562](https://bugs.python.org/issue?@action=redirect&bpo=39562) [https://bugs.python.org/issue?@action=redirect&bpo=39562])
- `array('u')` now uses `wchar_t` as C type instead of `Py_UNICODE`. This change doesn't affect to its behavior because `Py_UNICODE` is alias of `wchar_t` since Python 3.3. (Contributed by Inada Naoki in [bpo-34538](https://bugs.python.org/issue?@action=redirect&bpo=34538) [https://bugs.python.org/issue?@action=redirect&bpo=34538].)
- The `logging.getLogger()` API now returns the root logger when passed the name `'root'`, whereas previously it returned a non-root logger named `'root'`. This could affect cases where user code explicitly wants a non-root logger named `'root'`, or instantiates a logger using `logging.getLogger(__name__)` in some top-level module called `'root.py'`. (Contributed by Vinay Sajip in [bpo-37742](https://bugs.python.org/issue?@action=redirect&bpo=37742) [https://bugs.python.org/issue?@action=redirect&bpo=37742].)
- Division handling of `PurePath` now returns `NotImplemented` instead of raising a `TypeError` when passed something other than an instance of `str` or `PurePath`. This allows creating compatible classes that don't inherit from those mentioned types. (Contributed by Roger Aiudi in [bpo-34775](https://bugs.python.org/issue?@action=redirect&bpo=34775) [https://bugs.python.org/issue?@action=redirect&bpo=34775].)
- Starting with Python 3.9.5 the `ipaddress` module no longer accepts any leading zeros in IPv4 address strings. Leading zeros are ambiguous and interpreted as octal notation by some libraries. For example the legacy function `socket.inet_aton()` treats leading zeros as octal notation. glibc implementation of modern `inet_pton()` does not accept any leading zeros. (Contributed by Christian Heimes in [bpo-36384](https://bugs.python.org/issue?@action=redirect&bpo=36384) [https://bugs.python.org/issue?@action=redirect&bpo=36384].)
- `codecs.lookup()` now normalizes the encoding name the same way as `encodings.normalize_encoding()`, except that `codecs.lookup()` also converts the name to lower case. For example, `"latex+latin1"` encoding name is now

normalized to "latex\_latin1". (Contributed by Jordon Xu in [bpo-37751](https://bugs.python.org/issue?@action=redirect&bpo=37751) [https://bugs.python.org/issue?@action=redirect&bpo=37751].)

## Changes in the C API

- Instances of [heap-allocated types](#) (such as those created with [PyType\\_FromSpec\(\)](#) and similar APIs) hold a reference to their type object since Python 3.8. As indicated in the “Changes in the C API” of Python 3.8, for the vast majority of cases, there should be no side effect but for types that have a custom [tp\\_traverse](#) function, ensure that all custom `tp_traverse` functions of heap-allocated types visit the object’s type.

Example:

```
int
foo_traverse(foo_struct *self, visitproc visi
// Rest of the traverse function
#if PY_VERSION_HEX >= 0x03090000
    // This was not needed before Python 3.9
    Py_VISIT(Py_TYPE(self));
#endif
}
```

If your traverse function delegates to `tp_traverse` of its base class (or another type), ensure that `Py_TYPE(self)` is visited only once. Note that only [heap type](#) are expected to visit the type in `tp_traverse`.

For example, if your `tp_traverse` function includes:

```
base->tp_traverse(self, visit, arg)
```

then add:

```
#if PY_VERSION_HEX >= 0x03090000
    // This was not needed before Python 3.9
    if (base->tp_flags & Py_TPFLAGS_HEAPTYPE)
```

```

        // a heap type's tp_traverse already
    } else {
        Py_VISIT(Py_TYPE(self));
    }
#else

```

(See [bpo-35810](https://bugs.python.org/issue?@action=redirect&bpo=35810) [https://bugs.python.org/issue?@action=redirect&bpo=35810] and [bpo-40217](https://bugs.python.org/issue?@action=redirect&bpo=40217) [https://bugs.python.org/issue?@action=redirect&bpo=40217] for more information.)

- The functions `PyEval_CallObject`, `PyEval_CallFunction`, `PyEval_CallMethod` and `PyEval_CallObjectWithKeywords` are deprecated. Use `PyObject_Call()` and its variants instead. (See more details in [bpo-29548](https://bugs.python.org/issue?@action=redirect&bpo=29548) [https://bugs.python.org/issue?@action=redirect&bpo=29548].)

## CPython bytecode changes

- The `LOAD_ASSERTION_ERROR` opcode was added for handling the `assert` statement. Previously, the `assert` statement would not work correctly if the `AssertionError` exception was being shadowed. (Contributed by Zackery Spytz in [bpo-34880](https://bugs.python.org/issue?@action=redirect&bpo=34880) [https://bugs.python.org/issue?@action=redirect&bpo=34880].)
- The `COMPARE_OP` opcode was split into four distinct instructions:
  - `COMPARE_OP` for rich comparisons
  - `IS_OP` for ‘is’ and ‘is not’ tests
  - `CONTAINS_OP` for ‘in’ and ‘not in’ tests
  - `JUMP_IF_NOT_EXC_MATCH` for checking exceptions in ‘try-except’ statements.

(Contributed by Mark Shannon in [bpo-39156](https://bugs.python.org/issue?@action=redirect&bpo=39156) [https://bugs.python.org/issue?@action=redirect&bpo=39156].)

## Build Changes

- Added `--with-platlibdir` option to the `configure` script: name of the platform-specific library directory, stored in the new `sys.platlibdir` attribute. See `sys.platlibdir` attribute for more information. (Contributed by Jan Matějek, Matěj Cepl, Charalampos Stratakis and Victor Stinner in [bpo-1294959](https://bugs.python.org/issue?@action=redirect&bpo=1294959) [https://bugs.python.org/issue?@action=redirect&bpo=1294959].)
- The `COUNT_ALLOCS` special build macro has been removed. (Contributed by Victor Stinner in [bpo-39489](https://bugs.python.org/issue?@action=redirect&bpo=39489) [https://bugs.python.org/issue?@action=redirect&bpo=39489].)
- On non-Windows platforms, the `setenv()` and `unsetenv()` functions are now required to build Python. (Contributed by Victor Stinner in [bpo-39395](https://bugs.python.org/issue?@action=redirect&bpo=39395) [https://bugs.python.org/issue?@action=redirect&bpo=39395].)
- On non-Windows platforms, creating `bdist_wininst` installers is now officially unsupported. (See [bpo-10945](https://bugs.python.org/issue?@action=redirect&bpo=10945) [https://bugs.python.org/issue?@action=redirect&bpo=10945] for more details.)
- When building Python on macOS from source, `_tkinter` now links with non-system Tcl and Tk frameworks if they are installed in `/Library/Frameworks`, as had been the case on older releases of macOS. If a macOS SDK is explicitly configured, by using `--enable-universalsdk` or `--sysroot`, only the SDK itself is searched. The default behavior can still be overridden with `--with-tcltk-includes` and `--with-tcltk-libs`. (Contributed by Ned Deily in [bpo-34956](https://bugs.python.org/issue?@action=redirect&bpo=34956) [https://bugs.python.org/issue?@action=redirect&bpo=34956].)
- Python can now be built for Windows 10 ARM64. (Contributed by Steve Dower in [bpo-33125](https://bugs.python.org/issue?@action=redirect&bpo=33125) [https://bugs.python.org/issue?@action=redirect&bpo=33125].)
- Some individual tests are now skipped when `--pgo` is used. The tests in question increased the PGO task time significantly and likely didn't help improve optimization of the final executable. This speeds up the task by a factor of about 15x. Running the full unit test suite is slow. This change may result in a slightly less optimized build since not as many code branches will be executed. If you are willing to wait for the much slower build, the old behavior can be restored using `./configure [...] PROFILE_TASK="-m`

test --pgo-extended". We make no guarantees as to which PGO task set produces a faster build. Users who care should run their own relevant benchmarks as results can depend on the environment, workload, and compiler tool chain. (See [bpo-36044](https://bugs.python.org/issue?@action=redirect&bpo=36044) [https://bugs.python.org/issue?@action=redirect&bpo=36044] and [bpo-37707](https://bugs.python.org/issue?@action=redirect&bpo=37707) [https://bugs.python.org/issue?@action=redirect&bpo=37707] for more details.)

## C API Changes

### New Features

- [PEP 573](https://peps.python.org/pep-0573/) [https://peps.python.org/pep-0573/]: Added [PyType\\_FromModuleAndSpec\(\)](#) to associate a module with a class; [PyType\\_GetModule\(\)](#) and [PyType\\_GetModuleState\(\)](#) to retrieve the module and its state; and [PyCMethod](#) and [METH\\_METHOD](#) to allow a method to access the class it was defined in. (Contributed by Marcel Plch and Petr Viktorin in [bpo-38787](https://bugs.python.org/issue?@action=redirect&bpo=38787) [https://bugs.python.org/issue?@action=redirect&bpo=38787].)
- Added [PyFrame\\_GetCode\(\)](#) function: get a frame code. Added [PyFrame\\_GetBack\(\)](#) function: get the frame next outer frame. (Contributed by Victor Stinner in [bpo-40421](https://bugs.python.org/issue?@action=redirect&bpo=40421) [https://bugs.python.org/issue?@action=redirect&bpo=40421].)
- Added [PyFrame\\_GetLineNumber\(\)](#) to the limited C API. (Contributed by Victor Stinner in [bpo-40421](https://bugs.python.org/issue?@action=redirect&bpo=40421) [https://bugs.python.org/issue?@action=redirect&bpo=40421].)
- Added [PyThreadState\\_GetInterpreter\(\)](#) and [PyInterpreterState\\_Get\(\)](#) functions to get the interpreter. Added [PyThreadState\\_GetFrame\(\)](#) function to get the current frame of a Python thread state. Added [PyThreadState\\_GetID\(\)](#) function: get the unique identifier of a Python thread state. (Contributed by Victor Stinner in [bpo-39947](https://bugs.python.org/issue?@action=redirect&bpo=39947) [https://bugs.python.org/issue?@action=redirect&bpo=39947].)

- Added a new public `PyObject_CallNoArgs()` function to the C API, which calls a callable Python object without any arguments. It is the most efficient way to call a callable Python object without any argument. (Contributed by Victor Stinner in [bpo-37194](https://bugs.python.org/issue?@action=redirect&bpo=37194) [https://bugs.python.org/issue?@action=redirect&bpo=37194].)
- Changes in the limited C API (if `Py_LIMITED_API` macro is defined):
  - Provide `Py_EnterRecursiveCall()` and `Py_LeaveRecursiveCall()` as regular functions for the limited API. Previously, there were defined as macros, but these macros didn't compile with the limited C API which cannot access `PyThreadState.recursion_depth` field (the structure is opaque in the limited C API).
  - `PyObject_INIT()` and `PyObject_INIT_VAR()` become regular “opaque” function to hide implementation details.

(Contributed by Victor Stinner in [bpo-38644](https://bugs.python.org/issue?@action=redirect&bpo=38644) [https://bugs.python.org/issue?@action=redirect&bpo=38644] and [bpo-39542](https://bugs.python.org/issue?@action=redirect&bpo=39542) [https://bugs.python.org/issue?@action=redirect&bpo=39542].)

- The `PyModule_AddType()` function is added to help adding a type to a module. (Contributed by Dong-hee Na in [bpo-40024](https://bugs.python.org/issue?@action=redirect&bpo=40024) [https://bugs.python.org/issue?@action=redirect&bpo=40024].)
- Added the functions `PyObject_GC_IsTracked()` and `PyObject_GC_IsFinalized()` to the public API to allow to query if Python objects are being currently tracked or have been already finalized by the garbage collector respectively. (Contributed by Pablo Galindo Salgado in [bpo-40241](https://bugs.python.org/issue?@action=redirect&bpo=40241) [https://bugs.python.org/issue?@action=redirect&bpo=40241].)
- Added `_PyObject_FunctionStr()` to get a user-friendly string representation of a function-like object. (Patch by Jeroen Demeyer in [bpo-37645](https://bugs.python.org/issue?@action=redirect&bpo=37645) [https://bugs.python.org/issue?@action=redirect&bpo=37645].)

- Added `PyObject_CallOneArg()` for calling an object with one positional argument (Patch by Jeroen Demeyer in [bpo-37483](https://bugs.python.org/issue?@action=redirect&bpo=37483) [https://bugs.python.org/issue?@action=redirect&bpo=37483].)

## Porting to Python 3.9

- `PyInterpreterState.eval_frame` ([PEP 523](https://peps.python.org/pep-0523/) [https://peps.python.org/pep-0523/]) now requires a new mandatory *tstate* parameter (`PyThreadState*`). (Contributed by Victor Stinner in [bpo-38500](https://bugs.python.org/issue?@action=redirect&bpo=38500) [https://bugs.python.org/issue?@action=redirect&bpo=38500].)
- Extension modules: `m_traverse`, `m_clear` and `m_free` functions of `PyModuleDef` are no longer called if the module state was requested but is not allocated yet. This is the case immediately after the module is created and before the module is executed (`Py_mod_exec` function). More precisely, these functions are not called if `m_size` is greater than 0 and the module state (as returned by `PyModule_GetState()`) is `NULL`.

Extension modules without module state (`m_size <= 0`) are not affected.

- If `Py_AddPendingCall()` is called in a subinterpreter, the function is now scheduled to be called from the subinterpreter, rather than being called from the main interpreter. Each subinterpreter now has its own list of scheduled calls. (Contributed by Victor Stinner in [bpo-39984](https://bugs.python.org/issue?@action=redirect&bpo=39984) [https://bugs.python.org/issue?@action=redirect&bpo=39984].)
- The Windows registry is no longer used to initialize `sys.path` when the `-E` option is used (if `PyConfig.use_environment` is set to 0). This is significant when embedding Python on Windows. (Contributed by Zackery Spytz in [bpo-8901](https://bugs.python.org/issue?@action=redirect&bpo=8901) [https://bugs.python.org/issue?@action=redirect&bpo=8901].)
- The global variable `PyStructSequence_UnnamedField` is now a constant and refers to a constant string. (Contributed

by Serhiy Storchaka in [bpo-38650](https://bugs.python.org/issue?@action=redirect&bpo=38650) [https://bugs.python.org/issue?@action=redirect&bpo=38650].)

- The **PyGC\_Head** structure is now opaque. It is only defined in the internal C API (`pycore_gc.h`). (Contributed by Victor Stinner in [bpo-40241](https://bugs.python.org/issue?@action=redirect&bpo=40241) [https://bugs.python.org/issue?@action=redirect&bpo=40241].)
- The `Py_UNICODE_COPY`, `Py_UNICODE_FILL`, `PyUnicode_WSTR_LENGTH`, [PyUnicode\\_FromUnicode\(\)](#), [PyUnicode\\_AsUnicode\(\)](#), `_PyUnicode_AsUnicode`, and [PyUnicode\\_AsUnicodeAndSize\(\)](#) are marked as deprecated in C. They have been deprecated by [PEP 393](#) [https://peps.python.org/pep-0393/] since Python 3.3. (Contributed by Inada Naoki in [bpo-36346](https://bugs.python.org/issue?@action=redirect&bpo=36346) [https://bugs.python.org/issue?@action=redirect&bpo=36346].)
- The [Py\\_FatalError\(\)](#) function is replaced with a macro which logs automatically the name of the current function, unless the `Py_LIMITED_API` macro is defined. (Contributed by Victor Stinner in [bpo-39882](https://bugs.python.org/issue?@action=redirect&bpo=39882) [https://bugs.python.org/issue?@action=redirect&bpo=39882].)
- The vectorcall protocol now requires that the caller passes only strings as keyword names. (See [bpo-37540](https://bugs.python.org/issue?@action=redirect&bpo=37540) [https://bugs.python.org/issue?@action=redirect&bpo=37540] for more information.)
- Implementation details of a number of macros and functions are now hidden:
  - [PyObject\\_IS\\_GC\(\)](#) macro was converted to a function.
  - The [PyObject\\_NEW\(\)](#) macro becomes an alias to the [PyObject\\_New\(\)](#) macro, and the [PyObject\\_NEW\\_VAR\(\)](#) macro becomes an alias to the [PyObject\\_NewVar\(\)](#) macro. They no longer access directly the [PyTypeObject.tp\\_basicsize](#) member.
  - [PyObject\\_GET\\_WEAKREFS\\_LISTPTR\(\)](#) macro was converted to a function: the macro accessed directly the [PyTypeObject.tp\\_weaklistoffset](#) member.

- `PyObject_CheckBuffer()` macro was converted to a function: the macro accessed directly the `PyObject.tp_as_buffer` member.
- `PyIndex_Check()` is now always declared as an opaque function to hide implementation details: removed the `PyIndex_Check()` macro. The macro accessed directly the `PyObject.tp_as_number` member.

(See [bpo-40170](https://bugs.python.org/issue?@action=redirect&bpo=40170) [https://bugs.python.org/issue?@action=redirect&bpo=40170] for more details.)

## Removed

- Excluded `PyFPE_START_PROTECT()` and `PyFPE_END_PROTECT()` macros of `pyfpe.h` from the limited C API. (Contributed by Victor Stinner in [bpo-38835](https://bugs.python.org/issue?@action=redirect&bpo=38835) [https://bugs.python.org/issue?@action=redirect&bpo=38835].)
- The `tp_print` slot of `PyObject` has been removed. It was used for printing objects to files in Python 2.7 and before. Since Python 3.0, it has been ignored and unused. (Contributed by Jeroen Demeyer in [bpo-36974](https://bugs.python.org/issue?@action=redirect&bpo=36974) [https://bugs.python.org/issue?@action=redirect&bpo=36974].)
- Changes in the limited C API (if `Py_LIMITED_API` macro is defined):
  - Excluded the following functions from the limited C API:
    - `PyThreadState_DeleteCurrent()` (Contributed by Joannah Nanjeyye in [bpo-37878](https://bugs.python.org/issue?@action=redirect&bpo=37878) [https://bugs.python.org/issue?@action=redirect&bpo=37878].)
    - `_Py_CheckRecursionLimit`
    - `_Py_NewReference()`
    - `_Py_ForgetReference()`
    - `_PyTraceMalloc_NewReference()`
    - `_Py_GetRefTotal()`
    - The trashcan mechanism which never worked in the limited C API.

- PyTrash\_UNWIND\_LEVEL
- Py\_TRASHCAN\_BEGIN\_CONDITION
- Py\_TRASHCAN\_BEGIN
- Py\_TRASHCAN\_END
- Py\_TRASHCAN\_SAFE\_BEGIN
- Py\_TRASHCAN\_SAFE\_END
- Moved following functions and definitions to the internal C API:
  - \_PyDebug\_PrintTotalRefs()
  - \_Py\_PrintReferences()
  - \_Py\_PrintReferenceAddresses()
  - \_Py\_tracemalloc\_config
  - \_Py\_AddToAllObjects() (specific to Py\_TRACE\_REFS build)

(Contributed by Victor Stinner in [bpo-38644](https://bugs.python.org/issue/?@action=redirect&bpo=38644) [https://bugs.python.org/issue/?@action=redirect&bpo=38644] and [bpo-39542](https://bugs.python.org/issue/?@action=redirect&bpo=39542) [https://bugs.python.org/issue/?@action=redirect&bpo=39542].)

- Removed `_PyRuntime.getframe` hook and removed `_PyThreadState_GetFrame` macro which was an alias to `_PyRuntime.getframe`. They were only exposed by the internal C API. Removed also `PyThreadFrameGetter` type. (Contributed by Victor Stinner in [bpo-39946](https://bugs.python.org/issue/?@action=redirect&bpo=39946) [https://bugs.python.org/issue/?@action=redirect&bpo=39946].)
- Removed the following functions from the C API. Call [`PyGC\_Collect\(\)`](#) explicitly to clear all free lists. (Contributed by Inada Naoki and Victor Stinner in [bpo-37340](https://bugs.python.org/issue/?@action=redirect&bpo=37340) [https://bugs.python.org/issue/?@action=redirect&bpo=37340], [bpo-38896](https://bugs.python.org/issue/?@action=redirect&bpo=38896) [https://bugs.python.org/issue/?@action=redirect&bpo=38896] and [bpo-40428](https://bugs.python.org/issue/?@action=redirect&bpo=40428) [https://bugs.python.org/issue/?@action=redirect&bpo=40428].)
- `PyAsyncGen_ClearFreeLists()`
- `PyContext_ClearFreeList()`
- `PyDict_ClearFreeList()`
- `PyFloat_ClearFreeList()`
- `PyFrame_ClearFreeList()`
- `PyList_ClearFreeList()`
- `PyMethod_ClearFreeList()` and

- PyCFunction\_ClearFreeList(): the free lists of bound method objects have been removed.
  - PySet\_ClearFreeList(): the set free list has been removed in Python 3.4.
  - PyTuple\_ClearFreeList()
  - PyUnicode\_ClearFreeList(): the Unicode free list has been removed in Python 3.3.
- Removed `_PyUnicode_ClearStaticStrings()` function. (Contributed by Victor Stinner in [bpo-39465](https://bugs.python.org/issue?@action=redirect&bpo=39465) [https://bugs.python.org/issue?@action=redirect&bpo=39465].)
  - Removed `Py_UNICODE_MATCH`. It has been deprecated by [PEP 393](https://peps.python.org/pep-0393/) [https://peps.python.org/pep-0393/], and broken since Python 3.3. The `PyUnicode_Tailmatch()` function can be used instead. (Contributed by Inada Naoki in [bpo-36346](https://bugs.python.org/issue?@action=redirect&bpo=36346) [https://bugs.python.org/issue?@action=redirect&bpo=36346].)
  - Cleaned header files of interfaces defined but with no implementation. The public API symbols being removed are: `_PyBytes_InsertThousandsGroupingLocale`, `_PyBytes_InsertThousandsGrouping`, `_Py_InitializeFromArgs`, `_Py_InitializeFromWideArgs`, `_PyFloat_Repr`, `_PyFloat_Digits`, `_PyFloat_DigitsInit`, `PyFrame_ExtendStack`, `_PyAIterWrapper_Type`, `PyNullImporter_Type`, `PyCmpWrapper_Type`, `PySortWrapper_Type`, `PyNoArgsFunction`. (Contributed by Pablo Galindo Salgado in [bpo-39372](https://bugs.python.org/issue?@action=redirect&bpo=39372) [https://bugs.python.org/issue?@action=redirect&bpo=39372].)

## Notable changes in Python 3.9.1

### typing

The behavior of `typing.Literal` was changed to conform with [PEP 586](https://peps.python.org/pep-0586/) [https://peps.python.org/pep-0586/] and to match the behavior of static type checkers specified in the PEP.

1. `Literal` now de-duplicates parameters.

2. Equality comparisons between `Literal` objects are now order independent.
3. `Literal` comparisons now respect types. For example, `Literal[0] == Literal[False]` previously evaluated to `True`. It is now `False`. To support this change, the internally used type cache now supports differentiating types.
4. `Literal` objects will now raise a `TypeError` exception during equality comparisons if any of their parameters are not `hashable`. Note that declaring `Literal` with mutable parameters will not throw an error:

```
>>> from typing import Literal
>>> Literal[{0}]
>>> Literal[{0}] == Literal[{False}]
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
TypeError: unhashable type: 'set'
```

(Contributed by Yurii Karabas in [bpo-42345](https://bugs.python.org/issue?@action=redirect&bpo=42345) [<https://bugs.python.org/issue?@action=redirect&bpo=42345>].)

## macOS 11.0 (Big Sur) and Apple Silicon Mac support

As of 3.9.1, Python now fully supports building and running on macOS 11.0 (Big Sur) and on Apple Silicon Macs (based on the ARM64 architecture). A new universal build variant, `universal2`, is now available to natively support both ARM64 and Intel 64 in one set of executables. Binaries can also now be built on current versions of macOS to be deployed on a range of older macOS versions (tested to 10.9) while making some newer OS functions and options conditionally available based on the operating system version in use at runtime (“weaklinking”).

(Contributed by Ronald Oussoren and Lawrence D’Anna in [bpo-41100](https://bugs.python.org/issue?@action=redirect&bpo=41100) [<https://bugs.python.org/issue?@action=redirect&bpo=41100>].)

## Notable changes in Python 3.9.2

## **collections.abc**

**collections.abc.Callable** generic now flattens type parameters, similar to what **typing.Callable** currently does. This means that `collections.abc.Callable[[int, str], str]` will have `__args__` of `(int, str, str)`; previously this was `([int, str], str)`. To allow this change, **types.GenericAlias** can now be subclassed, and a subclass will be returned when subscripting the **collections.abc.Callable** type. Code which accesses the arguments via **typing.get\_args()** or `__args__` need to account for this change. A **DeprecationWarning** may be emitted for invalid forms of parameterizing **collections.abc.Callable** which may have passed silently in Python 3.9.1. This **DeprecationWarning** will become a **TypeError** in Python 3.10. (Contributed by Ken Jin in [bpo-42195](https://bugs.python.org/issue?@action=redirect&bpo=42195) [<https://bugs.python.org/issue?@action=redirect&bpo=42195>].)

## **urllib.parse**

Earlier Python versions allowed using both `;` and `&` as query parameter separators in **urllib.parse.parse\_qs()** and **urllib.parse.parse\_qsl()**. Due to security concerns, and to conform with newer W3C recommendations, this has been changed to allow only a single separator key, with `&` as the default. This change also affects **cgi.parse()** and **cgi.parse\_multipart()** as they use the affected functions internally. For more details, please see their respective documentation. (Contributed by Adam Goldschmidt, Senthil Kumaran and Ken Jin in [bpo-42967](https://bugs.python.org/issue?@action=redirect&bpo=42967) [<https://bugs.python.org/issue?@action=redirect&bpo=42967>].)

# What's New In Python 3.8

Editor

Raymond Hettinger

This article explains the new features in Python 3.8, compared to 3.7. Python 3.8 was released on October 14, 2019. For full details, see the [changelog](#).

## Summary – Release highlights

### New Features

#### Assignment expressions

There is new syntax `:=` that assigns values to variables as part of a larger expression. It is affectionately known as “the walrus operator” due to its resemblance to [the eyes and tusks of a walrus](https://en.wikipedia.org/wiki/Walrus#/media/File:Pacific_Walrus_-_Bull_(8247646168).jpg) [https://en.wikipedia.org/wiki/Walrus#/media/File:Pacific\_Walrus\_-\_Bull\_(8247646168).jpg].

In this example, the assignment expression helps avoid calling `len()` twice:

```
if (n := len(a)) > 10:
    print(f"List is too long ({n} elements, expected <=
```

A similar benefit arises during regular expression matching where match objects are needed twice, once to test whether a match occurred and another to extract a subgroup:

```
discount = 0.0
if (mo := re.search(r'(\d+)% discount', advertisement)):
    discount = float(mo.group(1)) / 100.0
```

The operator is also useful with while-loops that compute a value to test loop termination and then need that same value again in the body of the loop:

```
# Loop over fixed length blocks
while (block := f.read(256)) != '':
    process(block)
```

Another motivating use case arises in list comprehensions where a value computed in a filtering condition is also needed in the expression body:

```
[clean_name.title() for name in names
 if (clean_name := normalize('NFC', name)) in allowed_names]
```

Try to limit use of the walrus operator to clean cases that reduce complexity and improve readability.

See [PEP 572](https://peps.python.org/pep-0572/) [https://peps.python.org/pep-0572/] for a full description.

(Contributed by Emily Morehouse in [bpo-35224](https://bugs.python.org/issue?@action=redirect&bpo=35224) [https://bugs.python.org/issue?@action=redirect&bpo=35224].)

## Positional-only parameters

There is a new function parameter syntax `/` to indicate that some function parameters must be specified positionally and cannot be used as keyword arguments. This is the same notation shown by `help()` for C functions annotated with Larry Hastings' [Argument Clinic](#) tool.

In the following example, parameters *a* and *b* are positional-only, while *c* or *d* can be positional or keyword, and *e* or *f* are required to be keywords:

```
def f(a, b, /, c, d, *, e, f):
    print(a, b, c, d, e, f)
```

The following is a valid call:

```
f(10, 20, 30, d=40, e=50, f=60)
```

However, these are invalid calls:

```
f(10, b=20, c=30, d=40, e=50, f=60)    # b cannot be a keyword
f(10, 20, 30, 40, 50, f=60)            # e must be a keyword
```

One use case for this notation is that it allows pure Python functions to fully emulate behaviors of existing C coded functions. For example, the built-in `divmod()` function does not accept keyword arguments:

```
def divmod(a, b, /):
    "Emulate the built in divmod() function"
    return (a // b, a % b)
```

Another use case is to preclude keyword arguments when the parameter name is not helpful. For example, the builtin `len()` function has the signature `len(obj, /)`. This precludes awkward calls such as:

```
len(obj='hello')    # The "obj" keyword argument impairs readability
```

A further benefit of marking a parameter as positional-only is that it allows the parameter name to be changed in the future without risk of breaking client code. For example, in the `statistics` module, the parameter name `dist` may be changed in the future. This was made possible with the following function specification:

```
def quantiles(dist, /, *, n=4, method='exclusive')
    ...
```

Since the parameters to the left of `/` are not exposed as possible keywords, the parameters names remain available for use in `**kwargs`:

```
>>> def f(a, b, /, **kwargs):
...     print(a, b, kwargs)
...
>>> f(10, 20, a=1, b=2, c=3)           # a and b are used
10 20 {'a': 1, 'b': 2, 'c': 3}
```

This greatly simplifies the implementation of functions and methods

that need to accept arbitrary keyword arguments. For example, here is an excerpt from code in the `collections` module:

```
class Counter(dict):  
  
    def __init__(self, iterable=None, /, **kwds):  
        # Note "iterable" is a possible keyword argument
```

See [PEP 570](https://peps.python.org/pep-0570/) [https://peps.python.org/pep-0570/] for a full description.

(Contributed by Pablo Galindo in [bpo-36540](https://bugs.python.org/issue?@action=redirect&bpo=36540) [https://bugs.python.org/issue?@action=redirect&bpo=36540].)

## Parallel filesystem cache for compiled bytecode files

The new `PYTHONPYCACHEPREFIX` setting (also available as `-X pycache_prefix`) configures the implicit bytecode cache to use a separate parallel filesystem tree, rather than the default `__pycache__` subdirectories within each source directory.

The location of the cache is reported in `sys.pycache_prefix` (`None` indicates the default location in `__pycache__` subdirectories).

(Contributed by Carl Meyer in [bpo-33499](https://bugs.python.org/issue?@action=redirect&bpo=33499) [https://bugs.python.org/issue?@action=redirect&bpo=33499].)

## Debug build uses the same ABI as release build

Python now uses the same ABI whether it's built in release or debug mode. On Unix, when Python is built in debug mode, it is now possible to load C extensions built in release mode and C extensions built using the stable ABI.

Release builds and [debug builds](#) are now ABI compatible: defining the `Py_DEBUG` macro no longer implies the `Py_TRACE_REFS` macro, which introduces the only ABI incompatibility. The `Py_TRACE_REFS` macro, which adds the `sys.getobjects()` function and the `PYTHONDUMPREFS` environment variable, can be set using the new `./configure --with-trace-refs` build option. (Contributed by Victor Stinner in [bpo-36465](https://bugs.python.org/issue?@action=redirect&bpo=36465) [https://

[bugs.python.org/issue?@action=redirect&bpo=36465](https://bugs.python.org/issue?@action=redirect&bpo=36465)].)

On Unix, C extensions are no longer linked to libpython except on Android and Cygwin. It is now possible for a statically linked Python to load a C extension built using a shared library Python. (Contributed by Victor Stinner in [bpo-21536](https://bugs.python.org/issue?@action=redirect&bpo=21536) [<https://bugs.python.org/issue?@action=redirect&bpo=21536>].)

On Unix, when Python is built in debug mode, import now also looks for C extensions compiled in release mode and for C extensions compiled with the stable ABI. (Contributed by Victor Stinner in [bpo-36722](https://bugs.python.org/issue?@action=redirect&bpo=36722) [<https://bugs.python.org/issue?@action=redirect&bpo=36722>].)

To embed Python into an application, a new `--embed` option must be passed to `python3-config --libs --embed` to get `-lpython3.8` (link the application to libpython). To support both 3.8 and older, try `python3-config --libs --embed` first and fallback to `python3-config --libs` (without `--embed`) if the previous command fails.

Add a `pkg-config python-3.8-embed` module to embed Python into an application: `pkg-config python-3.8-embed --libs` includes `-lpython3.8`. To support both 3.8 and older, try `pkg-config python-X.Y-embed --libs` first and fallback to `pkg-config python-X.Y --libs` (without `--embed`) if the previous command fails (replace `X.Y` with the Python version).

On the other hand, `pkg-config python3.8 --libs` no longer contains `-lpython3.8`. C extensions must not be linked to libpython (except on Android and Cygwin, whose cases are handled by the script); this change is backward incompatible on purpose. (Contributed by Victor Stinner in [bpo-36721](https://bugs.python.org/issue?@action=redirect&bpo=36721) [<https://bugs.python.org/issue?@action=redirect&bpo=36721>].)

## **f-strings support = for self-documenting expressions and debugging**

Added an `=` specifier to [f-strings](#). An f-string such as `f'{expr=}'` will expand to the text of the expression, an equal sign, then the

representation of the evaluated expression. For example:

```
>>> user = 'eric_idle'
>>> member_since = date(1975, 7, 31)
>>> f'{user=} {member_since=}'
"user='eric_idle' member_since=datetime.date(1975, 7, 31)"
```

The usual [f-string format specifiers](#) allow more control over how the result of the expression is displayed:

```
>>> delta = date.today() - member_since
>>> f'{user=!s} {delta.days=:,d}'
'user=eric_idle delta.days=16,075'
```

The `=` specifier will display the whole expression so that calculations can be shown:

```
>>> print(f'{theta=} {cos(radians(theta))=:.3f}')
theta=30 cos(radians(theta))=0.866
```

## PEP 578: Python Runtime Audit Hooks

The PEP adds an Audit Hook and Verified Open Hook. Both are available from Python and native code, allowing applications and frameworks written in pure Python code to take advantage of extra notifications, while also allowing embedders or system administrators to deploy builds of Python where auditing is always enabled.

See [PEP 578](#) [<https://peps.python.org/pep-0578/>] for full details.

## PEP 587: Python Initialization Configuration

The [PEP 587](#) [<https://peps.python.org/pep-0587/>] adds a new C API to configure the Python Initialization providing finer control on the whole configuration and better error reporting.

New structures:

- `PyConfig`
- `PyPreConfig`
- `PyStatus`
- `PyWideStringList`

New functions:

- `PyConfig_Clear()`
- `PyConfig_InitIsolatedConfig()`
- `PyConfig_InitPythonConfig()`
- `PyConfig_Read()`
- `PyConfig_SetArgv()`
- `PyConfig_SetBytesArgv()`
- `PyConfig_SetBytesString()`
- `PyConfig_SetString()`
- `PyPreConfig_InitIsolatedConfig()`
- `PyPreConfig_InitPythonConfig()`
- `PyStatus_Error()`
- `PyStatus_Exception()`
- `PyStatus_Exit()`
- `PyStatus_IsError()`
- `PyStatus_IsExit()`
- `PyStatus_NoMemory()`
- `PyStatus_Ok()`
- `PyWideStringList_Append()`
- `PyWideStringList_Insert()`
- `Py_BytesMain()`
- `Py_ExitStatusException()`
- `Py_InitializeFromConfig()`
- `Py_PreInitialize()`
- `Py_PreInitializeFromArgs()`
- `Py_PreInitializeFromBytesArgs()`
- `Py_RunMain()`

This PEP also adds `_PyRuntimeState.preconfig` (`PyPreConfig` type) and `PyInterpreterState.config` (`PyConfig` type) fields to these internal structures.

`PyInterpreterState.config` becomes the new reference configuration, replacing global configuration variables and other private variables.

See [Python Initialization Configuration](#) for the documentation.

See [PEP 587](#) [<https://peps.python.org/pep-0587/>] for a full description.

(Contributed by Victor Stinner in [bpo-36763](#) [<https://bugs.python.org/issue?@action=redirect&bpo=36763>].)

## PEP 590: Vectorcall: a fast calling protocol for CPython

The [Vectorcall Protocol](#) is added to the Python/C API. It is meant to formalize existing optimizations which were already done for various classes. Any [static type](#) implementing a callable can use this protocol.

This is currently provisional. The aim is to make it fully public in Python 3.9.

See [PEP 590](#) [<https://peps.python.org/pep-0590/>] for a full description.

(Contributed by Jeroen Demeyer, Mark Shannon and Petr Viktorin in [bpo-36974](#) [<https://bugs.python.org/issue?@action=redirect&bpo=36974>].)

## Pickle protocol 5 with out-of-band data buffers

When [pickle](#) is used to transfer large data between Python processes in order to take advantage of multi-core or multi-machine processing, it is important to optimize the transfer by reducing memory copies, and possibly by applying custom techniques such as data-dependent compression.

The [pickle](#) protocol 5 introduces support for out-of-band buffers where [PEP 3118](#) [<https://peps.python.org/pep-3118/>]-compatible data can be transmitted separately from the main pickle stream, at the discretion of the communication layer.

See [PEP 574](#) [<https://peps.python.org/pep-0574/>] for a full description.

(Contributed by Antoine Pitrou in [bpo-36785](#) [<https://bugs.python.org/issue?@action=redirect&bpo=36785>].)

## Other Language Changes

- A `continue` statement was illegal in the `finally` clause due to a problem with the implementation. In Python 3.8 this restriction was lifted. (Contributed by Serhiy Storchaka in [bpo-32489](https://bugs.python.org/issue?@action=redirect&bpo=32489) [https://bugs.python.org/issue?@action=redirect&bpo=32489].)
- The `bool`, `int`, and `fractions.Fraction` types now have an `as_integer_ratio()` method like that found in `float` and `decimal.Decimal`. This minor API extension makes it possible to write `numerator, denominator = x.as_integer_ratio()` and have it work across multiple numeric types. (Contributed by Lisa Roach in [bpo-33073](https://bugs.python.org/issue?@action=redirect&bpo=33073) [https://bugs.python.org/issue?@action=redirect&bpo=33073] and Raymond Hettinger in [bpo-37819](https://bugs.python.org/issue?@action=redirect&bpo=37819) [https://bugs.python.org/issue?@action=redirect&bpo=37819].)
- Constructors of `int`, `float` and `complex` will now use the `__index__()` special method, if available and the corresponding method `__int__()`, `__float__()` or `__complex__()` is not available. (Contributed by Serhiy Storchaka in [bpo-20092](https://bugs.python.org/issue?@action=redirect&bpo=20092) [https://bugs.python.org/issue?@action=redirect&bpo=20092].)
- Added support of `\N{name}` escapes in **regular expressions**:

```
>>> notice = 'Copyright © 2019'
>>> copyright_year_pattern = re.compile(r'\N{copyri
>>> int(copyright_year_pattern.search(notice).group
2019
```

(Contributed by Jonathan Eunice and Serhiy Storchaka in [bpo-30688](https://bugs.python.org/issue?@action=redirect&bpo=30688) [https://bugs.python.org/issue?@action=redirect&bpo=30688].)

- Dict and dictviews are now iterable in reversed insertion order using `reversed()`. (Contributed by Rémi Lapeyre in [bpo-33462](https://bugs.python.org/issue?@action=redirect&bpo=33462) [https://bugs.python.org/issue?@action=redirect&bpo=33462].)

@action=redirect&bpo=33462].)

- The syntax allowed for keyword names in function calls was further restricted. In particular, `f((keyword)=arg)` is no longer allowed. It was never intended to permit more than a bare name on the left-hand side of a keyword argument assignment term. (Contributed by Benjamin Peterson in [bpo-34641](https://bugs.python.org/issue?@action=redirect&bpo=34641) [https://bugs.python.org/issue?@action=redirect&bpo=34641].)
- Generalized iterable unpacking in `yield` and `return` statements no longer requires enclosing parentheses. This brings the *yield* and *return* syntax into better agreement with normal assignment syntax:

```
>>> def parse(family):
        lastname, *members = family.split()
        return lastname.upper(), *members
```

```
>>> parse('simpsons homer marge bart lisa maggie')
('SIMPSONS', 'homer', 'marge', 'bart', 'lisa', 'mag
```

(Contributed by David Cuthbert and Jordan Chapman in [bpo-32117](https://bugs.python.org/issue?@action=redirect&bpo=32117) [https://bugs.python.org/issue?@action=redirect&bpo=32117].)

- When a comma is missed in code such as `[(10, 20) (30, 40)]`, the compiler displays a **SyntaxWarning** with a helpful suggestion. This improves on just having a **TypeError** indicating that the first tuple was not callable. (Contributed by Serhiy Storchaka in [bpo-15248](https://bugs.python.org/issue?@action=redirect&bpo=15248) [https://bugs.python.org/issue?@action=redirect&bpo=15248].)
- Arithmetic operations between subclasses of `datetime.date` or `datetime.datetime` and `datetime.timedelta` objects now return an instance of the subclass, rather than the base class. This also affects the return type of operations whose implementation (directly or indirectly) uses `datetime.timedelta` arithmetic, such as `astimezone()`. (Contributed by Paul Ganssle in [bpo-32417](https://bugs.python.org/issue?@action=redirect&bpo=32417) [https://bugs.python.org/issue?@action=redirect&bpo=32417].)

- When the Python interpreter is interrupted by Ctrl-C (SIGINT) and the resulting `KeyboardInterrupt` exception is not caught, the Python process now exits via a SIGINT signal or with the correct exit code such that the calling process can detect that it died due to a Ctrl-C. Shells on POSIX and Windows use this to properly terminate scripts in interactive sessions. (Contributed by Google via Gregory P. Smith in [bpo-1054041](https://bugs.python.org/issue?@action=redirect&bpo=1054041) [https://bugs.python.org/issue?@action=redirect&bpo=1054041].)
- Some advanced styles of programming require updating the `types.CodeType` object for an existing function. Since code objects are immutable, a new code object needs to be created, one that is modeled on the existing code object. With 19 parameters, this was somewhat tedious. Now, the new `replace()` method makes it possible to create a clone with a few altered parameters.

Here's an example that alters the `statistics.mean()` function to prevent the `data` parameter from being used as a keyword argument:

```
>>> from statistics import mean
>>> mean(data=[10, 20, 90])
40
>>> mean.__code__ = mean.__code__.replace(co_posonly
>>> mean(data=[10, 20, 90])
Traceback (most recent call last):
...
TypeError: mean() got some positional-only argument
```

(Contributed by Victor Stinner in [bpo-37032](https://bugs.python.org/issue?@action=redirect&bpo=37032) [https://bugs.python.org/issue?@action=redirect&bpo=37032].)

- For integers, the three-argument form of the `pow()` function now permits the exponent to be negative in the case where the base is relatively prime to the modulus. It then computes a modular inverse to the base when the exponent is `-1`, and a suitable power of that inverse for other negative exponents. For example, to compute the [modular multiplicative inverse](#)

[[https://en.wikipedia.org/wiki/Modular\\_multiplicative\\_inverse](https://en.wikipedia.org/wiki/Modular_multiplicative_inverse)] of 38 modulo 137, write:

```
>>> pow(38, -1, 137)
119
>>> 119 * 38 % 137
1
```

Modular inverses arise in the solution of [linear Diophantine equations](https://en.wikipedia.org/wiki/Diophantine_equation) [https://en.wikipedia.org/wiki/Diophantine\_equation]. For example, to find integer solutions for  $4258x + 147y = 369$ , first rewrite as  $4258x \equiv 369 \pmod{147}$  then solve:

```
>>> x = 369 * pow(4258, -1, 147) % 147
>>> y = (4258 * x - 369) // -147
>>> 4258 * x + 147 * y
369
```

(Contributed by Mark Dickinson in [bpo-36027](https://bugs.python.org/issue/?@action=redirect&bpo=36027) [https://bugs.python.org/issue/?@action=redirect&bpo=36027].)

- Dict comprehensions have been synced-up with dict literals so that the key is computed first and the value second:

```
>>> # Dict comprehension
>>> cast = {input('role? '): input('actor? ') for i
role? King Arthur
actor? Chapman
role? Black Knight
actor? Cleese

>>> # Dict literal
>>> cast = {input('role? '): input('actor? ')}
role? Sir Robin
actor? Eric Idle
```

The guaranteed execution order is helpful with assignment expressions because variables assigned in the key expression will be available in the value expression:

```
>>> names = ['Martin von Löwis', 'Łukasz Langa', 'W
>>> {(n := normalize('NFC', name)).casefold() : n f
{'martin von löwis': 'Martin von Löwis',
 'łukasz langa': 'Łukasz Langa',
 'walter dörwald': 'Walter Dörwald'}
```

(Contributed by Jörn Heissler in [bpo-35224](https://bugs.python.org/issue?@action=redirect&bpo=35224) [https://bugs.python.org/issue?@action=redirect&bpo=35224].)

- The `object.__reduce__()` method can now return a tuple from two to six elements long. Formerly, five was the limit. The new, optional sixth element is a callable with a `(obj, state)` signature. This allows the direct control over the state-updating behavior of a specific object. If not `None`, this callable will have priority over the object's `__setstate__()` method. (Contributed by Pierre Glaser and Olivier Grisel in [bpo-35900](https://bugs.python.org/issue?@action=redirect&bpo=35900) [https://bugs.python.org/issue?@action=redirect&bpo=35900].)

## New Modules

- The new `importlib.metadata` module provides (provisional) support for reading metadata from third-party packages. For example, it can extract an installed package's version number, list of entry points, and more:

```
>>> # Note following example requires that the popu
>>> # package has been installed.
>>>
>>> from importlib.metadata import version, require
>>> version('requests')
'2.22.0'
>>> list(requires('requests'))
['chardet (<3.1.0,>=3.0.2)']
>>> list(files('requests'))[:5]
[PackagePath('requests-2.22.0.dist-info/INSTALLER'),
 PackagePath('requests-2.22.0.dist-info/LICENSE'),
 PackagePath('requests-2.22.0.dist-info/METADATA'),
 PackagePath('requests-2.22.0.dist-info/RECORD'),
```

```
PackagePath('requests-2.22.0.dist-info/WHEEL']]
```

(Contributed by Barry Warsaw and Jason R. Coombs in [bpo-34632](https://bugs.python.org/issue?@action=redirect&bpo=34632) [https://bugs.python.org/issue?@action=redirect&bpo=34632].)

## Improved Modules

### ast

AST nodes now have `end_lineno` and `end_col_offset` attributes, which give the precise location of the end of the node. (This only applies to nodes that have `lineno` and `col_offset` attributes.)

New function `ast.get_source_segment()` returns the source code for a specific AST node.

(Contributed by Ivan Levkivskyi in [bpo-33416](https://bugs.python.org/issue?@action=redirect&bpo=33416) [https://bugs.python.org/issue?@action=redirect&bpo=33416].)

The `ast.parse()` function has some new flags:

- `type_comments=True` causes it to return the text of [PEP 484](https://peps.python.org/pep-0484/) [https://peps.python.org/pep-0484/] and [PEP 526](https://peps.python.org/pep-0526/) [https://peps.python.org/pep-0526/] type comments associated with certain AST nodes;
- `mode='func_type'` can be used to parse [PEP 484](https://peps.python.org/pep-0484/) [https://peps.python.org/pep-0484/] “signature type comments” (returned for function definition AST nodes);
- `feature_version=(3, N)` allows specifying an earlier Python 3 version. For example, `feature_version=(3, 4)` will treat `async` and `await` as non-reserved words.

(Contributed by Guido van Rossum in [bpo-35766](https://bugs.python.org/issue?@action=redirect&bpo=35766) [https://bugs.python.org/issue?@action=redirect&bpo=35766].)

### asyncio

`asyncio.run()` has graduated from the provisional to stable API.

This function can be used to execute a [coroutine](#) and return the result while automatically managing the event loop. For example:

```
import asyncio

async def main():
    await asyncio.sleep(0)
    return 42

asyncio.run(main())
```

This is *roughly* equivalent to:

```
import asyncio

async def main():
    await asyncio.sleep(0)
    return 42

loop = asyncio.new_event_loop()
asyncio.set_event_loop(loop)
try:
    loop.run_until_complete(main())
finally:
    asyncio.set_event_loop(None)
    loop.close()
```

The actual implementation is significantly more complex. Thus, [asyncio.run\(\)](#) should be the preferred way of running asyncio programs.

(Contributed by Yury Selivanov in [bpo-32314](#) [<https://bugs.python.org/issue?@action=redirect&bpo=32314>].)

Running `python -m asyncio` launches a natively async REPL. This allows rapid experimentation with code that has a top-level [await](#). There is no longer a need to directly call `asyncio.run()` which would spawn a new event loop on every invocation:

```
$ python -m asyncio
```

asyncio REPL 3.8.0

Use "await" directly instead of "asyncio.run()".

Type "help", "copyright", "credits" or "license" for more

```
>>> import asyncio
```

```
>>> await asyncio.sleep(10, result='hello')
```

```
hello
```

(Contributed by Yury Selivanov in [bpo-37028](https://bugs.python.org/issue?@action=redirect&bpo=37028) [https://bugs.python.org/issue?@action=redirect&bpo=37028].)

The exception `asyncio.CancelledError` now inherits from `BaseException` rather than `Exception` and no longer inherits from `concurrent.futures.CancelledError`. (Contributed by Yury Selivanov in [bpo-32528](https://bugs.python.org/issue?@action=redirect&bpo=32528) [https://bugs.python.org/issue?@action=redirect&bpo=32528].)

On Windows, the default event loop is now `ProactorEventLoop`. (Contributed by Victor Stinner in [bpo-34687](https://bugs.python.org/issue?@action=redirect&bpo=34687) [https://bugs.python.org/issue?@action=redirect&bpo=34687].)

`ProactorEventLoop` now also supports UDP. (Contributed by Adam Meily and Andrew Svetlov in [bpo-29883](https://bugs.python.org/issue?@action=redirect&bpo=29883) [https://bugs.python.org/issue?@action=redirect&bpo=29883].)

`ProactorEventLoop` can now be interrupted by `KeyboardInterrupt` ("CTRL + C"). (Contributed by Vladimir Matveev in [bpo-23057](https://bugs.python.org/issue?@action=redirect&bpo=23057) [https://bugs.python.org/issue?@action=redirect&bpo=23057].)

Added `asyncio.Task.get_coro()` for getting the wrapped coroutine within an `asyncio.Task`. (Contributed by Alex Grönholm in [bpo-36999](https://bugs.python.org/issue?@action=redirect&bpo=36999) [https://bugs.python.org/issue?@action=redirect&bpo=36999].)

Asyncio tasks can now be named, either by passing the `name` keyword argument to `asyncio.create_task()` or the `create_task()` event loop method, or by calling the `set_name()` method on the task object. The task name is visible in the `repr()` output of `asyncio.Task` and can also be retrieved using the `get_name()` method. (Contributed by Alex Grönholm in [bpo-34270](https://bugs.python.org/issue?@action=redirect&bpo=34270) [https://bugs.python.org/issue?@action=redirect&bpo=34270].)

Added support for [Happy Eyeballs](https://en.wikipedia.org/wiki/Happy_Eyeballs) [https://en.wikipedia.org/wiki/Happy\_Eyeballs] to `asyncio.loop.create_connection()`. To specify the behavior, two new parameters have been added: `happy_eyeballs_delay` and `interleave`. The Happy Eyeballs algorithm improves responsiveness in applications that support IPv4 and IPv6 by attempting to simultaneously connect using both. (Contributed by twisteroid ambassador in [bpo-33530](https://bugs.python.org/issue?@action=redirect&bpo=33530) [https://bugs.python.org/issue?@action=redirect&bpo=33530].)

## builtins

The `compile()` built-in has been improved to accept the `ast.PyCF_ALLOW_TOP_LEVEL_AWAIT` flag. With this new flag passed, `compile()` will allow top-level `await`, `async for` and `async with` constructs that are usually considered invalid syntax. Asynchronous code object marked with the `CO_COROUTINE` flag may then be returned. (Contributed by Matthias Bussonnier in [bpo-34616](https://bugs.python.org/issue?@action=redirect&bpo=34616) [https://bugs.python.org/issue?@action=redirect&bpo=34616])

## collections

The `__asdict()` method for `collections.namedtuple()` now returns a `dict` instead of a `collections.OrderedDict`. This works because regular dicts have guaranteed ordering since Python 3.7. If the extra features of `OrderedDict` are required, the suggested remediation is to cast the result to the desired type: `OrderedDict(nt.__asdict())`. (Contributed by Raymond Hettinger in [bpo-35864](https://bugs.python.org/issue?@action=redirect&bpo=35864) [https://bugs.python.org/issue?@action=redirect&bpo=35864].)

## cProfile

The `cProfile.Profile` class can now be used as a context manager. Profile a block of code by running:

```
import cProfile

with cProfile.Profile() as profiler:
    # code to be profiled
    ...
```

(Contributed by Scott Sanderson in [bpo-29235](https://bugs.python.org/issue?@action=redirect&bpo=29235) [https://bugs.python.org/issue?@action=redirect&bpo=29235].)

## csv

The `csv.DictReader` now returns instances of `dict` instead of a `collections.OrderedDict`. The tool is now faster and uses less memory while still preserving the field order. (Contributed by Michael Selik in [bpo-34003](https://bugs.python.org/issue?@action=redirect&bpo=34003) [https://bugs.python.org/issue?@action=redirect&bpo=34003].)

## curses

Added a new variable holding structured version information for the underlying ncurses library: `ncurses_version`. (Contributed by Serhiy Storchaka in [bpo-31680](https://bugs.python.org/issue?@action=redirect&bpo=31680) [https://bugs.python.org/issue?@action=redirect&bpo=31680].)

## ctypes

On Windows, `CDLL` and subclasses now accept a *winmode* parameter to specify flags for the underlying `LoadLibraryEx` call. The default flags are set to only load DLL dependencies from trusted locations, including the path where the DLL is stored (if a full or partial path is used to load the initial DLL) and paths added by `add_dll_directory()`. (Contributed by Steve Dower in [bpo-36085](https://bugs.python.org/issue?@action=redirect&bpo=36085) [https://bugs.python.org/issue?@action=redirect&bpo=36085].)

## datetime

Added new alternate constructors `datetime.date.fromisocalendar()` and `datetime.datetime.fromisocalendar()`, which construct `date` and `datetime` objects respectively from ISO year, week number, and weekday; these are the inverse of each class's `isocalendar` method. (Contributed by Paul Ganssle in [bpo-36004](https://bugs.python.org/issue?@action=redirect&bpo=36004) [https://bugs.python.org/issue?@action=redirect&bpo=36004].)

## functools

`functools.lru_cache()` can now be used as a straight decorator rather than as a function returning a decorator. So both of these are now supported:

```
@lru_cache
def f(x):
    ...
```

```
@lru_cache(maxsize=256)
def f(x):
    ...
```

(Contributed by Raymond Hettinger in [bpo-36772](https://bugs.python.org/issue?@action=redirect&bpo=36772) [https://bugs.python.org/issue?@action=redirect&bpo=36772].)

Added a new `functools.cached_property()` decorator, for computed properties cached for the life of the instance.

```
import functools
import statistics

class Dataset:
    def __init__(self, sequence_of_numbers):
        self.data = sequence_of_numbers

    @functools.cached_property
    def variance(self):
        return statistics.variance(self.data)
```

(Contributed by Carl Meyer in [bpo-21145](https://bugs.python.org/issue?@action=redirect&bpo=21145) [https://bugs.python.org/issue?@action=redirect&bpo=21145])

Added a new `functools.singledispatchmethod()` decorator that converts methods into [generic functions](#) using [single dispatch](#):

```
from functools import singledispatchmethod
from contextlib import suppress

class TaskManager:
```

```

def __init__(self, tasks):
    self.tasks = list(tasks)

@singledispatchmethod
def discard(self, value):
    with suppress(ValueError):
        self.tasks.remove(value)

@discard.register(list)
def _(self, tasks):
    targets = set(tasks)
    self.tasks = [x for x in self.tasks if x not in

```

(Contributed by Ethan Smith in [bpo-32380](https://bugs.python.org/issue?@action=redirect&bpo=32380) [https://bugs.python.org/issue?@action=redirect&bpo=32380])

## gc

[`get\_objects\(\)`](#) can now receive an optional *generation* parameter indicating a generation to get objects from. (Contributed by Pablo Galindo in [bpo-36016](https://bugs.python.org/issue?@action=redirect&bpo=36016) [https://bugs.python.org/issue?@action=redirect&bpo=36016].)

## gettext

Added [`pgettext\(\)`](#) and its variants. (Contributed by Franz Glasner, Éric Araujo, and Cheryl Sabella in [bpo-2504](https://bugs.python.org/issue?@action=redirect&bpo=2504) [https://bugs.python.org/issue?@action=redirect&bpo=2504].)

## gzip

Added the *mtime* parameter to [`gzip.compress\(\)`](#) for reproducible output. (Contributed by Guo Ci Teo in [bpo-34898](https://bugs.python.org/issue?@action=redirect&bpo=34898) [https://bugs.python.org/issue?@action=redirect&bpo=34898].)

A [`BadGzipFile`](#) exception is now raised instead of [`OSError`](#) for certain types of invalid or corrupt gzip files. (Contributed by Filip Gruszczyński, Michele Orrù, and Zackery Spytz in [bpo-6584](https://bugs.python.org/issue?@action=redirect&bpo=6584) [https://bugs.python.org/issue?@action=redirect&bpo=6584].)

## IDLE and idlelib

Output over N lines (50 by default) is squeezed down to a button. N can be changed in the PyShell section of the General page of the Settings dialog. Fewer, but possibly extra long, lines can be squeezed by right clicking on the output. Squeezed output can be expanded in place by double-clicking the button or into the clipboard or a separate window by right-clicking the button. (Contributed by Tal Einat in [bpo-1529353](https://bugs.python.org/issue?@action=redirect&bpo=1529353) [https://bugs.python.org/issue?@action=redirect&bpo=1529353].)

Add “Run Customized” to the Run menu to run a module with customized settings. Any command line arguments entered are added to sys.argv. They also re-appear in the box for the next customized run. One can also suppress the normal Shell main module restart. (Contributed by Cheryl Sabella, Terry Jan Reedy, and others in [bpo-5680](https://bugs.python.org/issue?@action=redirect&bpo=5680) [https://bugs.python.org/issue?@action=redirect&bpo=5680] and [bpo-37627](https://bugs.python.org/issue?@action=redirect&bpo=37627) [https://bugs.python.org/issue?@action=redirect&bpo=37627].)

Added optional line numbers for IDLE editor windows. Windows open without line numbers unless set otherwise in the General tab of the configuration dialog. Line numbers for an existing window are shown and hidden in the Options menu. (Contributed by Tal Einat and Saimadhav Heblikar in [bpo-17535](https://bugs.python.org/issue?@action=redirect&bpo=17535) [https://bugs.python.org/issue?@action=redirect&bpo=17535].)

OS native encoding is now used for converting between Python strings and Tcl objects. This allows IDLE to work with emoji and other non-BMP characters. These characters can be displayed or copied and pasted to or from the clipboard. Converting strings from Tcl to Python and back now never fails. (Many people worked on this for eight years but the problem was finally solved by Serhiy Storchaka in [bpo-13153](https://bugs.python.org/issue?@action=redirect&bpo=13153) [https://bugs.python.org/issue?@action=redirect&bpo=13153].)

New in 3.8.1:

Add option to toggle cursor blink off. (Contributed by Zackery Spytz in [bpo-4603](https://bugs.python.org/issue?@action=redirect&bpo=4603) [https://bugs.python.org/issue?@action=redirect&bpo=4603].)

Escape key now closes IDLE completion windows. (Contributed by Johnny Najera in [bpo-38944](https://bugs.python.org/issue?@action=redirect&bpo=38944) [https://bugs.python.org/issue?@action=redirect&bpo=38944].)

The changes above have been backported to 3.7 maintenance releases.

Add keywords to module name completion list. (Contributed by Terry J. Reedy in [bpo-37765](https://bugs.python.org/issue?@action=redirect&bpo=37765) [https://bugs.python.org/issue?@action=redirect&bpo=37765].)

## inspect

The `inspect.getdoc()` function can now find docstrings for `__slots__` if that attribute is a `dict` where the values are docstrings. This provides documentation options similar to what we already have for `property()`, `classmethod()`, and `staticmethod()`:

```
class AudioClip:
    __slots__ = {'bit_rate': 'expressed in kilohertz to
                  'duration': 'in seconds, rounded up to
    def __init__(self, bit_rate, duration):
        self.bit_rate = round(bit_rate / 1000.0, 1)
        self.duration = ceil(duration)
```

(Contributed by Raymond Hettinger in [bpo-36326](https://bugs.python.org/issue?@action=redirect&bpo=36326) [https://bugs.python.org/issue?@action=redirect&bpo=36326].)

## io

In development mode (`-X env`) and in `debug build`, the `io.IOBase` finalizer now logs the exception if the `close()` method fails. The exception is ignored silently by default in release build. (Contributed by Victor Stinner in [bpo-18748](https://bugs.python.org/issue?@action=redirect&bpo=18748) [https://bugs.python.org/issue?@action=redirect&bpo=18748].)

## itertools

The `itertools.accumulate()` function added an option *initial*

keyword argument to specify an initial value:

```
>>> from itertools import accumulate
>>> list(accumulate([10, 5, 30, 15], initial=1000))
[1000, 1010, 1015, 1045, 1060]
```

(Contributed by Lisa Roach in [bpo-34659](https://bugs.python.org/issue?@action=redirect&bpo=34659) [https://bugs.python.org/issue?@action=redirect&bpo=34659].)

## json.tool

Add option `--json-lines` to parse every input line as a separate JSON object. (Contributed by Weipeng Hong in [bpo-31553](https://bugs.python.org/issue?@action=redirect&bpo=31553) [https://bugs.python.org/issue?@action=redirect&bpo=31553].)

## logging

Added a *force* keyword argument to `logging.basicConfig()`. When set to true, any existing handlers attached to the root logger are removed and closed before carrying out the configuration specified by the other arguments.

This solves a long-standing problem. Once a logger or *basicConfig()* had been called, subsequent calls to *basicConfig()* were silently ignored. This made it difficult to update, experiment with, or teach the various logging configuration options using the interactive prompt or a Jupyter notebook.

(Suggested by Raymond Hettinger, implemented by Dong-hee Na, and reviewed by Vinay Sajip in [bpo-33897](https://bugs.python.org/issue?@action=redirect&bpo=33897) [https://bugs.python.org/issue?@action=redirect&bpo=33897].)

## math

Added new function `math.dist()` for computing Euclidean distance between two points. (Contributed by Raymond Hettinger in [bpo-33089](https://bugs.python.org/issue?@action=redirect&bpo=33089) [https://bugs.python.org/issue?@action=redirect&bpo=33089].)

Expanded the `math.hypot()` function to handle multiple dimensions. Formerly, it only supported the 2-D case. (Contributed

by Raymond Hettinger in [bpo-33089](https://bugs.python.org/issue?@action=redirect&bpo=33089) [https://bugs.python.org/issue?@action=redirect&bpo=33089].)

Added new function, `math.prod()`, as analogous function to `sum()` that returns the product of a 'start' value (default: 1) times an iterable of numbers:

```
>>> prior = 0.8
>>> likelihoods = [0.625, 0.84, 0.30]
>>> math.prod(likelihoods, start=prior)
0.126
```

(Contributed by Pablo Galindo in [bpo-35606](https://bugs.python.org/issue?@action=redirect&bpo=35606) [https://bugs.python.org/issue?@action=redirect&bpo=35606].)

Added two new combinatoric functions `math.perm()` and `math.comb()`:

```
>>> math.perm(10, 3)      # Permutations of 10 things taken 3 at a time
720
>>> math.comb(10, 3)      # Combinations of 10 things taken 3 at a time
120
```

(Contributed by Yash Aggarwal, Keller Fuchs, Serhiy Storchaka, and Raymond Hettinger in [bpo-37128](https://bugs.python.org/issue?@action=redirect&bpo=37128) [https://bugs.python.org/issue?@action=redirect&bpo=37128], [bpo-37178](https://bugs.python.org/issue?@action=redirect&bpo=37178) [https://bugs.python.org/issue?@action=redirect&bpo=37178], and [bpo-35431](https://bugs.python.org/issue?@action=redirect&bpo=35431) [https://bugs.python.org/issue?@action=redirect&bpo=35431].)

Added a new function `math.isqrt()` for computing accurate integer square roots without conversion to floating point. The new function supports arbitrarily large integers. It is faster than `floor(sqrt(n))` but slower than `math.sqrt()`:

```
>>> r = 650320427
>>> s = r ** 2
>>> isqrt(s - 1)          # correct
650320426
>>> floor(sqrt(s - 1))    # incorrect
650320427
```

(Contributed by Mark Dickinson in [bpo-36887](https://bugs.python.org/issue?@action=redirect&bpo=36887) [https://bugs.python.org/issue?@action=redirect&bpo=36887].)

The function `math.factorial()` no longer accepts arguments that are not int-like. (Contributed by Pablo Galindo in [bpo-33083](https://bugs.python.org/issue?@action=redirect&bpo=33083) [https://bugs.python.org/issue?@action=redirect&bpo=33083].)

## mmap

The `mmap.mmap` class now has an `advise()` method to access the `advise()` system call. (Contributed by Zackery Spytz in [bpo-32941](https://bugs.python.org/issue?@action=redirect&bpo=32941) [https://bugs.python.org/issue?@action=redirect&bpo=32941].)

## multiprocessing

Added new `multiprocessing.shared_memory` module. (Contributed by Davin Potts in [bpo-35813](https://bugs.python.org/issue?@action=redirect&bpo=35813) [https://bugs.python.org/issue?@action=redirect&bpo=35813].)

On macOS, the `spawn` start method is now used by default. (Contributed by Victor Stinner in [bpo-33725](https://bugs.python.org/issue?@action=redirect&bpo=33725) [https://bugs.python.org/issue?@action=redirect&bpo=33725].)

## os

Added new function `add_dll_directory()` on Windows for providing additional search paths for native dependencies when importing extension modules or loading DLLs using `ctypes`. (Contributed by Steve Dower in [bpo-36085](https://bugs.python.org/issue?@action=redirect&bpo=36085) [https://bugs.python.org/issue?@action=redirect&bpo=36085].)

A new `os.memfd_create()` function was added to wrap the `memfd_create()` syscall. (Contributed by Zackery Spytz and Christian Heimes in [bpo-26836](https://bugs.python.org/issue?@action=redirect&bpo=26836) [https://bugs.python.org/issue?@action=redirect&bpo=26836].)

On Windows, much of the manual logic for handling reparse points (including symlinks and directory junctions) has been delegated to the operating system. Specifically, `os.stat()` will now traverse anything supported by the operating system, while `os.lstat()`

will only open reparse points that identify as “name surrogates” while others are opened as for `os.stat()`. In all cases, `stat_result.st_mode` will only have `S_IFLNK` set for symbolic links and not other kinds of reparse points. To identify other kinds of reparse point, check the new `stat_result.st_reparse_tag` attribute.

On Windows, `os.readlink()` is now able to read directory junctions. Note that `islink()` will return `False` for directory junctions, and so code that checks `islink` first will continue to treat junctions as directories, while code that handles errors from `os.readlink()` may now treat junctions as links.

(Contributed by Steve Dower in [bpo-37834](https://bugs.python.org/issue?@action=redirect&bpo=37834) [https://bugs.python.org/issue?@action=redirect&bpo=37834].)

## os.path

`os.path` functions that return a boolean result like `exists()`, `lexists()`, `isdir()`, `isfile()`, `islink()`, and `ismount()` now return `False` instead of raising `ValueError` or its subclasses `UnicodeEncodeError` and `UnicodeDecodeError` for paths that contain characters or bytes unrepresentable at the OS level. (Contributed by Serhiy Storchaka in [bpo-33721](https://bugs.python.org/issue?@action=redirect&bpo=33721) [https://bugs.python.org/issue?@action=redirect&bpo=33721].)

`expanduser()` on Windows now prefers the `USERPROFILE` environment variable and does not use `HOME`, which is not normally set for regular user accounts. (Contributed by Anthony Sottile in [bpo-36264](https://bugs.python.org/issue?@action=redirect&bpo=36264) [https://bugs.python.org/issue?@action=redirect&bpo=36264].)

`isdir()` on Windows no longer returns `True` for a link to a non-existent directory.

`realpath()` on Windows now resolves reparse points, including symlinks and directory junctions.

(Contributed by Steve Dower in [bpo-37834](https://bugs.python.org/issue?@action=redirect&bpo=37834) [https://bugs.python.org/issue?@action=redirect&bpo=37834].)

## pathlib

`pathlib.Path` methods that return a boolean result like `exists()`, `is_dir()`, `is_file()`, `is_mount()`, `is_symlink()`, `is_block_device()`, `is_char_device()`, `is_fifo()`, `is_socket()` now return `False` instead of raising `ValueError` or its subclass `UnicodeEncodeError` for paths that contain characters unrepresentable at the OS level. (Contributed by Serhiy Storchaka in [bpo-33721](https://bugs.python.org/issue?@action=redirect&bpo=33721) [https://bugs.python.org/issue?@action=redirect&bpo=33721].)

Added `pathlib.Path.link_to()` which creates a hard link pointing to a path. (Contributed by Joannah Nanjeyye in [bpo-26978](https://bugs.python.org/issue?@action=redirect&bpo=26978) [https://bugs.python.org/issue?@action=redirect&bpo=26978])

## pickle

`pickle` extensions subclassing the C-optimized `Pickler` can now override the pickling logic of functions and classes by defining the special `reducer_override()` method. (Contributed by Pierre Glaser and Olivier Grisel in [bpo-35900](https://bugs.python.org/issue?@action=redirect&bpo=35900) [https://bugs.python.org/issue?@action=redirect&bpo=35900].)

## plistlib

Added new `plistlib.UID` and enabled support for reading and writing NSKeyedArchiver-encoded binary plists. (Contributed by Jon Janzen in [bpo-26707](https://bugs.python.org/issue?@action=redirect&bpo=26707) [https://bugs.python.org/issue?@action=redirect&bpo=26707].)

## pprint

The `pprint` module added a `sort_dicts` parameter to several functions. By default, those functions continue to sort dictionaries before rendering or printing. However, if `sort_dicts` is set to `false`, the dictionaries retain the order that keys were inserted. This can be useful for comparison to JSON inputs during debugging.

In addition, there is a convenience new function, `pprint.pp()` that is like `pprint.pprint()` but with `sort_dicts` defaulting to

False:

```
>>> from pprint import pprint, pp
>>> d = dict(source='input.txt', operation='filter', des
>>> pp(d, width=40)                                # Original order
{'source': 'input.txt',
 'operation': 'filter',
 'destination': 'output.txt'}
>>> pprint(d, width=40)                             # Keys sorted alpha
{'destination': 'output.txt',
 'operation': 'filter',
 'source': 'input.txt'}
```

(Contributed by Rémi Lapeyre in [bpo-30670](https://bugs.python.org/issue?@action=redirect&bpo=30670) [https://bugs.python.org/issue?@action=redirect&bpo=30670].)

## py\_compile

[`py\_compile.compile\(\)`](#) now supports silent mode. (Contributed by Joannah Nanjekye in [bpo-22640](https://bugs.python.org/issue?@action=redirect&bpo=22640) [https://bugs.python.org/issue?@action=redirect&bpo=22640].)

## shlex

The new [`shlex.join\(\)`](#) function acts as the inverse of [`shlex.split\(\)`](#). (Contributed by Bo Bayles in [bpo-32102](https://bugs.python.org/issue?@action=redirect&bpo=32102) [https://bugs.python.org/issue?@action=redirect&bpo=32102].)

## shutil

[`shutil.copypath\(\)`](#) now accepts a new `dirs_exist_ok` keyword argument. (Contributed by Josh Bronson in [bpo-20849](https://bugs.python.org/issue?@action=redirect&bpo=20849) [https://bugs.python.org/issue?@action=redirect&bpo=20849].)

[`shutil.make\_archive\(\)`](#) now defaults to the modern pax (POSIX.1-2001) format for new archives to improve portability and standards conformance, inherited from the corresponding change to the [`tarfile`](#) module. (Contributed by C.A.M. Gerlach in [bpo-30661](https://bugs.python.org/issue?@action=redirect&bpo=30661) [https://bugs.python.org/issue?@action=redirect&bpo=30661].)

`shutil.rmtree()` on Windows now removes directory junctions without recursively removing their contents first. (Contributed by Steve Dower in [bpo-37834](https://bugs.python.org/issue?@action=redirect&bpo=37834) [https://bugs.python.org/issue?@action=redirect&bpo=37834].)

## socket

Added `create_server()` and `has_dualstack_ipv6()` convenience functions to automate the necessary tasks usually involved when creating a server socket, including accepting both IPv4 and IPv6 connections on the same socket. (Contributed by Giampaolo Rodolà in [bpo-17561](https://bugs.python.org/issue?@action=redirect&bpo=17561) [https://bugs.python.org/issue?@action=redirect&bpo=17561].)

The `socket.if_nameindex()`, `socket.if_nametoindex()`, and `socket.if_indextoname()` functions have been implemented on Windows. (Contributed by Zackery Spytz in [bpo-37007](https://bugs.python.org/issue?@action=redirect&bpo=37007) [https://bugs.python.org/issue?@action=redirect&bpo=37007].)

## ssl

Added `post_handshake_auth` to enable and `verify_client_post_handshake()` to initiate TLS 1.3 post-handshake authentication. (Contributed by Christian Heimes in [bpo-34670](https://bugs.python.org/issue?@action=redirect&bpo=34670) [https://bugs.python.org/issue?@action=redirect&bpo=34670].)

## statistics

Added `statistics.fmean()` as a faster, floating point variant of `statistics.mean()`. (Contributed by Raymond Hettinger and Steven D'Aprano in [bpo-35904](https://bugs.python.org/issue?@action=redirect&bpo=35904) [https://bugs.python.org/issue?@action=redirect&bpo=35904].)

Added `statistics.geometric_mean()` (Contributed by Raymond Hettinger in [bpo-27181](https://bugs.python.org/issue?@action=redirect&bpo=27181) [https://bugs.python.org/issue?@action=redirect&bpo=27181].)

Added `statistics.multimode()` that returns a list of the most common values. (Contributed by Raymond Hettinger in [bpo-35892](https://bugs.python.org/issue?@action=redirect&bpo=35892) [https://bugs.python.org/issue?@action=redirect&bpo=35892].)

Added `statistics.quantiles()` that divides data or a distribution in to equiprobable intervals (e.g. quartiles, deciles, or percentiles). (Contributed by Raymond Hettinger in [bpo-36546](https://bugs.python.org/issue?@action=redirect&bpo=36546) [<https://bugs.python.org/issue?@action=redirect&bpo=36546>].)

Added `statistics.NormalDist`, a tool for creating and manipulating normal distributions of a random variable. (Contributed by Raymond Hettinger in [bpo-36018](https://bugs.python.org/issue?@action=redirect&bpo=36018) [<https://bugs.python.org/issue?@action=redirect&bpo=36018>].)

```
>>> temperature_feb = NormalDist.from_samples([4, 12, -3]
>>> temperature_feb.mean
6.0
>>> temperature_feb.stdev
6.356099432828281

>>> temperature_feb.cdf(3)                # Chance of being
0.3184678262814532
>>> # Relative chance of being 7 degrees versus 10 degrees
>>> temperature_feb.pdf(7) / temperature_feb.pdf(10)
1.2039930378537762

>>> el_niño = NormalDist(4, 2.5)
>>> temperature_feb += el_niño             # Add in a climate
>>> temperature_feb
NormalDist(mu=10.0, sigma=6.830080526611674)

>>> temperature_feb * (9/5) + 32          # Convert to Fahrenheit
NormalDist(mu=50.0, sigma=12.294144947901014)
>>> temperature_feb.samples(3)            # Generate random
[7.672102882379219, 12.000027119750287, 4.64748836976639]
```

## sys

Add new `sys.unraisablehook()` function which can be overridden to control how “unraisable exceptions” are handled. It is called when an exception has occurred but there is no way for Python to handle it. For example, when a destructor raises an exception or during garbage collection (`gc.collect()`).

(Contributed by Victor Stinner in [bpo-36829](https://bugs.python.org/issue?@action=redirect&bpo=36829) [https://bugs.python.org/issue?@action=redirect&bpo=36829].)

## tarfile

The **tarfile** module now defaults to the modern pax (POSIX.1-2001) format for new archives, instead of the previous GNU-specific one. This improves cross-platform portability with a consistent encoding (UTF-8) in a standardized and extensible format, and offers several other benefits. (Contributed by C.A.M. Gerlach in [bpo-36268](https://bugs.python.org/issue?@action=redirect&bpo=36268) [https://bugs.python.org/issue?@action=redirect&bpo=36268].)

## threading

Add a new **threading.excepthook()** function which handles uncaught **threading.Thread.run()** exception. It can be overridden to control how uncaught **threading.Thread.run()** exceptions are handled. (Contributed by Victor Stinner in [bpo-1230540](https://bugs.python.org/issue?@action=redirect&bpo=1230540) [https://bugs.python.org/issue?@action=redirect&bpo=1230540].)

Add a new **threading.get\_native\_id()** function and a **native\_id** attribute to the **threading.Thread** class. These return the native integral Thread ID of the current thread assigned by the kernel. This feature is only available on certain platforms, see **get\_native\_id** for more information. (Contributed by Jake Tesler in [bpo-36084](https://bugs.python.org/issue?@action=redirect&bpo=36084) [https://bugs.python.org/issue?@action=redirect&bpo=36084].)

## tokenize

The **tokenize** module now implicitly emits a `NEWLINE` token when provided with input that does not have a trailing new line. This behavior now matches what the C tokenizer does internally. (Contributed by Ammar Askar in [bpo-33899](https://bugs.python.org/issue?@action=redirect&bpo=33899) [https://bugs.python.org/issue?@action=redirect&bpo=33899].)

## tkinter

Added methods `selection_from()`, `selection_present()`, `selection_range()` and `selection_to()` in the `tkinter.Spinbox` class. (Contributed by Juliette Monsel in [bpo-34829](https://bugs.python.org/issue?@action=redirect&bpo=34829) [https://bugs.python.org/issue?@action=redirect&bpo=34829].)

Added method `moveto()` in the `tkinter.Canvas` class. (Contributed by Juliette Monsel in [bpo-23831](https://bugs.python.org/issue?@action=redirect&bpo=23831) [https://bugs.python.org/issue?@action=redirect&bpo=23831].)

The `tkinter.PhotoImage` class now has `transparency_get()` and `transparency_set()` methods. (Contributed by Zackery Spytz in [bpo-25451](https://bugs.python.org/issue?@action=redirect&bpo=25451) [https://bugs.python.org/issue?@action=redirect&bpo=25451].)

## time

Added new clock `CLOCK_UPTIME_RAW` for macOS 10.12. (Contributed by Joannah Nanjey in [bpo-35702](https://bugs.python.org/issue?@action=redirect&bpo=35702) [https://bugs.python.org/issue?@action=redirect&bpo=35702].)

## typing

The `typing` module incorporates several new features:

- A dictionary type with per-key types. See [PEP 589](https://peps.python.org/pep-0589/) [https://peps.python.org/pep-0589/] and `typing.TypedDict`. `TypedDict` uses only string keys. By default, every key is required to be present. Specify “total=False” to allow keys to be optional:

```
class Location(TypedDict, total=False):
    lat_long: tuple
    grid_square: str
    xy_coordinate: tuple
```

- Literal types. See [PEP 586](https://peps.python.org/pep-0586/) [https://peps.python.org/pep-0586/] and `typing.Literal`. Literal types indicate that a parameter or return value is constrained to one or more specific literal values:

```
def get_status(port: int) -> Literal['connected', ' ']
```

...

- “Final” variables, functions, methods and classes. See [PEP 591](https://peps.python.org/pep-0591/) [https://peps.python.org/pep-0591/], `typing.Final` and `typing.final()`. The final qualifier instructs a static type checker to restrict subclassing, overriding, or reassignment:

```
pi: Final[float] = 3.1415926536
```

- Protocol definitions. See [PEP 544](https://peps.python.org/pep-0544/) [https://peps.python.org/pep-0544/], `typing.Protocol` and `typing.runtime_checkable()`. Simple ABCs like `typing.SupportsInt` are now Protocol subclasses.
- New protocol class `typing.SupportsIndex`.
- New functions `typing.get_origin()` and `typing.get_args()`.

## unicodedata

The `unicodedata` module has been upgraded to use the [Unicode 12.1.0](https://blog.unicode.org/2019/05/unicode-12-1-en.html) [https://blog.unicode.org/2019/05/unicode-12-1-en.html] release.

New function `is_normalized()` can be used to verify a string is in a specific normal form, often much faster than by actually normalizing the string. (Contributed by Max Belanger, David Euresti, and Greg Price in [bpo-32285](https://bugs.python.org/issue?@action=redirect&bpo=32285) [https://bugs.python.org/issue?@action=redirect&bpo=32285] and [bpo-37966](https://bugs.python.org/issue?@action=redirect&bpo=37966) [https://bugs.python.org/issue?@action=redirect&bpo=37966]).

## unittest

Added `AsyncMock` to support an asynchronous version of `Mock`. Appropriate new assert functions for testing have been added as well. (Contributed by Lisa Roach in [bpo-26467](https://bugs.python.org/issue?@action=redirect&bpo=26467) [https://bugs.python.org/issue?@action=redirect&bpo=26467]).

Added `addModuleCleanup()` and `addClassCleanup()` to unittest to support cleanups for `setUpModule()` and `setUpClass()`. (Contributed by Lisa Roach in [bpo-24412](https://bugs.python.org/issue?@action=redirect&bpo=24412) [https://bugs.python.org/issue?@action=redirect&bpo=24412]).

[bugs.python.org/issue?@action=redirect&bpo=24412](https://bugs.python.org/issue?@action=redirect&bpo=24412).)

Several mock assert functions now also print a list of actual calls upon failure. (Contributed by Petter Strandmark in [bpo-35047](https://bugs.python.org/issue?@action=redirect&bpo=35047) [<https://bugs.python.org/issue?@action=redirect&bpo=35047>].)

**unittest** module gained support for coroutines to be used as test cases with **unittest.IsolatedAsyncioTestCase**. (Contributed by Andrew Svetlov in [bpo-32972](https://bugs.python.org/issue?@action=redirect&bpo=32972) [<https://bugs.python.org/issue?@action=redirect&bpo=32972>].)

Example:

```
import unittest

class TestRequest(unittest.IsolatedAsyncioTestCase):

    async def asyncSetUp(self):
        self.connection = await AsyncConnection()

    async def test_get(self):
        response = await self.connection.get("https://example.com")
        self.assertEqual(response.status_code, 200)

    async def asyncTearDown(self):
        await self.connection.close()

if __name__ == "__main__":
    unittest.main()
```

## venv

**venv** now includes an `Activate.ps1` script on all platforms for activating virtual environments under PowerShell Core 6.1. (Contributed by Brett Cannon in [bpo-32718](https://bugs.python.org/issue?@action=redirect&bpo=32718) [<https://bugs.python.org/issue?@action=redirect&bpo=32718>].)

## weakref

The proxy objects returned by `weakref.proxy()` now support the matrix multiplication operators `@` and `@=` in addition to the other numeric operators. (Contributed by Mark Dickinson in [bpo-36669](https://bugs.python.org/issue?@action=redirect&bpo=36669) [https://bugs.python.org/issue?@action=redirect&bpo=36669].)

## xml

As mitigation against DTD and external entity retrieval, the `xml.dom.minidom` and `xml.sax` modules no longer process external entities by default. (Contributed by Christian Heimes in [bpo-17239](https://bugs.python.org/issue?@action=redirect&bpo=17239) [https://bugs.python.org/issue?@action=redirect&bpo=17239].)

The `.find*()` methods in the `xml.etree.ElementTree` module support wildcard searches like `{*}tag` which ignores the namespace and `{namespace}*` which returns all tags in the given namespace. (Contributed by Stefan Behnel in [bpo-28238](https://bugs.python.org/issue?@action=redirect&bpo=28238) [https://bugs.python.org/issue?@action=redirect&bpo=28238].)

The `xml.etree.ElementTree` module provides a new function `-xml.etree.ElementTree.canonicalize()` that implements C14N 2.0. (Contributed by Stefan Behnel in [bpo-13611](https://bugs.python.org/issue?@action=redirect&bpo=13611) [https://bugs.python.org/issue?@action=redirect&bpo=13611].)

The target object of `xml.etree.ElementTree.XMLParser` can receive namespace declaration events through the new callback methods `start_ns()` and `end_ns()`. Additionally, the `xml.etree.ElementTree.TreeBuilder` target can be configured to process events about comments and processing instructions to include them in the generated tree. (Contributed by Stefan Behnel in [bpo-36676](https://bugs.python.org/issue?@action=redirect&bpo=36676) [https://bugs.python.org/issue?@action=redirect&bpo=36676] and [bpo-36673](https://bugs.python.org/issue?@action=redirect&bpo=36673) [https://bugs.python.org/issue?@action=redirect&bpo=36673].)

## xmlrpc

`xmlrpc.client.ServerProxy` now supports an optional *headers* keyword argument for a sequence of HTTP headers to be sent with each request. Among other things, this makes it possible to upgrade from default basic authentication to faster session authentication. (Contributed by Cédric Krier in [bpo-35153](https://bugs.python.org/) [https://bugs.python.org/

issue?@action=redirect&bpo=35153].)

## Optimizations

- The `subprocess` module can now use the `os.posix_spawn()` function in some cases for better performance. Currently, it is only used on macOS and Linux (using glibc 2.24 or newer) if all these conditions are met:
  - `close_fds` is false;
  - `preexec_fn`, `pass_fds`, `cwd` and `start_new_session` parameters are not set;
  - the `executable` path contains a directory.

(Contributed by Joannah Nanjeyye and Victor Stinner in [bpo-35537](https://bugs.python.org/issue?@action=redirect&bpo=35537) [https://bugs.python.org/issue?@action=redirect&bpo=35537].)

- `shutil.copyfile()`, `shutil.copy()`, `shutil.copy2()`, `shutil.copypath()` and `shutil.move()` use platform-specific “fast-copy” syscalls on Linux and macOS in order to copy the file more efficiently. “fast-copy” means that the copying operation occurs within the kernel, avoiding the use of userspace buffers in Python as in “`outfd.write(infd.read())`”. On Windows `shutil.copyfile()` uses a bigger default buffer size (1 MiB instead of 16 KiB) and a `memoryview()`-based variant of `shutil.copyfileobj()` is used. The speedup for copying a 512 MiB file within the same partition is about +26% on Linux, +50% on macOS and +40% on Windows. Also, much less CPU cycles are consumed. See [Platform-dependent efficient copy operations](#) section. (Contributed by Giampaolo Rodolà in [bpo-33671](https://bugs.python.org/issue?@action=redirect&bpo=33671) [https://bugs.python.org/issue?@action=redirect&bpo=33671].)
- `shutil.copypath()` uses `os.scandir()` function and all copy functions depending from it use cached `os.stat()` values. The speedup for copying a directory with 8000 files is around +9% on Linux, +20% on Windows and +30% on a Windows SMB share. Also the number of `os.stat()`

syscalls is reduced by 38% making `shutil.copypath()` especially faster on network filesystems. (Contributed by Giampaolo Rodolà in [bpo-33695](https://bugs.python.org/issue?@action=redirect&bpo=33695) [https://bugs.python.org/issue?@action=redirect&bpo=33695].)

- The default protocol in the `pickle` module is now Protocol 4, first introduced in Python 3.4. It offers better performance and smaller size compared to Protocol 3 available since Python 3.0.
- Removed one `Py_ssize_t` member from `PyGC_Head`. All GC tracked objects (e.g. tuple, list, dict) size is reduced 4 or 8 bytes. (Contributed by Inada Naoki in [bpo-33597](https://bugs.python.org/issue?@action=redirect&bpo=33597) [https://bugs.python.org/issue?@action=redirect&bpo=33597].)
- `uuid.UUID` now uses `__slots__` to reduce its memory footprint. (Contributed by Wouter Bolsterlee and Tal Einat in [bpo-30977](https://bugs.python.org/issue?@action=redirect&bpo=30977) [https://bugs.python.org/issue?@action=redirect&bpo=30977].)
- Improved performance of `operator.itemgetter()` by 33%. Optimized argument handling and added a fast path for the common case of a single non-negative integer index into a tuple (which is the typical use case in the standard library). (Contributed by Raymond Hettinger in [bpo-35664](https://bugs.python.org/issue?@action=redirect&bpo=35664) [https://bugs.python.org/issue?@action=redirect&bpo=35664].)
- Sped-up field lookups in `collections.namedtuple()`. They are now more than two times faster, making them the fastest form of instance variable lookup in Python. (Contributed by Raymond Hettinger, Pablo Galindo, and Joe Jevnik, Serhiy Storchaka in [bpo-32492](https://bugs.python.org/issue?@action=redirect&bpo=32492) [https://bugs.python.org/issue?@action=redirect&bpo=32492].)
- The `list` constructor does not overallocate the internal item buffer if the input iterable has a known length (the input implements `__len__`). This makes the created list 12% smaller on average. (Contributed by Raymond Hettinger and Pablo Galindo in [bpo-33234](https://bugs.python.org/issue?@action=redirect&bpo=33234) [https://bugs.python.org/issue?@action=redirect&bpo=33234].)

- Doubled the speed of class variable writes. When a non-dunder attribute was updated, there was an unnecessary call to update slots. (Contributed by Stefan Behnel, Pablo Galindo Salgado, Raymond Hettinger, Neil Schemenauer, and Serhiy Storchaka in [bpo-36012](https://bugs.python.org/issue?@action=redirect&bpo=36012) [https://bugs.python.org/issue?@action=redirect&bpo=36012].)
- Reduced an overhead of converting arguments passed to many builtin functions and methods. This sped up calling some simple builtin functions and methods up to 20–50%. (Contributed by Serhiy Storchaka in [bpo-23867](https://bugs.python.org/issue?@action=redirect&bpo=23867) [https://bugs.python.org/issue?@action=redirect&bpo=23867], [bpo-35582](https://bugs.python.org/issue?@action=redirect&bpo=35582) [https://bugs.python.org/issue?@action=redirect&bpo=35582] and [bpo-36127](https://bugs.python.org/issue?@action=redirect&bpo=36127) [https://bugs.python.org/issue?@action=redirect&bpo=36127].)
- `LOAD_GLOBAL` instruction now uses new “per opcode cache” mechanism. It is about 40% faster now. (Contributed by Yury Selivanov and Inada Naoki in [bpo-26219](https://bugs.python.org/issue?@action=redirect&bpo=26219) [https://bugs.python.org/issue?@action=redirect&bpo=26219].)

## Build and C API Changes

- Default `sys.abiflags` became an empty string: the `m` flag for pymalloc became useless (builds with and without pymalloc are ABI compatible) and so has been removed. (Contributed by Victor Stinner in [bpo-36707](https://bugs.python.org/issue?@action=redirect&bpo=36707) [https://bugs.python.org/issue?@action=redirect&bpo=36707].)

Example of changes:

- Only `python3.8` program is installed, `python3.8m` program is gone.
- Only `python3.8-config` script is installed, `python3.8m-config` script is gone.
- The `m` flag has been removed from the suffix of dynamic library filenames: extension modules in the standard library as well as those produced and installed by third-party packages, like those downloaded from PyPI. On Linux, for example, the Python 3.7 suffix

`.cpython-37m-x86_64-linux-gnu.so` became  
`.cpython-38-x86_64-linux-gnu.so` in Python  
3.8.

- The header files have been reorganized to better separate the different kinds of APIs:
  - `Include/*.h` should be the portable public stable C API.
  - `Include/cpython/*.h` should be the unstable C API specific to CPython; public API, with some private API prefixed by `_Py` or `_PY`.
  - `Include/internal/*.h` is the private internal C API very specific to CPython. This API comes with no backward compatibility warranty and should not be used outside CPython. It is only exposed for very specific needs like debuggers and profiles which has to access to CPython internals without calling functions. This API is now installed by `make install`.

(Contributed by Victor Stinner in [bpo-35134](https://bugs.python.org/issue?@action=redirect&bpo=35134) [https://bugs.python.org/issue?@action=redirect&bpo=35134] and [bpo-35081](https://bugs.python.org/issue?@action=redirect&bpo=35081) [https://bugs.python.org/issue?@action=redirect&bpo=35081], work initiated by Eric Snow in Python 3.7.)

- Some macros have been converted to static inline functions: parameter types and return type are well defined, they don't have issues specific to macros, variables have a local scopes. Examples:

- `Py_INCREF()`, `Py_DECREF()`
- `Py_XINCREF()`, `Py_XDECREF()`
- `PyObject_INIT()`, `PyObject_INIT_VAR()`
- Private functions: `_PyObject_GC_TRACK()`,  
`_PyObject_GC_UNTRACK()`, `_Py_Dealloc()`

(Contributed by Victor Stinner in [bpo-35059](https://bugs.python.org/issue?@action=redirect&bpo=35059) [https://bugs.python.org/issue?@action=redirect&bpo=35059].)

- The `PyByteArray_Init()` and `PyByteArray_Fini()` functions have been removed. They did nothing since Python

2.7.4 and Python 3.2.0, were excluded from the limited API (stable ABI), and were not documented. (Contributed by Victor Stinner in [bpo-35713](https://bugs.python.org/issue?@action=redirect&bpo=35713) [https://bugs.python.org/issue?@action=redirect&bpo=35713].)

- The result of `PyExceptionClass_Name()` is now of type `const char *` rather of `char *`. (Contributed by Serhiy Storchaka in [bpo-33818](https://bugs.python.org/issue?@action=redirect&bpo=33818) [https://bugs.python.org/issue?@action=redirect&bpo=33818].)
- The duality of `Modules/Setup.dist` and `Modules/Setup` has been removed. Previously, when updating the CPython source tree, one had to manually copy `Modules/Setup.dist` (inside the source tree) to `Modules/Setup` (inside the build tree) in order to reflect any changes upstream. This was of a small benefit to packagers at the expense of a frequent annoyance to developers following CPython development, as forgetting to copy the file could produce build failures.

Now the build system always reads from `Modules/Setup` inside the source tree. People who want to customize that file are encouraged to maintain their changes in a git fork of CPython or as patch files, as they would do for any other change to the source tree.

(Contributed by Antoine Pitrou in [bpo-32430](https://bugs.python.org/issue?@action=redirect&bpo=32430) [https://bugs.python.org/issue?@action=redirect&bpo=32430].)

- Functions that convert Python number to C integer like `PyLong_AsLong()` and argument parsing functions like `PyArg_ParseTuple()` with integer converting format units like `'i'` will now use the `__index__()` special method instead of `__int__()`, if available. The deprecation warning will be emitted for objects with the `__int__()` method but without the `__index__()` method (like `Decimal` and `Fraction`). `PyNumber_Check()` will now return `1` for objects implementing `__index__()`. `PyNumber_Long()`, `PyNumber_Float()` and `PyFloat_AsDouble()` also now use the `__index__()` method if available. (Contributed by Serhiy Storchaka in [bpo-36048](https://bugs.python.org/issue?@action=redirect&bpo=36048) [https://bugs.python.org/issue?@action=redirect&bpo=36048].)

@action=redirect&bpo=36048] and [bpo-20092](https://bugs.python.org/issue?@action=redirect&bpo=20092) [https://bugs.python.org/issue?@action=redirect&bpo=20092].)

- Heap-allocated type objects will now increase their reference count in `PyObject_Init()` (and its parallel macro `PyObject_INIT`) instead of in `PyType_GenericAlloc()`. Types that modify instance allocation or deallocation may need to be adjusted. (Contributed by Eddie Elizondo in [bpo-35810](https://bugs.python.org/issue?@action=redirect&bpo=35810) [https://bugs.python.org/issue?@action=redirect&bpo=35810].)
- The new function `PyCode_NewWithPosOnlyArgs()` allows to create code objects like `PyCode_New()`, but with an extra *posonlyargcount* parameter for indicating the number of positional-only arguments. (Contributed by Pablo Galindo in [bpo-37221](https://bugs.python.org/issue?@action=redirect&bpo=37221) [https://bugs.python.org/issue?@action=redirect&bpo=37221].)
- `Py_SetPath()` now sets `sys.executable` to the program full path (`Py_GetProgramFullPath()`) rather than to the program name (`Py_GetProgramName()`). (Contributed by Victor Stinner in [bpo-38234](https://bugs.python.org/issue?@action=redirect&bpo=38234) [https://bugs.python.org/issue?@action=redirect&bpo=38234].)

## Deprecated

- The distutils `bdist_wininst` command is now deprecated, use `bdist_wheel` (wheel packages) instead. (Contributed by Victor Stinner in [bpo-37481](https://bugs.python.org/issue?@action=redirect&bpo=37481) [https://bugs.python.org/issue?@action=redirect&bpo=37481].)
- Deprecated methods `getchildren()` and `getiterator()` in the `ElementTree` module now emit a `DeprecationWarning` instead of `PendingDeprecationWarning`. They will be removed in Python 3.9. (Contributed by Serhiy Storchaka in [bpo-29209](https://bugs.python.org/issue?@action=redirect&bpo=29209) [https://bugs.python.org/issue?@action=redirect&bpo=29209].)
- Passing an object that is not an instance of `concurrent.futures.ThreadPoolExecutor` to

`loop.set_default_executor()` is deprecated and will be prohibited in Python 3.9. (Contributed by Elvis Pranskevichus in [bpo-34075](https://bugs.python.org/issue?@action=redirect&bpo=34075) [https://bugs.python.org/issue?@action=redirect&bpo=34075].)

- The `__getitem__()` methods of `xml.dom.pulldom.DOMEventStream`, `wsgiref.util.FileWrapper` and `fileinput.FileInput` have been deprecated.

Implementations of these methods have been ignoring their *index* parameter, and returning the next item instead. (Contributed by Berker Peksag in [bpo-9372](https://bugs.python.org/issue?@action=redirect&bpo=9372) [https://bugs.python.org/issue?@action=redirect&bpo=9372].)

- The `typing.NamedTuple` class has deprecated the `_field_types` attribute in favor of the `__annotations__` attribute which has the same information. (Contributed by Raymond Hettinger in [bpo-36320](https://bugs.python.org/issue?@action=redirect&bpo=36320) [https://bugs.python.org/issue?@action=redirect&bpo=36320].)
- `ast` classes `Num`, `Str`, `Bytes`, `NameConstant` and `Ellipsis` are considered deprecated and will be removed in future Python versions. `Constant` should be used instead. (Contributed by Serhiy Storchaka in [bpo-32892](https://bugs.python.org/issue?@action=redirect&bpo=32892) [https://bugs.python.org/issue?@action=redirect&bpo=32892].)
- `ast.NodeVisitor` methods `visit_Num()`, `visit_Str()`, `visit_Bytes()`, `visit_NameConstant()` and `visit_Ellipsis()` are deprecated now and will not be called in future Python versions. Add the `visit_Constant()` method to handle all constant nodes. (Contributed by Serhiy Storchaka in [bpo-36917](https://bugs.python.org/issue?@action=redirect&bpo=36917) [https://bugs.python.org/issue?@action=redirect&bpo=36917].)
- The `asyncio.coroutine()` decorator is deprecated and will be removed in version 3.10. Instead of `@asyncio.coroutine`, use `async def` instead. (Contributed by Andrew Svetlov in [bpo-36921](https://bugs.python.org/issue?@action=redirect&bpo=36921) [https://bugs.python.org/issue?@action=redirect&bpo=36921].)

- In **asyncio**, the explicit passing of a *loop* argument has been deprecated and will be removed in version 3.10 for the following: **asyncio.sleep()**, **asyncio.gather()**, **asyncio.shield()**, **asyncio.wait\_for()**, **asyncio.wait()**, **asyncio.as\_completed()**, **asyncio.Task**, **asyncio.Lock**, **asyncio.Event**, **asyncio.Condition**, **asyncio.Semaphore**, **asyncio.BoundedSemaphore**, **asyncio.Queue**, **asyncio.create\_subprocess\_exec()**, and **asyncio.create\_subprocess\_shell()**.
- The explicit passing of coroutine objects to **asyncio.wait()** has been deprecated and will be removed in version 3.11. (Contributed by Yury Selivanov in [bpo-34790](https://bugs.python.org/issue?@action=redirect&bpo=34790) [<https://bugs.python.org/issue?@action=redirect&bpo=34790>].)
- The following functions and methods are deprecated in the **gettext** module: **lgettext()**, **ldgettext()**, **lngettext()** and **ldngettext()**. They return encoded bytes, and it's possible that you will get unexpected Unicode-related exceptions if there are encoding problems with the translated strings. It's much better to use alternatives which return Unicode strings in Python 3. These functions have been broken for a long time.

Function **bind\_textdomain\_codeset()**, methods **output\_charset()** and **set\_output\_charset()**, and the *codeset* parameter of functions **translation()** and **install()** are also deprecated, since they are only used for the **l\*gettext()** functions. (Contributed by Serhiy Storchaka in [bpo-33710](https://bugs.python.org/issue?@action=redirect&bpo=33710) [<https://bugs.python.org/issue?@action=redirect&bpo=33710>].)

- The **isAlive()** method of **threading.Thread** has been deprecated. (Contributed by Dong-hee Na in [bpo-35283](https://bugs.python.org/issue?@action=redirect&bpo=35283) [<https://bugs.python.org/issue?@action=redirect&bpo=35283>].)
- Many builtin and extension functions that take integer arguments will now emit a deprecation warning for **Decimals**, **Fractions** and any other objects that can be converted to integers only with a loss (e.g. that have the

`__int__()` method but do not have the `__index__()` method). In future version they will be errors. (Contributed by Serhiy Storchaka in [bpo-36048](https://bugs.python.org/issue?@action=redirect&bpo=36048) [https://bugs.python.org/issue?@action=redirect&bpo=36048].)

- Deprecated passing the following arguments as keyword arguments:
  - *func* in `functools.partialmethod()`, `weakref.finalize()`, `profile.Profile.runcall()`, `cProfile.Profile.runcall()`, `bdb.Bdb.runcall()`, `trace.Trace.runfunc()` and `curses.wrapper()`.
  - *function* in `unittest.TestCase.addCleanup()`.
  - *fn* in the `submit()` method of `concurrent.futures.ThreadPoolExecutor` and `concurrent.futures.ProcessPoolExecutor`.
  - *callback* in `contextlib.ExitStack.callback()`, `contextlib.AsyncExitStack.callback()` and `contextlib.AsyncExitStack.push_async_callback()`.
  - *c* and *typeid* in the `create()` method of `multiprocessing.managers.Server` and `multiprocessing.managers.SharedMemoryServer`.
  - *obj* in `weakref.finalize()`.

In future releases of Python, they will be [positional-only](https://bugs.python.org/issue?@action=redirect&bpo=36492). (Contributed by Serhiy Storchaka in [bpo-36492](https://bugs.python.org/issue?@action=redirect&bpo=36492) [https://bugs.python.org/issue?@action=redirect&bpo=36492].)

## API and Feature Removals

The following features and APIs have been removed from Python 3.8:

- Starting with Python 3.3, importing ABCs from `collections` was deprecated, and importing should be done from `collections.abc`. Being able to import from `collections` was marked for removal in 3.8, but has been delayed to 3.9. (See [bpo-36952](https://bugs.python.org/issue?@action=redirect&bpo=36952) [https://bugs.python.org/issue?@action=redirect&bpo=36952].)

@action=redirect&bpo=36952].)

- The **macpath** module, deprecated in Python 3.7, has been removed. (Contributed by Victor Stinner in [bpo-35471](https://bugs.python.org/issue?@action=redirect&bpo=35471) [https://bugs.python.org/issue?@action=redirect&bpo=35471].)
- The function **platform.popen()** has been removed, after having been deprecated since Python 3.3: use **os.popen()** instead. (Contributed by Victor Stinner in [bpo-35345](https://bugs.python.org/issue?@action=redirect&bpo=35345) [https://bugs.python.org/issue?@action=redirect&bpo=35345].)
- The function **time.clock()** has been removed, after having been deprecated since Python 3.3: use **time.perf\_counter()** or **time.process\_time()** instead, depending on your requirements, to have well-defined behavior. (Contributed by Matthias Bussonnier in [bpo-36895](https://bugs.python.org/issue?@action=redirect&bpo=36895) [https://bugs.python.org/issue?@action=redirect&bpo=36895].)
- The `pyenv` script has been removed in favor of `python3.8 -m venv` to help eliminate confusion as to what Python interpreter the `pyenv` script is tied to. (Contributed by Brett Cannon in [bpo-25427](https://bugs.python.org/issue?@action=redirect&bpo=25427) [https://bugs.python.org/issue?@action=redirect&bpo=25427].)
- `parse_qs`, `parse_qsl`, and `escape` are removed from the **cgi** module. They are deprecated in Python 3.2 or older. They should be imported from the `urllib.parse` and `html` modules instead.
- `filemode` function is removed from the **tarfile** module. It is not documented and deprecated since Python 3.3.
- The **XMLParser** constructor no longer accepts the `html` argument. It never had an effect and was deprecated in Python 3.4. All other parameters are now **keyword-only**. (Contributed by Serhiy Storchaka in [bpo-29209](https://bugs.python.org/issue?@action=redirect&bpo=29209) [https://bugs.python.org/issue?@action=redirect&bpo=29209].)
- Removed the `doctype()` method of **XMLParser**. (Contributed by Serhiy Storchaka in [bpo-29209](https://bugs.python.org/issue?@action=redirect&bpo=29209) [https://bugs.python.org/issue?@action=redirect&bpo=29209].)
- “unicode\_internal” codec is removed. (Contributed by Inada Naoki in [bpo-36297](https://bugs.python.org/issue?@action=redirect&bpo=36297) [https://bugs.python.org/issue?@action=redirect&bpo=36297].)
- The `Cache` and `Statement` objects of the **sqlite3** module are not exposed to the user. (Contributed by Aviv Palivoda in [bpo-30262](https://bugs.python.org/issue?@action=redirect&bpo=30262) [https://bugs.python.org/issue?@action=redirect&bpo=30262].)

@action=redirect&bpo=30262].)

- The `bufsize` keyword argument of `fileinput.input()` and `fileinput.FileInput()` which was ignored and deprecated since Python 3.6 has been removed. [bpo-36952](https://bugs.python.org/issue?@action=redirect&bpo=36952) [https://bugs.python.org/issue?@action=redirect&bpo=36952] (Contributed by Matthias Bussonnier.)
- The functions `sys.set_coroutine_wrapper()` and `sys.get_coroutine_wrapper()` deprecated in Python 3.7 have been removed; [bpo-36933](https://bugs.python.org/issue?@action=redirect&bpo=36933) [https://bugs.python.org/issue?@action=redirect&bpo=36933] (Contributed by Matthias Bussonnier.)

## Porting to Python 3.8

This section lists previously described changes and other bugfixes that may require changes to your code.

### Changes in Python behavior

- Yield expressions (both `yield` and `yield from` clauses) are now disallowed in comprehensions and generator expressions (aside from the iterable expression in the leftmost `for` clause). (Contributed by Serhiy Storchaka in [bpo-10544](https://bugs.python.org/issue?@action=redirect&bpo=10544) [https://bugs.python.org/issue?@action=redirect&bpo=10544].)
- The compiler now produces a `SyntaxWarning` when identity checks (`is` and `is not`) are used with certain types of literals (e.g. strings, numbers). These can often work by accident in CPython, but are not guaranteed by the language spec. The warning advises users to use equality tests (`==` and `!=`) instead. (Contributed by Serhiy Storchaka in [bpo-34850](https://bugs.python.org/issue?@action=redirect&bpo=34850) [https://bugs.python.org/issue?@action=redirect&bpo=34850].)
- The CPython interpreter can swallow exceptions in some circumstances. In Python 3.8 this happens in fewer cases. In particular, exceptions raised when getting the attribute from the type dictionary are no longer ignored. (Contributed by Serhiy Storchaka in [bpo-35459](https://bugs.python.org/issue?@action=redirect&bpo=35459) [https://bugs.python.org/issue?@action=redirect&bpo=35459].)
- Removed `__str__` implementations from builtin types `bool`, `int`, `float`, `complex` and few classes from the

standard library. They now inherit `__str__()` from **object**. As result, defining the `__repr__()` method in the subclass of these classes will affect their string representation. (Contributed by Serhiy Storchaka in [bpo-36793](https://bugs.python.org/issue?@action=redirect&bpo=36793) [https://bugs.python.org/issue?@action=redirect&bpo=36793].)

- On AIX, **sys.platform** doesn't contain the major version anymore. It is always 'aix', instead of 'aix3' .. 'aix7'. Since older Python versions include the version number, so it is recommended to always use `sys.platform.startswith('aix')`. (Contributed by M. Felt in [bpo-36588](https://bugs.python.org/issue?@action=redirect&bpo=36588) [https://bugs.python.org/issue?@action=redirect&bpo=36588].)
- **PyEval\_AcquireLock()** and **PyEval\_AcquireThread()** now terminate the current thread if called while the interpreter is finalizing, making them consistent with **PyEval\_RestoreThread()**, **Py\_END\_ALLOW\_THREADS()**, and **PyGILState\_Ensure()**. If this behavior is not desired, guard the call by checking **\_Py\_IsFinalizing()** or **sys.is\_finalizing()**. (Contributed by Joanna Nanjekye in [bpo-36475](https://bugs.python.org/issue?@action=redirect&bpo=36475) [https://bugs.python.org/issue?@action=redirect&bpo=36475].)

## Changes in the Python API

- The **os.getcwd()** function now uses the UTF-8 encoding on Windows, rather than the ANSI code page: see [PEP 529](https://peps.python.org/pep-0529/) [https://peps.python.org/pep-0529/] for the rationale. The function is no longer deprecated on Windows. (Contributed by Victor Stinner in [bpo-37412](https://bugs.python.org/issue?@action=redirect&bpo=37412) [https://bugs.python.org/issue?@action=redirect&bpo=37412].)
- **subprocess.Popen** can now use **os.posix\_spawn()** in some cases for better performance. On Windows Subsystem for Linux and QEMU User Emulation, the **Popen** constructor using **os.posix\_spawn()** no longer raises an exception on errors like “missing program”. Instead the child process fails with a non-zero **returncode**. (Contributed by Joanna Nanjekye and Victor Stinner in [bpo-35537](https://bugs.python.org/issue?@action=redirect&bpo=35537) [https://bugs.python.org/issue?@action=redirect&bpo=35537].)
- The *preexec\_fn* argument of \* **subprocess.Popen** is no

longer compatible with subinterpreters. The use of the parameter in a subinterpreter now raises `RuntimeError`. (Contributed by Eric Snow in [bpo-34651](https://bugs.python.org/issue?@action=redirect&bpo=34651) [https://bugs.python.org/issue?@action=redirect&bpo=34651], modified by Christian Heimes in [bpo-37951](https://bugs.python.org/issue?@action=redirect&bpo=37951) [https://bugs.python.org/issue?@action=redirect&bpo=37951].)

- The `imap.IMAP4.logout()` method no longer silently ignores arbitrary exceptions. (Contributed by Victor Stinner in [bpo-36348](https://bugs.python.org/issue?@action=redirect&bpo=36348) [https://bugs.python.org/issue?@action=redirect&bpo=36348].)
- The function `platform.popen()` has been removed, after having been deprecated since Python 3.3: use `os.popen()` instead. (Contributed by Victor Stinner in [bpo-35345](https://bugs.python.org/issue?@action=redirect&bpo=35345) [https://bugs.python.org/issue?@action=redirect&bpo=35345].)
- The `statistics.mode()` function no longer raises an exception when given multimodal data. Instead, it returns the first mode encountered in the input data. (Contributed by Raymond Hettinger in [bpo-35892](https://bugs.python.org/issue?@action=redirect&bpo=35892) [https://bugs.python.org/issue?@action=redirect&bpo=35892].)
- The `selection()` method of the `tkinter.ttk.Treeview` class no longer takes arguments. Using it with arguments for changing the selection was deprecated in Python 3.6. Use specialized methods like `selection_set()` for changing the selection. (Contributed by Serhiy Storchaka in [bpo-31508](https://bugs.python.org/issue?@action=redirect&bpo=31508) [https://bugs.python.org/issue?@action=redirect&bpo=31508].)
- The `writexml()`, `toxml()` and `toprettyxml()` methods of `xml.dom.minidom`, and the `write()` method of `xml.etree`, now preserve the attribute order specified by the user. (Contributed by Diego Rojas and Raymond Hettinger in [bpo-34160](https://bugs.python.org/issue?@action=redirect&bpo=34160) [https://bugs.python.org/issue?@action=redirect&bpo=34160].)
- A `dbm.dumb` database opened with flags `'r'` is now read-only. `dbm.dumb.open()` with flags `'r'` and `'w'` no longer creates a database if it does not exist. (Contributed by Serhiy Storchaka in [bpo-32749](https://bugs.python.org/issue?@action=redirect&bpo=32749) [https://bugs.python.org/issue?@action=redirect&bpo=32749].)
- The `doctype()` method defined in a subclass of `XMLParser` will no longer be called and will emit a `RuntimeWarning` instead of a `DeprecationWarning`.

Define the `doctype()` method on a target for handling an XML doctype declaration. (Contributed by Serhiy Storchaka in [bpo-29209](https://bugs.python.org/issue?@action=redirect&bpo=29209) [https://bugs.python.org/issue?@action=redirect&bpo=29209].)

- A `RuntimeError` is now raised when the custom metaclass doesn't provide the `__classcell__` entry in the namespace passed to `type.__new__`. A `DeprecationWarning` was emitted in Python 3.6–3.7. (Contributed by Serhiy Storchaka in [bpo-23722](https://bugs.python.org/issue?@action=redirect&bpo=23722) [https://bugs.python.org/issue?@action=redirect&bpo=23722].)
- The `cProfile.Profile` class can now be used as a context manager. (Contributed by Scott Sanderson in [bpo-29235](https://bugs.python.org/issue?@action=redirect&bpo=29235) [https://bugs.python.org/issue?@action=redirect&bpo=29235].)
- `shutil.copyfile()`, `shutil.copy()`, `shutil.copy2()`, `shutil.copytree()` and `shutil.move()` use platform-specific “fast-copy” syscalls (see [Platform-dependent efficient copy operations](#) section).
- `shutil.copyfile()` default buffer size on Windows was changed from 16 KiB to 1 MiB.
- The `PyGC_Head` struct has changed completely. All code that touched the struct member should be rewritten. (See [bpo-33597](https://bugs.python.org/issue?@action=redirect&bpo=33597) [https://bugs.python.org/issue?@action=redirect&bpo=33597].)
- The `PyInterpreterState` struct has been moved into the “internal” header files (specifically `Include/internal/pycore_pystate.h`). An opaque `PyInterpreterState` is still available as part of the public API (and stable ABI). The docs indicate that none of the struct's fields are public, so we hope no one has been using them. However, if you do rely on one or more of those private fields and have no alternative then please open a BPO issue. We'll work on helping you adjust (possibly including adding accessor functions to the public API). (See [bpo-35886](https://bugs.python.org/issue?@action=redirect&bpo=35886) [https://bugs.python.org/issue?@action=redirect&bpo=35886].)
- The `mmap.flush()` method now returns `None` on success and raises an exception on error under all platforms. Previously, its behavior was platform-dependent: a nonzero value was returned on success; zero was returned on error under Windows. A zero value was returned on success; an exception was raised on error under Unix. (Contributed by

Berker Peksag in [bpo-2122](https://bugs.python.org/issue?@action=redirect&bpo=2122) [https://bugs.python.org/issue?@action=redirect&bpo=2122].)

- `xml.dom.minidom` and `xml.sax` modules no longer process external entities by default. (Contributed by Christian Heimes in [bpo-17239](https://bugs.python.org/issue?@action=redirect&bpo=17239) [https://bugs.python.org/issue?@action=redirect&bpo=17239].)
- Deleting a key from a read-only `dbm` database (`dbm.dumb`, `dbm.gnu` or `dbm.ndbm`) raises `error` (`dbm.dumb.error`, `dbm.gnu.error` or `dbm.ndbm.error`) instead of `KeyError`. (Contributed by Xiang Zhang in [bpo-33106](https://bugs.python.org/issue?@action=redirect&bpo=33106) [https://bugs.python.org/issue?@action=redirect&bpo=33106].)
- Simplified AST for literals. All constants will be represented as `ast.Constant` instances. Instantiating old classes `Num`, `Str`, `Bytes`, `NameConstant` and `Ellipsis` will return an instance of `Constant`. (Contributed by Serhiy Storchaka in [bpo-32892](https://bugs.python.org/issue?@action=redirect&bpo=32892) [https://bugs.python.org/issue?@action=redirect&bpo=32892].)
- `expanduser()` on Windows now prefers the `USERPROFILE` environment variable and does not use `HOME`, which is not normally set for regular user accounts. (Contributed by Anthony Sottile in [bpo-36264](https://bugs.python.org/issue?@action=redirect&bpo=36264) [https://bugs.python.org/issue?@action=redirect&bpo=36264].)
- The exception `asyncio.CancelledError` now inherits from `BaseException` rather than `Exception` and no longer inherits from `concurrent.futures.CancelledError`. (Contributed by Yury Selivanov in [bpo-32528](https://bugs.python.org/issue?@action=redirect&bpo=32528) [https://bugs.python.org/issue?@action=redirect&bpo=32528].)
- The function `asyncio.wait_for()` now correctly waits for cancellation when using an instance of `asyncio.Task`. Previously, upon reaching *timeout*, it was cancelled and immediately returned. (Contributed by Elvis Pranskevichus in [bpo-32751](https://bugs.python.org/issue?@action=redirect&bpo=32751) [https://bugs.python.org/issue?@action=redirect&bpo=32751].)
- The function `asyncio.BaseTransport.get_extra_info()` now returns a safe to use socket object when 'socket' is passed to the *name* parameter. (Contributed by Yury Selivanov in [bpo-37027](https://bugs.python.org/issue?@action=redirect&bpo=37027) [https://bugs.python.org/issue?@action=redirect&bpo=37027].)

- `asyncio.BufferedProtocol` has graduated to the stable API.
- DLL dependencies for extension modules and DLLs loaded with `ctypes` on Windows are now resolved more securely. Only the system paths, the directory containing the DLL or PYD file, and directories added with `add_dll_directory()` are searched for load-time dependencies. Specifically, `PATH` and the current working directory are no longer used, and modifications to these will no longer have any effect on normal DLL resolution. If your application relies on these mechanisms, you should check for `add_dll_directory()` and if it exists, use it to add your DLLs directory while loading your library. Note that Windows 7 users will need to ensure that Windows Update KB2533623 has been installed (this is also verified by the installer). (Contributed by Steve Dower in [bpo-36085](https://bugs.python.org/issue/?@action=redirect&bpo=36085) [https://bugs.python.org/issue/?@action=redirect&bpo=36085].)
- The header files and functions related to pgen have been removed after its replacement by a pure Python implementation. (Contributed by Pablo Galindo in [bpo-36623](https://bugs.python.org/issue/?@action=redirect&bpo=36623) [https://bugs.python.org/issue/?@action=redirect&bpo=36623].)
- `types.CodeType` has a new parameter in the second position of the constructor (*posonlyargcount*) to support positional-only arguments defined in [PEP 570](https://peps.python.org/pep-0570/) [https://peps.python.org/pep-0570/]. The first argument (*argcount*) now represents the total number of positional arguments (including positional-only arguments). The new `replace()` method of `types.CodeType` can be used to make the code future-proof.
- The parameter `digestmod` for `hmac.new()` no longer uses the MD5 digest by default.

## Changes in the C API

- The `PyCompilerFlags` structure got a new `cf_feature_version` field. It should be initialized to `PY_MINOR_VERSION`. The field is ignored by default, and is used if and only if `PyCF_ONLY_AST` flag is set in `cf_flags`. (Contributed by Guido van Rossum in [bpo-35766](https://bugs.python.org/issue/?@action=redirect&bpo=35766) [https://bugs.python.org/issue/?@action=redirect&bpo=35766].)

[bugs.python.org/issue?@action=redirect&bpo=35766](https://bugs.python.org/issue?@action=redirect&bpo=35766)].)

- The **PyEval\_ReInitThreads()** function has been removed from the C API. It should not be called explicitly: use **PyOS\_AfterFork\_Child()** instead. (Contributed by Victor Stinner in [bpo-36728](https://bugs.python.org/issue?@action=redirect&bpo=36728) [<https://bugs.python.org/issue?@action=redirect&bpo=36728>].)
- On Unix, C extensions are no longer linked to libpython except on Android and Cygwin. When Python is embedded, libpython must not be loaded with `RTLD_LOCAL`, but `RTLD_GLOBAL` instead. Previously, using `RTLD_LOCAL`, it was already not possible to load C extensions which were not linked to libpython, like C extensions of the standard library built by the `*shared*` section of `Modules/Setup`. (Contributed by Victor Stinner in [bpo-21536](https://bugs.python.org/issue?@action=redirect&bpo=21536) [<https://bugs.python.org/issue?@action=redirect&bpo=21536>].)
- Use of `#` variants of formats in parsing or building value (e.g. **PyArg\_ParseTuple()**, **Py\_BuildValue()**, **PyObject\_CallFunction()**, etc.) without `PY_SSIZE_T_CLEAN` defined raises `DeprecationWarning` now. It will be removed in 3.10 or 4.0. Read [Parsing arguments and building values](#) for detail. (Contributed by Inada Naoki in [bpo-36381](https://bugs.python.org/issue?@action=redirect&bpo=36381) [<https://bugs.python.org/issue?@action=redirect&bpo=36381>].)
- Instances of heap-allocated types (such as those created with **PyType\_FromSpec()**) hold a reference to their type object. Increasing the reference count of these type objects has been moved from **PyType\_GenericAlloc()** to the more low-level functions, **PyObject\_Init()** and **PyObject\_INIT()**. This makes types created through **PyType\_FromSpec()** behave like other classes in managed code.

[Statically allocated types](#) are not affected.

For the vast majority of cases, there should be no side effect. However, types that manually increase the reference count after allocating an instance (perhaps to work around the bug)

may now become immortal. To avoid this, these classes need to call `Py_DECREF` on the type object during instance deallocation.

To correctly port these types into 3.8, please apply the following changes:

- Remove `Py_INCREF` on the type object after allocating an instance - if any. This may happen after calling `PyObject_New()`, `PyObject_NewVar()`, `PyObject_GC_New()`, `PyObject_GC_NewVar()`, or any other custom allocator that uses `PyObject_Init()` or `PyObject_INIT()`.

Example:

```
static foo_struct *
foo_new(PyObject *type) {
    foo_struct *foo = PyObject_GC_New(foo_struct,
    if (foo == NULL)
        return NULL;
#ifdef PY_VERSION_HEX < 0x03080000
    // Workaround for Python issue 35810; no longer needed
    Py_INCREF(type)
#endif
    return foo;
}
```

- Ensure that all custom `tp_dealloc` functions of heap-allocated types decrease the type's reference count.

Example:

```
static void
foo_dealloc(foo_struct *instance) {
    PyObject *type = Py_TYPE(instance);
    PyObject_GC_Del(instance);
#ifdef PY_VERSION_HEX >= 0x03080000
    // This was not needed before Python 3.8 (Python 3.8+
    Py_DECREF(type);
#endif
}
```

```
#endif
}
```

(Contributed by Eddie Elizondo in [bpo-35810](https://bugs.python.org/issue?@action=redirect&bpo=35810) [https://bugs.python.org/issue?@action=redirect&bpo=35810].)

- The **`Py_DEPRECATED()`** macro has been implemented for MSVC. The macro now must be placed before the symbol name.

Example:

```
Py_DEPRECATED(3.8) PyAPI_FUNC(int) Py_OldFunction(v
```

(Contributed by Zackery Spytz in [bpo-33407](https://bugs.python.org/issue?@action=redirect&bpo=33407) [https://bugs.python.org/issue?@action=redirect&bpo=33407].)

- The interpreter does not pretend to support binary compatibility of extension types across feature releases, anymore. A **`PyTypeObject`** exported by a third-party extension module is supposed to have all the slots expected in the current Python version, including **`tp_finalize`** (**`Py_TPFLAGS_HAVE_FINALIZE`** is not checked anymore before reading **`tp_finalize`**).

(Contributed by Antoine Pitrou in [bpo-32388](https://bugs.python.org/issue?@action=redirect&bpo=32388) [https://bugs.python.org/issue?@action=redirect&bpo=32388].)

- The functions **`PyNode_AddChild()`** and **`PyParser_AddToken()`** now accept two additional `int` arguments *end\_lineno* and *end\_col\_offset*.
- The `libpython38.a` file to allow MinGW tools to link directly against `python38.dll` is no longer included in the regular Windows distribution. If you require this file, it may be generated with the `gendef` and `dlltool` tools, which are part of the MinGW binutils package:

```
gendef - python38.dll > tmp.def
dlltool --dllname python38.dll --def tmp.def --outp
```

The location of an installed `pythonXY.dll` will depend on

the installation options and the version and language of Windows. See [Using Python on Windows](#) for more information. The resulting library should be placed in the same directory as `pythonXY.lib`, which is generally the `libs` directory under your Python installation.

(Contributed by Steve Dower in [bpo-37351](#) [<https://bugs.python.org/issue?@action=redirect&bpo=37351>].)

## CPython bytecode changes

- The interpreter loop has been simplified by moving the logic of unrolling the stack of blocks into the compiler. The compiler emits now explicit instructions for adjusting the stack of values and calling the cleaning-up code for **break**, **continue** and **return**.

Removed opcodes **BREAK\_LOOP**, **CONTINUE\_LOOP**, **SETUP\_LOOP** and **SETUP\_EXCEPT**. Added new opcodes **ROT\_FOUR**, **BEGIN\_FINALLY**, **CALL\_FINALLY** and **POP\_FINALLY**. Changed the behavior of **END\_FINALLY** and **WITH\_CLEANUP\_START**.

(Contributed by Mark Shannon, Antoine Pitrou and Serhiy Storchaka in [bpo-17611](#) [<https://bugs.python.org/issue?@action=redirect&bpo=17611>].)

- Added new opcode **END\_ASYNC\_FOR** for handling exceptions raised when awaiting a next item in an **async for** loop. (Contributed by Serhiy Storchaka in [bpo-33041](#) [<https://bugs.python.org/issue?@action=redirect&bpo=33041>].)
- The **MAP\_ADD** now expects the value as the first element in the stack and the key as the second element. This change was made so the key is always evaluated before the value in dictionary comprehensions, as proposed by [PEP 572](#) [<https://peps.python.org/pep-0572/>]. (Contributed by Jörn Heissler in [bpo-35224](#) [<https://bugs.python.org/issue?@action=redirect&bpo=35224>].)

## Demos and Tools

Added a benchmark script for timing various ways to access variables: `Tools/scripts/var_access_benchmark.py`.  
(Contributed by Raymond Hettinger in [bpo-35884](https://bugs.python.org/issue?@action=redirect&bpo=35884) [<https://bugs.python.org/issue?@action=redirect&bpo=35884>].)

Here's a summary of performance improvements since Python 3.3:

Python version	3.3	3.4	3.5
-----	---	---	---
Variable and attribute read access:			
<code>read_local</code>	4.0	7.1	7.1
<code>read_nonlocal</code>	5.3	7.1	8.1
<code>read_global</code>	13.3	15.5	19.0
<code>read_builtin</code>	20.0	21.1	21.6
<code>read_classvar_from_class</code>	20.5	25.6	26.5
<code>read_classvar_from_instance</code>	18.5	22.8	23.5
<code>read_instancevar</code>	26.8	32.4	33.1
<code>read_instancevar_slots</code>	23.7	27.8	31.3
<code>read_namedtuple</code>	68.5	73.8	57.5
<code>read_boundmethod</code>	29.8	37.6	37.9
Variable and attribute write access:			
<code>write_local</code>	4.6	8.7	9.3
<code>write_nonlocal</code>	7.3	10.5	11.1
<code>write_global</code>	15.9	19.7	21.2
<code>write_classvar</code>	81.9	92.9	96.0
<code>write_instancevar</code>	36.4	44.6	45.8
<code>write_instancevar_slots</code>	28.7	35.6	36.1
Data structure read access:			
<code>read_list</code>	19.2	24.2	24.5
<code>read_deque</code>	19.9	24.7	25.5
<code>read_dict</code>	19.7	24.3	25.7
<code>read_strdict</code>	17.9	22.6	24.3
Data structure write access:			
<code>write_list</code>	21.2	27.1	28.5
<code>write_deque</code>	23.8	28.7	30.1

<code>write_dict</code>	25.9	31.4	33.3
<code>write_strdict</code>	22.9	28.4	29.9
Stack (or queue) operations:			
<code>list_append_pop</code>	144.2	93.4	112.7
<code>deque_append_pop</code>	30.4	43.5	57.0
<code>deque_append_popleft</code>	30.8	43.7	57.3
Timing loop:			
<code>loop_overhead</code>	0.3	0.5	0.6

The benchmarks were measured on an [Intel® Core™ i7-4960HQ processor](https://ark.intel.com/content/www/us/en/ark/products/76088/intel-core-i7-4960hq-processor-6m-cache-up-to-3-80-ghz.html) [https://ark.intel.com/content/www/us/en/ark/products/76088/intel-core-i7-4960hq-processor-6m-cache-up-to-3-80-ghz.html] running the macOS 64-bit builds found at [python.org](https://www.python.org/downloads/macos/) [https://www.python.org/downloads/macos/]. The benchmark script displays timings in nanoseconds.

## Notable changes in Python 3.8.1

Due to significant security concerns, the *reuse\_address* parameter of `asyncio.loop.create_datagram_endpoint()` is no longer supported. This is because of the behavior of the socket option `SO_REUSEADDR` in UDP. For more details, see the documentation for `loop.create_datagram_endpoint()`. (Contributed by Kyle Stanley, Antoine Pitrou, and Yury Selivanov in [bpo-37228](https://bugs.python.org/issue?@action=redirect&bpo=37228) [https://bugs.python.org/issue?@action=redirect&bpo=37228].)

## Notable changes in Python 3.8.8

Earlier Python versions allowed using both `;` and `&` as query parameter separators in `urllib.parse.parse_qs()` and `urllib.parse.parse_qsl()`. Due to security concerns, and to conform with newer W3C recommendations, this has been changed to allow only a single separator key, with `&` as the default. This change also affects `cgi.parse()` and `cgi.parse_multipart()` as they use the affected functions internally. For more details, please see their respective documentation. (Contributed by Adam Goldschmidt, Senthil Kumaran and Ken Jin in [bpo-42967](https://bugs.python.org/issue?@action=redirect&bpo=42967) [https://bugs.python.org/issue?@action=redirect&bpo=42967].)

@action=redirect&bpo=42967].)

## Notable changes in Python 3.8.12

Starting with Python 3.8.12 the `ipaddress` module no longer accepts any leading zeros in IPv4 address strings. Leading zeros are ambiguous and interpreted as octal notation by some libraries. For example the legacy function `socket.inet_aton()` treats leading zeros as octal notation. glibc implementation of modern `inet_pton()` does not accept any leading zeros.

(Originally contributed by Christian Heimes in [bpo-36384](https://bugs.python.org/issue?@action=redirect&bpo=36384) [https://bugs.python.org/issue?@action=redirect&bpo=36384], and backported to 3.8 by Achraf Merzouki.)

# What's New In Python 3.7

## Editor

Elvis Pranskevichus <[elvis@magic.io](mailto:elvis@magic.io)>

This article explains the new features in Python 3.7, compared to 3.6. Python 3.7 was released on June 27, 2018. For full details, see the [changelog](#).

## Summary – Release Highlights

New syntax features:

- [PEP 563](#), postponed evaluation of type annotations.

Backwards incompatible syntax changes:

- [async](#) and [await](#) are now reserved keywords.

New library modules:

- [contextvars](#): [PEP 567 – Context Variables](#)
- [dataclasses](#): [PEP 557 – Data Classes](#)
- [importlib.resources](#)

New built-in features:

- [PEP 553](#), the new [breakpoint\(\)](#) function.

Python data model improvements:

- [PEP 562](#), customization of access to module attributes.
- [PEP 560](#), core support for typing module and generic types.
- the insertion-order preservation nature of [dict](#) objects [has been declared](#) [<https://mail.python.org/pipermail/python-dev/2017-December/151283.html>] to be an official part of the Python language spec.

Significant improvements in the standard library:

- The [asyncio](#) module has received new features, significant [usability and performance improvements](#).
- The [time](#) module gained support for [functions with nanosecond resolution](#).

CPython implementation improvements:

- Avoiding the use of ASCII as a default text encoding:
  - [PEP 538](#), legacy C locale coercion
  - [PEP 540](#), forced UTF-8 runtime mode
- [PEP 552](#), deterministic `.pycs`
- [New Python Development Mode](#)
- [PEP 565](#), improved [DeprecationWarning](#) handling

C API improvements:

- [PEP 539](#), new C API for thread-local storage

Documentation improvements:

- [PEP 545](#), Python documentation translations
- New documentation translations: [Japanese](#) [<https://docs.python.org/ja/>], [French](#) [<https://docs.python.org/fr/>], and [Korean](#) [<https://docs.python.org/ko/>].

This release features notable performance improvements in many areas. The [Optimizations](#) section lists them in detail.

For a list of changes that may affect compatibility with previous Python releases please refer to the [Porting to Python 3.7](#) section.

## New Features

### PEP 563: Postponed Evaluation of Annotations

The advent of type hints in Python uncovered two glaring usability issues with the functionality of annotations added in [PEP 3107](#) [<https://peps.python.org/pep-3107/>] and refined further in [PEP 526](#) [<https://peps.python.org/pep-0526/>]:

- annotations could only use names which were already available in the current scope, in other words they didn't support forward references of any kind; and
- annotating source code had adverse effects on startup time of Python programs.

Both of these issues are fixed by postponing the evaluation of annotations. Instead of compiling code which executes expressions in annotations at their definition time, the compiler stores the annotation in a string form equivalent to the AST of the expression in question. If needed, annotations can be resolved at runtime using `typing.get_type_hints()`. In the common case where this is not required, the annotations are cheaper to store (since short strings are interned by the interpreter) and make startup time faster.

Usability-wise, annotations now support forward references, making the following syntax valid:

```
class C:
    @classmethod
    def from_string(cls, source: str) -> C:
        ...

    def validate_b(self, obj: B) -> bool:
        ...

class B:
    ...
```

Since this change breaks compatibility, the new behavior needs to be enabled on a per-module basis in Python 3.7 using a `__future__` import:

```
from __future__ import annotations
```

It will become the default in Python 3.10.

**See also**

## PEP 563 [https://peps.python.org/pep-0563/] – Postponed evaluation of annotations

PEP written and implemented by Łukasz Langa.

## PEP 538: Legacy C Locale Coercion

An ongoing challenge within the Python 3 series has been determining a sensible default strategy for handling the “7-bit ASCII” text encoding assumption currently implied by the use of the default C or POSIX locale on non-Windows platforms.

**PEP 538** [https://peps.python.org/pep-0538/] updates the default interpreter command line interface to automatically coerce that locale to an available UTF-8 based locale as described in the documentation of the new **PYTHONCOERCECLOCALE** environment variable. Automatically setting `LC_CTYPE` this way means that both the core interpreter and locale-aware C extensions (such as **readline**) will assume the use of UTF-8 as the default text encoding, rather than ASCII.

The platform support definition in **PEP 11** [https://peps.python.org/pep-0011/] has also been updated to limit full text handling support to suitably configured non-ASCII based locales.

As part of this change, the default error handler for **stdin** and **stdout** is now `surrogateescape` (rather than `strict`) when using any of the defined coercion target locales (currently `C.UTF-8`, `C.utf8`, and `UTF-8`). The default error handler for **stderr** continues to be `backslashreplace`, regardless of locale.

Locale coercion is silent by default, but to assist in debugging potentially locale related integration problems, explicit warnings (emitted directly on **stderr**) can be requested by setting `PYTHONCOERCECLOCALE=warn`. This setting will also cause the Python runtime to emit a warning if the legacy C locale remains active when the core interpreter is initialized.

While **PEP 538** [https://peps.python.org/pep-0538/]’s locale coercion has the benefit of also affecting extension modules (such as GNU **readline**), as well as child processes (including those running

non-Python applications and older versions of Python), it has the downside of requiring that a suitable target locale be present on the running system. To better handle the case where no suitable target locale is available (as occurs on RHEL/CentOS 7, for example), Python 3.7 also implements [PEP 540: Forced UTF-8 Runtime Mode](#).

See also

**PEP 538** [<https://peps.python.org/pep-0538/>] – Coercing the legacy C locale to a UTF-8 based locale

PEP written and implemented by Nick Coghlan.

## PEP 540: Forced UTF-8 Runtime Mode

The new `-X utf8` command line option and `PYTHONUTF8` environment variable can be used to enable the [Python UTF-8 Mode](#).

When in UTF-8 mode, CPython ignores the locale settings, and uses the UTF-8 encoding by default. The error handlers for `sys.stdin` and `sys.stdout` streams are set to `surrogateescape`.

The forced UTF-8 mode can be used to change the text handling behavior in an embedded Python interpreter without changing the locale settings of an embedding application.

While [PEP 540](#) [<https://peps.python.org/pep-0540/>]'s UTF-8 mode has the benefit of working regardless of which locales are available on the running system, it has the downside of having no effect on extension modules (such as GNU `readline`), child processes running non-Python applications, and child processes running older versions of Python. To reduce the risk of corrupting text data when communicating with such components, Python 3.7 also implements [PEP 540: Forced UTF-8 Runtime Mode](#)).

The UTF-8 mode is enabled by default when the locale is C or POSIX, and the [PEP 538](#) [<https://peps.python.org/pep-0538/>] locale coercion feature fails to change it to a UTF-8 based alternative (whether that failure is due to `PYTHONCOERCECLOCALE=0` being set, `LC_ALL` being set, or the lack of a suitable target locale).

See also

**PEP 540** [<https://peps.python.org/pep-0540/>] – Add a new UTF-8 mode

PEP written and implemented by Victor Stinner

## PEP 553: Built-in `breakpoint()`

Python 3.7 includes the new built-in `breakpoint()` function as an easy and consistent way to enter the Python debugger.

Built-in `breakpoint()` calls `sys.breakpointhook()`. By default, the latter imports `pdb` and then calls `pdb.set_trace()`, but by binding `sys.breakpointhook()` to the function of your choosing, `breakpoint()` can enter any debugger. Additionally, the environment variable `PYTHONBREAKPOINT` can be set to the callable of your debugger of choice. Set `PYTHONBREAKPOINT=0` to completely disable built-in `breakpoint()`.

See also

**PEP 553** [<https://peps.python.org/pep-0553/>] – Built-in `breakpoint()`

PEP written and implemented by Barry Warsaw

## PEP 539: New C API for Thread-Local Storage

While Python provides a C API for thread-local storage support; the existing [Thread Local Storage \(TLS\) API](#) has used `int` to represent TLS keys across all platforms. This has not generally been a problem for officially support platforms, but that is neither POSIX-compliant, nor portable in any practical sense.

**PEP 539** [<https://peps.python.org/pep-0539/>] changes this by providing a new [Thread Specific Storage \(TSS\) API](#) to CPython which supersedes use of the existing TLS API within the CPython interpreter, while deprecating the existing API. The TSS API uses a new type `Py_tss_t` instead of `int` to represent TSS keys—an

opaque type the definition of which may depend on the underlying TLS implementation. Therefore, this will allow to build CPython on platforms where the native TLS key is defined in a way that cannot be safely cast to `int`.

Note that on platforms where the native TLS key is defined in a way that cannot be safely cast to `int`, all functions of the existing TLS API will be no-op and immediately return failure. This indicates clearly that the old API is not supported on platforms where it cannot be used reliably, and that no effort will be made to add such support.

**See also**

**PEP 539** [<https://peps.python.org/pep-0539/>] – A New C-API for Thread-Local Storage in CPython

PEP written by Erik M. Bray; implementation by Masayuki Yamamoto.

## **PEP 562: Customization of Access to Module Attributes**

Python 3.7 allows defining `__getattr__()` on modules and will call it whenever a module attribute is otherwise not found. Defining `__dir__()` on modules is now also allowed.

A typical example of where this may be useful is module attribute deprecation and lazy loading.

**See also**

**PEP 562** [<https://peps.python.org/pep-0562/>] – Module `__getattr__` and `__dir__`

PEP written and implemented by Ivan Levkivskyi

## **PEP 564: New Time Functions With Nanosecond Resolution**

The resolution of clocks in modern systems can exceed the limited precision of a floating point number returned by the `time.time()` function and its variants. To avoid loss of precision, **PEP 564** [<https://peps.python.org/pep-0564/>] adds six new “nanosecond” variants of the existing timer functions to the `time` module:

- `time.clock_gettime_ns()`
- `time.clock_settime_ns()`
- `time.monotonic_ns()`
- `time.perf_counter_ns()`
- `time.process_time_ns()`
- `time.time_ns()`

The new functions return the number of nanoseconds as an integer value.

**Measurements** [<https://peps.python.org/pep-0564/#annex-clocks-resolution-in-python>] show that on Linux and Windows the resolution of `time.time_ns()` is approximately 3 times better than that of `time.time()`.

See also

**PEP 564** [<https://peps.python.org/pep-0564/>] – Add new time functions with nanosecond resolution

PEP written and implemented by Victor Stinner

## PEP 565: Show DeprecationWarning in `__main__`

The default handling of `DeprecationWarning` has been changed such that these warnings are once more shown by default, but only when the code triggering them is running directly in the `__main__` module. As a result, developers of single file scripts and those using Python interactively should once again start seeing deprecation warnings for the APIs they use, but deprecation warnings triggered by imported application, library and framework modules will continue to be hidden by default.

As a result of this change, the standard library now allows developers to choose between three different deprecation warning

behaviours:

- **FutureWarning**: always displayed by default, recommended for warnings intended to be seen by application end users (e.g. for deprecated application configuration settings).
- **DeprecationWarning**: displayed by default only in `__main__` and when running tests, recommended for warnings intended to be seen by other Python developers where a version upgrade may result in changed behaviour or an error.
- **PendingDeprecationWarning**: displayed by default only when running tests, intended for cases where a future version upgrade will change the warning category to **DeprecationWarning** or **FutureWarning**.

Previously both **DeprecationWarning** and **PendingDeprecationWarning** were only visible when running tests, which meant that developers primarily writing single file scripts or using Python interactively could be surprised by breaking changes in the APIs they used.

See also

**PEP 565** [<https://peps.python.org/pep-0565/>] – Show  
**DeprecationWarning in `__main__`**

PEP written and implemented by Nick Coghlan

## PEP 560: Core Support for **typing** module and Generic Types

Initially **PEP 484** [<https://peps.python.org/pep-0484/>] was designed in such way that it would not introduce *any* changes to the core CPython interpreter. Now type hints and the **typing** module are extensively used by the community, so this restriction is removed. The PEP introduces two special methods `__class_getitem__()` and `__mro_entries__`, these methods are now used by most classes and special constructs in **typing**. As a result, the speed of various operations with types increased up to 7 times, the generic types can be used without metaclass conflicts, and several long

standing bugs in [typing](#) module are fixed.

See also

**PEP 560** [<https://peps.python.org/pep-0560/>] – Core support for typing module and generic types

PEP written and implemented by Ivan Levkivskyi

## PEP 552: Hash-based .pyc Files

Python has traditionally checked the up-to-dateness of bytecode cache files (i.e., `.pyc` files) by comparing the source metadata (last-modified timestamp and size) with source metadata saved in the cache file header when it was generated. While effective, this invalidation method has its drawbacks. When filesystem timestamps are too coarse, Python can miss source updates, leading to user confusion. Additionally, having a timestamp in the cache file is problematic for [build reproducibility](#) [<https://reproducible-builds.org/>] and content-based build systems.

**PEP 552** [<https://peps.python.org/pep-0552/>] extends the `pyc` format to allow the hash of the source file to be used for invalidation instead of the source timestamp. Such `.pyc` files are called “hash-based”. By default, Python still uses timestamp-based invalidation and does not generate hash-based `.pyc` files at runtime. Hash-based `.pyc` files may be generated with `py_compile` or `compileall`.

Hash-based `.pyc` files come in two variants: checked and unchecked. Python validates checked hash-based `.pyc` files against the corresponding source files at runtime but doesn’t do so for unchecked hash-based pycs. Unchecked hash-based `.pyc` files are a useful performance optimization for environments where a system external to Python (e.g., the build system) is responsible for keeping `.pyc` files up-to-date.

See [Cached bytecode invalidation](#) for more information.

See also

**PEP 552** [<https://peps.python.org/pep-0552/>] – **Deterministic pycs**  
PEP written and implemented by Benjamin Peterson

## PEP 545: Python Documentation Translations

**PEP 545** [<https://peps.python.org/pep-0545/>] describes the process of creating and maintaining Python documentation translations.

Three new translations have been added:

- Japanese: <https://docs.python.org/ja/>
- French: <https://docs.python.org/fr/>
- Korean: <https://docs.python.org/ko/>

See also

**PEP 545** [<https://peps.python.org/pep-0545/>] – **Python Documentation Translations**

PEP written and implemented by Julien Palard, Inada Naoki, and Victor Stinner.

## Python Development Mode (-X dev)

The new **-X dev** command line option or the new **PYTHONDEVMODE** environment variable can be used to enable **Python Development Mode**. When in development mode, Python performs additional runtime checks that are too expensive to be enabled by default. See **Python Development Mode** documentation for the full description.

## Other Language Changes

- An **await** expression and comprehensions containing an **async for** clause were illegal in the expressions in **formatted string literals** due to a problem with the implementation. In Python 3.7 this restriction was lifted.
- More than 255 arguments can now be passed to a function, and a function can now have more than 255 parameters.

(Contributed by Serhiy Storchaka in [bpo-12844](https://bugs.python.org/issue?@action=redirect&bpo=12844) [https://bugs.python.org/issue?@action=redirect&bpo=12844] and [bpo-18896](https://bugs.python.org/issue?@action=redirect&bpo=18896) [https://bugs.python.org/issue?@action=redirect&bpo=18896].)

- **`bytes.fromhex()`** and **`bytearray.fromhex()`** now ignore all ASCII whitespace, not only spaces. (Contributed by Robert Xiao in [bpo-28927](https://bugs.python.org/issue?@action=redirect&bpo=28927) [https://bugs.python.org/issue?@action=redirect&bpo=28927].)
- **`str`**, **`bytes`**, and **`bytearray`** gained support for the new **`isascii()`** method, which can be used to test if a string or bytes contain only the ASCII characters. (Contributed by INADA Naoki in [bpo-32677](https://bugs.python.org/issue?@action=redirect&bpo=32677) [https://bugs.python.org/issue?@action=redirect&bpo=32677].)
- **`ImportError`** now displays module name and module `__file__` path when `from ... import ...` fails. (Contributed by Matthias Bussonnier in [bpo-29546](https://bugs.python.org/issue?@action=redirect&bpo=29546) [https://bugs.python.org/issue?@action=redirect&bpo=29546].)
- Circular imports involving absolute imports with binding a submodule to a name are now supported. (Contributed by Serhiy Storchaka in [bpo-30024](https://bugs.python.org/issue?@action=redirect&bpo=30024) [https://bugs.python.org/issue?@action=redirect&bpo=30024].)
- `object.__format__(x, '')` is now equivalent to `str(x)` rather than `format(str(self), '')`. (Contributed by Serhiy Storchaka in [bpo-28974](https://bugs.python.org/issue?@action=redirect&bpo=28974) [https://bugs.python.org/issue?@action=redirect&bpo=28974].)
- In order to better support dynamic creation of stack traces, **`types.TracebackType`** can now be instantiated from Python code, and the `tb_next` attribute on **`tracebacks`** is now writable. (Contributed by Nathaniel J. Smith in [bpo-30579](https://bugs.python.org/issue?@action=redirect&bpo=30579) [https://bugs.python.org/issue?@action=redirect&bpo=30579].)
- When using the **`-m`** switch, `sys.path[0]` is now eagerly expanded to the full starting directory path, rather than being left as the empty directory (which allows imports from the *current* working directory at the time when an import occurs) (Contributed by Nick Coghlan in [bpo-33053](https://bugs.python.org/issue?@action=redirect&bpo=33053) [https://bugs.python.org/issue?@action=redirect&bpo=33053].)
- The new **`-X importtime`** option or the **`PYTHONPROFILEIMPORTTIME`** environment variable can be used to show the timing of each module import. (Contributed by Inada Naoki in [bpo-31415](https://bugs.python.org/issue?@action=redirect&bpo=31415) [https://bugs.python.org/issue?@action=redirect&bpo=31415].)

@action=redirect&bpo=31415].)

# New Modules

## contextvars

The new `contextvars` module and a set of `new C APIs` introduce support for *context variables*. Context variables are conceptually similar to thread-local variables. Unlike TLS, context variables support asynchronous code correctly.

The `asyncio` and `decimal` modules have been updated to use and support context variables out of the box. Particularly the active decimal context is now stored in a context variable, which allows decimal operations to work with the correct context in asynchronous code.

### See also

**PEP 567** [<https://peps.python.org/pep-0567/>] – Context Variables  
PEP written and implemented by Yuri Selivanov

## dataclasses

The new `dataclass()` decorator provides a way to declare *data classes*. A data class describes its attributes using class variable annotations. Its constructor and other magic methods, such as `__repr__()`, `__eq__()`, and `__hash__()` are generated automatically.

Example:

```
@dataclass
class Point:
    x: float
    y: float
    z: float = 0.0

p = Point(1.5, 2.5)
```

```
print(p)      # produces "Point(x=1.5, y=2.5, z=0.0)"
```

### See also

**PEP 557** [<https://peps.python.org/pep-0557/>] – Data Classes  
PEP written and implemented by Eric V. Smith

## importlib.resources

The new **importlib.resources** module provides several new APIs and one new ABC for access to, opening, and reading *resources* inside packages. Resources are roughly similar to files inside packages, but they needn't be actual files on the physical file system. Module loaders can provide a **get\_resource\_reader()** function which returns a **importlib.abc.ResourceReader** instance to support this new API. Built-in file path loaders and zip file loaders both support this.

Contributed by Barry Warsaw and Brett Cannon in [bpo-32248](https://bugs.python.org/issue?@action=redirect&bpo=32248)  
[<https://bugs.python.org/issue?@action=redirect&bpo=32248>].

### See also

**importlib\_resources** [<https://importlib-resources.readthedocs.io/en/latest/>]  
– a PyPI backport for earlier Python versions.

## Improved Modules

### argparse

The new **ArgumentParser.parse\_intermixed\_args()** method allows intermixing options and positional arguments. (Contributed by paul.j3 in [bpo-14191](https://bugs.python.org/issue?@action=redirect&bpo=14191) [<https://bugs.python.org/issue?@action=redirect&bpo=14191>].)

### asyncio

The **asyncio** module has received many new features, usability

and [performance improvements](#). Notable changes include:

- The new [provisional `asyncio.run\(\)`](#) function can be used to run a coroutine from synchronous code by automatically creating and destroying the event loop. (Contributed by Yury Selivanov in [bpo-32314](#) [<https://bugs.python.org/issue?@action=redirect&bpo=32314>].)
- `asyncio` gained support for [contextvars](#). [`loop.call\_soon\(\)`](#), [`loop.call\_soon\_threadsafe\(\)`](#), [`loop.call\_later\(\)`](#), [`loop.call\_at\(\)`](#), and [`Future.add\_done\_callback\(\)`](#) have a new optional keyword-only `context` parameter. [Tasks](#) now track their context automatically. See [PEP 567](#) [<https://peps.python.org/pep-0567/>] for more details. (Contributed by Yury Selivanov in [bpo-32436](#) [<https://bugs.python.org/issue?@action=redirect&bpo=32436>].)
- The new [`asyncio.create\_task\(\)`](#) function has been added as a shortcut to [`asyncio.get\_event\_loop\(\).create\_task\(\)`](#). (Contributed by Andrew Svetlov in [bpo-32311](#) [<https://bugs.python.org/issue?@action=redirect&bpo=32311>].)
- The new [`loop.start\_tls\(\)`](#) method can be used to upgrade an existing connection to TLS. (Contributed by Yury Selivanov in [bpo-23749](#) [<https://bugs.python.org/issue?@action=redirect&bpo=23749>].)
- The new [`loop.sock\_recv\_into\(\)`](#) method allows reading data from a socket directly into a provided buffer making it possible to reduce data copies. (Contributed by Antoine Pitrou in [bpo-31819](#) [<https://bugs.python.org/issue?@action=redirect&bpo=31819>].)
- The new [`asyncio.current\_task\(\)`](#) function returns the currently running [Task](#) instance, and the new [`asyncio.all\_tasks\(\)`](#) function returns a set of all existing Task instances in a given loop. The [`Task.current\_task\(\)`](#) and [`Task.all\_tasks\(\)`](#) methods have been deprecated. (Contributed by Andrew Svetlov in

[bpo-32250](https://bugs.python.org/issue?@action=redirect&bpo=32250) [https://bugs.python.org/issue?@action=redirect&bpo=32250].)

- The new *provisional* `BufferedProtocol` class allows implementing streaming protocols with manual control over the receive buffer. (Contributed by Yury Selivanov in [bpo-32251](https://bugs.python.org/issue?@action=redirect&bpo=32251) [https://bugs.python.org/issue?@action=redirect&bpo=32251].)
- The new `asyncio.get_running_loop()` function returns the currently running loop, and raises a `RuntimeError` if no loop is running. This is in contrast with `asyncio.get_event_loop()`, which will *create* a new event loop if none is running. (Contributed by Yury Selivanov in [bpo-32269](https://bugs.python.org/issue?@action=redirect&bpo=32269) [https://bugs.python.org/issue?@action=redirect&bpo=32269].)
- The new `StreamWriter.wait_closed()` coroutine method allows waiting until the stream writer is closed. The new `StreamWriter.is_closing()` method can be used to determine if the writer is closing. (Contributed by Andrew Svetlov in [bpo-32391](https://bugs.python.org/issue?@action=redirect&bpo=32391) [https://bugs.python.org/issue?@action=redirect&bpo=32391].)
- The new `loop.sock_sendfile()` coroutine method allows sending files using `os.sendfile` when possible. (Contributed by Andrew Svetlov in [bpo-32410](https://bugs.python.org/issue?@action=redirect&bpo=32410) [https://bugs.python.org/issue?@action=redirect&bpo=32410].)
- The new `Future.get_loop()` and `Task.get_loop()` methods return the instance of the loop on which a task or a future were created. `Server.get_loop()` allows doing the same for `asyncio.Server` objects. (Contributed by Yury Selivanov in [bpo-32415](https://bugs.python.org/issue?@action=redirect&bpo=32415) [https://bugs.python.org/issue?@action=redirect&bpo=32415] and Srinivas Reddy Thatiparthi in [bpo-32418](https://bugs.python.org/issue?@action=redirect&bpo=32418) [https://bugs.python.org/issue?@action=redirect&bpo=32418].)
- It is now possible to control how instances of `asyncio.Server` begin serving. Previously, the server would start serving immediately when created. The new

`start_serving` keyword argument to `loop.create_server()` and `loop.create_unix_server()`, as well as `Server.start_serving()`, and `Server.serve_forever()` can be used to decouple server instantiation and serving. The new `Server.is_serving()` method returns `True` if the server is serving. `Server` objects are now asynchronous context managers:

```
srv = await loop.create_server(...)
```

```
async with srv:  
    # some code
```

```
# At this point, srv is closed and no longer accept
```

(Contributed by Yury Selivanov in [bpo-32662](https://bugs.python.org/issue?@action=redirect&bpo=32662) [https://bugs.python.org/issue?@action=redirect&bpo=32662].)

- Callback objects returned by `loop.call_later()` gained the new `when()` method which returns an absolute scheduled callback timestamp. (Contributed by Andrew Svetlov in [bpo-32741](https://bugs.python.org/issue?@action=redirect&bpo=32741) [https://bugs.python.org/issue?@action=redirect&bpo=32741].)
- The `loop.create_datagram_endpoint()` method gained support for Unix sockets. (Contributed by Quentin Dawans in [bpo-31245](https://bugs.python.org/issue?@action=redirect&bpo=31245) [https://bugs.python.org/issue?@action=redirect&bpo=31245].)
- The `asyncio.open_connection()`, `asyncio.start_server()` functions, `loop.create_connection()`, `loop.create_server()`, `loop.create_accepted_socket()` methods and their corresponding UNIX socket variants now accept the `ssl_handshake_timeout` keyword argument. (Contributed by Neil Aspinall in [bpo-29970](https://bugs.python.org/issue?@action=redirect&bpo=29970) [https://bugs.python.org/issue?@action=redirect&bpo=29970].)
- The new `Handle.cancelled()` method returns `True` if the callback was cancelled. (Contributed by Marat Sharafutdinov in [bpo-31943](https://bugs.python.org/issue?@action=redirect&bpo=31943) [https://bugs.python.org/issue?@action=redirect&bpo=31943].)

@action=redirect&bpo=31943].)

- The `asyncio` source has been converted to use the `async/await` syntax. (Contributed by Andrew Svetlov in [bpo-32193](https://bugs.python.org/issue?@action=redirect&bpo=32193) [<https://bugs.python.org/issue?@action=redirect&bpo=32193>].)
- The new `ReadTransport.is_reading()` method can be used to determine the reading state of the transport. Additionally, calls to `ReadTransport.resume_reading()` and `ReadTransport.pause_reading()` are now idempotent. (Contributed by Yury Selivanov in [bpo-32356](https://bugs.python.org/issue?@action=redirect&bpo=32356) [<https://bugs.python.org/issue?@action=redirect&bpo=32356>].)
- Loop methods which accept socket paths now support passing *path-like objects*. (Contributed by Yury Selivanov in [bpo-32066](https://bugs.python.org/issue?@action=redirect&bpo=32066) [<https://bugs.python.org/issue?@action=redirect&bpo=32066>].)
- In `asyncio` TCP sockets on Linux are now created with `TCP_NODELAY` flag set by default. (Contributed by Yury Selivanov and Victor Stinner in [bpo-27456](https://bugs.python.org/issue?@action=redirect&bpo=27456) [<https://bugs.python.org/issue?@action=redirect&bpo=27456>].)
- Exceptions occurring in cancelled tasks are no longer logged. (Contributed by Yury Selivanov in [bpo-30508](https://bugs.python.org/issue?@action=redirect&bpo=30508) [<https://bugs.python.org/issue?@action=redirect&bpo=30508>].)
- New `WindowsSelectorEventLoopPolicy` and `WindowsProactorEventLoopPolicy` classes. (Contributed by Yury Selivanov in [bpo-33792](https://bugs.python.org/issue?@action=redirect&bpo=33792) [<https://bugs.python.org/issue?@action=redirect&bpo=33792>].)

Several `asyncio` APIs have been *deprecated*.

## **binascii**

The `b2a_uu()` function now accepts an optional *backtick* keyword argument. When it's true, zeros are represented by `` `` instead of spaces. (Contributed by Xiang Zhang in [bpo-30103](https://bugs.python.org/issue?@action=redirect&bpo=30103) [<https://bugs.python.org/issue?@action=redirect&bpo=30103>].)

## calendar

The **HTMLCalendar** class has new class attributes which ease the customization of CSS classes in the produced HTML calendar.

(Contributed by Oz Tiram in [bpo-30095](https://bugs.python.org/issue?@action=redirect&bpo=30095) [https://bugs.python.org/issue?@action=redirect&bpo=30095].)

## collections

`collections.namedtuple()` now supports default values.

(Contributed by Raymond Hettinger in [bpo-32320](https://bugs.python.org/issue?@action=redirect&bpo=32320) [https://bugs.python.org/issue?@action=redirect&bpo=32320].)

## compileall

**compileall.compile\_dir()** learned the new *invalidation\_mode* parameter, which can be used to enable **hash-based .pyc invalidation**. The invalidation mode can also be specified on the command line using the new `--invalidation-mode` argument.

(Contributed by Benjamin Peterson in [bpo-31650](https://bugs.python.org/issue?@action=redirect&bpo=31650) [https://bugs.python.org/issue?@action=redirect&bpo=31650].)

## concurrent.futures

**ProcessPoolExecutor** and **ThreadPoolExecutor** now support the new *initializer* and *initargs* constructor arguments.

(Contributed by Antoine Pitrou in [bpo-21423](https://bugs.python.org/issue?@action=redirect&bpo=21423) [https://bugs.python.org/issue?@action=redirect&bpo=21423].)

The **ProcessPoolExecutor** can now take the multiprocessing context via the new *mp\_context* argument. (Contributed by Thomas Moreau in [bpo-31540](https://bugs.python.org/issue?@action=redirect&bpo=31540) [https://bugs.python.org/issue?@action=redirect&bpo=31540].)

(Contributed by Thomas Moreau in [bpo-31540](https://bugs.python.org/issue?@action=redirect&bpo=31540) [https://bugs.python.org/issue?@action=redirect&bpo=31540].)

## contextlib

The new **nullcontext()** is a simpler and faster no-op context manager than **ExitStack**. (Contributed by Jesse Bakker in [bpo-10049](https://bugs.python.org/issue?@action=redirect&bpo=10049) [https://bugs.python.org/issue?@action=redirect&bpo=10049].)

(Contributed by Jesse Bakker in [bpo-10049](https://bugs.python.org/issue?@action=redirect&bpo=10049) [https://bugs.python.org/issue?@action=redirect&bpo=10049].)

The new `asynccontextmanager()`, `AbstractAsyncContextManager`, and `AsyncExitStack` have been added to complement their synchronous counterparts. (Contributed by Jelle Zijlstra in [bpo-29679](https://bugs.python.org/issue?@action=redirect&bpo=29679) [https://bugs.python.org/issue?@action=redirect&bpo=29679] and [bpo-30241](https://bugs.python.org/issue?@action=redirect&bpo=30241) [https://bugs.python.org/issue?@action=redirect&bpo=30241], and by Alexander Mohr and Ilya Kulakov in [bpo-29302](https://bugs.python.org/issue?@action=redirect&bpo=29302) [https://bugs.python.org/issue?@action=redirect&bpo=29302].)

## cProfile

The `cProfile` command line now accepts `-m module_name` as an alternative to script path. (Contributed by Sanyam Khurana in [bpo-21862](https://bugs.python.org/issue?@action=redirect&bpo=21862) [https://bugs.python.org/issue?@action=redirect&bpo=21862].)

## crypt

The `crypt` module now supports the Blowfish hashing method. (Contributed by Serhiy Storchaka in [bpo-31664](https://bugs.python.org/issue?@action=redirect&bpo=31664) [https://bugs.python.org/issue?@action=redirect&bpo=31664].)

The `mksalt()` function now allows specifying the number of rounds for hashing. (Contributed by Serhiy Storchaka in [bpo-31702](https://bugs.python.org/issue?@action=redirect&bpo=31702) [https://bugs.python.org/issue?@action=redirect&bpo=31702].)

## datetime

The new `datetime.fromisoformat()` method constructs a `datetime` object from a string in one of the formats output by `datetime.isoformat()`. (Contributed by Paul Ganssle in [bpo-15873](https://bugs.python.org/issue?@action=redirect&bpo=15873) [https://bugs.python.org/issue?@action=redirect&bpo=15873].)

The `tzinfo` class now supports sub-minute offsets. (Contributed by Alexander Belopolsky in [bpo-5288](https://bugs.python.org/issue?@action=redirect&bpo=5288) [https://bugs.python.org/issue?@action=redirect&bpo=5288].)

## dbm

`dbm.dumb` now supports reading read-only files and no longer writes the index file when it is not changed.

## decimal

The **decimal** module now uses **context variables** to store the decimal context. (Contributed by Yury Selivanov in [bpo-32630](https://bugs.python.org/issue?@action=redirect&bpo=32630) [<https://bugs.python.org/issue?@action=redirect&bpo=32630>].)

## dis

The **dis()** function is now able to disassemble nested code objects (the code of comprehensions, generator expressions and nested functions, and the code used for building nested classes). The maximum depth of disassembly recursion is controlled by the new **depth** parameter. (Contributed by Serhiy Storchaka in [bpo-11822](https://bugs.python.org/issue?@action=redirect&bpo=11822) [<https://bugs.python.org/issue?@action=redirect&bpo=11822>].)

## distutils

`README.rst` is now included in the list of `distutils` standard READMEs and therefore included in source distributions. (Contributed by Ryan Gonzalez in [bpo-11913](https://bugs.python.org/issue?@action=redirect&bpo=11913) [<https://bugs.python.org/issue?@action=redirect&bpo=11913>].)

## enum

The **Enum** learned the new `_ignore_class` property, which allows listing the names of properties which should not become enum members. (Contributed by Ethan Furman in [bpo-31801](https://bugs.python.org/issue?@action=redirect&bpo=31801) [<https://bugs.python.org/issue?@action=redirect&bpo=31801>].)

In Python 3.8, attempting to check for non-Enum objects in **Enum** classes will raise a **TypeError** (e.g. `1 in Color`); similarly, attempting to check for non-Flag objects in a **Flag** member will raise **TypeError** (e.g. `1 in Perm.RW`); currently, both operations return **False** instead and are deprecated. (Contributed by Ethan Furman in [bpo-33217](https://bugs.python.org/issue?@action=redirect&bpo=33217) [<https://bugs.python.org/issue?@action=redirect&bpo=33217>].)

## functools

`functools.singledispatch()` now supports registering implementations using type annotations. (Contributed by Łukasz Langa in [bpo-32227](https://bugs.python.org/issue?@action=redirect&bpo=32227) [https://bugs.python.org/issue?@action=redirect&bpo=32227].)

## gc

The new `gc.freeze()` function allows freezing all objects tracked by the garbage collector and excluding them from future collections. This can be used before a POSIX `fork()` call to make the GC copy-on-write friendly or to speed up collection. The new `gc.unfreeze()` functions reverses this operation. Additionally, `gc.get_freeze_count()` can be used to obtain the number of frozen objects. (Contributed by Li Zekun in [bpo-31558](https://bugs.python.org/issue?@action=redirect&bpo=31558) [https://bugs.python.org/issue?@action=redirect&bpo=31558].)

## hmac

The `hmac` module now has an optimized one-shot `digest()` function, which is up to three times faster than `HMAC()`. (Contributed by Christian Heimes in [bpo-32433](https://bugs.python.org/issue?@action=redirect&bpo=32433) [https://bugs.python.org/issue?@action=redirect&bpo=32433].)

## http.client

`HTTPConnection` and `HTTPSConnection` now support the new `blocksize` argument for improved upload throughput. (Contributed by Nir Soffer in [bpo-31945](https://bugs.python.org/issue?@action=redirect&bpo=31945) [https://bugs.python.org/issue?@action=redirect&bpo=31945].)

## http.server

`SimpleHTTPRequestHandler` now supports the HTTP `If-Modified-Since` header. The server returns the 304 response status if the target file was not modified after the time specified in the header. (Contributed by Pierre Quentel in [bpo-29654](https://bugs.python.org/issue?@action=redirect&bpo=29654) [https://bugs.python.org/issue?@action=redirect&bpo=29654].)

`SimpleHTTPRequestHandler` accepts the new `directory` argument, in addition to the new `--directory` command line

argument. With this parameter, the server serves the specified directory, by default it uses the current working directory. (Contributed by Stéphane Wirtel and Julien Palard in [bpo-28707](https://bugs.python.org/issue?@action=redirect&bpo=28707) [<https://bugs.python.org/issue?@action=redirect&bpo=28707>].)

The new **ThreadingHTTPServer** class uses threads to handle requests using **ThreadingMixin**. It is used when `http.server` is run with `-m`. (Contributed by Julien Palard in [bpo-31639](https://bugs.python.org/issue?@action=redirect&bpo=31639) [<https://bugs.python.org/issue?@action=redirect&bpo=31639>].)

## idlelib and IDLE

Multiple fixes for autocompletion. (Contributed by Louie Lu in [bpo-15786](https://bugs.python.org/issue?@action=redirect&bpo=15786) [<https://bugs.python.org/issue?@action=redirect&bpo=15786>].)

Module Browser (on the File menu, formerly called Class Browser), now displays nested functions and classes in addition to top-level functions and classes. (Contributed by Guilherme Polo, Cheryl Sabella, and Terry Jan Reedy in [bpo-1612262](https://bugs.python.org/issue?@action=redirect&bpo=1612262) [<https://bugs.python.org/issue?@action=redirect&bpo=1612262>].)

The Settings dialog (Options, Configure IDLE) has been partly rewritten to improve both appearance and function. (Contributed by Cheryl Sabella and Terry Jan Reedy in multiple issues.)

The font sample now includes a selection of non-Latin characters so that users can better see the effect of selecting a particular font. (Contributed by Terry Jan Reedy in [bpo-13802](https://bugs.python.org/issue?@action=redirect&bpo=13802) [<https://bugs.python.org/issue?@action=redirect&bpo=13802>].) The sample can be edited to include other characters. (Contributed by Serhiy Storchaka in [bpo-31860](https://bugs.python.org/issue?@action=redirect&bpo=31860) [<https://bugs.python.org/issue?@action=redirect&bpo=31860>].)

The IDLE features formerly implemented as extensions have been reimplemented as normal features. Their settings have been moved from the Extensions tab to other dialog tabs. (Contributed by Charles Wohlganger and Terry Jan Reedy in [bpo-27099](https://bugs.python.org/issue?@action=redirect&bpo=27099) [<https://bugs.python.org/issue?@action=redirect&bpo=27099>].)

Editor code context option revised. Box displays all context lines up to maxlines. Clicking on a context line jumps the editor to that line. Context colors for custom themes is added to Highlights tab of

Settings dialog. (Contributed by Cheryl Sabella and Terry Jan Reedy in [bpo-33642](https://bugs.python.org/issue?@action=redirect&bpo=33642) [https://bugs.python.org/issue?@action=redirect&bpo=33642], [bpo-33768](https://bugs.python.org/issue?@action=redirect&bpo=33768) [https://bugs.python.org/issue?@action=redirect&bpo=33768], and [bpo-33679](https://bugs.python.org/issue?@action=redirect&bpo=33679) [https://bugs.python.org/issue?@action=redirect&bpo=33679].)

On Windows, a new API call tells Windows that tk scales for DPI. On Windows 8.1 + or 10, with DPI compatibility properties of the Python binary unchanged, and a monitor resolution greater than 96 DPI, this should make text and lines sharper. It should otherwise have no effect. (Contributed by Terry Jan Reedy in [bpo-33656](https://bugs.python.org/issue?@action=redirect&bpo=33656) [https://bugs.python.org/issue?@action=redirect&bpo=33656].)

New in 3.7.1:

Output over N lines (50 by default) is squeezed down to a button. N can be changed in the PyShell section of the General page of the Settings dialog. Fewer, but possibly extra long, lines can be squeezed by right clicking on the output. Squeezed output can be expanded in place by double-clicking the button or into the clipboard or a separate window by right-clicking the button. (Contributed by Tal Einat in [bpo-1529353](https://bugs.python.org/issue?@action=redirect&bpo=1529353) [https://bugs.python.org/issue?@action=redirect&bpo=1529353].)

The changes above have been backported to 3.6 maintenance releases.

NEW in 3.7.4:

Add “Run Customized” to the Run menu to run a module with customized settings. Any command line arguments entered are added to sys.argv. They re-appear in the box for the next customized run. One can also suppress the normal Shell main module restart. (Contributed by Cheryl Sabella, Terry Jan Reedy, and others in [bpo-5680](https://bugs.python.org/issue?@action=redirect&bpo=5680) [https://bugs.python.org/issue?@action=redirect&bpo=5680] and [bpo-37627](https://bugs.python.org/issue?@action=redirect&bpo=37627) [https://bugs.python.org/issue?@action=redirect&bpo=37627].)

New in 3.7.5:

Add optional line numbers for IDLE editor windows. Windows open without line numbers unless set otherwise in the General tab of the

configuration dialog. Line numbers for an existing window are shown and hidden in the Options menu. (Contributed by Tal Einat and Saimadhav Heblikar in [bpo-17535](https://bugs.python.org/issue?@action=redirect&bpo=17535) [https://bugs.python.org/issue?@action=redirect&bpo=17535].)

## importlib

The `importlib.abc.ResourceReader` ABC was introduced to support the loading of resources from packages. See also [importlib.resources](https://bugs.python.org/issue?@action=redirect&bpo=32248). (Contributed by Barry Warsaw, Brett Cannon in [bpo-32248](https://bugs.python.org/issue?@action=redirect&bpo=32248) [https://bugs.python.org/issue?@action=redirect&bpo=32248].)

`importlib.reload()` now raises `ModuleNotFoundError` if the module lacks a spec. (Contributed by Garvit Khatri in [bpo-29851](https://bugs.python.org/issue?@action=redirect&bpo=29851) [https://bugs.python.org/issue?@action=redirect&bpo=29851].)

`importlib.find_spec()` now raises `ModuleNotFoundError` instead of `AttributeError` if the specified parent module is not a package (i.e. lacks a `__path__` attribute). (Contributed by Milan Oberkirch in [bpo-30436](https://bugs.python.org/issue?@action=redirect&bpo=30436) [https://bugs.python.org/issue?@action=redirect&bpo=30436].)

The new `importlib.source_hash()` can be used to compute the hash of the passed source. A [hash-based .pyc file](#) embeds the value returned by this function.

## io

The new `TextIOWrapper.reconfigure()` method can be used to reconfigure the text stream with the new settings. (Contributed by Antoine Pitrou in [bpo-30526](https://bugs.python.org/issue?@action=redirect&bpo=30526) [https://bugs.python.org/issue?@action=redirect&bpo=30526] and INADA Naoki in [bpo-15216](https://bugs.python.org/issue?@action=redirect&bpo=15216) [https://bugs.python.org/issue?@action=redirect&bpo=15216].)

## ipaddress

The new `subnet_of()` and `supernet_of()` methods of `ipaddress.IPv6Network` and `ipaddress.IPv4Network` can be used for network containment tests. (Contributed by Michel Albert and Cheryl Sabella in [bpo-20825](https://bugs.python.org/issue?@action=redirect&bpo=20825) [https://bugs.python.org/issue?@action=redirect&bpo=20825].)

@action=redirect&bpo=20825].)

## itertools

`itertools.islice()` now accepts **integer-like objects** as start, stop, and slice arguments. (Contributed by Will Roberts in [bpo-30537](https://bugs.python.org/issue?@action=redirect&bpo=30537) [https://bugs.python.org/issue?@action=redirect&bpo=30537].)

## locale

The new *monetary* argument to `locale.format_string()` can be used to make the conversion use monetary thousands separators and grouping strings. (Contributed by Garvit in [bpo-10379](https://bugs.python.org/issue?@action=redirect&bpo=10379) [https://bugs.python.org/issue?@action=redirect&bpo=10379].)

The `locale.getpreferredencoding()` function now always returns `'UTF-8'` on Android or when in the **forced UTF-8 mode**.

## logging

**Logger** instances can now be pickled. (Contributed by Vinay Sajip in [bpo-30520](https://bugs.python.org/issue?@action=redirect&bpo=30520) [https://bugs.python.org/issue?@action=redirect&bpo=30520].)

The new `StreamHandler.setStream()` method can be used to replace the logger stream after handler creation. (Contributed by Vinay Sajip in [bpo-30522](https://bugs.python.org/issue?@action=redirect&bpo=30522) [https://bugs.python.org/issue?@action=redirect&bpo=30522].)

It is now possible to specify keyword arguments to handler constructors in configuration passed to `logging.config.fileConfig()`. (Contributed by Preston Landers in [bpo-31080](https://bugs.python.org/issue?@action=redirect&bpo=31080) [https://bugs.python.org/issue?@action=redirect&bpo=31080].)

## math

The new `math.remainder()` function implements the IEEE 754-style remainder operation. (Contributed by Mark Dickinson in [bpo-29962](https://bugs.python.org/issue?@action=redirect&bpo=29962) [https://bugs.python.org/issue?@action=redirect&bpo=29962].)

## mimetypes

The MIME type of `.bmp` has been changed from `'image/x-ms-bmp'` to `'image/bmp'`. (Contributed by Nitish Chandra in [bpo-22589](https://bugs.python.org/issue?@action=redirect&bpo=22589) [https://bugs.python.org/issue?@action=redirect&bpo=22589].)

## msilib

The new `Database.Close()` method can be used to close the MSI database. (Contributed by Berker Peksag in [bpo-20486](https://bugs.python.org/issue?@action=redirect&bpo=20486) [https://bugs.python.org/issue?@action=redirect&bpo=20486].)

## multiprocessing

The new `Process.close()` method explicitly closes the process object and releases all resources associated with it. `ValueError` is raised if the underlying process is still running. (Contributed by Antoine Pitrou in [bpo-30596](https://bugs.python.org/issue?@action=redirect&bpo=30596) [https://bugs.python.org/issue?@action=redirect&bpo=30596].)

The new `Process.kill()` method can be used to terminate the process using the `SIGKILL` signal on Unix. (Contributed by Vitor Pereira in [bpo-30794](https://bugs.python.org/issue?@action=redirect&bpo=30794) [https://bugs.python.org/issue?@action=redirect&bpo=30794].)

Non-daemonic threads created by `Process` are now joined on process exit. (Contributed by Antoine Pitrou in [bpo-18966](https://bugs.python.org/issue?@action=redirect&bpo=18966) [https://bugs.python.org/issue?@action=redirect&bpo=18966].)

## os

`os.fwalk()` now accepts the *path* argument as `bytes`. (Contributed by Serhiy Storchaka in [bpo-28682](https://bugs.python.org/issue?@action=redirect&bpo=28682) [https://bugs.python.org/issue?@action=redirect&bpo=28682].)

`os.scandir()` gained support for [file descriptors](#). (Contributed by Serhiy Storchaka in [bpo-25996](https://bugs.python.org/issue?@action=redirect&bpo=25996) [https://bugs.python.org/issue?@action=redirect&bpo=25996].)

The new `register_at_fork()` function allows registering

Python callbacks to be executed at process fork. (Contributed by Antoine Pitrou in [bpo-16500](https://bugs.python.org/issue?@action=redirect&bpo=16500) [https://bugs.python.org/issue?@action=redirect&bpo=16500].)

Added `os.preadv()` (combine the functionality of `os.readv()` and `os.pread()`) and `os.pwritev()` functions (combine the functionality of `os.writev()` and `os.pwrite()`). (Contributed by Pablo Galindo in [bpo-31368](https://bugs.python.org/issue?@action=redirect&bpo=31368) [https://bugs.python.org/issue?@action=redirect&bpo=31368].)

The mode argument of `os.makedirs()` no longer affects the file permission bits of newly created intermediate-level directories. (Contributed by Serhiy Storchaka in [bpo-19930](https://bugs.python.org/issue?@action=redirect&bpo=19930) [https://bugs.python.org/issue?@action=redirect&bpo=19930].)

`os.dup2()` now returns the new file descriptor. Previously, `None` was always returned. (Contributed by Benjamin Peterson in [bpo-32441](https://bugs.python.org/issue?@action=redirect&bpo=32441) [https://bugs.python.org/issue?@action=redirect&bpo=32441].)

The structure returned by `os.stat()` now contains the `st_fstype` attribute on Solaris and its derivatives. (Contributed by Jesús Cea Avi3n in [bpo-32659](https://bugs.python.org/issue?@action=redirect&bpo=32659) [https://bugs.python.org/issue?@action=redirect&bpo=32659].)

## pathlib

The new `Path.is_mount()` method is now available on POSIX systems and can be used to determine whether a path is a mount point. (Contributed by Cooper Ry Lees in [bpo-30897](https://bugs.python.org/issue?@action=redirect&bpo=30897) [https://bugs.python.org/issue?@action=redirect&bpo=30897].)

## pdb

`pdb.set_trace()` now takes an optional *header* keyword-only argument. If given, it is printed to the console just before debugging begins. (Contributed by Barry Warsaw in [bpo-31389](https://bugs.python.org/issue?@action=redirect&bpo=31389) [https://bugs.python.org/issue?@action=redirect&bpo=31389].)

`pdb` command line now accepts `-m module_name` as an alternative to script file. (Contributed by Mario Corchero in [bpo-32206](https://bugs.python.org/issue?@action=redirect&bpo=32206) [https://bugs.python.org/issue?@action=redirect&bpo=32206].)

## py\_compile

`py_compile.compile()` – and by extension, `compileall` – now respects the `SOURCE_DATE_EPOCH` environment variable by unconditionally creating `.pyc` files for hash-based validation. This allows for guaranteeing [reproducible builds](https://reproducible-builds.org/) [https://reproducible-builds.org/] of `.pyc` files when they are created eagerly. (Contributed by Bernhard M. Wiedemann in [bpo-29708](https://bugs.python.org/issue?@action=redirect&bpo=29708) [https://bugs.python.org/issue?@action=redirect&bpo=29708].)

## pydoc

The pydoc server can now bind to an arbitrary hostname specified by the new `-n` command-line argument. (Contributed by Feanil Patel in [bpo-31128](https://bugs.python.org/issue?@action=redirect&bpo=31128) [https://bugs.python.org/issue?@action=redirect&bpo=31128].)

## queue

The new `SimpleQueue` class is an unbounded FIFO queue. (Contributed by Antoine Pitrou in [bpo-14976](https://bugs.python.org/issue?@action=redirect&bpo=14976) [https://bugs.python.org/issue?@action=redirect&bpo=14976].)

## re

The flags `re.ASCII`, `re.LOCALE` and `re.UNICODE` can be set within the scope of a group. (Contributed by Serhiy Storchaka in [bpo-31690](https://bugs.python.org/issue?@action=redirect&bpo=31690) [https://bugs.python.org/issue?@action=redirect&bpo=31690].)

`re.split()` now supports splitting on a pattern like `r'\b', '^$'` or `(?=-)` that matches an empty string. (Contributed by Serhiy Storchaka in [bpo-25054](https://bugs.python.org/issue?@action=redirect&bpo=25054) [https://bugs.python.org/issue?@action=redirect&bpo=25054].)

Regular expressions compiled with the `re.LOCALE` flag no longer depend on the locale at compile time. Locale settings are applied only when the compiled regular expression is used. (Contributed by Serhiy Storchaka in [bpo-30215](https://bugs.python.org/issue?@action=redirect&bpo=30215) [https://bugs.python.org/issue?@action=redirect&bpo=30215].)

**FutureWarning** is now emitted if a regular expression contains character set constructs that will change semantically in the future, such as nested sets and set operations. (Contributed by Serhiy Storchaka in [bpo-30349](https://bugs.python.org/issue?@action=redirect&bpo=30349) [https://bugs.python.org/issue?@action=redirect&bpo=30349].)

Compiled regular expression and match objects can now be copied using `copy.copy()` and `copy.deepcopy()`. (Contributed by Serhiy Storchaka in [bpo-10076](https://bugs.python.org/issue?@action=redirect&bpo=10076) [https://bugs.python.org/issue?@action=redirect&bpo=10076].)

## signal

The new `warn_on_full_buffer` argument to the `signal.set_wakeup_fd()` function makes it possible to specify whether Python prints a warning on stderr when the wakeup buffer overflows. (Contributed by Nathaniel J. Smith in [bpo-30050](https://bugs.python.org/issue?@action=redirect&bpo=30050) [https://bugs.python.org/issue?@action=redirect&bpo=30050].)

## socket

The new `socket.getblocking()` method returns `True` if the socket is in blocking mode and `False` otherwise. (Contributed by Yury Selivanov in [bpo-32373](https://bugs.python.org/issue?@action=redirect&bpo=32373) [https://bugs.python.org/issue?@action=redirect&bpo=32373].)

The new `socket.close()` function closes the passed socket file descriptor. This function should be used instead of `os.close()` for better compatibility across platforms. (Contributed by Christian Heimes in [bpo-32454](https://bugs.python.org/issue?@action=redirect&bpo=32454) [https://bugs.python.org/issue?@action=redirect&bpo=32454].)

The `socket` module now exposes the `socket.TCP_CONGESTION` (Linux 2.6.13), `socket.TCP_USER_TIMEOUT` (Linux 2.6.37), and `socket.TCP_NOTSENT_LOWAT` (Linux 3.12) constants. (Contributed by Omar Sandoval in [bpo-26273](https://bugs.python.org/issue?@action=redirect&bpo=26273) [https://bugs.python.org/issue?@action=redirect&bpo=26273] and Nathaniel J. Smith in [bpo-29728](https://bugs.python.org/issue?@action=redirect&bpo=29728) [https://bugs.python.org/issue?@action=redirect&bpo=29728].)

Support for `socket.AF_VSOCK` sockets has been added to allow

communication between virtual machines and their hosts.  
(Contributed by Cathy Avery in [bpo-27584](https://bugs.python.org/issue?@action=redirect&bpo=27584) [https://bugs.python.org/issue?@action=redirect&bpo=27584].)

Sockets now auto-detect family, type and protocol from file descriptor by default. (Contributed by Christian Heimes in [bpo-28134](https://bugs.python.org/issue?@action=redirect&bpo=28134) [https://bugs.python.org/issue?@action=redirect&bpo=28134].)

## socketserver

`socketserver.ThreadingMixIn.server_close()` now waits until all non-daemon threads complete.

`socketserver.ForkingMixIn.server_close()` now waits until all child processes complete.

Add a new `socketserver.ForkingMixIn.block_on_close` class attribute to `socketserver.ForkingMixIn` and `socketserver.ThreadingMixIn` classes. Set the class attribute to `False` to get the pre-3.7 behaviour.

## sqlite3

`sqlite3.Connection` now exposes the `backup()` method when the underlying SQLite library is at version 3.6.11 or higher.

(Contributed by Lele Gaifax in [bpo-27645](https://bugs.python.org/issue?@action=redirect&bpo=27645) [https://bugs.python.org/issue?@action=redirect&bpo=27645].)

The `database` argument of `sqlite3.connect()` now accepts any `path-like object`, instead of just a string. (Contributed by Anders Lorentsen in [bpo-31843](https://bugs.python.org/issue?@action=redirect&bpo=31843) [https://bugs.python.org/issue?@action=redirect&bpo=31843].)

## ssl

The `ssl` module now uses OpenSSL's builtin API instead of `match_hostname()` to check a host name or an IP address. Values are validated during TLS handshake. Any certificate validation error including failing the host name check now raises `SSLCertVerificationError` and aborts the handshake with a proper TLS Alert message. The new exception contains additional

information. Host name validation can be customized with `SSLContext.hostname_checks_common_name`. (Contributed by Christian Heimes in [bpo-31399](https://bugs.python.org/issue?@action=redirect&bpo=31399) [https://bugs.python.org/issue?@action=redirect&bpo=31399].)

## Note

The improved host name check requires a *libssl* implementation compatible with OpenSSL 1.0.2 or 1.1. Consequently, OpenSSL 0.9.8 and 1.0.1 are no longer supported (see [Platform Support Removals](#) for more details). The `ssl` module is mostly compatible with LibreSSL 2.7.2 and newer.

The `ssl` module no longer sends IP addresses in SNI TLS extension. (Contributed by Christian Heimes in [bpo-32185](https://bugs.python.org/issue?@action=redirect&bpo=32185) [https://bugs.python.org/issue?@action=redirect&bpo=32185].)

`match_hostname()` no longer supports partial wildcards like `www*.example.org`. (Contributed by Mandeep Singh in [bpo-23033](https://bugs.python.org/issue?@action=redirect&bpo=23033) [https://bugs.python.org/issue?@action=redirect&bpo=23033] and Christian Heimes in [bpo-31399](https://bugs.python.org/issue?@action=redirect&bpo=31399) [https://bugs.python.org/issue?@action=redirect&bpo=31399].)

The default cipher suite selection of the `ssl` module now uses a blacklist approach rather than a hard-coded whitelist. Python no longer re-enables ciphers that have been blocked by OpenSSL security updates. Default cipher suite selection can be configured at compile time. (Contributed by Christian Heimes in [bpo-31429](https://bugs.python.org/issue?@action=redirect&bpo=31429) [https://bugs.python.org/issue?@action=redirect&bpo=31429].)

Validation of server certificates containing internationalized domain names (IDNs) is now supported. As part of this change, the `SSLSocket.server_hostname` attribute now stores the expected hostname in A-label form ("`xn--pythn-mua.org`"), rather than the U-label form ("`pythön.org`"). (Contributed by Nathaniel J. Smith and Christian Heimes in [bpo-28414](https://bugs.python.org/issue?@action=redirect&bpo=28414) [https://bugs.python.org/issue?@action=redirect&bpo=28414].)

The `ssl` module has preliminary and experimental support for TLS 1.3 and OpenSSL 1.1.1. At the time of Python 3.7.0 release,

OpenSSL 1.1.1 is still under development and TLS 1.3 hasn't been finalized yet. The TLS 1.3 handshake and protocol behaves slightly differently than TLS 1.2 and earlier, see [TLS 1.3](#). (Contributed by Christian Heimes in [bpo-32947](#) [<https://bugs.python.org/issue?@action=redirect&bpo=32947>], [bpo-20995](#) [<https://bugs.python.org/issue?@action=redirect&bpo=20995>], [bpo-29136](#) [<https://bugs.python.org/issue?@action=redirect&bpo=29136>], [bpo-30622](#) [<https://bugs.python.org/issue?@action=redirect&bpo=30622>] and [bpo-33618](#) [<https://bugs.python.org/issue?@action=redirect&bpo=33618>])

`SSLContext` and `SSLObject` no longer have a public constructor. Direct instantiation was never a documented and supported feature. Instances must be created with `SSLContext` methods `wrap_socket()` and `wrap_bio()`. (Contributed by Christian Heimes in [bpo-32951](#) [<https://bugs.python.org/issue?@action=redirect&bpo=32951>])

OpenSSL 1.1 APIs for setting the minimum and maximum TLS protocol version are available as `SSLContext.minimum_version` and `SSLContext.maximum_version`. Supported protocols are indicated by several new flags, such as `HAS_TLSv1_1`. (Contributed by Christian Heimes in [bpo-32609](#) [<https://bugs.python.org/issue?@action=redirect&bpo=32609>].)

## string

`string.Template` now lets you to optionally modify the regular expression pattern for braced placeholders and non-braced placeholders separately. (Contributed by Barry Warsaw in [bpo-1198569](#) [<https://bugs.python.org/issue?@action=redirect&bpo=1198569>].)

## subprocess

The `subprocess.run()` function accepts the new `capture_output` keyword argument. When true, stdout and stderr will be captured. This is equivalent to passing `subprocess.PIPE` as `stdout` and `stderr` arguments. (Contributed by Bo Bayles in [bpo-32102](#) [<https://bugs.python.org/issue?@action=redirect&bpo=32102>].)

The `subprocess.run` function and the `subprocess.Popen` constructor now accept the `text` keyword argument as an alias to `universal_newlines`. (Contributed by Andrew Clegg in [bpo-31756](https://bugs.python.org/issue?@action=redirect&bpo=31756) [<https://bugs.python.org/issue?@action=redirect&bpo=31756>].)

On Windows the default for `close_fds` was changed from `False` to `True` when redirecting the standard handles. It's now possible to set `close_fds` to `true` when redirecting the standard handles. See `subprocess.Popen`. This means that `close_fds` now defaults to `True` on all supported platforms. (Contributed by Segev Finer in [bpo-19764](https://bugs.python.org/issue?@action=redirect&bpo=19764) [<https://bugs.python.org/issue?@action=redirect&bpo=19764>].)

The `subprocess` module is now more graceful when handling `KeyboardInterrupt` during `subprocess.call()`, `subprocess.run()`, or in a `Popen` context manager. It now waits a short amount of time for the child to exit, before continuing the handling of the `KeyboardInterrupt` exception. (Contributed by Gregory P. Smith in [bpo-25942](https://bugs.python.org/issue?@action=redirect&bpo=25942) [<https://bugs.python.org/issue?@action=redirect&bpo=25942>].)

## sys

The new `sys.breakpointhook()` hook function is called by the built-in `breakpoint()`. (Contributed by Barry Warsaw in [bpo-31353](https://bugs.python.org/issue?@action=redirect&bpo=31353) [<https://bugs.python.org/issue?@action=redirect&bpo=31353>].)

On Android, the new `sys.getandroidapilevel()` returns the build-time Android API version. (Contributed by Victor Stinner in [bpo-28740](https://bugs.python.org/issue?@action=redirect&bpo=28740) [<https://bugs.python.org/issue?@action=redirect&bpo=28740>].)

The new `sys.get_coroutine_origin_tracking_depth()` function returns the current coroutine origin tracking depth, as set by the new `sys.set_coroutine_origin_tracking_depth()`. `asyncio` has been converted to use this new API instead of the deprecated `sys.set_coroutine_wrapper()`. (Contributed by Nathaniel J. Smith in [bpo-32591](https://bugs.python.org/issue?@action=redirect&bpo=32591) [<https://bugs.python.org/issue?@action=redirect&bpo=32591>].)

## time

**PEP 564** [<https://peps.python.org/pep-0564/>] adds six new functions with nanosecond resolution to the `time` module:

- `time.clock_gettime_ns()`
- `time.clock_settime_ns()`
- `time.monotonic_ns()`
- `time.perf_counter_ns()`
- `time.process_time_ns()`
- `time.time_ns()`

New clock identifiers have been added:

- `time.CLOCK_BOOTTIME` (Linux): Identical to `time.CLOCK_MONOTONIC`, except it also includes any time that the system is suspended.
- `time.CLOCK_PROF` (FreeBSD, NetBSD and OpenBSD): High-resolution per-process CPU timer.
- `time.CLOCK_UPTIME` (FreeBSD, OpenBSD): Time whose absolute value is the time the system has been running and not suspended, providing accurate uptime measurement.

The new `time.thread_time()` and `time.thread_time_ns()` functions can be used to get per-thread CPU time measurements. (Contributed by Antoine Pitrou in [bpo-32025](https://bugs.python.org/issue?@action=redirect&bpo=32025) [<https://bugs.python.org/issue?@action=redirect&bpo=32025>].)

The new `time.pthread_getcpuclockid()` function returns the clock ID of the thread-specific CPU-time clock.

## tkinter

The new `tkinter.ttk.Spinbox` class is now available. (Contributed by Alan Moore in [bpo-32585](https://bugs.python.org/issue?@action=redirect&bpo=32585) [<https://bugs.python.org/issue?@action=redirect&bpo=32585>].)

## tracemalloc

`tracemalloc.Traceback` behaves more like regular tracebacks, sorting the frames from oldest to most recent.

`Traceback.format()` now accepts negative *limit*, truncating the result to the `abs(limit)` oldest frames. To get the old behaviour,

use the new *most\_recent\_first* argument to `Traceback.format()`. (Contributed by Jesse Bakker in [bpo-32121](https://bugs.python.org/issue?@action=redirect&bpo=32121) [https://bugs.python.org/issue?@action=redirect&bpo=32121].)

## types

The new `WrapperDescriptorType`, `MethodWrapperType`, `MethodDescriptorType`, and `ClassMethodDescriptorType` classes are now available. (Contributed by Manuel Krebber and Guido van Rossum in [bpo-29377](https://bugs.python.org/issue?@action=redirect&bpo=29377) [https://bugs.python.org/issue?@action=redirect&bpo=29377], and Serhiy Storchaka in [bpo-32265](https://bugs.python.org/issue?@action=redirect&bpo=32265) [https://bugs.python.org/issue?@action=redirect&bpo=32265].)

The new `types.resolve_bases()` function resolves MRO entries dynamically as specified by [PEP 560](https://peps.python.org/pep-0560/) [https://peps.python.org/pep-0560/]. (Contributed by Ivan Levkivskiy in [bpo-32717](https://bugs.python.org/issue?@action=redirect&bpo=32717) [https://bugs.python.org/issue?@action=redirect&bpo=32717].)

## unicodedata

The internal `unicodedata` database has been upgraded to use [Unicode 11](https://www.unicode.org/versions/Unicode11.0.0/) [https://www.unicode.org/versions/Unicode11.0.0/]. (Contributed by Benjamin Peterson.)

## unittest

The new `-k` command-line option allows filtering tests by a name substring or a Unix shell-like pattern. For example, `python -m unittest -k foo` runs `foo_tests.SomeTest.test_something`, `bar_tests.SomeTest.test_foo`, but not `bar_tests.FooTest.test_something`. (Contributed by Jonas Haag in [bpo-32071](https://bugs.python.org/issue?@action=redirect&bpo=32071) [https://bugs.python.org/issue?@action=redirect&bpo=32071].)

## unittest.mock

The `sentinel` attributes now preserve their identity when they are `copied` or `pickled`. (Contributed by Serhiy Storchaka in [bpo-20804](https://bugs.python.org/issue?@action=redirect&bpo=20804) [https://bugs.python.org/issue?@action=redirect&bpo=20804].)

The new `seal()` function allows sealing `Mock` instances, which will disallow further creation of attribute mocks. The seal is applied recursively to all attributes that are themselves mocks. (Contributed by Mario Corchero in [bpo-30541](https://bugs.python.org/issue?@action=redirect&bpo=30541) [https://bugs.python.org/issue?@action=redirect&bpo=30541].)

## **urllib.parse**

`urllib.parse.quote()` has been updated from [RFC 2396](https://datatracker.ietf.org/doc/html/rfc2396) [https://datatracker.ietf.org/doc/html/rfc2396.html] to [RFC 3986](https://datatracker.ietf.org/doc/html/rfc3986) [https://datatracker.ietf.org/doc/html/rfc3986.html], adding `~` to the set of characters that are never quoted by default. (Contributed by Christian Theune and Ratnadeep Debnath in [bpo-16285](https://bugs.python.org/issue?@action=redirect&bpo=16285) [https://bugs.python.org/issue?@action=redirect&bpo=16285].)

## **uu**

The `uu.encode()` function now accepts an optional *backtick* keyword argument. When it's true, zeros are represented by `` `` instead of spaces. (Contributed by Xiang Zhang in [bpo-30103](https://bugs.python.org/issue?@action=redirect&bpo=30103) [https://bugs.python.org/issue?@action=redirect&bpo=30103].)

## **uuid**

The new `UUID.is_safe` attribute relays information from the platform about whether generated UUIDs are generated with a multiprocessing-safe method. (Contributed by Barry Warsaw in [bpo-22807](https://bugs.python.org/issue?@action=redirect&bpo=22807) [https://bugs.python.org/issue?@action=redirect&bpo=22807].)

`uuid.getnode()` now prefers universally administered MAC addresses over locally administered MAC addresses. This makes a better guarantee for global uniqueness of UUIDs returned from `uuid.uuid1()`. If only locally administered MAC addresses are available, the first such one found is returned. (Contributed by Barry Warsaw in [bpo-32107](https://bugs.python.org/issue?@action=redirect&bpo=32107) [https://bugs.python.org/issue?@action=redirect&bpo=32107].)

## **warnings**

The initialization of the default warnings filters has changed as

follows:

- warnings enabled via command line options (including those for `-b` and the new CPython-specific `-X` dev option) are always passed to the warnings machinery via the `sys.warnoptions` attribute.
- warnings filters enabled via the command line or the environment now have the following order of precedence:
  - the BytesWarning filter for `-b` (or `-bb`)
  - any filters specified with the `-W` option
  - any filters specified with the `PYTHONWARNINGS` environment variable
  - any other CPython specific filters (e.g. the default filter added for the new `-X` dev mode)
  - any implicit filters defined directly by the warnings machinery
- in CPython debug builds, all warnings are now displayed by default (the implicit filter list is empty)

(Contributed by Nick Coghlan and Victor Stinner in [bpo-20361](https://bugs.python.org/issue?@action=redirect&bpo=20361) [<https://bugs.python.org/issue?@action=redirect&bpo=20361>], [bpo-32043](https://bugs.python.org/issue?@action=redirect&bpo=32043) [<https://bugs.python.org/issue?@action=redirect&bpo=32043>], and [bpo-32230](https://bugs.python.org/issue?@action=redirect&bpo=32230) [<https://bugs.python.org/issue?@action=redirect&bpo=32230>].)

Deprecation warnings are once again shown by default in single-file scripts and at the interactive prompt. See [PEP 565: Show DeprecationWarning in \\_\\_main\\_\\_](#) for details. (Contributed by Nick Coghlan in [bpo-31975](https://bugs.python.org/issue?@action=redirect&bpo=31975) [<https://bugs.python.org/issue?@action=redirect&bpo=31975>].)

## xml.etree

`ElementPath` predicates in the `find()` methods can now compare text of the current node with `[. = "text"]`, not only text in children. Predicates also allow adding spaces for better readability.

(Contributed by Stefan Behnel in [bpo-31648](https://bugs.python.org/issue?@action=redirect&bpo=31648) [https://bugs.python.org/issue?@action=redirect&bpo=31648].)

## xmlrpc.server

**SimpleXMLRPCDispatcher.register\_function** can now be used as a decorator. (Contributed by Xiang Zhang in [bpo-7769](https://bugs.python.org/issue?@action=redirect&bpo=7769) [https://bugs.python.org/issue?@action=redirect&bpo=7769].)

## zipapp

Function **create\_archive()** now accepts an optional *filter* argument to allow the user to select which files should be included in the archive. (Contributed by Irmen de Jong in [bpo-31072](https://bugs.python.org/issue?@action=redirect&bpo=31072) [https://bugs.python.org/issue?@action=redirect&bpo=31072].)

Function **create\_archive()** now accepts an optional *compressed* argument to generate a compressed archive. A command line option `--compress` has also been added to support compression. (Contributed by Zhiming Wang in [bpo-31638](https://bugs.python.org/issue?@action=redirect&bpo=31638) [https://bugs.python.org/issue?@action=redirect&bpo=31638].)

## zipfile

**ZipFile** now accepts the new *compresslevel* parameter to control the compression level. (Contributed by Bo Bayles in [bpo-21417](https://bugs.python.org/issue?@action=redirect&bpo=21417) [https://bugs.python.org/issue?@action=redirect&bpo=21417].)

Subdirectories in archives created by `ZipFile` are now stored in alphabetical order. (Contributed by Bernhard M. Wiedemann in [bpo-30693](https://bugs.python.org/issue?@action=redirect&bpo=30693) [https://bugs.python.org/issue?@action=redirect&bpo=30693].)

## C API Changes

A new API for thread-local storage has been implemented. See [PEP 539: New C API for Thread-Local Storage](#) for an overview and [Thread Specific Storage \(TSS\) API](#) for a complete reference. (Contributed by Masayuki Yamamoto in [bpo-25658](https://bugs.python.org/issue?@action=redirect&bpo=25658) [https://bugs.python.org/issue?@action=redirect&bpo=25658].)

The new [context variables](#) functionality exposes a number of [new C APIs](#).

The new [PyImport\\_GetModule\(\)](#) function returns the previously imported module with the given name. (Contributed by Eric Snow in [bpo-28411](#) [<https://bugs.python.org/issue?@action=redirect&bpo=28411>].)

The new [Py\\_RETURN\\_RICHCOMPARE](#) macro eases writing rich comparison functions. (Contributed by Petr Victorin in [bpo-23699](#) [<https://bugs.python.org/issue?@action=redirect&bpo=23699>].)

The new [Py\\_UNREACHABLE](#) macro can be used to mark unreachable code paths. (Contributed by Barry Warsaw in [bpo-31338](#) [<https://bugs.python.org/issue?@action=redirect&bpo=31338>].)

The [tracemalloc](#) now exposes a C API through the new [PyTraceMalloc\\_Track\(\)](#) and [PyTraceMalloc\\_Untrack\(\)](#) functions. (Contributed by Victor Stinner in [bpo-30054](#) [<https://bugs.python.org/issue?@action=redirect&bpo=30054>].)

The new [import\\_\\_find\\_\\_load\\_\\_start\(\)](#) and [import\\_\\_find\\_\\_load\\_\\_done\(\)](#) static markers can be used to trace module imports. (Contributed by Christian Heimes in [bpo-31574](#) [<https://bugs.python.org/issue?@action=redirect&bpo=31574>].)

The fields **name** and **doc** of structures [PyMemberDef](#), [PyGetSetDef](#), [PyStructSequence\\_Field](#), [PyStructSequence\\_Desc](#), and **wrapperbase** are now of type `const char *` rather of `char *`. (Contributed by Serhiy Storchaka in [bpo-28761](#) [<https://bugs.python.org/issue?@action=redirect&bpo=28761>].)

The result of [PyUnicode\\_AsUTF8AndSize\(\)](#) and [PyUnicode\\_AsUTF8\(\)](#) is now of type `const char *` rather of `char *`. (Contributed by Serhiy Storchaka in [bpo-28769](#) [<https://bugs.python.org/issue?@action=redirect&bpo=28769>].)

The result of [PyMapping\\_Keys\(\)](#), [PyMapping\\_Values\(\)](#) and [PyMapping\\_Items\(\)](#) is now always a list, rather than a list or a tuple. (Contributed by Oren Milman in [bpo-28280](#) [<https://>]

[bugs.python.org/issue?@action=redirect&bpo=28280](https://bugs.python.org/issue?@action=redirect&bpo=28280)].)

Added functions `PySlice_Unpack()` and `PySlice_AdjustIndices()`. (Contributed by Serhiy Storchaka in [bpo-27867](https://bugs.python.org/issue?@action=redirect&bpo=27867) [<https://bugs.python.org/issue?@action=redirect&bpo=27867>].)

`PyOS_AfterFork()` is deprecated in favour of the new functions `PyOS_BeforeFork()`, `PyOS_AfterFork_Parent()` and `PyOS_AfterFork_Child()`. (Contributed by Antoine Pitrou in [bpo-16500](https://bugs.python.org/issue?@action=redirect&bpo=16500) [<https://bugs.python.org/issue?@action=redirect&bpo=16500>].)

The `PyExc_RecursionErrorInst` singleton that was part of the public API has been removed as its members being never cleared may cause a segfault during finalization of the interpreter.

Contributed by Xavier de Gaye in [bpo-22898](https://bugs.python.org/issue?@action=redirect&bpo=22898) [<https://bugs.python.org/issue?@action=redirect&bpo=22898>] and [bpo-30697](https://bugs.python.org/issue?@action=redirect&bpo=30697) [<https://bugs.python.org/issue?@action=redirect&bpo=30697>].

Added C API support for timezones with timezone constructors `PyTimeZone_FromOffset()` and `PyTimeZone_FromOffsetAndName()`, and access to the UTC singleton with `PyDateTime_TimeZone_UTC`. Contributed by Paul Ganssle in [bpo-10381](https://bugs.python.org/issue?@action=redirect&bpo=10381) [<https://bugs.python.org/issue?@action=redirect&bpo=10381>].

The type of results of `PyThread_start_new_thread()` and `PyThread_get_thread_ident()`, and the `id` parameter of `PyThreadState_SetAsyncExc()` changed from long to unsigned long. (Contributed by Serhiy Storchaka in [bpo-6532](https://bugs.python.org/issue?@action=redirect&bpo=6532) [<https://bugs.python.org/issue?@action=redirect&bpo=6532>].)

`PyUnicode_AsWideCharString()` now raises a `ValueError` if the second argument is `NULL` and the `wchar_t*` string contains null characters. (Contributed by Serhiy Storchaka in [bpo-30708](https://bugs.python.org/issue?@action=redirect&bpo=30708) [<https://bugs.python.org/issue?@action=redirect&bpo=30708>].)

Changes to the startup sequence and the management of dynamic memory allocators mean that the long documented requirement to call `Py_Initialize()` before calling most C API functions is now relied on more heavily, and failing to abide by it may lead to segfaults in embedding applications. See the [Porting to Python 3.7](#)

section in this document and the [Before Python Initialization](#) section in the C API documentation for more details.

The new `PyInterpreterState_GetID()` returns the unique ID for a given interpreter. (Contributed by Eric Snow in [bpo-29102](#) [<https://bugs.python.org/issue?@action=redirect&bpo=29102>].)

`Py_DecodeLocale()`, `Py_EncodeLocale()` now use the UTF-8 encoding when the [UTF-8 mode](#) is enabled. (Contributed by Victor Stinner in [bpo-29240](#) [<https://bugs.python.org/issue?@action=redirect&bpo=29240>].)

`PyUnicode_DecodeLocaleAndSize()` and `PyUnicode_EncodeLocale()` now use the current locale encoding for `surrogateescape` error handler. (Contributed by Victor Stinner in [bpo-29240](#) [<https://bugs.python.org/issue?@action=redirect&bpo=29240>].)

The *start* and *end* parameters of `PyUnicode_FindChar()` are now adjusted to behave like string slices. (Contributed by Xiang Zhang in [bpo-28822](#) [<https://bugs.python.org/issue?@action=redirect&bpo=28822>].)

## Build Changes

Support for building `--without-threads` has been removed. The [threading](#) module is now always available. (Contributed by Antoine Pitrou in [bpo-31370](#) [<https://bugs.python.org/issue?@action=redirect&bpo=31370>].)

A full copy of `libffi` is no longer bundled for use when building the `_ctypes` module on non-OSX UNIX platforms. An installed copy of `libffi` is now required when building `_ctypes` on such platforms. (Contributed by Zachary Ware in [bpo-27979](#) [<https://bugs.python.org/issue?@action=redirect&bpo=27979>].)

The Windows build process no longer depends on Subversion to pull in external sources, a Python script is used to download zipfiles from GitHub instead. If Python 3.6 is not found on the system (via `py -3.6`), NuGet is used to download a copy of 32-bit Python for

this purpose. (Contributed by Zachary Ware in [bpo-30450](https://bugs.python.org/issue?@action=redirect&bpo=30450) [https://bugs.python.org/issue?@action=redirect&bpo=30450].)

The **ssl** module requires OpenSSL 1.0.2 or 1.1 compatible libssl. OpenSSL 1.0.1 has reached end of lifetime on 2016-12-31 and is no longer supported. LibreSSL is temporarily not supported as well. LibreSSL releases up to version 2.6.4 are missing required OpenSSL 1.0.2 APIs.

## Optimizations

The overhead of calling many methods of various standard library classes implemented in C has been significantly reduced by porting more code to use the `METH_FASTCALL` convention. (Contributed by Victor Stinner in [bpo-29300](https://bugs.python.org/issue?@action=redirect&bpo=29300) [https://bugs.python.org/issue?@action=redirect&bpo=29300], [bpo-29507](https://bugs.python.org/issue?@action=redirect&bpo=29507) [https://bugs.python.org/issue?@action=redirect&bpo=29507], [bpo-29452](https://bugs.python.org/issue?@action=redirect&bpo=29452) [https://bugs.python.org/issue?@action=redirect&bpo=29452], and [bpo-29286](https://bugs.python.org/issue?@action=redirect&bpo=29286) [https://bugs.python.org/issue?@action=redirect&bpo=29286].)

Various optimizations have reduced Python startup time by 10% on Linux and up to 30% on macOS. (Contributed by Victor Stinner, INADA Naoki in [bpo-29585](https://bugs.python.org/issue?@action=redirect&bpo=29585) [https://bugs.python.org/issue?@action=redirect&bpo=29585], and Ivan Levkivskiy in [bpo-31333](https://bugs.python.org/issue?@action=redirect&bpo=31333) [https://bugs.python.org/issue?@action=redirect&bpo=31333].)

Method calls are now up to 20% faster due to the bytecode changes which avoid creating bound method instances. (Contributed by Yury Selivanov and INADA Naoki in [bpo-26110](https://bugs.python.org/issue?@action=redirect&bpo=26110) [https://bugs.python.org/issue?@action=redirect&bpo=26110].)

The **asyncio** module received a number of notable optimizations for commonly used functions:

- The **`asyncio.get_event_loop()`** function has been reimplemented in C to make it up to 15 times faster. (Contributed by Yury Selivanov in [bpo-32296](https://bugs.python.org/issue?@action=redirect&bpo=32296) [https://bugs.python.org/issue?@action=redirect&bpo=32296].)
- **`asyncio.Future`** callback management has been optimized. (Contributed by Yury Selivanov in [bpo-32348](https://bugs.python.org/issue?@action=redirect&bpo=32348) [https://bugs.python.org/issue?@action=redirect&bpo=32348].)

bugs.python.org/issue?@action=redirect&bpo=32348].)

- **`asyncio.gather()`** is now up to 15% faster. (Contributed by Yury Selivanov in [bpo-32355](https://bugs.python.org/issue?@action=redirect&bpo=32355) [https://bugs.python.org/issue?@action=redirect&bpo=32355].)
- **`asyncio.sleep()`** is now up to 2 times faster when the *delay* argument is zero or negative. (Contributed by Andrew Svetlov in [bpo-32351](https://bugs.python.org/issue?@action=redirect&bpo=32351) [https://bugs.python.org/issue?@action=redirect&bpo=32351].)
- The performance overhead of asyncio debug mode has been reduced. (Contributed by Antoine Pitrou in [bpo-31970](https://bugs.python.org/issue?@action=redirect&bpo=31970) [https://bugs.python.org/issue?@action=redirect&bpo=31970].)

As a result of [PEP 560 work](#), the import time of **`typing`** has been reduced by a factor of 7, and many typing operations are now faster. (Contributed by Ivan Levkivskiy in [bpo-32226](https://bugs.python.org/issue?@action=redirect&bpo=32226) [https://bugs.python.org/issue?@action=redirect&bpo=32226].)

**`sorted()`** and **`list.sort()`** have been optimized for common cases to be up to 40-75% faster. (Contributed by Elliot Gorokhovskiy in [bpo-28685](https://bugs.python.org/issue?@action=redirect&bpo=28685) [https://bugs.python.org/issue?@action=redirect&bpo=28685].)

**`dict.copy()`** is now up to 5.5 times faster. (Contributed by Yury Selivanov in [bpo-31179](https://bugs.python.org/issue?@action=redirect&bpo=31179) [https://bugs.python.org/issue?@action=redirect&bpo=31179].)

**`hasattr()`** and **`getattr()`** are now about 4 times faster when *name* is not found and *obj* does not override **`object.__getattr__()`** or **`object.__getattribute__()`**. (Contributed by INADA Naoki in [bpo-32544](https://bugs.python.org/issue?@action=redirect&bpo=32544) [https://bugs.python.org/issue?@action=redirect&bpo=32544].)

Searching for certain Unicode characters (like Ukrainian capital “Є”) in a string was up to 25 times slower than searching for other characters. It is now only 3 times slower in the worst case. (Contributed by Serhiy Storchaka in [bpo-24821](https://bugs.python.org/issue?@action=redirect&bpo=24821) [https://bugs.python.org/issue?@action=redirect&bpo=24821].)

The **`collections.namedtuple()`** factory has been reimplemented to make the creation of named tuples 4 to 6 times faster. (Contributed by Jelle Zijlstra with further improvements by INADA Naoki, Serhiy Storchaka, and Raymond Hettinger in

[bpo-28638](https://bugs.python.org/issue?@action=redirect&bpo=28638) [https://bugs.python.org/issue?@action=redirect&bpo=28638].)

`date.fromordinal()` and `date.fromtimestamp()` are now up to 30% faster in the common case. (Contributed by Paul Ganssle in [bpo-32403](https://bugs.python.org/issue?@action=redirect&bpo=32403) [https://bugs.python.org/issue?@action=redirect&bpo=32403].)

The `os.fwalk()` function is now up to 2 times faster thanks to the use of `os.scandir()`. (Contributed by Serhiy Storchaka in [bpo-25996](https://bugs.python.org/issue?@action=redirect&bpo=25996) [https://bugs.python.org/issue?@action=redirect&bpo=25996].)

The speed of the `shutil.rmtree()` function has been improved by 20–40% thanks to the use of the `os.scandir()` function. (Contributed by Serhiy Storchaka in [bpo-28564](https://bugs.python.org/issue?@action=redirect&bpo=28564) [https://bugs.python.org/issue?@action=redirect&bpo=28564].)

Optimized case-insensitive matching and searching of **regular expressions**. Searching some patterns can now be up to 20 times faster. (Contributed by Serhiy Storchaka in [bpo-30285](https://bugs.python.org/issue?@action=redirect&bpo=30285) [https://bugs.python.org/issue?@action=redirect&bpo=30285].)

`re.compile()` now converts `flags` parameter to int object if it is `RegexFlag`. It is now as fast as Python 3.5, and faster than Python 3.6 by about 10% depending on the pattern. (Contributed by INADA Naoki in [bpo-31671](https://bugs.python.org/issue?@action=redirect&bpo=31671) [https://bugs.python.org/issue?@action=redirect&bpo=31671].)

The `modify()` methods of classes `selectors.EpollSelector`, `selectors.PollSelector` and `selectors.DevpollSelector` may be around 10% faster under heavy loads. (Contributed by Giampaolo Rodola' in [bpo-30014](https://bugs.python.org/issue?@action=redirect&bpo=30014) [https://bugs.python.org/issue?@action=redirect&bpo=30014].)

Constant folding has been moved from the peephole optimizer to the new AST optimizer, which is able perform optimizations more consistently. (Contributed by Eugene Toder and INADA Naoki in [bpo-29469](https://bugs.python.org/issue?@action=redirect&bpo=29469) [https://bugs.python.org/issue?@action=redirect&bpo=29469] and [bpo-11549](https://bugs.python.org/issue?@action=redirect&bpo=11549) [https://bugs.python.org/issue?@action=redirect&bpo=11549].)

Most functions and methods in **abc** have been rewritten in C. This makes creation of abstract base classes, and calling `isinstance()` and `issubclass()` on them 1.5x faster. This also

reduces Python start-up time by up to 10%. (Contributed by Ivan Levkivskyi and INADA Naoki in [bpo-31333](https://bugs.python.org/issue?@action=redirect&bpo=31333) [https://bugs.python.org/issue?@action=redirect&bpo=31333])

Significant speed improvements to alternate constructors for `datetime.date` and `datetime.datetime` by using fast-path constructors when not constructing subclasses. (Contributed by Paul Ganssle in [bpo-32403](https://bugs.python.org/issue?@action=redirect&bpo=32403) [https://bugs.python.org/issue?@action=redirect&bpo=32403])

The speed of comparison of `array.array` instances has been improved considerably in certain cases. It is now from 10x to 70x faster when comparing arrays holding values of the same integer type. (Contributed by Adrian Wielgosik in [bpo-24700](https://bugs.python.org/issue?@action=redirect&bpo=24700) [https://bugs.python.org/issue?@action=redirect&bpo=24700].)

The `math.erf()` and `math.erfc()` functions now use the (faster) C library implementation on most platforms. (Contributed by Serhiy Storchaka in [bpo-26121](https://bugs.python.org/issue?@action=redirect&bpo=26121) [https://bugs.python.org/issue?@action=redirect&bpo=26121].)

## Other CPython Implementation Changes

- Trace hooks may now opt out of receiving the `line` and opt into receiving the `opcode` events from the interpreter by setting the corresponding new `f_trace_lines` and `f_trace_opcodes` attributes on the frame being traced. (Contributed by Nick Coghlan in [bpo-31344](https://bugs.python.org/issue?@action=redirect&bpo=31344) [https://bugs.python.org/issue?@action=redirect&bpo=31344].)
- Fixed some consistency problems with namespace package module attributes. Namespace module objects now have an `__file__` that is set to `None` (previously unset), and their `__spec__.origin` is also set to `None` (previously the string `"namespace"`). See [bpo-32305](https://bugs.python.org/issue?@action=redirect&bpo=32305) [https://bugs.python.org/issue?@action=redirect&bpo=32305]. Also, the namespace module object's `__spec__.loader` is set to the same value as `__loader__` (previously, the former was set to `None`). See [bpo-32303](https://bugs.python.org/issue?@action=redirect&bpo=32303) [https://bugs.python.org/issue?@action=redirect&bpo=32303].)
- The `locals()` dictionary now displays in the lexical order

that variables were defined. Previously, the order was undefined. (Contributed by Raymond Hettinger in [bpo-32690](https://bugs.python.org/issue?@action=redirect&bpo=32690) [https://bugs.python.org/issue?@action=redirect&bpo=32690].)

- The `distutils` `upload` command no longer tries to change CR end-of-line characters to CRLF. This fixes a corruption issue with sdists that ended with a byte equivalent to CR. (Contributed by Bo Bayles in [bpo-32304](https://bugs.python.org/issue?@action=redirect&bpo=32304) [https://bugs.python.org/issue?@action=redirect&bpo=32304].)

## Deprecated Python Behavior

Yield expressions (both `yield` and `yield from` clauses) are now deprecated in comprehensions and generator expressions (aside from the iterable expression in the leftmost `for` clause). This ensures that comprehensions always immediately return a container of the appropriate type (rather than potentially returning a `generator iterator` object), while generator expressions won't attempt to interleave their implicit output with the output from any explicit yield expressions. In Python 3.7, such expressions emit `DeprecationWarning` when compiled, in Python 3.8 this will be a `SyntaxError`. (Contributed by Serhiy Storchaka in [bpo-10544](https://bugs.python.org/issue?@action=redirect&bpo=10544) [https://bugs.python.org/issue?@action=redirect&bpo=10544].)

Returning a subclass of `complex` from `object.__complex__()` is deprecated and will be an error in future Python versions. This makes `__complex__()` consistent with `object.__int__()` and `object.__float__()`. (Contributed by Serhiy Storchaka in [bpo-28894](https://bugs.python.org/issue?@action=redirect&bpo=28894) [https://bugs.python.org/issue?@action=redirect&bpo=28894].)

## Deprecated Python modules, functions and methods

### `aifc`

`aifc.openfp()` has been deprecated and will be removed in Python 3.9. Use `aifc.open()` instead. (Contributed by Brian Curtin in [bpo-31985](https://bugs.python.org/issue?@action=redirect&bpo=31985) [https://bugs.python.org/issue?@action=redirect&bpo=31985].)

## asyncio

Support for directly `await`-ing instances of `asyncio.Lock` and other asyncio synchronization primitives has been deprecated. An asynchronous context manager must be used in order to acquire and release the synchronization resource. (Contributed by Andrew Svetlov in [bpo-32253](https://bugs.python.org/issue?@action=redirect&bpo=32253) [https://bugs.python.org/issue?@action=redirect&bpo=32253].)

The `asyncio.Task.current_task()` and `asyncio.Task.all_tasks()` methods have been deprecated. (Contributed by Andrew Svetlov in [bpo-32250](https://bugs.python.org/issue?@action=redirect&bpo=32250) [https://bugs.python.org/issue?@action=redirect&bpo=32250].)

## collections

In Python 3.8, the abstract base classes in `collections.abc` will no longer be exposed in the regular `collections` module. This will help create a clearer distinction between the concrete classes and the abstract base classes. (Contributed by Serhiy Storchaka in [bpo-25988](https://bugs.python.org/issue?@action=redirect&bpo=25988) [https://bugs.python.org/issue?@action=redirect&bpo=25988].)

## dbm

`dbm.dumb` now supports reading read-only files and no longer writes the index file when it is not changed. A deprecation warning is now emitted if the index file is missing and recreated in the `'r'` and `'w'` modes (this will be an error in future Python releases). (Contributed by Serhiy Storchaka in [bpo-28847](https://bugs.python.org/issue?@action=redirect&bpo=28847) [https://bugs.python.org/issue?@action=redirect&bpo=28847].)

## enum

In Python 3.8, attempting to check for non-Enum objects in `Enum` classes will raise a `TypeError` (e.g. `1 in Color`); similarly, attempting to check for non-Flag objects in a `Flag` member will raise `TypeError` (e.g. `1 in Perm.RW`); currently, both operations return `False` instead. (Contributed by Ethan Furman in [bpo-33217](https://bugs.python.org/issue?@action=redirect&bpo=33217) [https://bugs.python.org/issue?@action=redirect&bpo=33217].)

## gettext

Using non-integer value for selecting a plural form in `gettext` is now deprecated. It never correctly worked. (Contributed by Serhiy Storchaka in [bpo-28692](https://bugs.python.org/issue?@action=redirect&bpo=28692) [https://bugs.python.org/issue?@action=redirect&bpo=28692].)

## importlib

Methods `MetaPathFinder.find_module()` (replaced by `MetaPathFinder.find_spec()`) and `PathEntryFinder.find_loader()` (replaced by `PathEntryFinder.find_spec()`) both deprecated in Python 3.4 now emit `DeprecationWarning`. (Contributed by Matthias Bussonnier in [bpo-29576](https://bugs.python.org/issue?@action=redirect&bpo=29576) [https://bugs.python.org/issue?@action=redirect&bpo=29576])

The `importlib.abc.ResourceLoader` ABC has been deprecated in favour of `importlib.abc.ResourceReader`.

## locale

`locale.format()` has been deprecated, use `locale.format_string()` instead. (Contributed by Garvit in [bpo-10379](https://bugs.python.org/issue?@action=redirect&bpo=10379) [https://bugs.python.org/issue?@action=redirect&bpo=10379].)

## macpath

The `macpath` is now deprecated and will be removed in Python 3.8. (Contributed by Chi Hsuan Yen in [bpo-9850](https://bugs.python.org/issue?@action=redirect&bpo=9850) [https://bugs.python.org/issue?@action=redirect&bpo=9850].)

## threading

`dummy_threading` and `_dummy_thread` have been deprecated. It is no longer possible to build Python with threading disabled. Use `threading` instead. (Contributed by Antoine Pitrou in [bpo-31370](https://bugs.python.org/issue?@action=redirect&bpo=31370) [https://bugs.python.org/issue?@action=redirect&bpo=31370].)

## socket

The silent argument value truncation in `socket.htons()` and `socket.ntohs()` has been deprecated. In future versions of Python, if the passed argument is larger than 16 bits, an exception will be raised. (Contributed by Oren Milman in [bpo-28332](https://bugs.python.org/issue?@action=redirect&bpo=28332) [https://bugs.python.org/issue?@action=redirect&bpo=28332].)

## ssl

`ssl.wrap_socket()` is deprecated. Use `ssl.SSLContext.wrap_socket()` instead. (Contributed by Christian Heimes in [bpo-28124](https://bugs.python.org/issue?@action=redirect&bpo=28124) [https://bugs.python.org/issue?@action=redirect&bpo=28124].)

## sunau

`sunau.openfp()` has been deprecated and will be removed in Python 3.9. Use `sunau.open()` instead. (Contributed by Brian Curtin in [bpo-31985](https://bugs.python.org/issue?@action=redirect&bpo=31985) [https://bugs.python.org/issue?@action=redirect&bpo=31985].)

## sys

Deprecated `sys.set_coroutine_wrapper()` and `sys.get_coroutine_wrapper()`.

The undocumented `sys.callstats()` function has been deprecated and will be removed in a future Python version. (Contributed by Victor Stinner in [bpo-28799](https://bugs.python.org/issue?@action=redirect&bpo=28799) [https://bugs.python.org/issue?@action=redirect&bpo=28799].)

## wave

`wave.openfp()` has been deprecated and will be removed in Python 3.9. Use `wave.open()` instead. (Contributed by Brian Curtin in [bpo-31985](https://bugs.python.org/issue?@action=redirect&bpo=31985) [https://bugs.python.org/issue?@action=redirect&bpo=31985].)

# Deprecated functions and types of the C API

Function `PySlice_GetIndicesEx()` is deprecated and replaced with a macro if `PY_LIMITED_API` is not set or set to a value in the range between `0x03050400` and `0x03060000` (not inclusive), or is `0x03060100` or higher. (Contributed by Serhiy Storchaka in [bpo-27867](https://bugs.python.org/issue?@action=redirect&bpo=27867) [<https://bugs.python.org/issue?@action=redirect&bpo=27867>].)

`PyOS_AfterFork()` has been deprecated. Use `PyOS_BeforeFork()`, `PyOS_AfterFork_Parent()` or `PyOS_AfterFork_Child()` instead. (Contributed by Antoine Pitrou in [bpo-16500](https://bugs.python.org/issue?@action=redirect&bpo=16500) [<https://bugs.python.org/issue?@action=redirect&bpo=16500>].)

## Platform Support Removals

- FreeBSD 9 and older are no longer officially supported.
- For full Unicode support, including within extension modules, \*nix platforms are now expected to provide at least one of `C.UTF-8` (full locale), `C.utf8` (full locale) or `UTF-8` (LC\_CTYPE-only locale) as an alternative to the legacy ASCII-based `C` locale.
- OpenSSL 0.9.8 and 1.0.1 are no longer supported, which means building CPython 3.7 with SSL/TLS support on older platforms still using these versions requires custom build options that link to a more recent version of OpenSSL.

Notably, this issue affects the Debian 8 (aka “jessie”) and Ubuntu 14.04 (aka “Trusty”) LTS Linux distributions, as they still use OpenSSL 1.0.1 by default.

Debian 9 (“stretch”) and Ubuntu 16.04 (“xenial”), as well as recent releases of other LTS Linux releases (e.g. RHEL/CentOS 7.5, SLES 12-SP3), use OpenSSL 1.0.2 or later, and remain supported in the default build configuration.

CPython's own [CI configuration file](https://github.com/python/cpython/blob/v3.7.13/.travis.yml) [https://github.com/python/cpython/blob/v3.7.13/.travis.yml] provides an example of using the SSL [compatibility testing infrastructure](https://github.com/python/cpython/tree/3.11/Tools/ssl/multissltests.py) [https://github.com/python/cpython/tree/3.11/Tools/ssl/multissltests.py] in CPython's test suite to build and link against OpenSSL 1.1.0 rather than an outdated system provided OpenSSL.

## API and Feature Removals

The following features and APIs have been removed from Python 3.7:

- The `os.stat_float_times()` function has been removed. It was introduced in Python 2.3 for backward compatibility with Python 2.2, and was deprecated since Python 3.1.
- Unknown escapes consisting of `'\'` and an ASCII letter in replacement templates for `re.sub()` were deprecated in Python 3.5, and will now cause an error.
- Removed support of the `exclude` argument in `tarfile.TarFile.add()`. It was deprecated in Python 2.7 and 3.2. Use the `filter` argument instead.
- The `splitunc()` function in the `ntpath` module was deprecated in Python 3.1, and has now been removed. Use the `splitdrive()` function instead.
- `collections.namedtuple()` no longer supports the `verbose` parameter or `_source` attribute which showed the generated source code for the named tuple class. This was part of an optimization designed to speed-up class creation. (Contributed by Jelle Zijlstra with further improvements by INADA Naoki, Serhiy Storchaka, and Raymond Hettinger in [bpo-28638](https://bugs.python.org/issue?@action=redirect&bpo=28638) [https://bugs.python.org/issue?@action=redirect&bpo=28638].)
- Functions `bool()`, `float()`, `list()` and `tuple()` no longer take keyword arguments. The first argument of `int()` can now be passed only as positional argument.
- Removed previously deprecated in Python 2.4 classes `Plist`, `Dict` and `_InternalDict` in the `plistlib` module. Dict values in the result of functions `readPlist()` and `readPlistFromBytes()` are now normal dicts. You no longer can use attribute access to access items of these

dictionaries.

- The `asyncio.windows_utils.socketpair()` function has been removed. Use the `socket.socketpair()` function instead, it is available on all platforms since Python 3.5. `asyncio.windows_utils.socketpair` was just an alias to `socket.socketpair` on Python 3.5 and newer.
- `asyncio` no longer exports the `selectors` and `_overlapped` modules as `asyncio.selectors` and `asyncio._overlapped`. Replace `from asyncio import selectors` with `import selectors`.
- Direct instantiation of `ssl.SSLSocket` and `ssl.SSLObject` objects is now prohibited. The constructors were never documented, tested, or designed as public constructors. Users were supposed to use `ssl.wrap_socket()` or `ssl.SSLContext`. (Contributed by Christian Heimes in [bpo-32951](https://bugs.python.org/issue?@action=redirect&bpo=32951) [<https://bugs.python.org/issue?@action=redirect&bpo=32951>].)
- The unused `distutils` `install_misc` command has been removed. (Contributed by Eric N. Vander Weele in [bpo-29218](https://bugs.python.org/issue?@action=redirect&bpo=29218) [<https://bugs.python.org/issue?@action=redirect&bpo=29218>].)

## Module Removals

The `fpectl` module has been removed. It was never enabled by default, never worked correctly on x86-64, and it changed the Python ABI in ways that caused unexpected breakage of C extensions. (Contributed by Nathaniel J. Smith in [bpo-29137](https://bugs.python.org/issue?@action=redirect&bpo=29137) [<https://bugs.python.org/issue?@action=redirect&bpo=29137>].)

## Windows-only Changes

The python launcher, (`py.exe`), can accept 32 & 64 bit specifiers **without** having to specify a minor version as well. So `py -3-32` and `py -3-64` become valid as well as `py -3.7-32`, also the `-m-64` and `-m.n-64` forms are now accepted to force 64 bit python even if 32 bit would have otherwise been used. If the specified version is not available `py.exe` will error exit. (Contributed by Steve Barnes in [bpo-30291](https://bugs.python.org/issue?@action=redirect&bpo=30291) [<https://bugs.python.org/issue?@action=redirect&bpo=30291>].)

@action=redirect&bpo=30291].)

The launcher can be run as `py -0` to produce a list of the installed pythons, *with default marked with an asterisk*. Running `py -0p` will include the paths. If `py` is run with a version specifier that cannot be matched it will also print the *short form* list of available specifiers. (Contributed by Steve Barnes in [bpo-30362](https://bugs.python.org/issue?@action=redirect&bpo=30362) [https://bugs.python.org/issue?@action=redirect&bpo=30362].)

## Porting to Python 3.7

This section lists previously described changes and other bugfixes that may require changes to your code.

### Changes in Python Behavior

- **`async`** and **`await`** names are now reserved keywords. Code using these names as identifiers will now raise a **`SyntaxError`**. (Contributed by Jelle Zijlstra in [bpo-30406](https://bugs.python.org/issue?@action=redirect&bpo=30406) [https://bugs.python.org/issue?@action=redirect&bpo=30406].)
- **[PEP 479](https://peps.python.org/pep-0479/)** [https://peps.python.org/pep-0479/] is enabled for all code in Python 3.7, meaning that **`StopIteration`** exceptions raised directly or indirectly in coroutines and generators are transformed into **`RuntimeError`** exceptions. (Contributed by Yury Selivanov in [bpo-32670](https://bugs.python.org/issue?@action=redirect&bpo=32670) [https://bugs.python.org/issue?@action=redirect&bpo=32670].)
- **`object.__aiter__()`** methods can no longer be declared as asynchronous. (Contributed by Yury Selivanov in [bpo-31709](https://bugs.python.org/issue?@action=redirect&bpo=31709) [https://bugs.python.org/issue?@action=redirect&bpo=31709].)
- Due to an oversight, earlier Python versions erroneously accepted the following syntax:

```
f(1 for x in [1],)
```

```
class C(1 for x in [1]):  
    pass
```

Python 3.7 now correctly raises a `SyntaxError`, as a generator expression always needs to be directly inside a set of parentheses and cannot have a comma on either side, and the duplication of the parentheses can be omitted only on calls. (Contributed by Serhiy Storchaka in [bpo-32012](https://bugs.python.org/issue?@action=redirect&bpo=32012) [https://bugs.python.org/issue?@action=redirect&bpo=32012] and [bpo-32023](https://bugs.python.org/issue?@action=redirect&bpo=32023) [https://bugs.python.org/issue?@action=redirect&bpo=32023].)

- When using the `-m` switch, the initial working directory is now added to `sys.path`, rather than an empty string (which dynamically denoted the current working directory at the time of each import). Any programs that are checking for the empty string, or otherwise relying on the previous behaviour, will need to be updated accordingly (e.g. by also checking for `os.getcwd()` or `os.path.dirname(__main__.__file__)`, depending on why the code was checking for the empty string in the first place).

## Changes in the Python API

- `socketserver.ThreadingMixIn.server_close()` now waits until all non-daemon threads complete. Set the new `socketserver.ThreadingMixIn.block_on_close` class attribute to `False` to get the pre-3.7 behaviour. (Contributed by Victor Stinner in [bpo-31233](https://bugs.python.org/issue?@action=redirect&bpo=31233) [https://bugs.python.org/issue?@action=redirect&bpo=31233] and [bpo-33540](https://bugs.python.org/issue?@action=redirect&bpo=33540) [https://bugs.python.org/issue?@action=redirect&bpo=33540].)
- `socketserver.ForkingMixIn.server_close()` now waits until all child processes complete. Set the new `socketserver.ForkingMixIn.block_on_close` class attribute to `False` to get the pre-3.7 behaviour. (Contributed by Victor Stinner in [bpo-31151](https://bugs.python.org/issue?@action=redirect&bpo=31151) [https://bugs.python.org/issue?@action=redirect&bpo=31151] and [bpo-33540](https://bugs.python.org/issue?@action=redirect&bpo=33540) [https://bugs.python.org/issue?@action=redirect&bpo=33540].)
- The `locale.localeconv()` function now temporarily sets the `LC_CTYPE` locale to the value of `LC_NUMERIC` in some cases. (Contributed by Victor Stinner in [bpo-31900](https://bugs.python.org/issue?@action=redirect&bpo=31900) [https://bugs.python.org/issue?@action=redirect&bpo=31900].)

bugs.python.org/issue?@action=redirect&bpo=31900].)

- `pkgutil.walk_packages()` now raises a `ValueError` if `path` is a string. Previously an empty list was returned. (Contributed by Sanyam Khurana in [bpo-24744](https://bugs.python.org/issue?@action=redirect&bpo=24744) [https://bugs.python.org/issue?@action=redirect&bpo=24744].)
- A format string argument for `string.Formatter.format()` is now **positional-only**. Passing it as a keyword argument was deprecated in Python 3.5. (Contributed by Serhiy Storchaka in [bpo-29193](https://bugs.python.org/issue?@action=redirect&bpo=29193) [https://bugs.python.org/issue?@action=redirect&bpo=29193].)
- Attributes `key`, `value` and `coded_value` of class `http.cookies.Morsel` are now read-only. Assigning to them was deprecated in Python 3.5. Use the `set()` method for setting them. (Contributed by Serhiy Storchaka in [bpo-29192](https://bugs.python.org/issue?@action=redirect&bpo=29192) [https://bugs.python.org/issue?@action=redirect&bpo=29192].)
- The `mode` argument of `os.makedirs()` no longer affects the file permission bits of newly created intermediate-level directories. To set their file permission bits you can set the `umask` before invoking `makedirs()`. (Contributed by Serhiy Storchaka in [bpo-19930](https://bugs.python.org/issue?@action=redirect&bpo=19930) [https://bugs.python.org/issue?@action=redirect&bpo=19930].)
- The `struct.Struct.format` type is now `str` instead of `bytes`. (Contributed by Victor Stinner in [bpo-21071](https://bugs.python.org/issue?@action=redirect&bpo=21071) [https://bugs.python.org/issue?@action=redirect&bpo=21071].)
- `parse_multipart()` now accepts the *encoding* and *errors* arguments and returns the same results as `FieldStorage`: for non-file fields, the value associated to a key is a list of strings, not bytes. (Contributed by Pierre Quentel in [bpo-29979](https://bugs.python.org/issue?@action=redirect&bpo=29979) [https://bugs.python.org/issue?@action=redirect&bpo=29979].)
- Due to internal changes in `socket`, calling `socket.fromshare()` on a socket created by `socket.share` in older Python versions is not supported.

- repr for `BaseException` has changed to not include the trailing comma. Most exceptions are affected by this change. (Contributed by Serhiy Storchaka in [bpo-30399](https://bugs.python.org/issue?@action=redirect&bpo=30399) [https://bugs.python.org/issue?@action=redirect&bpo=30399].)
- repr for `datetime.timedelta` has changed to include the keyword arguments in the output. (Contributed by Utkarsh Upadhyay in [bpo-30302](https://bugs.python.org/issue?@action=redirect&bpo=30302) [https://bugs.python.org/issue?@action=redirect&bpo=30302].)
- Because `shutil.rmtree()` is now implemented using the `os.scandir()` function, the user specified handler `onerror` is now called with the first argument `os.scandir` instead of `os.listdir` when listing the directory is failed.
- Support for nested sets and set operations in regular expressions as in [Unicode Technical Standard #18](https://unicode.org/reports/tr18/) [https://unicode.org/reports/tr18/] might be added in the future. This would change the syntax. To facilitate this future change a `FutureWarning` will be raised in ambiguous cases for the time being. That include sets starting with a literal '[' or containing literal character sequences '--', '&&', '~~', and '||'. To avoid a warning, escape them with a backslash. (Contributed by Serhiy Storchaka in [bpo-30349](https://bugs.python.org/issue?@action=redirect&bpo=30349) [https://bugs.python.org/issue?@action=redirect&bpo=30349].)
- The result of splitting a string on a `regular expression` that could match an empty string has been changed. For example splitting on `r'\s*'` will now split not only on whitespaces as it did previously, but also on empty strings before all non-whitespace characters and just before the end of the string. The previous behavior can be restored by changing the pattern to `r'\s+'`. A `FutureWarning` was emitted for such patterns since Python 3.5.

For patterns that match both empty and non-empty strings, the result of searching for all matches may also be changed in other cases. For example in the string `'a\n\n'`, the pattern `r'(?m)^\s*?$'` will not only match empty strings at positions 2 and 3, but also the string `'\n'` at positions 2–3. To match only blank lines, the pattern should be rewritten as

`r' (?m) ^ [ ^ \S \n ] * $ '.`

**`re.sub()`** now replaces empty matches adjacent to a previous non-empty match. For example `re.sub('x*', '-', 'abxd')` returns now `'-a-b--d-'` instead of `'-a-b-d-'` (the first minus between 'b' and 'd' replaces 'x', and the second minus replaces an empty string between 'x' and 'd').

(Contributed by Serhiy Storchaka in [bpo-25054](https://bugs.python.org/issue?@action=redirect&bpo=25054) [https://bugs.python.org/issue?@action=redirect&bpo=25054] and [bpo-32308](https://bugs.python.org/issue?@action=redirect&bpo=32308) [https://bugs.python.org/issue?@action=redirect&bpo=32308].)

- Change **`re.escape()`** to only escape regex special characters instead of escaping all characters other than ASCII letters, numbers, and `'_'`. (Contributed by Serhiy Storchaka in [bpo-29995](https://bugs.python.org/issue?@action=redirect&bpo=29995) [https://bugs.python.org/issue?@action=redirect&bpo=29995].)
- **`tracemalloc.Traceback`** frames are now sorted from oldest to most recent to be more consistent with **`traceback`**. (Contributed by Jesse Bakker in [bpo-32121](https://bugs.python.org/issue?@action=redirect&bpo=32121) [https://bugs.python.org/issue?@action=redirect&bpo=32121].)
- On OSes that support **`socket.SOCK_NONBLOCK`** or **`socket.SOCK_CLOEXEC`** bit flags, the **`socket.type`** no longer has them applied. Therefore, checks like `if sock.type == socket.SOCK_STREAM` work as expected on all platforms. (Contributed by Yuri Selivanov in [bpo-32331](https://bugs.python.org/issue?@action=redirect&bpo=32331) [https://bugs.python.org/issue?@action=redirect&bpo=32331].)
- On Windows the default for the `close_fds` argument of **`subprocess.Popen`** was changed from **`False`** to **`True`** when redirecting the standard handles. If you previously depended on handles being inherited when using **`subprocess.Popen`** with standard io redirection, you will have to pass `close_fds=False` to preserve the previous behaviour, or use **`STARTUPINFO.lpAttributeList`**.
- **`importlib.machinery.PathFinder.invalidate_caches()`**

– which implicitly affects

`importlib.invalidate_caches()` – now deletes entries in `sys.path_importer_cache` which are set to `None`. (Contributed by Brett Cannon in [bpo-33169](https://bugs.python.org/issue?@action=redirect&bpo=33169) [https://bugs.python.org/issue?@action=redirect&bpo=33169].)

- In `asyncio`, `loop.sock_recv()`, `loop.sock_sendall()`, `loop.sock_accept()`, `loop.getaddrinfo()`, `loop.getnameinfo()` have been changed to be proper coroutine methods to match their documentation. Previously, these methods returned `asyncio.Future` instances. (Contributed by Yury Selivanov in [bpo-32327](https://bugs.python.org/issue?@action=redirect&bpo=32327) [https://bugs.python.org/issue?@action=redirect&bpo=32327].)
- `asyncio.Server.sockets` now returns a copy of the internal list of server sockets, instead of returning it directly. (Contributed by Yury Selivanov in [bpo-32662](https://bugs.python.org/issue?@action=redirect&bpo=32662) [https://bugs.python.org/issue?@action=redirect&bpo=32662].)
- `Struct.format` is now a `str` instance instead of a `bytes` instance. (Contributed by Victor Stinner in [bpo-21071](https://bugs.python.org/issue?@action=redirect&bpo=21071) [https://bugs.python.org/issue?@action=redirect&bpo=21071].)
- `argparse` subparsers can now be made mandatory by passing `required=True` to `ArgumentParser.add_subparsers()`. (Contributed by Anthony Sottile in [bpo-26510](https://bugs.python.org/issue?@action=redirect&bpo=26510) [https://bugs.python.org/issue?@action=redirect&bpo=26510].)
- `ast.literal_eval()` is now stricter. Addition and subtraction of arbitrary numbers are no longer allowed. (Contributed by Serhiy Storchaka in [bpo-31778](https://bugs.python.org/issue?@action=redirect&bpo=31778) [https://bugs.python.org/issue?@action=redirect&bpo=31778].)
- `Calendar.itermonthdates` will now consistently raise an exception when a date falls outside of the 0001-01-01 through 9999-12-31 range. To support applications that cannot tolerate such exceptions, the new `Calendar.itermonthdays3` and `Calendar.itermonthdays4` can be used. The new

methods return tuples and are not restricted by the range supported by `datetime.date`. (Contributed by Alexander Belopolsky in [bpo-28292](https://bugs.python.org/issue?@action=redirect&bpo=28292) [https://bugs.python.org/issue?@action=redirect&bpo=28292].)

- `collections.ChainMap` now preserves the order of the underlying mappings. (Contributed by Raymond Hettinger in [bpo-32792](https://bugs.python.org/issue?@action=redirect&bpo=32792) [https://bugs.python.org/issue?@action=redirect&bpo=32792].)
- The `submit()` method of `concurrent.futures.ThreadPoolExecutor` and `concurrent.futures.ProcessPoolExecutor` now raises a `RuntimeError` if called during interpreter shutdown. (Contributed by Mark Nemec in [bpo-33097](https://bugs.python.org/issue?@action=redirect&bpo=33097) [https://bugs.python.org/issue?@action=redirect&bpo=33097].)
- The `configparser.ConfigParser` constructor now uses `read_dict()` to process the default values, making its behavior consistent with the rest of the parser. Non-string keys and values in the defaults dictionary are now being implicitly converted to strings. (Contributed by James Tocknell in [bpo-23835](https://bugs.python.org/issue?@action=redirect&bpo=23835) [https://bugs.python.org/issue?@action=redirect&bpo=23835].)
- Several undocumented internal imports were removed. One example is that `os.errno` is no longer available; use `import errno` directly instead. Note that such undocumented internal imports may be removed any time without notice, even in micro version releases.

## Changes in the C API

The function `PySlice_GetIndicesEx()` is considered unsafe for resizable sequences. If the slice indices are not instances of `int`, but objects that implement the `__index__()` method, the sequence can be resized after passing its length to `PySlice_GetIndicesEx()`. This can lead to returning indices out of the length of the sequence. For avoiding possible problems use new functions `PySlice_Unpack()` and `PySlice_AdjustIndices()`. (Contributed by Serhiy Storchaka in

[bpo-27867](https://bugs.python.org/issue?@action=redirect&bpo=27867) [https://bugs.python.org/issue?@action=redirect&bpo=27867].)

## CPython bytecode changes

There are two new opcodes: **LOAD\_METHOD** and **CALL\_METHOD**. (Contributed by Yury Selivanov and INADA Naoki in [bpo-26110](https://bugs.python.org/issue?@action=redirect&bpo=26110) [https://bugs.python.org/issue?@action=redirect&bpo=26110].)

The **STORE\_ANNOTATION** opcode has been removed. (Contributed by Mark Shannon in [bpo-32550](https://bugs.python.org/issue?@action=redirect&bpo=32550) [https://bugs.python.org/issue?@action=redirect&bpo=32550].)

## Windows-only Changes

The file used to override **sys.path** is now called `<python-executable>._pth` instead of `'sys.path'`. See [Finding modules](https://bugs.python.org/issue?@action=redirect&bpo=28137) for more information. (Contributed by Steve Dower in [bpo-28137](https://bugs.python.org/issue?@action=redirect&bpo=28137) [https://bugs.python.org/issue?@action=redirect&bpo=28137].)

## Other CPython implementation changes

In preparation for potential future changes to the public CPython runtime initialization API (see [PEP 432](https://peps.python.org/pep-0432/) [https://peps.python.org/pep-0432/] for an initial, but somewhat outdated, draft), CPython's internal startup and configuration management logic has been significantly refactored. While these updates are intended to be entirely transparent to both embedding applications and users of the regular CPython CLI, they're being mentioned here as the refactoring changes the internal order of various operations during interpreter startup, and hence may uncover previously latent defects, either in embedding applications, or in CPython itself. (Initially contributed by Nick Coghlan and Eric Snow as part of [bpo-22257](https://bugs.python.org/issue?@action=redirect&bpo=22257) [https://bugs.python.org/issue?@action=redirect&bpo=22257], and further updated by Nick, Eric, and Victor Stinner in a number of other issues). Some known details affected:

- **PySys\_AddWarnOptionUnicode()** is not currently usable by embedding applications due to the requirement to create a Unicode object prior to calling `Py_Initialize`. Use **PySys\_AddWarnOption()** instead.

- warnings filters added by an embedding application with `PySys_AddWarnOption()` should now more consistently take precedence over the default filters set by the interpreter

Due to changes in the way the default warnings filters are configured, setting `Py_BytesWarningFlag` to a value greater than one is no longer sufficient to both emit `BytesWarning` messages and have them converted to exceptions. Instead, the flag must be set (to cause the warnings to be emitted in the first place), and an explicit `error::BytesWarning` warnings filter added to convert them to exceptions.

Due to a change in the way docstrings are handled by the compiler, the implicit `return None` in a function body consisting solely of a docstring is now marked as occurring on the same line as the docstring, not on the function's header line.

The current exception state has been moved from the frame object to the co-routine. This simplified the interpreter and fixed a couple of obscure bugs caused by having swap exception state when entering or exiting a generator. (Contributed by Mark Shannon in [bpo-25612](https://bugs.python.org/issue?@action=redirect&bpo=25612) [https://bugs.python.org/issue?@action=redirect&bpo=25612].)

## Notable changes in Python 3.7.1

Starting in 3.7.1, `Py_Initialize()` now consistently reads and respects all of the same environment settings as `Py_Main()` (in earlier Python versions, it respected an ill-defined subset of those environment variables, while in Python 3.7.0 it didn't read any of them due to [bpo-34247](https://bugs.python.org/issue?@action=redirect&bpo=34247) [https://bugs.python.org/issue?@action=redirect&bpo=34247]). If this behavior is unwanted, set `Py_IgnoreEnvironmentFlag` to 1 before calling `Py_Initialize()`.

In 3.7.1 the C API for Context Variables [was updated](https://bugs.python.org/issue?@action=redirect&bpo=34762) to use `PyObject` pointers. See also [bpo-34762](https://bugs.python.org/issue?@action=redirect&bpo=34762) [https://bugs.python.org/issue?@action=redirect&bpo=34762].

In 3.7.1 the `tokenize` module now implicitly emits a `NEWLINE` token when provided with input that does not have a trailing new

line. This behavior now matches what the C tokenizer does internally. (Contributed by Ammar Askar in [bpo-33899](https://bugs.python.org/issue?@action=redirect&bpo=33899) [https://bugs.python.org/issue?@action=redirect&bpo=33899].)

## Notable changes in Python 3.7.2

In 3.7.2, **venv** on Windows no longer copies the original binaries, but creates redirector scripts named `python.exe` and `pythonw.exe` instead. This resolves a long standing issue where all virtual environments would have to be upgraded or recreated with each Python update. However, note that this release will still require recreation of virtual environments in order to get the new scripts.

## Notable changes in Python 3.7.6

Due to significant security concerns, the *reuse\_address* parameter of [`asyncio.loop.create\_datagram\_endpoint\(\)`](#) is no longer supported. This is because of the behavior of the socket option `SO_REUSEADDR` in UDP. For more details, see the documentation for `loop.create_datagram_endpoint()`. (Contributed by Kyle Stanley, Antoine Pitrou, and Yury Selivanov in [bpo-37228](https://bugs.python.org/issue?@action=redirect&bpo=37228) [https://bugs.python.org/issue?@action=redirect&bpo=37228].)

## Notable changes in Python 3.7.10

Earlier Python versions allowed using both `;` and `&` as query parameter separators in [`urllib.parse.parse\_qs\(\)`](#) and [`urllib.parse.parse\_qsl\(\)`](#). Due to security concerns, and to conform with newer W3C recommendations, this has been changed to allow only a single separator key, with `&` as the default. This change also affects [`cgi.parse\(\)`](#) and [`cgi.parse\_multipart\(\)`](#) as they use the affected functions internally. For more details, please see their respective documentation. (Contributed by Adam Goldschmidt, Senthil Kumaran and Ken Jin in [bpo-42967](https://bugs.python.org/issue?@action=redirect&bpo=42967) [https://bugs.python.org/issue?@action=redirect&bpo=42967].)

# What's New In Python 3.6

## Editors

Elvis Pranskevichus <[elvis@magic.io](mailto:elvis@magic.io)>, Yury Selivanov <[yury@magic.io](mailto:yury@magic.io)>

This article explains the new features in Python 3.6, compared to 3.5. Python 3.6 was released on December 23, 2016. See the [changelog](https://docs.python.org/3.6/whatsnew/changelog.html) [https://docs.python.org/3.6/whatsnew/changelog.html] for a full list of changes.

## See also

[PEP 494](https://peps.python.org/pep-0494/) [https://peps.python.org/pep-0494/] - Python 3.6 Release Schedule

## Summary – Release highlights

New syntax features:

- [PEP 498](#), formatted string literals.
- [PEP 515](#), underscores in numeric literals.
- [PEP 526](#), syntax for variable annotations.
- [PEP 525](#), asynchronous generators.
- [PEP 530](#): asynchronous comprehensions.

New library modules:

- [secrets](#): [PEP 506 – Adding A Secrets Module To The Standard Library](#).

CPython implementation improvements:

- The [dict](#) type has been reimplemented to use a [more compact representation](#) based on a [proposal by Raymond Hettinger](#)

[<https://mail.python.org/pipermail/python-dev/2012-December/123028.html>] and similar to the [PyPy dict implementation](#) [<https://morepypy.blogspot.com/2015/01/faster-more-memory-efficient-and-more.html>]. This resulted in dictionaries using 20% to 25% less memory when compared to Python 3.5.

- Customization of class creation has been simplified with the [new protocol](#).
- The class attribute definition order is [now preserved](#).
- The order of elements in `**kwargs` now [corresponds to the order](#) in which keyword arguments were passed to the function.
- DTrace and SystemTap [probing support](#) has been added.
- The new `PYTHONMALLOC` environment variable can now be used to debug the interpreter memory allocation and access errors.

### Significant improvements in the standard library:

- The [asyncio](#) module has received new features, significant usability and performance improvements, and a fair amount of bug fixes. Starting with Python 3.6 the `asyncio` module is no longer provisional and its API is considered stable.
- A new [file system path protocol](#) has been implemented to support [path-like objects](#). All standard library functions operating on paths have been updated to work with the new protocol.
- The [datetime](#) module has gained support for [Local Time Disambiguation](#).
- The [typing](#) module received a number of [improvements](#).
- The [tracemalloc](#) module has been significantly reworked and is now used to provide better output for [ResourceWarning](#) as well as provide better diagnostics for memory allocation errors. See the [PYTHONMALLOC section](#) for more information.

### Security improvements:

- The new [secrets](#) module has been added to simplify the generation of cryptographically strong pseudo-random numbers suitable for managing secrets such as account authentication, tokens, and similar.

- On Linux, `os.urandom()` now blocks until the system urandom entropy pool is initialized to increase the security. See the [PEP 524](https://peps.python.org/pep-0524/) [https://peps.python.org/pep-0524/] for the rationale.
- The `hashlib` and `ssl` modules now support OpenSSL 1.1.0.
- The default settings and feature set of the `ssl` module have been improved.
- The `hashlib` module received support for the BLAKE2, SHA-3 and SHAKE hash algorithms and the `script()` key derivation function.

Windows improvements:

- [PEP 528](https://peps.python.org/pep-0528/) and [PEP 529](https://peps.python.org/pep-0529/), Windows filesystem and console encoding changed to UTF-8.
- The `py.exe` launcher, when used interactively, no longer prefers Python 2 over Python 3 when the user doesn't specify a version (via command line arguments or a config file). Handling of shebang lines remains unchanged - "python" refers to Python 2 in that case.
- `python.exe` and `pythonw.exe` have been marked as long-path aware, which means that the 260 character path limit may no longer apply. See [removing the MAX\\_PATH limitation](#) for details.
- A `._pth` file can be added to force isolated mode and fully specify all search paths to avoid registry and environment lookup. See [the documentation](#) for more information.
- A `python36.zip` file now works as a landmark to infer `PYTHONHOME`. See [the documentation](#) for more information.

## New Features

### PEP 498: Formatted string literals

[PEP 498](https://peps.python.org/pep-0498/) [https://peps.python.org/pep-0498/] introduces a new kind of string literals: *f-strings*, or [formatted string literals](#).

Formatted string literals are prefixed with `'f'` and are similar to the format strings accepted by `str.format()`. They contain

replacement fields surrounded by curly braces. The replacement fields are expressions, which are evaluated at run time, and then formatted using the `format()` protocol:

```
>>> name = "Fred"
>>> f"He said his name is {name}."
'He said his name is Fred.'
>>> width = 10
>>> precision = 4
>>> value = decimal.Decimal("12.34567")
>>> f"result: {value:{width}.{precision}}" # nested fields
'result:          12.35'
```

**See also**

**PEP 498** [<https://peps.python.org/pep-0498/>] – **Literal String Interpolation.**

PEP written and implemented by Eric V. Smith.

[Feature documentation.](#)

## PEP 526: Syntax for variable annotations

**PEP 484** [<https://peps.python.org/pep-0484/>] introduced the standard for type annotations of function parameters, a.k.a. type hints. This PEP adds syntax to Python for annotating the types of variables including class variables and instance variables:

```
primes: List[int] = []

captain: str # Note: no initial value!

class Starship:
    stats: Dict[str, int] = {}
```

Just as for function annotations, the Python interpreter does not attach any particular meaning to variable annotations and only stores them in the `__annotations__` attribute of a class or module.

In contrast to variable declarations in statically typed languages, the goal of annotation syntax is to provide an easy way to specify structured type metadata for third party tools and libraries via the abstract syntax tree and the `__annotations__` attribute.

See also

**PEP 526** [<https://peps.python.org/pep-0526/>] – Syntax for variable annotations.

PEP written by Ryan Gonzalez, Philip House, Ivan Levkivskyi, Lisa Roach, and Guido van Rossum.  
Implemented by Ivan Levkivskyi.

Tools that use or will use the new syntax: [mypy](https://www.mypy-lang.org/) [<https://www.mypy-lang.org/>], [pytype](https://github.com/google/pytype) [<https://github.com/google/pytype>], PyCharm, etc.

## PEP 515: Underscores in Numeric Literals

**PEP 515** [<https://peps.python.org/pep-0515/>] adds the ability to use underscores in numeric literals for improved readability. For example:

```
>>> 1_000_000_000_000_000
1000000000000000
>>> 0xFF_FF_FF_FF
4294967295
```

Single underscores are allowed between digits and after any base specifier. Leading, trailing, or multiple underscores in a row are not allowed.

The [string formatting](#) language also now has support for the `'_'` option to signal the use of an underscore for a thousands separator for floating point presentation types and for integer presentation type `'d'`. For integer presentation types `'b'`, `'o'`, `'x'`, and `'X'`, underscores will be inserted every 4 digits:

```
>>> '{:_}'.format(1000000)
'1_000_000'
>>> '{:_x}'.format(0xFFFFFFFF)
```

```
'ffff_ffff'
```

**See also**

**PEP 515** [<https://peps.python.org/pep-0515/>] – **Underscores in Numeric Literals**

PEP written by Georg Brandl and Serhiy Storchaka.

## PEP 525: Asynchronous Generators

**PEP 492** [<https://peps.python.org/pep-0492/>] introduced support for native coroutines and `async / await` syntax to Python 3.5. A notable limitation of the Python 3.5 implementation is that it was not possible to use `await` and `yield` in the same function body. In Python 3.6 this restriction has been lifted, making it possible to define *asynchronous generators*:

```
async def ticker(delay, to):
    """Yield numbers from 0 to *to* every *delay* second
    for i in range(to):
        yield i
        await asyncio.sleep(delay)
```

The new syntax allows for faster and more concise code.

**See also**

**PEP 525** [<https://peps.python.org/pep-0525/>] – **Asynchronous Generators**

PEP written and implemented by Yuri Selivanov.

## PEP 530: Asynchronous Comprehensions

**PEP 530** [<https://peps.python.org/pep-0530/>] adds support for using `async for` in list, set, dict comprehensions and generator expressions:

```
result = [i async for i in aiter() if i % 2]
```

Additionally, `await` expressions are supported in all kinds of comprehensions:

```
result = [await fun() for fun in funcs if await condition]
```

**See also**

**PEP 530** [<https://peps.python.org/pep-0530/>] – **Asynchronous Comprehensions**

PEP written and implemented by Yuri Selivanov.

## PEP 487: Simpler customization of class creation

It is now possible to customize subclass creation without using a metaclass. The new `__init_subclass__` classmethod will be called on the base class whenever a new subclass is created:

```
class PluginBase:
    subclasses = []

    def __init_subclass__(cls, **kwargs):
        super().__init_subclass__(**kwargs)
        cls.subclasses.append(cls)

class Plugin1(PluginBase):
    pass

class Plugin2(PluginBase):
    pass
```

In order to allow zero-argument `super()` calls to work correctly from `__init_subclass__()` implementations, custom metaclasses must ensure that the new `__classcell__` namespace entry is propagated to `type.__new__` (as described in [Creating the class object](#)).

**See also**

**PEP 487** [<https://peps.python.org/pep-0487/>] – **Simpler**

## customization of class creation

PEP written and implemented by Martin Teichmann.

[Feature documentation](#)

## PEP 487: Descriptor Protocol Enhancements

**PEP 487** [<https://peps.python.org/pep-0487/>] extends the descriptor protocol to include the new optional `__set_name__()` method. Whenever a new class is defined, the new method will be called on all descriptors included in the definition, providing them with a reference to the class being defined and the name given to the descriptor within the class namespace. In other words, instances of descriptors can now know the attribute name of the descriptor in the owner class:

```
class IntField:
    def __get__(self, instance, owner):
        return instance.__dict__[self.name]

    def __set__(self, instance, value):
        if not isinstance(value, int):
            raise ValueError(f'expecting integer in {self.name}')
        instance.__dict__[self.name] = value

    # this is the new initializer:
    def __set_name__(self, owner, name):
        self.name = name

class Model:
    int_field = IntField()
```

## PEP 519: Adding a file system path protocol

File system paths have historically been represented as `str` or `bytes` objects. This has led to people who write code which operate on file system paths to assume that such objects are only one of those two types (an `int` representing a file descriptor does not count as that is not a file path). Unfortunately that assumption prevents alternative object representations of file system paths like `pathlib` from working with pre-existing code, including Python's standard library.

To fix this situation, a new interface represented by `os.PathLike` has been defined. By implementing the `__fspath__()` method, an object signals that it represents a path. An object can then provide a low-level representation of a file system path as a `str` or `bytes` object. This means an object is considered *path-like* if it implements `os.PathLike` or is a `str` or `bytes` object which represents a file system path. Code can use `os.fspath()`, `os.fsdecode()`, or `os.fsencode()` to explicitly get a `str` and/or `bytes` representation of a path-like object.

The built-in `open()` function has been updated to accept `os.PathLike` objects, as have all relevant functions in the `os` and `os.path` modules, and most other functions and classes in the standard library. The `os.DirEntry` class and relevant classes in `pathlib` have also been updated to implement `os.PathLike`.

The hope is that updating the fundamental functions for operating on file system paths will lead to third-party code to implicitly support all *path-like objects* without any code changes, or at least very minimal ones (e.g. calling `os.fspath()` at the beginning of code before operating on a path-like object).

Here are some examples of how the new interface allows for `pathlib.Path` to be used more easily and transparently with pre-existing code:

```
>>> import pathlib
>>> with open(pathlib.Path("README")) as f:
...     contents = f.read()
```

```
...
>>> import os.path
>>> os.path.splitext(pathlib.Path("some_file.txt"))
('some_file', '.txt')
>>> os.path.join("/a/b", pathlib.Path("c"))
'/a/b/c'
>>> import os
>>> os.fspath(pathlib.Path("some_file.txt"))
'some_file.txt'
```

(Implemented by Brett Cannon, Ethan Furman, Dusty Phillips, and Jelle Zijlstra.)

PEP written by Brett Cannon and Koos Zevenhoven.

## PEP 495: Local Time Disambiguation

In most world locations, there have been and will be times when local clocks are moved back. In those times, intervals are introduced in which local clocks show the same time twice in the same day. In these situations, the information displayed on a local clock (or stored in a Python `datetime` instance) is insufficient to identify a particular moment in time.

**PEP 495** [<https://peps.python.org/pep-0495/>] adds the new *fold* attribute to instances of `datetime.datetime` and `datetime.time` classes to differentiate between two moments in time for which local times are the same:

```
>>> u0 = datetime(2016, 11, 6, 4, tzinfo=timezone.utc)
>>> for i in range(4):
...     u = u0 + i*HOUR
...     t = u.astimezone(Eastern)
...     print(u.time(), 'UTC =', t.time(), t.tzname(), t.fold())
... 
```

```
04:00:00 UTC = 00:00:00 EDT 0
05:00:00 UTC = 01:00:00 EDT 0
06:00:00 UTC = 01:00:00 EST 1
07:00:00 UTC = 02:00:00 EST 0
```

The values of the `fold` attribute have the value `0` for all instances except those that represent the second (chronologically) moment in time in an ambiguous case.

PEP written by Alexander Belopolsky and Tim Peters, implementation by Alexander Belopolsky.

## **PEP 529: Change Windows filesystem encoding to UTF-8**

Representing filesystem paths is best performed with `str` (Unicode) rather than `bytes`. However, there are some situations where using `bytes` is sufficient and correct.

Prior to Python 3.6, data loss could result when using `bytes` paths on Windows. With this change, using `bytes` to represent paths is now supported on Windows, provided those `bytes` are encoded with the encoding returned by `sys.getfilesystemencoding()`, which now defaults to `'utf-8'`.

Applications that do not use `str` to represent paths should use `os.fsencode()` and `os.fsdecode()` to ensure their `bytes` are correctly encoded. To revert to the previous behaviour, set `PYTHONLEGACYWINDOWSFSENCODING` or call `sys._enablelegacywindowsfsencoding()`.

See **PEP 529** [<https://peps.python.org/pep-0529/>] for more information and discussion of code modifications that may be required.

## **PEP 528: Change Windows console encoding to UTF-8**

The default console on Windows will now accept all Unicode characters and provide correctly read str objects to Python code. `sys.stdin`, `sys.stdout` and `sys.stderr` now default to utf-8 encoding.

This change only applies when using an interactive console, and not when redirecting files or pipes. To revert to the previous behaviour for interactive console use, set `PYTHONLEGACYWINDOWSSTDIO`.

See also

**PEP 528** [<https://peps.python.org/pep-0528/>] – Change Windows console encoding to UTF-8

PEP written and implemented by Steve Dower.

## PEP 520: Preserving Class Attribute Definition Order

Attributes in a class definition body have a natural ordering: the same order in which the names appear in the source. This order is now preserved in the new class's `__dict__` attribute.

Also, the effective default class *execution* namespace (returned from `type._prepare_()`) is now an insertion-order-preserving mapping.

See also

**PEP 520** [<https://peps.python.org/pep-0520/>] – Preserving Class Attribute Definition Order

PEP written and implemented by Eric Snow.

## PEP 468: Preserving Keyword Argument Order

`**kwargs` in a function signature is now guaranteed to be an insertion-order-preserving mapping.

See also

**PEP 468** [<https://peps.python.org/pep-0468/>] – Preserving

## Keyword Argument Order

PEP written and implemented by Eric Snow.

## New **dict** implementation

The **dict** type now uses a “compact” representation based on [a proposal by Raymond Hettinger](https://mail.python.org/pipermail/python-dev/2012-December/123028.html) [https://mail.python.org/pipermail/python-dev/2012-December/123028.html] which was [first implemented by PyPy](https://morepypy.blogspot.com/2015/01/faster-more-memory-efficient-and-more.html) [https://morepypy.blogspot.com/2015/01/faster-more-memory-efficient-and-more.html]. The memory usage of the new **dict()** is between 20% and 25% smaller compared to Python 3.5.

The order-preserving aspect of this new implementation is considered an implementation detail and should not be relied upon (this may change in the future, but it is desired to have this new dict implementation in the language for a few releases before changing the language spec to mandate order-preserving semantics for all current and future Python implementations; this also helps preserve backwards-compatibility with older versions of the language where random iteration order is still in effect, e.g. Python 3.5).

(Contributed by INADA Naoki in [bpo-27350](https://bugs.python.org/issue?@action=redirect&bpo=27350) [https://bugs.python.org/issue?@action=redirect&bpo=27350]. Idea [originally suggested by Raymond Hettinger](https://mail.python.org/pipermail/python-dev/2012-December/123028.html) [https://mail.python.org/pipermail/python-dev/2012-December/123028.html].)

## PEP 523: Adding a frame evaluation API to CPython

While Python provides extensive support to customize how code executes, one place it has not done so is in the evaluation of frame objects. If you wanted some way to intercept frame evaluation in Python there really wasn't any way without directly manipulating function pointers for defined functions.

**PEP 523** [https://peps.python.org/pep-0523/] changes this by providing an API to make frame evaluation pluggable at the C level. This will allow for tools such as debuggers and JITs to intercept frame evaluation before the execution of Python code begins. This enables the use of alternative evaluation implementations for Python code,

tracking frame evaluation, etc.

This API is not part of the limited C API and is marked as private to signal that usage of this API is expected to be limited and only applicable to very select, low-level use-cases. Semantics of the API will change with Python as necessary.

See also

**PEP 523** [<https://peps.python.org/pep-0523/>] – Adding a frame evaluation API to CPython

PEP written by Brett Cannon and Dino Viehland.

## PYTHONMALLOC environment variable

The new **PYTHONMALLOC** environment variable allows setting the Python memory allocators and installing debug hooks.

It is now possible to install debug hooks on Python memory allocators on Python compiled in release mode using **PYTHONMALLOC=debug**. Effects of debug hooks:

- Newly allocated memory is filled with the byte `0xCB`
- Freed memory is filled with the byte `0xDB`
- Detect violations of the Python memory allocator API. For example, **PyObject\_Free()** called on a memory block allocated by **PyMem\_Malloc()**.
- Detect writes before the start of a buffer (buffer underflows)
- Detect writes after the end of a buffer (buffer overflows)
- Check that the **GIL** is held when allocator functions of **PYMEM\_DOMAIN\_OBJ** (ex: **PyObject\_Malloc()**) and **PYMEM\_DOMAIN\_MEM** (ex: **PyMem\_Malloc()**) domains are called.

Checking if the GIL is held is also a new feature of Python 3.6.

See the **PyMem\_SetupDebugHooks()** function for debug hooks on Python memory allocators.

It is now also possible to force the usage of the **malloc()** allocator

of the C library for all Python memory allocations using `PYTHONMALLOC=malloc`. This is helpful when using external memory debuggers like Valgrind on a Python compiled in release mode.

On error, the debug hooks on Python memory allocators now use the `tracemalloc` module to get the traceback where a memory block was allocated.

Example of fatal error on buffer overflow using `python3.6 -X tracemalloc=5` (store 5 frames in traces):

```
Debug memory block at address p=0x7fbcd41666f8: API 'o'
  4 bytes originally requested

(Contributed by Victor Stinner in [bpo-26516](https://bugs.python.org/issue?@action=redirect&bpo=26516) [https://bugs.python.org/issue?@action=redirect&bpo=26516] and [bpo-26564](https://bugs.python.org/issue?@action=redirect&bpo=26564) [https://bugs.python.org/issue?@action=redirect&bpo=26564].)

## DTrace and SystemTap probing support

Python can now be built `--with-dtrace` which enables static markers for the following events in the interpreter:

- function call/return
- garbage collection started/finished
- line of code executed.

This can be used to instrument running interpreters in production, without the need to recompile specific [debug builds](#) or providing application-specific profiling/debugging code.

More details in [Instrumenting CPython with DTrace and SystemTap](#).

The current implementation is tested on Linux and macOS. Additional markers may be added in the future.

(Contributed by Łukasz Langa in [bpo-21590](https://bugs.python.org/issue?@action=redirect&bpo=21590) [https://bugs.python.org/issue?@action=redirect&bpo=21590], based on patches by Jesús Cea Avi3n, David Malcolm, and Nikhil Benesch.)

## Other Language Changes

Some smaller changes made to the core Python language are:

- A `global` or `nonlocal` statement must now textually appear before the first use of the affected name in the same scope. Previously this was a [SyntaxWarning](#).

- It is now possible to set a **special method** to `None` to indicate that the corresponding operation is not available. For example, if a class sets `__iter__()` to `None`, the class is not iterable. (Contributed by Andrew Barnert and Ivan Levkivskiy in [bpo-25958](https://bugs.python.org/issue?@action=redirect&bpo=25958) [https://bugs.python.org/issue?@action=redirect&bpo=25958].)
- Long sequences of repeated traceback lines are now abbreviated as "[Previous line repeated {count} more times]" (see [traceback](#) for an example). (Contributed by Emanuel Barry in [bpo-26823](https://bugs.python.org/issue?@action=redirect&bpo=26823) [https://bugs.python.org/issue?@action=redirect&bpo=26823].)
- `Import` now raises the new exception **ModuleNotFoundError** (subclass of **ImportError**) when it cannot find a module. Code that currently checks for `ImportError` (in try-except) will still work. (Contributed by Eric Snow in [bpo-15767](https://bugs.python.org/issue?@action=redirect&bpo=15767) [https://bugs.python.org/issue?@action=redirect&bpo=15767].)
- Class methods relying on zero-argument `super()` will now work correctly when called from metaclass methods during class creation. (Contributed by Martin Teichmann in [bpo-23722](https://bugs.python.org/issue?@action=redirect&bpo=23722) [https://bugs.python.org/issue?@action=redirect&bpo=23722].)

## New Modules

### secrets

The main purpose of the new **secrets** module is to provide an obvious way to reliably generate cryptographically strong pseudo-random values suitable for managing secrets, such as account authentication, tokens, and similar.

### Warning

Note that the pseudo-random generators in the **random** module should *NOT* be used for security purposes. Use **secrets** on Python 3.6+ and **os.urandom()** on Python 3.5 and earlier.

See also

## **PEP 506** [<https://peps.python.org/pep-0506/>] – Adding A Secrets Module To The Standard Library

PEP written and implemented by Steven D'Aprano.

# Improved Modules

## **array**

Exhausted iterators of **`array.array`** will now stay exhausted even if the iterated array is extended. This is consistent with the behavior of other mutable sequences.

Contributed by Serhiy Storchaka in **`bpo-26492`** [<https://bugs.python.org/issue?@action=redirect&bpo=26492>].

## **ast**

The new **`ast.Constant`** AST node has been added. It can be used by external AST optimizers for the purposes of constant folding.

Contributed by Victor Stinner in **`bpo-26146`** [<https://bugs.python.org/issue?@action=redirect&bpo=26146>].

## **asyncio**

Starting with Python 3.6 the **`asyncio`** module is no longer provisional and its API is considered stable.

Notable changes in the **`asyncio`** module since Python 3.5.0 (all backported to 3.5.x due to the provisional status):

- The **`get_event_loop()`** function has been changed to always return the currently running loop when called from coroutines and callbacks. (Contributed by Yury Selivanov in **`bpo-28613`** [<https://bugs.python.org/issue?@action=redirect&bpo=28613>].)
- The **`ensure_future()`** function and all functions that use

it, such as `loop.run_until_complete()`, now accept all kinds of `awaitable objects`. (Contributed by Yury Selivanov.)

- New `run_coroutine_threadsafe()` function to submit coroutines to event loops from other threads. (Contributed by Vincent Michel.)
- New `Transport.is_closing()` method to check if the transport is closing or closed. (Contributed by Yury Selivanov.)
- The `loop.create_server()` method can now accept a list of hosts. (Contributed by Yann Sionneau.)
- New `loop.create_future()` method to create Future objects. This allows alternative event loop implementations, such as `uvloop` [<https://github.com/MagicStack/uvloop>], to provide a faster `asyncio.Future` implementation. (Contributed by Yury Selivanov in [bpo-27041](https://bugs.python.org/issue?@action=redirect&bpo=27041) [<https://bugs.python.org/issue?@action=redirect&bpo=27041>].)
- New `loop.get_exception_handler()` method to get the current exception handler. (Contributed by Yury Selivanov in [bpo-27040](https://bugs.python.org/issue?@action=redirect&bpo=27040) [<https://bugs.python.org/issue?@action=redirect&bpo=27040>].)
- New `StreamReader.readuntil()` method to read data from the stream until a separator bytes sequence appears. (Contributed by Mark Korenberg.)
- The performance of `StreamReader.readexactly()` has been improved. (Contributed by Mark Korenberg in [bpo-28370](https://bugs.python.org/issue?@action=redirect&bpo=28370) [<https://bugs.python.org/issue?@action=redirect&bpo=28370>].)
- The `loop.getaddrinfo()` method is optimized to avoid calling the system `getaddrinfo` function if the address is already resolved. (Contributed by A. Jesse Jiryu Davis.)
- The `loop.stop()` method has been changed to stop the loop immediately after the current iteration. Any new callbacks scheduled as a result of the last iteration will be discarded. (Contributed by Guido van Rossum in [bpo-25593](https://bugs.python.org/issue?@action=redirect&bpo=25593) [<https://bugs.python.org/issue?@action=redirect&bpo=25593>].)
- `Future.set_exception` will now raise `TypeError` when passed an instance of the `StopIteration` exception. (Contributed by Chris Angelico in [bpo-26221](https://bugs.python.org/issue?@action=redirect&bpo=26221) [<https://bugs.python.org/issue?@action=redirect&bpo=26221>].)
- New `loop.connect_accepted_socket()` method to be

used by servers that accept connections outside of `asyncio`, but that use `asyncio` to handle them. (Contributed by Jim Fulton in [bpo-27392](https://bugs.python.org/issue?@action=redirect&bpo=27392) [https://bugs.python.org/issue?@action=redirect&bpo=27392].)

- `TCP_NODELAY` flag is now set for all TCP transports by default. (Contributed by Yury Selivanov in [bpo-27456](https://bugs.python.org/issue?@action=redirect&bpo=27456) [https://bugs.python.org/issue?@action=redirect&bpo=27456].)
- New `loop.shutdown_asyncgens()` to properly close pending asynchronous generators before closing the loop. (Contributed by Yury Selivanov in [bpo-28003](https://bugs.python.org/issue?@action=redirect&bpo=28003) [https://bugs.python.org/issue?@action=redirect&bpo=28003].)
- `Future` and `Task` classes now have an optimized C implementation which makes `asyncio` code up to 30% faster. (Contributed by Yury Selivanov and INADA Naoki in [bpo-26081](https://bugs.python.org/issue?@action=redirect&bpo=26081) [https://bugs.python.org/issue?@action=redirect&bpo=26081] and [bpo-28544](https://bugs.python.org/issue?@action=redirect&bpo=28544) [https://bugs.python.org/issue?@action=redirect&bpo=28544].)

## binascii

The `b2a_base64()` function now accepts an optional *newline* keyword argument to control whether the newline character is appended to the return value. (Contributed by Victor Stinner in [bpo-25357](https://bugs.python.org/issue?@action=redirect&bpo=25357) [https://bugs.python.org/issue?@action=redirect&bpo=25357].)

## cmath

The new `cmath.tau` ( $\tau$ ) constant has been added. (Contributed by Lisa Roach in [bpo-12345](https://bugs.python.org/issue?@action=redirect&bpo=12345) [https://bugs.python.org/issue?@action=redirect&bpo=12345], see [PEP 628](https://peps.python.org/pep-0628/) [https://peps.python.org/pep-0628/] for details.)

New constants: `cmath.inf` and `cmath.nan` to match `math.inf` and `math.nan`, and also `cmath.infj` and `cmath.nanj` to match the format used by complex repr. (Contributed by Mark Dickinson in [bpo-23229](https://bugs.python.org/issue?@action=redirect&bpo=23229) [https://bugs.python.org/issue?@action=redirect&bpo=23229].)

## collections

The new **Collection** abstract base class has been added to represent sized iterable container classes. (Contributed by Ivan Levkivskyi, docs by Neil Girdhar in [bpo-27598](https://bugs.python.org/issue?@action=redirect&bpo=27598) [https://bugs.python.org/issue?@action=redirect&bpo=27598].)

The new **Reversible** abstract base class represents iterable classes that also provide the `__reversed__()` method. (Contributed by Ivan Levkivskyi in [bpo-25987](https://bugs.python.org/issue?@action=redirect&bpo=25987) [https://bugs.python.org/issue?@action=redirect&bpo=25987].)

The new **AsyncGenerator** abstract base class represents asynchronous generators. (Contributed by Yuri Selivanov in [bpo-28720](https://bugs.python.org/issue?@action=redirect&bpo=28720) [https://bugs.python.org/issue?@action=redirect&bpo=28720].)

The **namedtuple()** function now accepts an optional keyword argument *module*, which, when specified, is used for the `__module__` attribute of the returned named tuple class. (Contributed by Raymond Hettinger in [bpo-17941](https://bugs.python.org/issue?@action=redirect&bpo=17941) [https://bugs.python.org/issue?@action=redirect&bpo=17941].)

The *verbose* and *rename* arguments for **namedtuple()** are now keyword-only. (Contributed by Raymond Hettinger in [bpo-25628](https://bugs.python.org/issue?@action=redirect&bpo=25628) [https://bugs.python.org/issue?@action=redirect&bpo=25628].)

Recursive **collections.deque** instances can now be pickled. (Contributed by Serhiy Storchaka in [bpo-26482](https://bugs.python.org/issue?@action=redirect&bpo=26482) [https://bugs.python.org/issue?@action=redirect&bpo=26482].)

## concurrent.futures

The **ThreadPoolExecutor** class constructor now accepts an optional *thread\_name\_prefix* argument to make it possible to customize the names of the threads created by the pool. (Contributed by Gregory P. Smith in [bpo-27664](https://bugs.python.org/issue?@action=redirect&bpo=27664) [https://bugs.python.org/issue?@action=redirect&bpo=27664].)

## contextlib

The **contextlib.AbstractContextManager** class has been added to provide an abstract base class for context managers. It provides a sensible default implementation for `__enter__()`

which returns `self` and leaves `__exit__()` an abstract method. A matching class has been added to the `typing` module as `typing.ContextManager`. (Contributed by Brett Cannon in [bpo-25609](https://bugs.python.org/issue?@action=redirect&bpo=25609) [https://bugs.python.org/issue?@action=redirect&bpo=25609].)

## datetime

The `datetime` and `time` classes have the new `fold` attribute used to disambiguate local time when necessary. Many functions in the `datetime` have been updated to support local time disambiguation. See [Local Time Disambiguation](#) section for more information. (Contributed by Alexander Belopolsky in [bpo-24773](https://bugs.python.org/issue?@action=redirect&bpo=24773) [https://bugs.python.org/issue?@action=redirect&bpo=24773].)

The `datetime.strptime()` and `date.strptime()` methods now support ISO 8601 date directives `%G`, `%u` and `%V`. (Contributed by Ashley Anderson in [bpo-12006](https://bugs.python.org/issue?@action=redirect&bpo=12006) [https://bugs.python.org/issue?@action=redirect&bpo=12006].)

The `datetime.isoformat()` function now accepts an optional *timespec* argument that specifies the number of additional components of the time value to include. (Contributed by Alessandro Cucci and Alexander Belopolsky in [bpo-19475](https://bugs.python.org/issue?@action=redirect&bpo=19475) [https://bugs.python.org/issue?@action=redirect&bpo=19475].)

The `datetime.combine()` now accepts an optional *tzinfo* argument. (Contributed by Alexander Belopolsky in [bpo-27661](https://bugs.python.org/issue?@action=redirect&bpo=27661) [https://bugs.python.org/issue?@action=redirect&bpo=27661].)

## decimal

New `Decimal.as_integer_ratio()` method that returns a pair `(n, d)` of integers that represent the given `Decimal` instance as a fraction, in lowest terms and with a positive denominator:

```
>>> Decimal('-3.14').as_integer_ratio()
(-157, 50)
```

(Contributed by Stefan Krah and Mark Dickinson in [bpo-25928](https://bugs.python.org/issue?@action=redirect&bpo=25928) [https://bugs.python.org/issue?@action=redirect&bpo=25928].)

## distutils

The `default_format` attribute has been removed from **`distutils.command.sdist.sdist`** and the `formats` attribute defaults to `['gztar']`. Although not anticipated, any code relying on the presence of `default_format` may need to be adapted. See [bpo-27819](https://bugs.python.org/issue/?@action=redirect&bpo=27819) [https://bugs.python.org/issue/?@action=redirect&bpo=27819] for more details.

## email

The new email API, enabled via the *policy* keyword to various constructors, is no longer provisional. The [email](#) documentation has been reorganized and rewritten to focus on the new API, while retaining the old documentation for the legacy API. (Contributed by R. David Murray in [bpo-24277](https://bugs.python.org/issue/?@action=redirect&bpo=24277) [https://bugs.python.org/issue/?@action=redirect&bpo=24277].)

The [email.mime](#) classes now all accept an optional *policy* keyword. (Contributed by Berker Peksag in [bpo-27331](https://bugs.python.org/issue/?@action=redirect&bpo=27331) [https://bugs.python.org/issue/?@action=redirect&bpo=27331].)

The [DecodedGenerator](#) now supports the *policy* keyword.

There is a new [policy](#) attribute, [message\\_factory](#), that controls what class is used by default when the parser creates new message objects. For the [email.policy.compat32](#) policy this is [Message](#), for the new policies it is [EmailMessage](#). (Contributed by R. David Murray in [bpo-20476](https://bugs.python.org/issue/?@action=redirect&bpo=20476) [https://bugs.python.org/issue/?@action=redirect&bpo=20476].)

## encodings

On Windows, added the `'oem'` encoding to use `CP_OEMCP`, and the `'ansi'` alias for the existing `'mbcs'` encoding, which uses the `CP_ACP` code page. (Contributed by Steve Dower in [bpo-27959](https://bugs.python.org/issue/?@action=redirect&bpo=27959) [https://bugs.python.org/issue/?@action=redirect&bpo=27959].)

## enum

Two new enumeration base classes have been added to the `enum` module: `Flag` and `IntFlags`. Both are used to define constants that can be combined using the bitwise operators. (Contributed by Ethan Furman in [bpo-23591](https://bugs.python.org/issue?@action=redirect&bpo=23591) [https://bugs.python.org/issue?@action=redirect&bpo=23591].)

Many standard library modules have been updated to use the `IntFlags` class for their constants.

The new `enum.auto` value can be used to assign values to enum members automatically:

```
>>> from enum import Enum, auto
>>> class Color(Enum):
...     red = auto()
...     blue = auto()
...     green = auto()
...
>>> list(Color)
[<Color.red: 1>, <Color.blue: 2>, <Color.green: 3>]
```

## faulthandler

On Windows, the `faulthandler` module now installs a handler for Windows exceptions: see `faulthandler.enable()`. (Contributed by Victor Stinner in [bpo-23848](https://bugs.python.org/issue?@action=redirect&bpo=23848) [https://bugs.python.org/issue?@action=redirect&bpo=23848].)

## fileinput

`hook_encoded()` now supports the `errors` argument. (Contributed by Joseph Hackman in [bpo-25788](https://bugs.python.org/issue?@action=redirect&bpo=25788) [https://bugs.python.org/issue?@action=redirect&bpo=25788].)

## hashlib

`hashlib` supports OpenSSL 1.1.0. The minimum recommended version is 1.0.2. (Contributed by Christian Heimes in [bpo-26470](https://bugs.python.org/issue?@action=redirect&bpo=26470) [https://bugs.python.org/issue?@action=redirect&bpo=26470].)

BLAKE2 hash functions were added to the module. `blake2b()` and `blake2s()` are always available and support the full feature set of BLAKE2. (Contributed by Christian Heimes in [bpo-26798](https://bugs.python.org/issue?@action=redirect&bpo=26798) [<https://bugs.python.org/issue?@action=redirect&bpo=26798>] based on code by Dmitry Chestnykh and Samuel Neves. Documentation written by Dmitry Chestnykh.)

The SHA-3 hash functions `sha3_224()`, `sha3_256()`, `sha3_384()`, `sha3_512()`, and SHAKE hash functions `shake_128()` and `shake_256()` were added. (Contributed by Christian Heimes in [bpo-16113](https://bugs.python.org/issue?@action=redirect&bpo=16113) [<https://bugs.python.org/issue?@action=redirect&bpo=16113>]. Keccak Code Package by Guido Bertoni, Joan Daemen, Michaël Peeters, Gilles Van Assche, and Ronny Van Keer.)

The password-based key derivation function `scrypt()` is now available with OpenSSL 1.1.0 and newer. (Contributed by Christian Heimes in [bpo-27928](https://bugs.python.org/issue?@action=redirect&bpo=27928) [<https://bugs.python.org/issue?@action=redirect&bpo=27928>].)

## http.client

`HTTPConnection.request()` and `endheaders()` both now support chunked encoding request bodies. (Contributed by Demian Brecht and Rolf Krahl in [bpo-12319](https://bugs.python.org/issue?@action=redirect&bpo=12319) [<https://bugs.python.org/issue?@action=redirect&bpo=12319>].)

## idlelib and IDLE

The `idlelib` package is being modernized and refactored to make IDLE look and work better and to make the code easier to understand, test, and improve. Part of making IDLE look better, especially on Linux and Mac, is using `ttk` widgets, mostly in the dialogs. As a result, IDLE no longer runs with `tcl/tk` 8.4. It now requires `tcl/tk` 8.5 or 8.6. We recommend running the latest release of either.

‘Modernizing’ includes renaming and consolidation of `idlelib` modules. The renaming of files with partial uppercase names is similar to the renaming of, for instance, `Tkinter` and `TkFont` to

tkinter and tkinter.font in 3.0. As a result, imports of idlelib files that worked in 3.5 will usually not work in 3.6. At least a module name change will be needed (see [idlelib/README.txt](https://bugs.python.org/issue?@action=redirect&bpo=24225)), sometimes more. (Name changes contributed by Al Swiegart and Terry Reedy in [bpo-24225](https://bugs.python.org/issue?@action=redirect&bpo=24225) [https://bugs.python.org/issue?@action=redirect&bpo=24225]. Most idlelib patches since have been and will be part of the process.)

In compensation, the eventual result will be that some idlelib classes will be easier to use, with better APIs and docstrings explaining them. Additional useful information will be added to idlelib when available.

New in 3.6.2:

Multiple fixes for autocompletion. (Contributed by Louie Lu in [bpo-15786](https://bugs.python.org/issue?@action=redirect&bpo=15786) [https://bugs.python.org/issue?@action=redirect&bpo=15786].)

New in 3.6.3:

Module Browser (on the File menu, formerly called Class Browser), now displays nested functions and classes in addition to top-level functions and classes. (Contributed by Guilherme Polo, Cheryl Sabella, and Terry Jan Reedy in [bpo-1612262](https://bugs.python.org/issue?@action=redirect&bpo=1612262) [https://bugs.python.org/issue?@action=redirect&bpo=1612262].)

The IDLE features formerly implemented as extensions have been reimplemented as normal features. Their settings have been moved from the Extensions tab to other dialog tabs. (Contributed by Charles Wohlganger and Terry Jan Reedy in [bpo-27099](https://bugs.python.org/issue?@action=redirect&bpo=27099) [https://bugs.python.org/issue?@action=redirect&bpo=27099].)

The Settings dialog (Options, Configure IDLE) has been partly rewritten to improve both appearance and function. (Contributed by Cheryl Sabella and Terry Jan Reedy in multiple issues.)

New in 3.6.4:

The font sample now includes a selection of non-Latin characters so that users can better see the effect of selecting a particular font. (Contributed by Terry Jan Reedy in [bpo-13802](https://bugs.python.org/issue?@action=redirect&bpo=13802) [https://bugs.python.org/issue?@action=redirect&bpo=13802].)

issue?@action=redirect&bpo=13802].) The sample can be edited to include other characters. (Contributed by Serhiy Storchaka in [bpo-31860](https://bugs.python.org/issue?@action=redirect&bpo=31860) [https://bugs.python.org/issue?@action=redirect&bpo=31860].)

### New in 3.6.6:

Editor code context option revised. Box displays all context lines up to maxlines. Clicking on a context line jumps the editor to that line. Context colors for custom themes is added to Highlights tab of Settings dialog. (Contributed by Cheryl Sabella and Terry Jan Reedy in [bpo-33642](https://bugs.python.org/issue?@action=redirect&bpo=33642) [https://bugs.python.org/issue?@action=redirect&bpo=33642], [bpo-33768](https://bugs.python.org/issue?@action=redirect&bpo=33768) [https://bugs.python.org/issue?@action=redirect&bpo=33768], and [bpo-33679](https://bugs.python.org/issue?@action=redirect&bpo=33679) [https://bugs.python.org/issue?@action=redirect&bpo=33679].)

On Windows, a new API call tells Windows that tk scales for DPI. On Windows 8.1 + or 10, with DPI compatibility properties of the Python binary unchanged, and a monitor resolution greater than 96 DPI, this should make text and lines sharper. It should otherwise have no effect. (Contributed by Terry Jan Reedy in [bpo-33656](https://bugs.python.org/issue?@action=redirect&bpo=33656) [https://bugs.python.org/issue?@action=redirect&bpo=33656].)

### New in 3.6.7:

Output over N lines (50 by default) is squeezed down to a button. N can be changed in the PyShell section of the General page of the Settings dialog. Fewer, but possibly extra long, lines can be squeezed by right clicking on the output. Squeezed output can be expanded in place by double-clicking the button or into the clipboard or a separate window by right-clicking the button. (Contributed by Tal Einat in [bpo-1529353](https://bugs.python.org/issue?@action=redirect&bpo=1529353) [https://bugs.python.org/issue?@action=redirect&bpo=1529353].)

## importlib

Import now raises the new exception `ModuleNotFoundError` (subclass of `ImportError`) when it cannot find a module. Code that current checks for `ImportError` (in try-except) will still work. (Contributed by Eric Snow in [bpo-15767](https://bugs.python.org/issue?@action=redirect&bpo=15767) [https://bugs.python.org/issue?@action=redirect&bpo=15767].)

`importlib.util.LazyLoader` now calls `create_module()`

on the wrapped loader, removing the restriction that `importlib.machinery.BuiltinImporter` and `importlib.machinery.ExtensionFileLoader` couldn't be used with `importlib.util.LazyLoader`.

`importlib.util.cache_from_source()`, `importlib.util.source_from_cache()`, and `importlib.util.spec_from_file_location()` now accept a path-like object.

## inspect

The `inspect.signature()` function now reports the implicit `.0` parameters generated by the compiler for comprehension and generator expression scopes as if they were positional-only parameters called `implicit0`. (Contributed by Jelle Zijlstra in [bpo-19611](https://bugs.python.org/issue?@action=redirect&bpo=19611) [https://bugs.python.org/issue?@action=redirect&bpo=19611].)

To reduce code churn when upgrading from Python 2.7 and the legacy `inspect.getargspec()` API, the previously documented deprecation of `inspect.getfullargspec()` has been reversed. While this function is convenient for single/source Python 2/3 code bases, the richer `inspect.signature()` interface remains the recommended approach for new code. (Contributed by Nick Coghlan in [bpo-27172](https://bugs.python.org/issue?@action=redirect&bpo=27172) [https://bugs.python.org/issue?@action=redirect&bpo=27172]).

## json

`json.load()` and `json.loads()` now support binary input. Encoded JSON should be represented using either UTF-8, UTF-16, or UTF-32. (Contributed by Serhiy Storchaka in [bpo-17909](https://bugs.python.org/issue?@action=redirect&bpo=17909) [https://bugs.python.org/issue?@action=redirect&bpo=17909].)

## logging

The new `WatchedFileHandler.reopenIfNeeded()` method has been added to add the ability to check if the log file needs to be reopened. (Contributed by Marian Horban in [bpo-24884](https://bugs.python.org/issue?@action=redirect&bpo=24884) [https://bugs.python.org/issue?@action=redirect&bpo=24884].)

## math

The tau ( $\tau$ ) constant has been added to the `math` and `cmath` modules. (Contributed by Lisa Roach in [bpo-12345](https://bugs.python.org/issue/?@action=redirect&bpo=12345) [https://bugs.python.org/issue/?@action=redirect&bpo=12345], see [PEP 628](https://peps.python.org/pep-0628/) [https://peps.python.org/pep-0628/] for details.)

## multiprocessing

`Proxy Objects` returned by `multiprocessing.Manager()` can now be nested. (Contributed by Davin Potts in [bpo-6766](https://bugs.python.org/issue/?@action=redirect&bpo=6766) [https://bugs.python.org/issue/?@action=redirect&bpo=6766].)

## os

See the summary of [PEP 519](https://peps.python.org/pep-519/) for details on how the `os` and `os.path` modules now support `path-like objects`.

`scandir()` now supports `bytes` paths on Windows.

A new `close()` method allows explicitly closing a `scandir()` iterator. The `scandir()` iterator now supports the `context manager` protocol. If a `scandir()` iterator is neither exhausted nor explicitly closed a `ResourceWarning` will be emitted in its destructor. (Contributed by Serhiy Storchaka in [bpo-25994](https://bugs.python.org/issue/?@action=redirect&bpo=25994) [https://bugs.python.org/issue/?@action=redirect&bpo=25994].)

On Linux, `os.urandom()` now blocks until the system urandom entropy pool is initialized to increase the security. See the [PEP 524](https://peps.python.org/pep-0524/) [https://peps.python.org/pep-0524/] for the rationale.

The Linux `getrandom()` syscall (get random bytes) is now exposed as the new `os.getrandom()` function. (Contributed by Victor Stinner, part of the [PEP 524](https://peps.python.org/pep-0524/) [https://peps.python.org/pep-0524/])

## pathlib

`pathlib` now supports `path-like objects`. (Contributed by Brett Cannon in [bpo-27186](https://bugs.python.org/issue/?@action=redirect&bpo=27186) [https://bugs.python.org/issue/?@action=redirect&bpo=27186].)

See the summary of [PEP 519](#) for details.

## **pdb**

The **pdb** class constructor has a new optional *readrc* argument to control whether `.pdbrc` files should be read.

## **pickle**

Objects that need `__new__` called with keyword arguments can now be pickled using [pickle protocols](#) older than protocol version 4. Protocol version 4 already supports this case. (Contributed by Serhiy Storchaka in [bpo-24164](#) [<https://bugs.python.org/issue?@action=redirect&bpo=24164>].)

## **pickletools**

[pickletools.dis\(\)](#) now outputs the implicit memo index for the `MEMOIZE` opcode. (Contributed by Serhiy Storchaka in [bpo-25382](#) [<https://bugs.python.org/issue?@action=redirect&bpo=25382>].)

## **pydoc**

The **pydoc** module has learned to respect the `MANPAGER` environment variable. (Contributed by Matthias Klose in [bpo-8637](#) [<https://bugs.python.org/issue?@action=redirect&bpo=8637>].)

[help\(\)](#) and **pydoc** can now list named tuple fields in the order they were defined rather than alphabetically. (Contributed by Raymond Hettinger in [bpo-24879](#) [<https://bugs.python.org/issue?@action=redirect&bpo=24879>].)

## **random**

The new [choices\(\)](#) function returns a list of elements of specified size from the given population with optional weights. (Contributed by Raymond Hettinger in [bpo-18844](#) [<https://bugs.python.org/issue?@action=redirect&bpo=18844>].)

## re

Added support of modifier spans in regular expressions. Examples: `'(?:p)ython'` matches `'python'` and `'Python'`, but not `'PYTHON'`; `'(?:i)g(?:-i:v)r'` matches `'GvR'` and `'gvr'`, but not `'GVR'`. (Contributed by Serhiy Storchaka in [bpo-433028](https://bugs.python.org/issue?@action=redirect&bpo=433028) [<https://bugs.python.org/issue?@action=redirect&bpo=433028>].)

Match object groups can be accessed by `__getitem__`, which is equivalent to `group()`. So `mo['name']` is now equivalent to `mo.group('name')`. (Contributed by Eric Smith in [bpo-24454](https://bugs.python.org/issue?@action=redirect&bpo=24454) [<https://bugs.python.org/issue?@action=redirect&bpo=24454>].)

**Match** objects now support **index-like objects** as group indices. (Contributed by Jeroen Demeyer and Xiang Zhang in [bpo-27177](https://bugs.python.org/issue?@action=redirect&bpo=27177) [<https://bugs.python.org/issue?@action=redirect&bpo=27177>].)

## readline

Added `set_auto_history()` to enable or disable automatic addition of input to the history list. (Contributed by Tyler Crompton in [bpo-26870](https://bugs.python.org/issue?@action=redirect&bpo=26870) [<https://bugs.python.org/issue?@action=redirect&bpo=26870>].)

## rlcompleter

Private and special attribute names now are omitted unless the prefix starts with underscores. A space or a colon is added after some completed keywords. (Contributed by Serhiy Storchaka in [bpo-25011](https://bugs.python.org/issue?@action=redirect&bpo=25011) [<https://bugs.python.org/issue?@action=redirect&bpo=25011>] and [bpo-25209](https://bugs.python.org/issue?@action=redirect&bpo=25209) [<https://bugs.python.org/issue?@action=redirect&bpo=25209>].)

## shlex

The **shlex** has much **improved shell compatibility** through the new `punctuation_chars` argument to control which characters are treated as punctuation. (Contributed by Vinay Sajip in [bpo-1521950](https://bugs.python.org/issue?@action=redirect&bpo=1521950) [<https://bugs.python.org/issue?@action=redirect&bpo=1521950>].)

## site

When specifying paths to add to `sys.path` in a `.pth` file, you may now specify file paths on top of directories (e.g. zip files). (Contributed by Wolfgang Langner in [bpo-26587](https://bugs.python.org/issue?@action=redirect&bpo=26587) [https://bugs.python.org/issue?@action=redirect&bpo=26587]).

## sqlite3

`sqlite3.Cursor.lastrowid` now supports the `REPLACE` statement. (Contributed by Alex LordThorsen in [bpo-16864](https://bugs.python.org/issue?@action=redirect&bpo=16864) [https://bugs.python.org/issue?@action=redirect&bpo=16864].)

## socket

The `ioctl()` function now supports the `SIO_LOOPBACK_FAST_PATH` control code. (Contributed by Daniel Stokes in [bpo-26536](https://bugs.python.org/issue?@action=redirect&bpo=26536) [https://bugs.python.org/issue?@action=redirect&bpo=26536].)

The `getsockopt()` constants `SO_DOMAIN`, `SO_PROTOCOL`, `SO_PEERSEC`, and `SO_PASSSEC` are now supported. (Contributed by Christian Heimes in [bpo-26907](https://bugs.python.org/issue?@action=redirect&bpo=26907) [https://bugs.python.org/issue?@action=redirect&bpo=26907].)

The `setsockopt()` now supports the `setsockopt(level, optname, None, optlen: int)` form. (Contributed by Christian Heimes in [bpo-27744](https://bugs.python.org/issue?@action=redirect&bpo=27744) [https://bugs.python.org/issue?@action=redirect&bpo=27744].)

The socket module now supports the address family `AF_ALG` to interface with Linux Kernel crypto API. `ALG_*`, `SOL_ALG` and `sendmsg_afalg()` were added. (Contributed by Christian Heimes in [bpo-27744](https://bugs.python.org/issue?@action=redirect&bpo=27744) [https://bugs.python.org/issue?@action=redirect&bpo=27744] with support from Victor Stinner.)

New Linux constants `TCP_USER_TIMEOUT` and `TCP_CONGESTION` were added. (Contributed by Omar Sandoval, [bpo-26273](https://bugs.python.org/issue?@action=redirect&bpo=26273) [https://bugs.python.org/issue?@action=redirect&bpo=26273]).

## socketserver

Servers based on the `socketserver` module, including those defined in `http.server`, `xmlrpc.server` and `wsgiref.simple_server`, now support the `context manager` protocol. (Contributed by Aviv Palivoda in [bpo-26404](https://bugs.python.org/issue?@action=redirect&bpo=26404) [https://bugs.python.org/issue?@action=redirect&bpo=26404].)

The `wfile` attribute of `StreamRequestHandler` classes now implements the `io.BufferedIOBase` writable interface. In particular, calling `write()` is now guaranteed to send the data in full. (Contributed by Martin Panter in [bpo-26721](https://bugs.python.org/issue?@action=redirect&bpo=26721) [https://bugs.python.org/issue?@action=redirect&bpo=26721].)

## ssl

`ssl` supports OpenSSL 1.1.0. The minimum recommend version is 1.0.2. (Contributed by Christian Heimes in [bpo-26470](https://bugs.python.org/issue?@action=redirect&bpo=26470) [https://bugs.python.org/issue?@action=redirect&bpo=26470].)

3DES has been removed from the default cipher suites and ChaCha20 Poly1305 cipher suites have been added. (Contributed by Christian Heimes in [bpo-27850](https://bugs.python.org/issue?@action=redirect&bpo=27850) [https://bugs.python.org/issue?@action=redirect&bpo=27850] and [bpo-27766](https://bugs.python.org/issue?@action=redirect&bpo=27766) [https://bugs.python.org/issue?@action=redirect&bpo=27766].)

`SSLContext` has better default configuration for options and ciphers. (Contributed by Christian Heimes in [bpo-28043](https://bugs.python.org/issue?@action=redirect&bpo=28043) [https://bugs.python.org/issue?@action=redirect&bpo=28043].)

SSL session can be copied from one client-side connection to another with the new `SSLSession` class. TLS session resumption can speed up the initial handshake, reduce latency and improve performance (Contributed by Christian Heimes in [bpo-19500](https://bugs.python.org/issue?@action=redirect&bpo=19500) [https://bugs.python.org/issue?@action=redirect&bpo=19500] based on a draft by Alex Warhawk.)

The new `get_ciphers()` method can be used to get a list of enabled ciphers in order of cipher priority.

All constants and flags have been converted to `IntEnum` and `IntFlags`. (Contributed by Christian Heimes in [bpo-28025](https://bugs.python.org/issue?@action=redirect&bpo=28025) [https://bugs.python.org/issue?@action=redirect&bpo=28025].)

Server and client-side specific TLS protocols for `SSLContext` were added. (Contributed by Christian Heimes in [bpo-28085](https://bugs.python.org/issue?@action=redirect&bpo=28085) [https://bugs.python.org/issue?@action=redirect&bpo=28085].)

## statistics

A new `harmonic_mean()` function has been added. (Contributed by Steven D'Aprano in [bpo-27181](https://bugs.python.org/issue?@action=redirect&bpo=27181) [https://bugs.python.org/issue?@action=redirect&bpo=27181].)

## struct

`struct` now supports IEEE 754 half-precision floats via the `'e'` format specifier. (Contributed by Eli Stevens, Mark Dickinson in [bpo-11734](https://bugs.python.org/issue?@action=redirect&bpo=11734) [https://bugs.python.org/issue?@action=redirect&bpo=11734].)

## subprocess

`subprocess.Popen` destructor now emits a `ResourceWarning` warning if the child process is still running. Use the context manager protocol (with `proc: ...`) or explicitly call the `wait()` method to read the exit status of the child process. (Contributed by Victor Stinner in [bpo-26741](https://bugs.python.org/issue?@action=redirect&bpo=26741) [https://bugs.python.org/issue?@action=redirect&bpo=26741].)

The `subprocess.Popen` constructor and all functions that pass arguments through to it now accept `encoding` and `errors` arguments. Specifying either of these will enable text mode for the `stdin`, `stdout` and `stderr` streams. (Contributed by Steve Dower in [bpo-6135](https://bugs.python.org/issue?@action=redirect&bpo=6135) [https://bugs.python.org/issue?@action=redirect&bpo=6135].)

## sys

The new `getfilesystemencodingerrors()` function returns the name of the error mode used to convert between Unicode filenames and bytes filenames. (Contributed by Steve Dower in [bpo-27781](https://bugs.python.org/issue?@action=redirect&bpo=27781) [https://bugs.python.org/issue?@action=redirect&bpo=27781].)

On Windows the return value of the `getwindowsversion()` function now includes the `platform_version` field which contains the

accurate major version, minor version and build number of the current operating system, rather than the version that is being emulated for the process (Contributed by Steve Dower in [bpo-27932](https://bugs.python.org/issue?@action=redirect&bpo=27932) [<https://bugs.python.org/issue?@action=redirect&bpo=27932>]).

## telnetlib

**Telnet** is now a context manager (contributed by Stéphane Wirtel in [bpo-25485](https://bugs.python.org/issue?@action=redirect&bpo=25485) [<https://bugs.python.org/issue?@action=redirect&bpo=25485>]).

## time

The **struct\_time** attributes **tm\_gmtoff** and **tm\_zone** are now available on all platforms.

## timeit

The new **Timer.autorange()** convenience method has been added to call **Timer.timeit()** repeatedly so that the total run time is greater or equal to 200 milliseconds. (Contributed by Steven D'Aprano in [bpo-6422](https://bugs.python.org/issue?@action=redirect&bpo=6422) [<https://bugs.python.org/issue?@action=redirect&bpo=6422>]).

**timeit** now warns when there is substantial (4x) variance between best and worst times. (Contributed by Serhiy Storchaka in [bpo-23552](https://bugs.python.org/issue?@action=redirect&bpo=23552) [<https://bugs.python.org/issue?@action=redirect&bpo=23552>]).

## tkinter

Added methods **trace\_add()**, **trace\_remove()** and **trace\_info()** in the **tkinter.Variable** class. They replace old methods **trace\_variable()**, **trace()**, **trace\_vdelete()** and **trace\_vinfo()** that use obsolete Tcl commands and might not work in future versions of Tcl. (Contributed by Serhiy Storchaka in [bpo-22115](https://bugs.python.org/issue?@action=redirect&bpo=22115) [<https://bugs.python.org/issue?@action=redirect&bpo=22115>]).

## traceback

Both the traceback module and the interpreter's builtin exception

display now abbreviate long sequences of repeated lines in tracebacks as shown in the following example:

```
>>> def f(): f()
...
>>> f()
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
  File "<stdin>", line 1, in f
  File "<stdin>", line 1, in f
  File "<stdin>", line 1, in f
  [Previous line repeated 995 more times]
RecursionError: maximum recursion depth exceeded
```

(Contributed by Emanuel Barry in [bpo-26823](https://bugs.python.org/issue?@action=redirect&bpo=26823) [https://bugs.python.org/issue?@action=redirect&bpo=26823].)

## tracemalloc

The [tracemalloc](#) module now supports tracing memory allocations in multiple different address spaces.

The new [DomainFilter](#) filter class has been added to filter block traces by their address space (domain).

(Contributed by Victor Stinner in [bpo-26588](https://bugs.python.org/issue?@action=redirect&bpo=26588) [https://bugs.python.org/issue?@action=redirect&bpo=26588].)

## typing

Since the [typing](#) module is [provisional](#), all changes introduced in Python 3.6 have also been backported to Python 3.5.x.

The [typing](#) module has a much improved support for generic type aliases. For example `Dict[str, Tuple[S, T]]` is now a valid type annotation. (Contributed by Guido van Rossum in [Github #195](https://github.com/python/typing/pull/195) [https://github.com/python/typing/pull/195].)

The [typing.ContextManager](#) class has been added for representing [contextlib.AbstractContextManager](#).

(Contributed by Brett Cannon in [bpo-25609](https://bugs.python.org/issue?@action=redirect&bpo=25609) [https://bugs.python.org/issue?@action=redirect&bpo=25609].)

The `typing.Collection` class has been added for representing `collections.abc.Collection`. (Contributed by Ivan Levkivskyi in [bpo-27598](https://bugs.python.org/issue?@action=redirect&bpo=27598) [https://bugs.python.org/issue?@action=redirect&bpo=27598].)

The `typing.ClassVar` type construct has been added to mark class variables. As introduced in [PEP 526](https://peps.python.org/pep-0526/) [https://peps.python.org/pep-0526/], a variable annotation wrapped in `ClassVar` indicates that a given attribute is intended to be used as a class variable and should not be set on instances of that class. (Contributed by Ivan Levkivskyi in [Github #280](https://github.com/python/typing/pull/280) [https://github.com/python/typing/pull/280].)

A new `TYPE_CHECKING` constant that is assumed to be `True` by the static type checkers, but is `False` at runtime. (Contributed by Guido van Rossum in [Github #230](https://github.com/python/typing/issues/230) [https://github.com/python/typing/issues/230].)

A new `NewType()` helper function has been added to create lightweight distinct types for annotations:

```
from typing import NewType

UserId = NewType('UserId', int)
some_id = UserId(524313)
```

The static type checker will treat the new type as if it were a subclass of the original type. (Contributed by Ivan Levkivskyi in [Github #189](https://github.com/python/typing/issues/189) [https://github.com/python/typing/issues/189].)

## unicodedata

The `unicodedata` module now uses data from [Unicode 9.0.0](https://unicode.org/versions/Unicode9.0.0/) [https://unicode.org/versions/Unicode9.0.0/]. (Contributed by Benjamin Peterson.)

## unittest.mock

The `Mock` class has the following improvements:

- Two new methods, `Mock.assert_called()` and `Mock.assert_called_once()` to check if the mock object was called. (Contributed by Amit Saha in [bpo-26323](https://bugs.python.org/issue?@action=redirect&bpo=26323) [https://bugs.python.org/issue?@action=redirect&bpo=26323].)
- The `Mock.reset_mock()` method now has two optional keyword only arguments: *return\_value* and *side\_effect*. (Contributed by Kushal Das in [bpo-21271](https://bugs.python.org/issue?@action=redirect&bpo=21271) [https://bugs.python.org/issue?@action=redirect&bpo=21271].)

## urllib.request

If a HTTP request has a file or iterable body (other than a bytes object) but no `Content-Length` header, rather than throwing an error, `AbstractHTTPHandler` now falls back to use chunked transfer encoding. (Contributed by Demian Brecht and Rolf Krah1 in [bpo-12319](https://bugs.python.org/issue?@action=redirect&bpo=12319) [https://bugs.python.org/issue?@action=redirect&bpo=12319].)

## urllib.robotparser

`RobotFileParser` now supports the `Crawl-delay` and `Request-rate` extensions. (Contributed by Nikolay Bogoychev in [bpo-16099](https://bugs.python.org/issue?@action=redirect&bpo=16099) [https://bugs.python.org/issue?@action=redirect&bpo=16099].)

## venv

`venv` accepts a new parameter `--prompt`. This parameter provides an alternative prefix for the virtual environment. (Proposed by Łukasz Balcerzak and ported to 3.6 by Stéphane Wirtel in [bpo-22829](https://bugs.python.org/issue?@action=redirect&bpo=22829) [https://bugs.python.org/issue?@action=redirect&bpo=22829].)

## warnings

A new optional *source* parameter has been added to the `warnings.warn_explicit()` function: the destroyed object which emitted a `ResourceWarning`. A *source* attribute has also been added to `warnings.WarningMessage` (contributed by Victor Stinner in [bpo-26568](https://bugs.python.org/issue?@action=redirect&bpo=26568) [https://bugs.python.org/issue?@action=redirect&bpo=26568] and [bpo-26567](https://bugs.python.org/) [https://bugs.python.org/

issue?@action=redirect&bpo=26567]).

When a **ResourceWarning** warning is logged, the **tracemalloc** module is now used to try to retrieve the traceback where the destroyed object was allocated.

Example with the script `example.py`:

```
import warnings

def func():
    return open(__file__)

f = func()
f = None
```

Output of the command `python3.6 -Wd -X tracemalloc=5 example.py`:

```
example.py:7: ResourceWarning: unclosed file <_io.TextIO
    f = None
Object allocated at (most recent call first):
  File "example.py", lineno 4
    return open(__file__)
  File "example.py", lineno 6
    f = func()
```

The “Object allocated at” traceback is new and is only displayed if **tracemalloc** is tracing Python memory allocations and if the **warnings** module was already imported.

## winreg

Added the 64-bit integer type **REG\_QWORD**. (Contributed by Clement Rouault in [bpo-23026](https://bugs.python.org/issue?@action=redirect&bpo=23026) [https://bugs.python.org/issue?@action=redirect&bpo=23026].)

## winsound

Allowed keyword arguments to be passed to **Beep**,

**MessageBeep**, and **PlaySound** ([bpo-27982](https://bugs.python.org/issue?@action=redirect&bpo=27982) [<https://bugs.python.org/issue?@action=redirect&bpo=27982>])).

## **xmlrpc.client**

The **xmlrpc.client** module now supports unmarshalling additional data types used by the Apache XML-RPC implementation for numerics and `None`. (Contributed by Serhiy Storchaka in [bpo-26885](https://bugs.python.org/issue?@action=redirect&bpo=26885) [<https://bugs.python.org/issue?@action=redirect&bpo=26885>].)

## **zipfile**

A new **ZipInfo.from\_file()** class method allows making a **ZipInfo** instance from a filesystem file. A new **ZipInfo.is\_dir()** method can be used to check if the **ZipInfo** instance represents a directory. (Contributed by Thomas Kluyver in [bpo-26039](https://bugs.python.org/issue?@action=redirect&bpo=26039) [<https://bugs.python.org/issue?@action=redirect&bpo=26039>].)

The **ZipFile.open()** method can now be used to write data into a ZIP file, as well as for extracting data. (Contributed by Thomas Kluyver in [bpo-26039](https://bugs.python.org/issue?@action=redirect&bpo=26039) [<https://bugs.python.org/issue?@action=redirect&bpo=26039>].)

## **zlib**

The **compress()** and **decompress()** functions now accept keyword arguments. (Contributed by Aviv Palivoda in [bpo-26243](https://bugs.python.org/issue?@action=redirect&bpo=26243) [<https://bugs.python.org/issue?@action=redirect&bpo=26243>] and Xiang Zhang in [bpo-16764](https://bugs.python.org/issue?@action=redirect&bpo=16764) [<https://bugs.python.org/issue?@action=redirect&bpo=16764>] respectively.)

## **Optimizations**

- The Python interpreter now uses a 16-bit wordcode instead of bytecode which made a number of opcode optimizations possible. (Contributed by Demur Rumed with input and reviews from Serhiy Storchaka and Victor Stinner in [bpo-26647](https://bugs.python.org/issue?@action=redirect&bpo=26647) [<https://bugs.python.org/issue?@action=redirect&bpo=26647>] and [bpo-28050](https://bugs.python.org/issue?@action=redirect&bpo=28050) [[https://](https://bugs.python.org/issue?@action=redirect&bpo=28050)

bugs.python.org/issue?@action=redirect&bpo=28050].)

- The `asyncio.Future` class now has an optimized C implementation. (Contributed by Yury Selivanov and INADA Naoki in [bpo-26081](https://bugs.python.org/issue?@action=redirect&bpo=26081) [https://bugs.python.org/issue?@action=redirect&bpo=26081].)
- The `asyncio.Task` class now has an optimized C implementation. (Contributed by Yury Selivanov in [bpo-28544](https://bugs.python.org/issue?@action=redirect&bpo=28544) [https://bugs.python.org/issue?@action=redirect&bpo=28544].)
- Various implementation improvements in the `typing` module (such as caching of generic types) allow up to 30 times performance improvements and reduced memory footprint.
- The ASCII decoder is now up to 60 times as fast for error handlers `surrogateescape`, `ignore` and `replace` (Contributed by Victor Stinner in [bpo-24870](https://bugs.python.org/issue?@action=redirect&bpo=24870) [https://bugs.python.org/issue?@action=redirect&bpo=24870]).
- The ASCII and the Latin1 encoders are now up to 3 times as fast for the error handler `surrogateescape` (Contributed by Victor Stinner in [bpo-25227](https://bugs.python.org/issue?@action=redirect&bpo=25227) [https://bugs.python.org/issue?@action=redirect&bpo=25227]).
- The UTF-8 encoder is now up to 75 times as fast for error handlers `ignore`, `replace`, `surrogateescape`, `surrogatepass` (Contributed by Victor Stinner in [bpo-25267](https://bugs.python.org/issue?@action=redirect&bpo=25267) [https://bugs.python.org/issue?@action=redirect&bpo=25267]).
- The UTF-8 decoder is now up to 15 times as fast for error handlers `ignore`, `replace` and `surrogateescape` (Contributed by Victor Stinner in [bpo-25301](https://bugs.python.org/issue?@action=redirect&bpo=25301) [https://bugs.python.org/issue?@action=redirect&bpo=25301]).
- `bytes % args` is now up to 2 times faster. (Contributed by Victor Stinner in [bpo-25349](https://bugs.python.org/issue?@action=redirect&bpo=25349) [https://bugs.python.org/issue?@action=redirect&bpo=25349]).
- `bytearray % args` is now between 2.5 and 5 times faster. (Contributed by Victor Stinner in [bpo-25399](https://bugs.python.org/issue?@action=redirect&bpo=25399) [https://bugs.python.org/issue?@action=redirect&bpo=25399]).
- Optimize `bytes.fromhex()` and `bytearray.fromhex()`: they are now between 2x and 3.5x faster. (Contributed by Victor Stinner in [bpo-25401](https://bugs.python.org/issue?@action=redirect&bpo=25401) [https://bugs.python.org/issue?@action=redirect&bpo=25401]).

- Optimize `bytes.replace(b'', b'.')` and `bytearray.replace(b'', b'.')`: up to 80% faster. (Contributed by Josh Snider in [bpo-26574](https://bugs.python.org/issue?@action=redirect&bpo=26574) [https://bugs.python.org/issue?@action=redirect&bpo=26574]).
- Allocator functions of the `PyMem_Malloc()` domain (`PYMEM_DOMAIN_MEM`) now use the `pymalloc memory allocator` instead of `malloc()` function of the C library. The `pymalloc` allocator is optimized for objects smaller or equal to 512 bytes with a short lifetime, and use `malloc()` for larger memory blocks. (Contributed by Victor Stinner in [bpo-26249](https://bugs.python.org/issue?@action=redirect&bpo=26249) [https://bugs.python.org/issue?@action=redirect&bpo=26249]).
- `pickle.load()` and `pickle.loads()` are now up to 10% faster when deserializing many small objects (Contributed by Victor Stinner in [bpo-27056](https://bugs.python.org/issue?@action=redirect&bpo=27056) [https://bugs.python.org/issue?@action=redirect&bpo=27056]).
- Passing `keyword arguments` to a function has an overhead in comparison with passing `positional arguments`. Now in extension functions implemented with using Argument Clinic this overhead is significantly decreased. (Contributed by Serhiy Storchaka in [bpo-27574](https://bugs.python.org/issue?@action=redirect&bpo=27574) [https://bugs.python.org/issue?@action=redirect&bpo=27574]).
- Optimized `glob()` and `iglob()` functions in the `glob` module; they are now about 3–6 times faster. (Contributed by Serhiy Storchaka in [bpo-25596](https://bugs.python.org/issue?@action=redirect&bpo=25596) [https://bugs.python.org/issue?@action=redirect&bpo=25596]).
- Optimized globbing in `pathlib` by using `os.scandir()`; it is now about 1.5–4 times faster. (Contributed by Serhiy Storchaka in [bpo-26032](https://bugs.python.org/issue?@action=redirect&bpo=26032) [https://bugs.python.org/issue?@action=redirect&bpo=26032]).
- `xml.etree.ElementTree` parsing, iteration and deepcopy performance has been significantly improved. (Contributed by Serhiy Storchaka in [bpo-25638](https://bugs.python.org/issue?@action=redirect&bpo=25638) [https://bugs.python.org/issue?@action=redirect&bpo=25638], [bpo-25873](https://bugs.python.org/issue?@action=redirect&bpo=25873) [https://bugs.python.org/issue?@action=redirect&bpo=25873], and [bpo-25869](https://bugs.python.org/issue?@action=redirect&bpo=25869) [https://bugs.python.org/issue?@action=redirect&bpo=25869].)
- Creation of `fractions.Fraction` instances from floats and decimals is now 2 to 3 times faster. (Contributed by Serhiy Storchaka in [bpo-25971](https://bugs.python.org/issue?@action=redirect&bpo=25971) [https://bugs.python.org/issue?@action=redirect&bpo=25971]).

# Build and C API Changes

- Python now requires some C99 support in the toolchain to build. Most notably, Python now uses standard integer types and macros in place of custom macros like `PY_LONG_LONG`. For more information, see [PEP 7](https://peps.python.org/pep-0007/) [https://peps.python.org/pep-0007/] and [bpo-17884](https://bugs.python.org/issue?@action=redirect&bpo=17884) [https://bugs.python.org/issue?@action=redirect&bpo=17884].
- Cross-compiling CPython with the Android NDK and the Android API level set to 21 (Android 5.0 Lollipop) or greater runs successfully. While Android is not yet a supported platform, the Python test suite runs on the Android emulator with only about 16 tests failures. See the Android meta-issue [bpo-26865](https://bugs.python.org/issue?@action=redirect&bpo=26865) [https://bugs.python.org/issue?@action=redirect&bpo=26865].
- The `--enable-optimizations` configure flag has been added. Turning it on will activate expensive optimizations like PGO. (Original patch by Alecsandru Patrascu of Intel in [bpo-26359](https://bugs.python.org/issue?@action=redirect&bpo=26359) [https://bugs.python.org/issue?@action=redirect&bpo=26359].)
- The `GIL` must now be held when allocator functions of `PyMEM_DOMAIN_OBJ` (ex: `PyObject_Malloc()`) and `PyMEM_DOMAIN_MEM` (ex: `PyMem_Malloc()`) domains are called.
- New `Py_FinalizeEx()` API which indicates if flushing buffered data failed. (Contributed by Martin Panter in [bpo-5319](https://bugs.python.org/issue?@action=redirect&bpo=5319) [https://bugs.python.org/issue?@action=redirect&bpo=5319].)
- `PyArg_ParseTupleAndKeywords()` now supports [positional-only parameters](https://bugs.python.org/issue?@action=redirect&bpo=26282). Positional-only parameters are defined by empty names. (Contributed by Serhiy Storchaka in [bpo-26282](https://bugs.python.org/issue?@action=redirect&bpo=26282) [https://bugs.python.org/issue?@action=redirect&bpo=26282]).
- `PyTraceback_Print` method now abbreviates long sequences of repeated lines as `"[Previous line repeated {count} more times]"`. (Contributed by Emanuel Barry in [bpo-26823](https://bugs.python.org/issue?@action=redirect&bpo=26823) [https://bugs.python.org/issue?@action=redirect&bpo=26823].)
- The new `PyErr_SetImportErrorSubclass()` function

allows for specifying a subclass of `ImportError` to raise. (Contributed by Eric Snow in [bpo-15767](https://bugs.python.org/issue?@action=redirect&bpo=15767) [https://bugs.python.org/issue?@action=redirect&bpo=15767].)

- The new `PyErr_ResourceWarning()` function can be used to generate a `ResourceWarning` providing the source of the resource allocation. (Contributed by Victor Stinner in [bpo-26567](https://bugs.python.org/issue?@action=redirect&bpo=26567) [https://bugs.python.org/issue?@action=redirect&bpo=26567].)
- The new `PyOS_FSPath()` function returns the file system representation of a `path-like object`. (Contributed by Brett Cannon in [bpo-27186](https://bugs.python.org/issue?@action=redirect&bpo=27186) [https://bugs.python.org/issue?@action=redirect&bpo=27186].)
- The `PyUnicode_FSConverter()` and `PyUnicode_FSDecoder()` functions will now accept `path-like objects`.

## Other Improvements

- When `--version` (short form: `-V`) is supplied twice, Python prints `sys.version` for detailed information.

```
$ ./python -VV
```

```
Python 3.6.0b4+ (3.6:223967b49e49+, Nov 21 2016, 20  
[GCC 4.2.1 Compatible Apple LLVM 8.0.0 (clang-800.0
```

## Deprecated

### New Keywords

`async` and `await` are not recommended to be used as variable, class, function or module names. Introduced by [PEP 492](https://peps.python.org/pep-0492/) [https://peps.python.org/pep-0492/] in Python 3.5, they will become proper keywords in Python 3.7. Starting in Python 3.6, the use of `async` or `await` as names will generate a `DeprecationWarning`.

### Deprecated Python behavior

Raising the `StopIteration` exception inside a generator will now generate a `DeprecationWarning`, and will trigger a

**RuntimeError** in Python 3.7. See [PEP 479: Change StopIteration handling inside generators](#) for details.

The `__aiter__()` method is now expected to return an asynchronous iterator directly instead of returning an awaitable as previously. Doing the former will trigger a **DeprecationWarning**. Backward compatibility will be removed in Python 3.7. (Contributed by Yury Selivanov in [bpo-27243](#) [<https://bugs.python.org/issue?@action=redirect&bpo=27243>].)

A backslash-character pair that is not a valid escape sequence now generates a **DeprecationWarning**. Although this will eventually become a **SyntaxError**, that will not be for several Python releases. (Contributed by Emanuel Barry in [bpo-27364](#) [<https://bugs.python.org/issue?@action=redirect&bpo=27364>].)

When performing a relative import, falling back on `__name__` and `__path__` from the calling module when `__spec__` or `__package__` are not defined now raises an **ImportWarning**. (Contributed by Rose Ames in [bpo-25791](#) [<https://bugs.python.org/issue?@action=redirect&bpo=25791>].)

## Deprecated Python modules, functions and methods

### **asynchat**

The **asynchat** has been deprecated in favor of **asyncio**. (Contributed by Mariatta in [bpo-25002](#) [<https://bugs.python.org/issue?@action=redirect&bpo=25002>].)

### **asyncore**

The **asyncore** has been deprecated in favor of **asyncio**. (Contributed by Mariatta in [bpo-25002](#) [<https://bugs.python.org/issue?@action=redirect&bpo=25002>].)

### **dbm**

Unlike other **dbm** implementations, the **dbm.dumb** module creates databases with the `'rw'` mode and allows modifying the database

opened with the 'r' mode. This behavior is now deprecated and will be removed in 3.8. (Contributed by Serhiy Storchaka in [bpo-21708](https://bugs.python.org/issue?@action=redirect&bpo=21708) [https://bugs.python.org/issue?@action=redirect&bpo=21708].)

## distutils

The undocumented `extra_path` argument to the **Distribution** constructor is now considered deprecated and will raise a warning if set. Support for this parameter will be removed in a future Python release. See [bpo-27919](https://bugs.python.org/issue?@action=redirect&bpo=27919) [https://bugs.python.org/issue?@action=redirect&bpo=27919] for details.

## grp

The support of non-integer arguments in `getgrgid()` has been deprecated. (Contributed by Serhiy Storchaka in [bpo-26129](https://bugs.python.org/issue?@action=redirect&bpo=26129) [https://bugs.python.org/issue?@action=redirect&bpo=26129].)

## importlib

The `importlib.machinery.SourceFileLoader.load_module()` and `importlib.machinery.SourcelessFileLoader.load_module()` methods are now deprecated. They were the only remaining implementations of `importlib.abc.Loader.load_module()` in `importlib` that had not been deprecated in previous versions of Python in favour of `importlib.abc.Loader.exec_module()`.

The `importlib.machinery.WindowsRegistryFinder` class is now deprecated. As of 3.6.0, it is still added to `sys.meta_path` by default (on Windows), but this may change in future releases.

## os

Undocumented support of general bytes-like objects as paths in `os` functions, `compile()` and similar functions is now deprecated. (Contributed by Serhiy Storchaka in [bpo-25791](https://bugs.python.org/issue?@action=redirect&bpo=25791) [https://bugs.python.org/issue?@action=redirect&bpo=25791].)

bugs.python.org/issue?@action=redirect&bpo=25791] and [bpo-26754](#) [https://bugs.python.org/issue?@action=redirect&bpo=26754].)

## re

Support for inline flags (`?letters`) in the middle of the regular expression has been deprecated and will be removed in a future Python version. Flags at the start of a regular expression are still allowed. (Contributed by Serhiy Storchaka in [bpo-22493](#) [https://bugs.python.org/issue?@action=redirect&bpo=22493].)

## ssl

OpenSSL 0.9.8, 1.0.0 and 1.0.1 are deprecated and no longer supported. In the future the `ssl` module will require at least OpenSSL 1.0.2 or 1.1.0.

SSL-related arguments like `certfile`, `keyfile` and `check_hostname` in [ftplib](#), [http.client](#), [imaplib](#), [poplib](#), and [smtplib](#) have been deprecated in favor of `context`. (Contributed by Christian Heimes in [bpo-28022](#) [https://bugs.python.org/issue?@action=redirect&bpo=28022].)

A couple of protocols and functions of the `ssl` module are now deprecated. Some features will no longer be available in future versions of OpenSSL. Other features are deprecated in favor of a different API. (Contributed by Christian Heimes in [bpo-28022](#) [https://bugs.python.org/issue?@action=redirect&bpo=28022] and [bpo-26470](#) [https://bugs.python.org/issue?@action=redirect&bpo=26470].)

## tkinter

The `tkinter.tix` module is now deprecated. `tkinter` users should use `tkinter.ttk` instead.

## venv

The `pyvenv` script has been deprecated in favour of `python3 -m venv`. This prevents confusion as to what Python interpreter

pyvenv is connected to and thus what Python interpreter will be used by the virtual environment. (Contributed by Brett Cannon in [bpo-25154](https://bugs.python.org/issue?@action=redirect&bpo=25154) [https://bugs.python.org/issue?@action=redirect&bpo=25154].)

## Deprecated functions and types of the C API

Undocumented functions `PyUnicode_AsEncodedObject()`, `PyUnicode_AsDecodedObject()`, `PyUnicode_AsEncodedUnicode()` and `PyUnicode_AsDecodedUnicode()` are deprecated now. Use the [generic codec based API](#) instead.

## Deprecated Build Options

The `--with-system-ffi` configure flag is now on by default on non-macOS UNIX platforms. It may be disabled by using `--without-system-ffi`, but using the flag is deprecated and will not be accepted in Python 3.7. macOS is unaffected by this change. Note that many OS distributors already use the `--with-system-ffi` flag when building their system Python.

## Removed

### API and Feature Removals

- Unknown escapes consisting of `'\'` and an ASCII letter in regular expressions will now cause an error. In replacement templates for `re.sub()` they are still allowed, but deprecated. The `re.LOCALE` flag can now only be used with binary patterns.
- `inspect.getmoduleinfo()` was removed (was deprecated since CPython 3.3). `inspect.getmodulename()` should be used for obtaining the module name for a given path. (Contributed by Yury Selivanov in [bpo-13248](https://bugs.python.org/issue?@action=redirect&bpo=13248) [https://bugs.python.org/issue?@action=redirect&bpo=13248].)
- `traceback.Ignore` class and `traceback.usage`, `traceback.modname`, `traceback.fullmodname`, `traceback.find_lines_from_code`, `traceback.find_lines`, `traceback.find_strings`,

`traceback.find_executable_lines` methods were removed from the `traceback` module. They were undocumented methods deprecated since Python 3.2 and equivalent functionality is available from private methods.

- The `tk_menuBar()` and `tk_bindForTraversal()` dummy methods in `tkinter` widget classes were removed (corresponding Tk commands were obsolete since Tk 4.0).
- The `open()` method of the `zipfile.ZipFile` class no longer supports the `'U'` mode (was deprecated since Python 3.4). Use `io.TextIOWrapper` for reading compressed text files in `universal newlines` mode.
- The undocumented `IN`, `CDROM`, `DLFCN`, `TYPES`, `CDIO`, and `STROPTS` modules have been removed. They had been available in the platform specific `Lib/plat-*/` directories, but were chronically out of date, inconsistently available across platforms, and unmaintained. The script that created these modules is still available in the source distribution at [Tools/scripts/h2py.py](https://github.com/python/cpython/blob/v3.6.15/Tools/scripts/h2py.py) [https://github.com/python/cpython/blob/v3.6.15/Tools/scripts/h2py.py].
- The deprecated `asynchat.fifo` class has been removed.

## Porting to Python 3.6

This section lists previously described changes and other bugfixes that may require changes to your code.

### Changes in ‘python’ Command Behavior

- The output of a special Python build with defined `COUNT_ALLOCS`, `SHOW_ALLOC_COUNT` or `SHOW_TRACK_COUNT` macros is now off by default. It can be re-enabled using the `-X showalloccount` option. It now outputs to `stderr` instead of `stdout`. (Contributed by Serhiy Storchaka in [bpo-23034](https://bugs.python.org/issue?@action=redirect&bpo=23034) [https://bugs.python.org/issue?@action=redirect&bpo=23034].)

### Changes in the Python API

- `open()` will no longer allow combining the `'U'` mode flag

with `'+'`. (Contributed by Jeff Balogh and John O'Connor in [bpo-2091](https://bugs.python.org/issue?@action=redirect&bpo=2091) [https://bugs.python.org/issue?@action=redirect&bpo=2091].)

- `sqlite3` no longer implicitly commits an open transaction before DDL statements.
- On Linux, `os.urandom()` now blocks until the system urandom entropy pool is initialized to increase the security.
- When `importlib.abc.Loader.exec_module()` is defined, `importlib.abc.Loader.create_module()` must also be defined.
- `PyErr_SetImportError()` now sets `TypeError` when its `msg` argument is not set. Previously only `NULL` was returned.
- The format of the `co_lnotab` attribute of code objects changed to support a negative line number delta. By default, Python does not emit bytecode with a negative line number delta. Functions using `frame.f_lineno`, `PyFrame_GetLineNumber()` or `PyCode_Addr2Line()` are not affected. Functions directly decoding `co_lnotab` should be updated to use a signed 8-bit integer type for the line number delta, but this is only required to support applications using a negative line number delta. See `Objects/lnotab_notes.txt` for the `co_lnotab` format and how to decode it, and see the [PEP 511](https://peps.python.org/pep-0511/) [https://peps.python.org/pep-0511/] for the rationale.
- The functions in the `compileall` module now return booleans instead of `1` or `0` to represent success or failure, respectively. Thanks to booleans being a subclass of integers, this should only be an issue if you were doing identity checks for `1` or `0`. See [bpo-25768](https://bugs.python.org/issue?@action=redirect&bpo=25768) [https://bugs.python.org/issue?@action=redirect&bpo=25768].
- Reading the `port` attribute of `urllib.parse.urlsplit()` and `urlparse()` results now raises `ValueError` for out-of-range values, rather than returning `None`. See [bpo-20059](https://bugs.python.org/issue?@action=redirect&bpo=20059) [https://bugs.python.org/issue?@action=redirect&bpo=20059].

@action=redirect&bpo=20059].

- The `imp` module now raises a `DeprecationWarning` instead of `PendingDeprecationWarning`.
- The following modules have had missing APIs added to their `__all__` attributes to match the documented APIs: `calendar`, `cgi`, `csv`, `ElementTree`, `enum`, `fileinput`, `ftplib`, `logging`, `mailbox`, `mimetypes`, `optparse`, `plistlib`, `smtpd`, `subprocess`, `tarfile`, `threading` and `wave`. This means they will export new symbols when `import *` is used. (Contributed by Joel Taddei and Jacek Kołodziej in [bpo-23883](https://bugs.python.org/issue?@action=redirect&bpo=23883) [https://bugs.python.org/issue?@action=redirect&bpo=23883].)
- When performing a relative import, if `__package__` does not compare equal to `__spec__.parent` then `ImportWarning` is raised. (Contributed by Brett Cannon in [bpo-25791](https://bugs.python.org/issue?@action=redirect&bpo=25791) [https://bugs.python.org/issue?@action=redirect&bpo=25791].)
- When a relative import is performed and no parent package is known, then `ImportError` will be raised. Previously, `SystemError` could be raised. (Contributed by Brett Cannon in [bpo-18018](https://bugs.python.org/issue?@action=redirect&bpo=18018) [https://bugs.python.org/issue?@action=redirect&bpo=18018].)
- Servers based on the `socketserver` module, including those defined in `http.server`, `xmlrpc.server` and `wsgiref.simple_server`, now only catch exceptions derived from `Exception`. Therefore if a request handler raises an exception like `SystemExit` or `KeyboardInterrupt`, `handle_error()` is no longer called, and the exception will stop a single-threaded server. (Contributed by Martin Panter in [bpo-23430](https://bugs.python.org/issue?@action=redirect&bpo=23430) [https://bugs.python.org/issue?@action=redirect&bpo=23430].)
- `spwd.getspnam()` now raises a `PermissionError` instead of `KeyError` if the user doesn't have privileges.
- The `socket.socket.close()` method now raises an

exception if an error (e.g. `EBADF`) was reported by the underlying system call. (Contributed by Martin Panter in [bpo-26685](https://bugs.python.org/issue?@action=redirect&bpo=26685) [https://bugs.python.org/issue?@action=redirect&bpo=26685].)

- The `decode_data` argument for the `smtpd.SMTPChannel` and `smtpd.SMTPServer` constructors is now `False` by default. This means that the argument passed to `process_message()` is now a bytes object by default, and `process_message()` will be passed keyword arguments. Code that has already been updated in accordance with the deprecation warning generated by 3.5 will not be affected.
- All optional arguments of the `dump()`, `dumps()`, `load()` and `loads()` functions and `JSONEncoder` and `JSONDecoder` class constructors in the `json` module are now **keyword-only**. (Contributed by Serhiy Storchaka in [bpo-18726](https://bugs.python.org/issue?@action=redirect&bpo=18726) [https://bugs.python.org/issue?@action=redirect&bpo=18726].)
- Subclasses of `type` which don't override `type.__new__` may no longer use the one-argument form to get the type of an object.
- As part of [PEP 487](https://peps.python.org/pep-0487/) [https://peps.python.org/pep-0487/], the handling of keyword arguments passed to `type` (other than the metaclass hint, `metaclass`) is now consistently delegated to `object.__init_subclass__()`. This means that `type.__new__()` and `type.__init__()` both now accept arbitrary keyword arguments, but `object.__init_subclass__()` (which is called from `type.__new__()`) will reject them by default. Custom metaclasses accepting additional keyword arguments will need to adjust their calls to `type.__new__()` (whether direct or via `super`) accordingly.
- In `distutils.command.sdist.sdist`, the `default_format` attribute has been removed and is no longer honored. Instead, the gzipped tarfile format is the default on all platforms and no platform-specific selection is made. In environments where distributions are built on

Windows and zip distributions are required, configure the project with a `setup.cfg` file containing the following:

```
[sdist]
formats=zip
```

This behavior has also been backported to earlier Python versions by Setuptools 26.0.0.

- In the `urllib.request` module and the `http.client.HTTPConnection.request()` method, if no Content-Length header field has been specified and the request body is a file object, it is now sent with HTTP 1.1 chunked encoding. If a file object has to be sent to a HTTP 1.0 server, the Content-Length value now has to be specified by the caller. (Contributed by Demian Brecht and Rolf Krahel with tweaks from Martin Panter in [bpo-12319](https://bugs.python.org/issue?@action=redirect&bpo=12319) [https://bugs.python.org/issue?@action=redirect&bpo=12319].)
- The `DictReader` now returns rows of type `OrderedDict`. (Contributed by Steve Holden in [bpo-27842](https://bugs.python.org/issue?@action=redirect&bpo=27842) [https://bugs.python.org/issue?@action=redirect&bpo=27842].)
- The `crypt.METHOD_CRYPT` will no longer be added to `crypt.methods` if unsupported by the platform. (Contributed by Victor Stinner in [bpo-25287](https://bugs.python.org/issue?@action=redirect&bpo=25287) [https://bugs.python.org/issue?@action=redirect&bpo=25287].)
- The *verbose* and *rename* arguments for `namedtuple()` are now keyword-only. (Contributed by Raymond Hettinger in [bpo-25628](https://bugs.python.org/issue?@action=redirect&bpo=25628) [https://bugs.python.org/issue?@action=redirect&bpo=25628].)
- On Linux, `ctypes.util.find_library()` now looks in `LD_LIBRARY_PATH` for shared libraries. (Contributed by Vinay Sajip in [bpo-9998](https://bugs.python.org/issue?@action=redirect&bpo=9998) [https://bugs.python.org/issue?@action=redirect&bpo=9998].)
- The `imaplib.IMAP4` class now handles flags containing the `' ] '` character in messages sent from the server to improve real-world compatibility. (Contributed by Lita Cho in

[bpo-21815](https://bugs.python.org/issue?@action=redirect&bpo=21815) [<https://bugs.python.org/issue?@action=redirect&bpo=21815>].)

- The **mmap.write()** function now returns the number of bytes written like other write methods. (Contributed by Jakub Stasiak in [bpo-26335](https://bugs.python.org/issue?@action=redirect&bpo=26335) [<https://bugs.python.org/issue?@action=redirect&bpo=26335>].)
- The **pkgutil.iter\_modules()** and **pkgutil.walk\_packages()** functions now return **ModuleInfo** named tuples. (Contributed by Ramchandra Apte in [bpo-17211](https://bugs.python.org/issue?@action=redirect&bpo=17211) [<https://bugs.python.org/issue?@action=redirect&bpo=17211>].)
- **re.sub()** now raises an error for invalid numerical group references in replacement templates even if the pattern is not found in the string. The error message for invalid group references now includes the group index and the position of the reference. (Contributed by SilentGhost, Serhiy Storchaka in [bpo-25953](https://bugs.python.org/issue?@action=redirect&bpo=25953) [<https://bugs.python.org/issue?@action=redirect&bpo=25953>].)
- **zipfile.ZipFile** will now raise **NotImplementedError** for unrecognized compression values. Previously a plain **RuntimeError** was raised. Additionally, calling **ZipFile** methods on a closed **ZipFile** or calling the **write()** method on a **ZipFile** created with mode 'r' will raise a **ValueError**. Previously, a **RuntimeError** was raised in those scenarios.
- when custom metaclasses are combined with zero-argument **super()** or direct references from methods to the implicit `__class__` closure variable, the implicit `__classcell__` namespace entry must now be passed up to `type.__new__` for initialisation. Failing to do so will result in a **DeprecationWarning** in Python 3.6 and a **RuntimeError** in Python 3.8.
- With the introduction of **ModuleNotFoundError**, import system consumers may start expecting import system replacements to raise that more specific exception when

appropriate, rather than the less-specific `ImportError`. To provide future compatibility with such consumers, implementors of alternative import systems that completely replace `__import__()` will need to update their implementations to raise the new subclass when a module can't be found at all. Implementors of compliant plugins to the default import system shouldn't need to make any changes, as the default import system will raise the new subclass when appropriate.

## Changes in the C API

- The `PyMem_Malloc()` allocator family now uses the `pymalloc` allocator rather than the system `malloc()`. Applications calling `PyMem_Malloc()` without holding the GIL can now crash. Set the `PYTHONMALLOC` environment variable to `debug` to validate the usage of memory allocators in your application. See [bpo-26249](https://bugs.python.org/issue?@action=redirect&bpo=26249) [https://bugs.python.org/issue?@action=redirect&bpo=26249].
- `Py_Exit()` (and the main interpreter) now override the exit status with 120 if flushing buffered data failed. See [bpo-5319](https://bugs.python.org/issue?@action=redirect&bpo=5319) [https://bugs.python.org/issue?@action=redirect&bpo=5319].

## CPython bytecode changes

There have been several major changes to the `bytecode` in Python 3.6.

- The Python interpreter now uses a 16-bit wordcode instead of bytecode. (Contributed by Demur Rumed with input and reviews from Serhiy Storchaka and Victor Stinner in [bpo-26647](https://bugs.python.org/issue?@action=redirect&bpo=26647) [https://bugs.python.org/issue?@action=redirect&bpo=26647] and [bpo-28050](https://bugs.python.org/issue?@action=redirect&bpo=28050) [https://bugs.python.org/issue?@action=redirect&bpo=28050].)
- The new `FORMAT_VALUE` and `BUILD_STRING` opcodes as part of the `formatted string literal` implementation. (Contributed by Eric Smith in [bpo-25483](https://bugs.python.org/issue?@action=redirect&bpo=25483) [https://bugs.python.org/issue?@action=redirect&bpo=25483] and Serhiy Storchaka in [bpo-27078](https://bugs.python.org/issue?@action=redirect&bpo=27078) [https://bugs.python.org/issue?@action=redirect&bpo=27078].)

- The new **BUILD\_CONST\_KEY\_MAP** opcode to optimize the creation of dictionaries with constant keys. (Contributed by Serhiy Storchaka in [bpo-27140](https://bugs.python.org/issue?@action=redirect&bpo=27140) [https://bugs.python.org/issue?@action=redirect&bpo=27140].)
- The function call opcodes have been heavily reworked for better performance and simpler implementation. The **MAKE\_FUNCTION**, **CALL\_FUNCTION**, **CALL\_FUNCTION\_KW** and **BUILD\_MAP\_UNPACK\_WITH\_CALL** opcodes have been modified, the new **CALL\_FUNCTION\_EX** and **BUILD\_TUPLE\_UNPACK\_WITH\_CALL** have been added, and **CALL\_FUNCTION\_VAR**, **CALL\_FUNCTION\_VAR\_KW** and **MAKE\_CLOSURE** opcodes have been removed. (Contributed by Demur Rumed in [bpo-27095](https://bugs.python.org/issue?@action=redirect&bpo=27095) [https://bugs.python.org/issue?@action=redirect&bpo=27095], and Serhiy Storchaka in [bpo-27213](https://bugs.python.org/issue?@action=redirect&bpo=27213) [https://bugs.python.org/issue?@action=redirect&bpo=27213], [bpo-28257](https://bugs.python.org/issue?@action=redirect&bpo=28257) [https://bugs.python.org/issue?@action=redirect&bpo=28257].)
- The new **SETUP\_ANNOTATIONS** and **STORE\_ANNOTATION** opcodes have been added to support the new [variable annotation](#) syntax. (Contributed by Ivan Levkivskiy in [bpo-27985](https://bugs.python.org/issue?@action=redirect&bpo=27985) [https://bugs.python.org/issue?@action=redirect&bpo=27985].)

## Notable changes in Python 3.6.2

### New `make regen-all` build target

To simplify cross-compilation, and to ensure that CPython can reliably be compiled without requiring an existing version of Python to already be available, the autotools-based build system no longer attempts to implicitly recompile generated files based on file modification times.

Instead, a new `make regen-all` command has been added to force regeneration of these files when desired (e.g. after an initial version of Python has already been built based on the pregenerated versions).

More selective regeneration targets are also defined - see [Makefile.pre.in](https://github.com/python/cpython/tree/3.11/Makefile.pre.in) [https://github.com/python/cpython/tree/3.11/Makefile.pre.in]

for details.

(Contributed by Victor Stinner in [bpo-23404](https://bugs.python.org/issue?@action=redirect&bpo=23404) [https://bugs.python.org/issue?@action=redirect&bpo=23404].)

*New in version 3.6.2.*

## Removal of `make touch` build target

The `make touch` build target previously used to request implicit regeneration of generated files by updating their modification times has been removed.

It has been replaced by the new `make regen-all` target.

(Contributed by Victor Stinner in [bpo-23404](https://bugs.python.org/issue?@action=redirect&bpo=23404) [https://bugs.python.org/issue?@action=redirect&bpo=23404].)

*Changed in version 3.6.2.*

## Notable changes in Python 3.6.4

The `PyExc_RecursionErrorInst` singleton that was part of the public API has been removed as its members being never cleared may cause a segfault during finalization of the interpreter.

(Contributed by Xavier de Gaye in [bpo-22898](https://bugs.python.org/issue?@action=redirect&bpo=22898) [https://bugs.python.org/issue?@action=redirect&bpo=22898] and [bpo-30697](https://bugs.python.org/issue?@action=redirect&bpo=30697) [https://bugs.python.org/issue?@action=redirect&bpo=30697].)

## Notable changes in Python 3.6.5

The `locale.localeconv()` function now sets temporarily the `LC_CTYPE` locale to the `LC_NUMERIC` locale in some cases.

(Contributed by Victor Stinner in [bpo-31900](https://bugs.python.org/issue?@action=redirect&bpo=31900) [https://bugs.python.org/issue?@action=redirect&bpo=31900].)

## Notable changes in Python 3.6.7

In 3.6.7 the `tokenize` module now implicitly emits a `NEWLINE`

token when provided with input that does not have a trailing new line. This behavior now matches what the C tokenizer does internally. (Contributed by Ammar Askar in [bpo-33899](https://bugs.python.org/issue?@action=redirect&bpo=33899) [https://bugs.python.org/issue?@action=redirect&bpo=33899].)

## Notable changes in Python 3.6.10

Due to significant security concerns, the *reuse\_address* parameter of [`asyncio.loop.create\_datagram\_endpoint\(\)`](#) is no longer supported. This is because of the behavior of the socket option `SO_REUSEADDR` in UDP. For more details, see the documentation for `loop.create_datagram_endpoint()`. (Contributed by Kyle Stanley, Antoine Pitrou, and Yuri Selivanov in [bpo-37228](https://bugs.python.org/issue?@action=redirect&bpo=37228) [https://bugs.python.org/issue?@action=redirect&bpo=37228].)

## Notable changes in Python 3.6.13

Earlier Python versions allowed using both `;` and `&` as query parameter separators in [`urllib.parse.parse\_qs\(\)`](#) and [`urllib.parse.parse\_qs1\(\)`](#). Due to security concerns, and to conform with newer W3C recommendations, this has been changed to allow only a single separator key, with `&` as the default. This change also affects [`cgi.parse\(\)`](#) and [`cgi.parse\_multipart\(\)`](#) as they use the affected functions internally. For more details, please see their respective documentation. (Contributed by Adam Goldschmidt, Senthil Kumaran and Ken Jin in [bpo-42967](https://bugs.python.org/issue?@action=redirect&bpo=42967) [https://bugs.python.org/issue?@action=redirect&bpo=42967].)

# What's New In Python 3.5

## Editors

Elvis Pranskevichus <[elvis@magic.io](mailto:elvis@magic.io)>, Yury Selivanov <[yury@magic.io](mailto:yury@magic.io)>

This article explains the new features in Python 3.5, compared to 3.4. Python 3.5 was released on September 13, 2015. See the [changelog](https://docs.python.org/3.5/whatsnew/changelog.html) [https://docs.python.org/3.5/whatsnew/changelog.html] for a full list of changes.

**PEP 478** [https://peps.python.org/pep-0478/] - Python 3.5 Release Schedule

## Summary – Release highlights

New syntax features:

- [PEP 492](#), coroutines with `async` and `await` syntax.
- [PEP 465](#), a new matrix multiplication operator: `a @ b`.
- [PEP 448](#), additional unpacking generalizations.

New library modules:

- **typing**: [PEP 484 – Type Hints](#).
- **zipapp**: [PEP 441 Improving Python ZIP Application Support](#).

New built-in features:

- `bytes % args`, `bytearray % args`: [PEP 461 – Adding % formatting to bytes and bytearray](#).
- New [bytes.hex\(\)](#), [bytearray.hex\(\)](#) and [memoryview.hex\(\)](#) methods. (Contributed by Arnon Yaari)

in [bpo-9951](https://bugs.python.org/issue?@action=redirect&bpo=9951) [[https://bugs.python.org/issue?](https://bugs.python.org/issue?@action=redirect&bpo=9951)

[@action=redirect&bpo=9951](https://bugs.python.org/issue?@action=redirect&bpo=9951)].)

- [memoryview](#) now supports tuple indexing (including multi-dimensional). (Contributed by Antoine Pitrou in [bpo-23632](https://bugs.python.org/issue?@action=redirect&bpo=23632) [<https://bugs.python.org/issue?@action=redirect&bpo=23632>].)
- Generators have a new `gi_yieldfrom` attribute, which returns the object being iterated by `yield from` expressions. (Contributed by Benno Leslie and Yuri Selivanov in [bpo-24450](https://bugs.python.org/issue?@action=redirect&bpo=24450) [[https://bugs.python.org/issue?](https://bugs.python.org/issue?@action=redirect&bpo=24450) [@action=redirect&bpo=24450](https://bugs.python.org/issue?@action=redirect&bpo=24450)].)
- A new [RecursionError](#) exception is now raised when maximum recursion depth is reached. (Contributed by Georg Brandl in [bpo-19235](https://bugs.python.org/issue?@action=redirect&bpo=19235) [[https://bugs.python.org/issue?](https://bugs.python.org/issue?@action=redirect&bpo=19235) [@action=redirect&bpo=19235](https://bugs.python.org/issue?@action=redirect&bpo=19235)].)

### CPython implementation improvements:

- When the `LC_TYPE` locale is the POSIX locale (C locale), [sys.stdin](#) and [sys.stdout](#) now use the `surrogateescape` error handler, instead of the `strict` error handler. (Contributed by Victor Stinner in [bpo-19977](https://bugs.python.org/issue?@action=redirect&bpo=19977) [<https://bugs.python.org/issue?@action=redirect&bpo=19977>].)
- `.pyo` files are no longer used and have been replaced by a more flexible scheme that includes the optimization level explicitly in `.pyc` name. (See [PEP 488 overview](#).)
- Builtin and extension modules are now initialized in a multi-phase process, which is similar to how Python modules are loaded. (See [PEP 489 overview](#).)

### Significant improvements in the standard library:

- [collections.OrderedDict](#) is now [implemented in C](#), which makes it 4 to 100 times faster.
- The [ssl](#) module gained [support for Memory BIO](#), which decouples SSL protocol handling from network IO.
- The new [os.scandir\(\)](#) function provides a [better and significantly faster way](#) of directory traversal.
- [functools.lru\\_cache\(\)](#) has been mostly [reimplemented in C](#), yielding much better performance.
- The new [subprocess.run\(\)](#) function provides a [streamlined way to run subprocesses](#).

- The **traceback** module has been significantly **enhanced** for improved performance and developer convenience.

#### Security improvements:

- SSLv3 is now disabled throughout the standard library. It can still be enabled by instantiating a **ssl.SSLContext** manually. (See [bpo-22638](https://bugs.python.org/issue?@action=redirect&bpo=22638) [https://bugs.python.org/issue?@action=redirect&bpo=22638] for more details; this change was backported to CPython 3.4 and 2.7.)
- HTTP cookie parsing is now stricter, in order to protect against potential injection attacks. (Contributed by Antoine Pitrou in [bpo-22796](https://bugs.python.org/issue?@action=redirect&bpo=22796) [https://bugs.python.org/issue?@action=redirect&bpo=22796].)

#### Windows improvements:

- A new installer for Windows has replaced the old MSI. See [Using Python on Windows](#) for more information.
- Windows builds now use Microsoft Visual C++ 14.0, and extension modules should use the same.

Please read on for a comprehensive list of user-facing changes, including many other smaller improvements, CPython optimizations, deprecations, and potential porting issues.

## New Features

### PEP 492 - Coroutines with **async** and **await** syntax

**PEP 492** [https://peps.python.org/pep-0492/] greatly improves support for asynchronous programming in Python by adding **awaitable objects**, **coroutine functions**, **asynchronous iteration**, and **asynchronous context managers**.

Coroutine functions are declared using the new **async def** syntax:

```
>>> async def coro():  
...     return 'spam'
```

Inside a coroutine function, the new `await` expression can be used to suspend coroutine execution until the result is available. Any object can be *awaited*, as long as it implements the `awaitable` protocol by defining the `__await__()` method.

PEP 492 also adds `async for` statement for convenient iteration over asynchronous iterables.

An example of a rudimentary HTTP client written using the new syntax:

```
import asyncio

async def http_get(domain):
    reader, writer = await asyncio.open_connection(domain)

    writer.write(b'\r\n'.join([
        b'GET / HTTP/1.1',
        b'Host: %b' % domain.encode('latin-1'),
        b'Connection: close',
        b'', b''
    ]))

    async for line in reader:
        print('>>>', line)

    writer.close()

loop = asyncio.get_event_loop()
try:
    loop.run_until_complete(http_get('example.com'))
finally:
    loop.close()
```

Similarly to asynchronous iteration, there is a new syntax for asynchronous context managers. The following script:

```
import asyncio

async def coro(name, lock):
```

```
print('coro {}: waiting for lock'.format(name))
async with lock:
    print('coro {}: holding the lock'.format(name))
    await asyncio.sleep(1)
    print('coro {}: releasing the lock'.format(name))

loop = asyncio.get_event_loop()
lock = asyncio.Lock()
coros = asyncio.gather(coro(1, lock), coro(2, lock))
try:
    loop.run_until_complete(coros)
finally:
    loop.close()
```

will output:

```
coro 2: waiting for lock
coro 2: holding the lock
coro 1: waiting for lock
coro 2: releasing the lock
coro 1: holding the lock
coro 1: releasing the lock
```

Note that both **async for** and **async with** can only be used inside a coroutine function declared with **async def**.

Coroutine functions are intended to be run inside a compatible event loop, such as the [asyncio loop](#).

## Note

*Changed in version 3.5.2:* Starting with CPython 3.5.2, `__aiter__` can directly return [asynchronous iterators](#). Returning an [awaitable](#) object will result in a **PendingDeprecationWarning**.

See more details in the [Asynchronous Iterators](#) documentation section.

**PEP 492** [<https://peps.python.org/pep-0492/>] – Coroutines with **async** and **await** syntax

PEP written and implemented by Yuri Selivanov.

## PEP 465 - A dedicated infix operator for matrix multiplication

**PEP 465** [<https://peps.python.org/pep-0465/>] adds the `@` infix operator for matrix multiplication. Currently, no builtin Python types implement the new operator, however, it can be implemented by defining `__matmul__()`, `__rmatmul__()`, and `__imatmul__()` for regular, reflected, and in-place matrix multiplication. The semantics of these methods is similar to that of methods defining other infix arithmetic operators.

Matrix multiplication is a notably common operation in many fields of mathematics, science, engineering, and the addition of `@` allows writing cleaner code:

```
S = (H @ beta - r).T @ inv(H @ V @ H.T) @ (H @ beta - r)
```

instead of:

```
S = dot((dot(H, beta) - r).T,  
        dot(inv(dot(dot(H, V), H.T)), dot(H, beta) - r))
```

NumPy 1.10 has support for the new operator:

```
>>> import numpy
```

```
>>> x = numpy.ones(3)
```

```
>>> x
```

```
array([ 1.,  1.,  1.])
```

```
>>> m = numpy.eye(3)
```

```
>>> m
```

```
array([[ 1.,  0.,  0.],  
       [ 0.,  1.,  0.]
```

```
[ 0., 0., 1.]])  
  
>>> x @ m  
array([ 1., 1., 1.]])
```

## See also

### **PEP 465** [<https://peps.python.org/pep-0465/>] – A dedicated infix operator for matrix multiplication

PEP written by Nathaniel J. Smith; implemented by Benjamin Peterson.

## PEP 448 - Additional Unpacking Generalizations

**PEP 448** [<https://peps.python.org/pep-0448/>] extends the allowed uses of the `*` iterable unpacking operator and `**` dictionary unpacking operator. It is now possible to use an arbitrary number of unpackings in [function calls](#):

```
>>> print(*[1], *[2], 3, *[4, 5])  
1 2 3 4 5  
  
>>> def fn(a, b, c, d):  
...     print(a, b, c, d)  
...  
  
>>> fn(**{'a': 1, 'c': 3}, **{'b': 2, 'd': 4})  
1 2 3 4
```

Similarly, tuple, list, set, and dictionary displays allow multiple unpackings (see [Expression lists](#) and [Dictionary displays](#)):

```
>>> *range(4), 4  
(0, 1, 2, 3, 4)  
  
>>> [*range(4), 4]  
[0, 1, 2, 3, 4]  
  
>>> {*range(4), 4, *(5, 6, 7)}
```

```
{0, 1, 2, 3, 4, 5, 6, 7}
```

```
>>> {'x': 1, **{'y': 2}}  
{'x': 1, 'y': 2}
```

## See also

### **PEP 448** [<https://peps.python.org/pep-0448/>] – **Additional Unpacking Generalizations**

PEP written by Joshua Landau; implemented by Neil Girdhar, Thomas Wouters, and Joshua Landau.

## **PEP 461 - percent formatting support for bytes and bytearray**

**PEP 461** [<https://peps.python.org/pep-0461/>] adds support for the `%` **interpolation operator** to **bytes** and **bytearray**.

While interpolation is usually thought of as a string operation, there are cases where interpolation on `bytes` or `bytearrays` makes sense, and the work needed to make up for this missing functionality detracts from the overall readability of the code. This issue is particularly important when dealing with wire format protocols, which are often a mixture of binary and ASCII compatible text.

### Examples:

```
>>> b'Hello %b!' % b'World'  
b'Hello World!'
```

```
>>> b'x=%i y=%f' % (1, 2.5)  
b'x=1 y=2.500000'
```

Unicode is not allowed for `%b`, but it is accepted by `%a` (equivalent of `repr(obj).encode('ascii', 'backslashreplace')`):

```
>>> b'Hello %b!' % 'World'  
Traceback (most recent call last):
```

```
File "<stdin>", line 1, in <module>
TypeError: %b requires bytes, or an object that implements
the buffer interface

>>> b'price: %a' % '10€'
b'price: '10\\u20ac''
```

Note that `%s` and `%r` conversion types, although supported, should only be used in codebases that need compatibility with Python 2.

PEP written by Ethan Furman; implemented by Neil Schemenauer and Ethan Furman.

## PEP 484 - Type Hints

Function annotation syntax has been a Python feature since version 3.0 (**PEP 3107** [<https://peps.python.org/pep-3107/>]), however the semantics of annotations has been left undefined.

Experience has shown that the majority of function annotation uses were to provide type hints to function parameters and return values. It became evident that it would be beneficial for Python users, if the standard library included the base definitions and tools for type annotations.

**PEP 484** [<https://peps.python.org/pep-0484/>] introduces a **provisional module** to provide these standard definitions and tools, along with some conventions for situations where annotations are not available.

For example, here is a simple function whose argument and return type are declared in the annotations:

```
def greeting(name: str) -> str:
    return 'Hello ' + name
```

While these annotations are available at runtime through the usual

`__annotations__` attribute, *no automatic type checking happens at runtime*. Instead, it is assumed that a separate off-line type checker (e.g. `mypy` [<https://mypy-lang.org>]) will be used for on-demand source code analysis.

The type system supports unions, generic types, and a special type named `Any` which is consistent with (i.e. assignable to and from) all types.

PEP written by Guido van Rossum

## PEP 471 - `os.scandir()` function – a better and faster directory iterator

**PEP 471** [<https://peps.python.org/pep-0471/>] adds a new directory iteration function, `os.scandir()`, to the standard library. Additionally, `os.walk()` is now implemented using `scandir`, which makes it 3 to 5 times faster on POSIX systems and 7 to 20 times faster on Windows systems. This is largely achieved by greatly reducing the number of calls to `os.stat()` required to walk a directory tree.

Additionally, `scandir` returns an iterator, as opposed to returning a list of file names, which improves memory efficiency when iterating over very large directories.

The following example shows a simple use of `os.scandir()` to display all the files (excluding directories) in the given *path* that don't start with `'.'`. The `entry.is_file()` call will generally

not make an additional system call:

```
for entry in os.scandir(path):
    if not entry.name.startswith('.') and entry.is_file():
        print(entry.name)
```

## See also

**PEP 471** [<https://peps.python.org/pep-0471/>] – **os.scandir()**

**function – a better and faster directory iterator**

PEP written and implemented by Ben Hoyt with the help of Victor Stinner.

## PEP 475: Retry system calls failing with EINTR

An **errno.EINTR** error code is returned whenever a system call, that is waiting for I/O, is interrupted by a signal. Previously, Python would raise **InterruptedError** in such cases. This meant that, when writing a Python application, the developer had two choices:

1. Ignore the `InterruptedError`.
2. Handle the `InterruptedError` and attempt to restart the interrupted system call at every call site.

The first option makes an application fail intermittently. The second option adds a large amount of boilerplate that makes the code nearly unreadable. Compare:

```
print("Hello World")
```

and:

```
while True:
    try:
        print("Hello World")
        break
    except InterruptedError:
        continue
```

**PEP 475** [<https://peps.python.org/pep-0475/>] implements automatic retry

of system calls on `EINTR`. This removes the burden of dealing with `EINTR` or `InterruptedError` in user code in most situations and makes Python programs, including the standard library, more robust. Note that the system call is only retried if the signal handler does not raise an exception.

Below is a list of functions which are now retried when interrupted by a signal:

- `open()` and `io.open()`;
- functions of the `faulthandler` module;
- `os` functions: `fchdir()`, `fchmod()`, `fchown()`, `fdatasync()`, `fstat()`, `fstatvfs()`, `fsync()`, `ftruncate()`, `mkfifo()`, `mknod()`, `open()`, `posix_fadvise()`, `posix_fallocate()`, `pread()`, `pwrite()`, `read()`, `readv()`, `sendfile()`, `wait3()`, `wait4()`, `wait()`, `waitid()`, `waitpid()`, `write()`, `writew()`;
- special cases: `os.close()` and `os.dup2()` now ignore `EINTR` errors; the syscall is not retried (see the PEP for the rationale);
- `select` functions: `devpoll.poll()`, `epoll.poll()`, `kqueue.control()`, `poll.poll()`, `select()`;
- methods of the `socket` class: `accept()`, `connect()` (except for non-blocking sockets), `recv()`, `recvfrom()`, `recvmsg()`, `send()`, `sendall()`, `sendmsg()`, `sendto()`;
- `signal.sigtimedwait()` and `signal.sigwaitinfo()`;
- `time.sleep()`.

See also

**PEP 475** [<https://peps.python.org/pep-0475/>] – Retry system calls failing with `EINTR`

PEP and implementation written by Charles-François Natali and Victor Stinner, with the help of Antoine Pitrou (the French connection).

**PEP 479: Change StopIteration handling inside**

## generators

The interaction of generators and `StopIteration` in Python 3.4 and earlier was sometimes surprising, and could conceal obscure bugs. Previously, `StopIteration` raised accidentally inside a generator function was interpreted as the end of the iteration by the loop construct driving the generator.

**PEP 479** [<https://peps.python.org/pep-0479/>] changes the behavior of generators: when a `StopIteration` exception is raised inside a generator, it is replaced with a `RuntimeError` before it exits the generator frame. The main goal of this change is to ease debugging in the situation where an unguarded `next()` call raises `StopIteration` and causes the iteration controlled by the generator to terminate silently. This is particularly pernicious in combination with the `yield from` construct.

This is a backwards incompatible change, so to enable the new behavior, a `__future__` import is necessary:

```
>>> from __future__ import generator_stop

>>> def gen():
...     next(iter([]))
...     yield
...
>>> next(gen())
Traceback (most recent call last):
  File "<stdin>", line 2, in gen
StopIteration
```

The above exception was the direct cause of the following:

```
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
RuntimeError: generator raised StopIteration
```

Without a `__future__` import, a **PendingDeprecationWarning** will be raised whenever a `StopIteration` exception is raised inside a generator.

See also

**PEP 479** [<https://peps.python.org/pep-0479/>] – **Change  
StopIteration handling inside generators**

PEP written by Chris Angelico and Guido van Rossum.  
Implemented by Chris Angelico, Yury Selivanov and Nick  
Coghlan.

## PEP 485: A function for testing approximate equality

**PEP 485** [<https://peps.python.org/pep-0485/>] adds the `math.isclose()` and `cmath.isclose()` functions which tell whether two values are approximately equal or “close” to each other. Whether or not two values are considered close is determined according to given absolute and relative tolerances. Relative tolerance is the maximum allowed difference between `isclose` arguments, relative to the larger absolute value:

```
>>> import math
>>> a = 5.0
>>> b = 4.99998
>>> math.isclose(a, b, rel_tol=1e-5)
True
>>> math.isclose(a, b, rel_tol=1e-6)
False
```

It is also possible to compare two values using absolute tolerance, which must be a non-negative value:

```
>>> import math
>>> a = 5.0
>>> b = 4.99998
>>> math.isclose(a, b, abs_tol=0.00003)
True
>>> math.isclose(a, b, abs_tol=0.00001)
False
```

See also

**PEP 485** [<https://peps.python.org/pep-0485/>] – A function for testing approximate equality

PEP written by Christopher Barker; implemented by Chris Barker and Tal Einat.

## **PEP 486: Make the Python Launcher aware of virtual environments**

**PEP 486** [<https://peps.python.org/pep-0486/>] makes the Windows launcher (see **PEP 397** [<https://peps.python.org/pep-0397/>]) aware of an active virtual environment. When the default interpreter would be used and the `VIRTUAL_ENV` environment variable is set, the interpreter in the virtual environment will be used.

See also

**PEP 486** [<https://peps.python.org/pep-0486/>] – Make the Python Launcher aware of virtual environments

PEP written and implemented by Paul Moore.

## **PEP 488: Elimination of PYO files**

**PEP 488** [<https://peps.python.org/pep-0488/>] does away with the concept of `.pyo` files. This means that `.pyc` files represent both unoptimized and optimized bytecode. To prevent the need to constantly regenerate bytecode files, `.pyc` files now have an optional `opt-` tag in their name when the bytecode is optimized. This has the side-effect of no more bytecode file name clashes when running under either `-O` or `-OO`. Consequently, bytecode files generated from `-O`, and `-OO` may now exist simultaneously. `importlib.util.cache_from_source()` has an updated API to help with this change.

See also

**PEP 488** [<https://peps.python.org/pep-0488/>] – Elimination of PYO files

PEP written and implemented by Brett Cannon.

## PEP 489: Multi-phase extension module initialization

**PEP 489** [<https://peps.python.org/pep-0489/>] updates extension module initialization to take advantage of the two step module loading mechanism introduced by **PEP 451** [<https://peps.python.org/pep-0451/>] in Python 3.4.

This change brings the import semantics of extension modules that opt-in to using the new mechanism much closer to those of Python source and bytecode modules, including the ability to use any valid identifier as a module name, rather than being restricted to ASCII.

See also

**PEP 489** [<https://peps.python.org/pep-0489/>] – Multi-phase extension module initialization

PEP written by Petr Viktorin, Stefan Behnel, and Nick Coghlan; implemented by Petr Viktorin.

## Other Language Changes

Some smaller changes made to the core Python language are:

- Added the "namereplace" error handlers. The "backslashreplace" error handlers now work with decoding and translating. (Contributed by Serhiy Storchaka in [bpo-19676](https://bugs.python.org/issue?@action=redirect&bpo=19676) [<https://bugs.python.org/issue?@action=redirect&bpo=19676>] and [bpo-22286](https://bugs.python.org/issue?@action=redirect&bpo=22286) [<https://bugs.python.org/issue?@action=redirect&bpo=22286>].)
- The `-b` option now affects comparisons of `bytes` with `int`. (Contributed by Serhiy Storchaka in [bpo-23681](https://bugs.python.org/issue?@action=redirect&bpo=23681) [<https://bugs.python.org/issue?@action=redirect&bpo=23681>].)
- New Kazakh `kz1048` and Tajik `koi8_t` codecs. (Contributed by Serhiy Storchaka in [bpo-22682](https://bugs.python.org/issue?@action=redirect&bpo=22682) [<https://bugs.python.org/issue?@action=redirect&bpo=22682>] and [bpo-22681](https://bugs.python.org/issue?@action=redirect&bpo=22681) [<https://bugs.python.org/issue?@action=redirect&bpo=22681>].)
- Property docstrings are now writable. This is especially useful for `collections.namedtuple()` docstrings. (Contributed by Berker Peksag in [bpo-24064](https://bugs.python.org/issue?@action=redirect&bpo=24064) [<https://bugs.python.org/issue?@action=redirect&bpo=24064>].)

@action=redirect&bpo=24064].)

- Circular imports involving relative imports are now supported. (Contributed by Brett Cannon and Antoine Pitrou in [bpo-17636](https://bugs.python.org/issue?@action=redirect&bpo=17636) [https://bugs.python.org/issue?@action=redirect&bpo=17636].)

## New Modules

### typing

The new [typing provisional](#) module provides standard definitions and tools for function type annotations. See [Type Hints](#) for more information.

### zipapp

The new [zipapp](#) module (specified in [PEP 441](#) [https://peps.python.org/pep-0441/]) provides an API and command line tool for creating executable Python Zip Applications, which were introduced in Python 2.6 in [bpo-1739468](https://bugs.python.org/issue?@action=redirect&bpo=1739468) [https://bugs.python.org/issue?@action=redirect&bpo=1739468], but which were not well publicized, either at the time or since.

With the new module, bundling your application is as simple as putting all the files, including a `__main__.py` file, into a directory `myapp` and running:

```
$ python -m zipapp myapp
$ python myapp.pyz
```

The module implementation has been contributed by Paul Moore in [bpo-23491](https://bugs.python.org/issue?@action=redirect&bpo=23491) [https://bugs.python.org/issue?@action=redirect&bpo=23491].

### See also

[PEP 441](#) [https://peps.python.org/pep-0441/] – Improving Python ZIP Application Support

# Improved Modules

## argparse

The **ArgumentParser** class now allows disabling **abbreviated usage** of long options by setting **allow\_abbrev** to `False`. (Contributed by Jonathan Paugh, Steven Bethard, paul j3 and Daniel Eriksson in [bpo-14910](https://bugs.python.org/issue?@action=redirect&bpo=14910) [https://bugs.python.org/issue?@action=redirect&bpo=14910].)

## asyncio

Since the **asyncio** module is **provisional**, all changes introduced in Python 3.5 have also been backported to Python 3.4.x.

Notable changes in the **asyncio** module since Python 3.4.0:

- New debugging APIs: **loop.set\_debug()** and **loop.get\_debug()** methods. (Contributed by Victor Stinner.)
- The proactor event loop now supports SSL. (Contributed by Antoine Pitrou and Victor Stinner in [bpo-22560](https://bugs.python.org/issue?@action=redirect&bpo=22560) [https://bugs.python.org/issue?@action=redirect&bpo=22560].)
- A new **loop.is\_closed()** method to check if the event loop is closed. (Contributed by Victor Stinner in [bpo-21326](https://bugs.python.org/issue?@action=redirect&bpo=21326) [https://bugs.python.org/issue?@action=redirect&bpo=21326].)
- A new **loop.create\_task()** to conveniently create and schedule a new **Task** for a coroutine. The `create_task` method is also used by all asyncio functions that wrap coroutines into tasks, such as **asyncio.wait()**, **asyncio.gather()**, etc. (Contributed by Victor Stinner.)
- A new **transport.get\_write\_buffer\_limits()** method to inquire for *high*- and *low*- water limits of the flow control. (Contributed by Victor Stinner.)
- The **async()** function is deprecated in favor of **ensure\_future()**. (Contributed by Yury Selivanov.)
- New **loop.set\_task\_factory()** and **loop.get\_task\_factory()** methods to customize the task factory that **loop.create\_task()** method uses.

(Contributed by Yury Selivanov.)

- New `Queue.join()` and `Queue.task_done()` queue methods. (Contributed by Victor Stinner.)
- The `JoinableQueue` class was removed, in favor of the `asyncio.Queue` class. (Contributed by Victor Stinner.)

#### Updates in 3.5.1:

- The `ensure_future()` function and all functions that use it, such as `loop.run_until_complete()`, now accept all kinds of `awaitable objects`. (Contributed by Yury Selivanov.)
- New `run_coroutine_threadsafe()` function to submit coroutines to event loops from other threads. (Contributed by Vincent Michel.)
- New `Transport.is_closing()` method to check if the transport is closing or closed. (Contributed by Yury Selivanov.)
- The `loop.create_server()` method can now accept a list of hosts. (Contributed by Yann Sionneau.)

#### Updates in 3.5.2:

- New `loop.create_future()` method to create Future objects. This allows alternative event loop implementations, such as `uvloop` [<https://github.com/MagicStack/uvloop>], to provide a faster `asyncio.Future` implementation. (Contributed by Yury Selivanov.)
- New `loop.get_exception_handler()` method to get the current exception handler. (Contributed by Yury Selivanov.)
- New `StreamReader.readuntil()` method to read data from the stream until a separator bytes sequence appears. (Contributed by Mark Korenberg.)
- The `loop.create_connection()` and `loop.create_server()` methods are optimized to avoid calling the system `getaddrinfo` function if the address is already resolved. (Contributed by A. Jesse Jiryu Davis.)
- The `loop.sock_connect(sock, address)` no longer requires the `address` to be resolved prior to the call. (Contributed by A. Jesse Jiryu Davis.)

## **bz2**

The `BZ2Decompressor.decompress` method now accepts an optional `max_length` argument to limit the maximum size of decompressed data. (Contributed by Nikolaus Rath in [bpo-15955](https://bugs.python.org/issue?@action=redirect&bpo=15955) [<https://bugs.python.org/issue?@action=redirect&bpo=15955>].)

## **cgi**

The `FieldStorage` class now supports the [context manager](#) protocol. (Contributed by Berker Peksag in [bpo-20289](https://bugs.python.org/issue?@action=redirect&bpo=20289) [<https://bugs.python.org/issue?@action=redirect&bpo=20289>].)

## **cmath**

A new function `isclose()` provides a way to test for approximate equality. (Contributed by Chris Barker and Tal Einat in [bpo-24270](https://bugs.python.org/issue?@action=redirect&bpo=24270) [<https://bugs.python.org/issue?@action=redirect&bpo=24270>].)

## **code**

The `InteractiveInterpreter.showtraceback()` method now prints the full chained traceback, just like the interactive interpreter. (Contributed by Claudiu Popa in [bpo-17442](https://bugs.python.org/issue?@action=redirect&bpo=17442) [<https://bugs.python.org/issue?@action=redirect&bpo=17442>].)

## **collections**

The `OrderedDict` class is now implemented in C, which makes it 4 to 100 times faster. (Contributed by Eric Snow in [bpo-16991](https://bugs.python.org/issue?@action=redirect&bpo=16991) [<https://bugs.python.org/issue?@action=redirect&bpo=16991>].)

`OrderedDict.items()`, `OrderedDict.keys()`, `OrderedDict.values()` views now support `reversed()` iteration. (Contributed by Serhiy Storchaka in [bpo-19505](https://bugs.python.org/issue?@action=redirect&bpo=19505) [<https://bugs.python.org/issue?@action=redirect&bpo=19505>].)

The `deque` class now defines `index()`, `insert()`, and `copy()`, and supports the `+` and `*` operators. This allows deques to be recognized as a `MutableSequence` and improves their

substitutability for lists. (Contributed by Raymond Hettinger in [bpo-23704](https://bugs.python.org/issue?@action=redirect&bpo=23704) [https://bugs.python.org/issue?@action=redirect&bpo=23704].)

Docstrings produced by `namedtuple()` can now be updated:

```
Point = namedtuple('Point', ['x', 'y'])
Point.__doc__ += ': Cartesian coordinate'
Point.x.__doc__ = 'abscissa'
Point.y.__doc__ = 'ordinate'
```

(Contributed by Berker Peksag in [bpo-24064](https://bugs.python.org/issue?@action=redirect&bpo=24064) [https://bugs.python.org/issue?@action=redirect&bpo=24064].)

The `UserString` class now implements the `__getnewargs__()`, `__rmod__()`, `casefold()`, `format_map()`, `isprintable()`, and `maketrans()` methods to match the corresponding methods of `str`. (Contributed by Joe Jevnik in [bpo-22189](https://bugs.python.org/issue?@action=redirect&bpo=22189) [https://bugs.python.org/issue?@action=redirect&bpo=22189].)

## `collections.abc`

The `Sequence.index()` method now accepts *start* and *stop* arguments to match the corresponding methods of `tuple`, `list`, etc. (Contributed by Devin Jeanpierre in [bpo-23086](https://bugs.python.org/issue?@action=redirect&bpo=23086) [https://bugs.python.org/issue?@action=redirect&bpo=23086].)

A new `Generator` abstract base class. (Contributed by Stefan Behnel in [bpo-24018](https://bugs.python.org/issue?@action=redirect&bpo=24018) [https://bugs.python.org/issue?@action=redirect&bpo=24018].)

New `Awaitable`, `Coroutine`, `AsyncIterator`, and `AsyncIterable` abstract base classes. (Contributed by Yury Selivanov in [bpo-24184](https://bugs.python.org/issue?@action=redirect&bpo=24184) [https://bugs.python.org/issue?@action=redirect&bpo=24184].)

For earlier Python versions, a backport of the new ABCs is available in an external [PyPI package](https://pypi.org/project/backports_abc) [https://pypi.org/project/backports\_abc].

## `compileall`

A new `compileall` option, `-j N`, allows running  $N$  workers simultaneously to perform parallel bytecode compilation. The `compile_dir()` function has a corresponding `workers` parameter. (Contributed by Claudiu Popa in [bpo-16104](https://bugs.python.org/issue/?@action=redirect&bpo=16104) [https://bugs.python.org/issue/?@action=redirect&bpo=16104].)

Another new option, `-r`, allows controlling the maximum recursion level for subdirectories. (Contributed by Claudiu Popa in [bpo-19628](https://bugs.python.org/issue/?@action=redirect&bpo=19628) [https://bugs.python.org/issue/?@action=redirect&bpo=19628].)

The `-q` command line option can now be specified more than once, in which case all output, including errors, will be suppressed. The corresponding `quiet` parameter in `compile_dir()`, `compile_file()`, and `compile_path()` can now accept an integer value indicating the level of output suppression. (Contributed by Thomas Kluyver in [bpo-21338](https://bugs.python.org/issue/?@action=redirect&bpo=21338) [https://bugs.python.org/issue/?@action=redirect&bpo=21338].)

## concurrent.futures

The `Executor.map()` method now accepts a `chunksize` argument to allow batching of tasks to improve performance when `ProcessPoolExecutor()` is used. (Contributed by Dan O'Reilly in [bpo-11271](https://bugs.python.org/issue/?@action=redirect&bpo=11271) [https://bugs.python.org/issue/?@action=redirect&bpo=11271].)

The number of workers in the `ThreadPoolExecutor` constructor is optional now. The default value is 5 times the number of CPUs. (Contributed by Claudiu Popa in [bpo-21527](https://bugs.python.org/issue/?@action=redirect&bpo=21527) [https://bugs.python.org/issue/?@action=redirect&bpo=21527].)

## configparser

`configparser` now provides a way to customize the conversion of values by specifying a dictionary of converters in the `ConfigParser` constructor, or by defining them as methods in `ConfigParser` subclasses. Converters defined in a parser instance are inherited by its section proxies.

Example:

```
>>> import configparser
```

```

>>> conv = {}
>>> conv['list'] = lambda v: [e.strip() for e in v.split]
>>> cfg = configparser.ConfigParser(converters=conv)
>>> cfg.read_string("""
... [s]
... list = a b c d e f g
... """)
>>> cfg.get('s', 'list')
'a b c d e f g'
>>> cfg.getlist('s', 'list')
['a', 'b', 'c', 'd', 'e', 'f', 'g']
>>> section = cfg['s']
>>> section.getlist('list')
['a', 'b', 'c', 'd', 'e', 'f', 'g']

```

(Contributed by Łukasz Langa in [bpo-18159](https://bugs.python.org/issue?@action=redirect&bpo=18159) [https://bugs.python.org/issue?@action=redirect&bpo=18159].)

## contextlib

The new [redirect\\_stderr\(\)](#) context manager (similar to [redirect\\_stdout\(\)](#)) makes it easier for utility scripts to handle inflexible APIs that write their output to [sys.stderr](#) and don't provide any options to redirect it:

```

>>> import contextlib, io, logging
>>> f = io.StringIO()
>>> with contextlib.redirect_stderr(f):
...     logging.warning('warning')
...
>>> f.getvalue()
'WARNING:root:warning\n'

```

(Contributed by Berker Peksag in [bpo-22389](https://bugs.python.org/issue?@action=redirect&bpo=22389) [https://bugs.python.org/issue?@action=redirect&bpo=22389].)

## csv

The [writerow\(\)](#) method now supports arbitrary iterables, not just

sequences. (Contributed by Serhiy Storchaka in [bpo-23171](https://bugs.python.org/issue?@action=redirect&bpo=23171) [https://bugs.python.org/issue?@action=redirect&bpo=23171].)

## curses

The new `update_lines_cols()` function updates the `LINES` and `COLS` environment variables. This is useful for detecting manual screen resizing. (Contributed by Arnon Yaari in [bpo-4254](https://bugs.python.org/issue?@action=redirect&bpo=4254) [https://bugs.python.org/issue?@action=redirect&bpo=4254].)

## dbm

`dumb.open` always creates a new database when the flag has the value `"n"`. (Contributed by Claudiu Popa in [bpo-18039](https://bugs.python.org/issue?@action=redirect&bpo=18039) [https://bugs.python.org/issue?@action=redirect&bpo=18039].)

## difflib

The charset of HTML documents generated by `HtmlDiff.make_file()` can now be customized by using a new *charset* keyword-only argument. The default charset of HTML document changed from `"ISO-8859-1"` to `"utf-8"`. (Contributed by Berker Peksag in [bpo-2052](https://bugs.python.org/issue?@action=redirect&bpo=2052) [https://bugs.python.org/issue?@action=redirect&bpo=2052].)

The `diff_bytes()` function can now compare lists of byte strings. This fixes a regression from Python 2. (Contributed by Terry J. Reedy and Greg Ward in [bpo-17445](https://bugs.python.org/issue?@action=redirect&bpo=17445) [https://bugs.python.org/issue?@action=redirect&bpo=17445].)

## distutils

Both the `build` and `build_ext` commands now accept a `-j` option to enable parallel building of extension modules. (Contributed by Antoine Pitrou in [bpo-5309](https://bugs.python.org/issue?@action=redirect&bpo=5309) [https://bugs.python.org/issue?@action=redirect&bpo=5309].)

The `distutils` module now supports `xz` compression, and can be enabled by passing `xztar` as an argument to `bdist --format`. (Contributed by Serhiy Storchaka in [bpo-16314](https://bugs.python.org/issue?@action=redirect&bpo=16314) [https://bugs.python.org/issue?@action=redirect&bpo=16314].)

[bugs.python.org/issue?@action=redirect&bpo=16314](https://bugs.python.org/issue?@action=redirect&bpo=16314).)

## doctest

The `DocTestSuite()` function returns an empty `unittest.TestSuite` if *module* contains no docstrings, instead of raising `ValueError`. (Contributed by Glenn Jones in [bpo-15916](https://bugs.python.org/issue?@action=redirect&bpo=15916) [<https://bugs.python.org/issue?@action=redirect&bpo=15916>].)

## email

A new policy option `Policy.mangle_from_` controls whether or not lines that start with "From " in email bodies are prefixed with a ">" character by generators. The default is `True` for `compat32` and `False` for all other policies. (Contributed by Milan Oberkirch in [bpo-20098](https://bugs.python.org/issue?@action=redirect&bpo=20098) [<https://bugs.python.org/issue?@action=redirect&bpo=20098>].)

A new `Message.get_content_disposition()` method provides easy access to a canonical value for the *Content-Disposition* header. (Contributed by Abhilash Raj in [bpo-21083](https://bugs.python.org/issue?@action=redirect&bpo=21083) [<https://bugs.python.org/issue?@action=redirect&bpo=21083>].)

A new policy option `EmailPolicy.utf8` can be set to `True` to encode email headers using the UTF-8 charset instead of using encoded words. This allows `Messages` to be formatted according to [RFC 6532](https://datatracker.ietf.org/doc/html/rfc6532) [<https://datatracker.ietf.org/doc/html/rfc6532>] and used with an SMTP server that supports the [RFC 6531](https://datatracker.ietf.org/doc/html/rfc6531) [<https://datatracker.ietf.org/doc/html/rfc6531>] SMTPUTF8 extension. (Contributed by R. David Murray in [bpo-24211](https://bugs.python.org/issue?@action=redirect&bpo=24211) [<https://bugs.python.org/issue?@action=redirect&bpo=24211>].)

The `mime.text.MIMEText` constructor now accepts a `charset.Charset` instance. (Contributed by Claude Paroz and Berker Peksag in [bpo-16324](https://bugs.python.org/issue?@action=redirect&bpo=16324) [<https://bugs.python.org/issue?@action=redirect&bpo=16324>].)

## enum

The `Enum` callable has a new parameter *start* to specify the initial number of enum values if only *names* are provided:

```
>>> Animal = enum.Enum('Animal', 'cat dog', start=10)
>>> Animal.cat
<Animal.cat: 10>
>>> Animal.dog
<Animal.dog: 11>
```

(Contributed by Ethan Furman in [bpo-21706](https://bugs.python.org/issue?@action=redirect&bpo=21706) [https://bugs.python.org/issue?@action=redirect&bpo=21706].)

## faulthandler

The [enable\(\)](#), [register\(\)](#), [dump\\_traceback\(\)](#) and [dump\\_traceback\\_later\(\)](#) functions now accept file descriptors in addition to file-like objects. (Contributed by Wei Wu in [bpo-23566](https://bugs.python.org/issue?@action=redirect&bpo=23566) [https://bugs.python.org/issue?@action=redirect&bpo=23566].)

## functools

Most of the [lru\\_cache\(\)](#) machinery is now implemented in C, making it significantly faster. (Contributed by Matt Joiner, Alexey Kachayev, and Serhiy Storchaka in [bpo-14373](https://bugs.python.org/issue?@action=redirect&bpo=14373) [https://bugs.python.org/issue?@action=redirect&bpo=14373].)

## glob

The [iglob\(\)](#) and [glob\(\)](#) functions now support recursive search in subdirectories, using the `"**"` pattern. (Contributed by Serhiy Storchaka in [bpo-13968](https://bugs.python.org/issue?@action=redirect&bpo=13968) [https://bugs.python.org/issue?@action=redirect&bpo=13968].)

## gzip

The *mode* argument of the [GzipFile](#) constructor now accepts `"x"` to request exclusive creation. (Contributed by Tim Heaney in [bpo-19222](https://bugs.python.org/issue?@action=redirect&bpo=19222) [https://bugs.python.org/issue?@action=redirect&bpo=19222].)

## heapq

Element comparison in [merge\(\)](#) can now be customized by

passing a [key function](#) in a new optional *key* keyword argument, and a new optional *reverse* keyword argument can be used to reverse element comparison:

```
>>> import heapq
>>> a = ['9', '777', '55555']
>>> b = ['88', '6666']
>>> list(heapq.merge(a, b, key=len))
['9', '88', '777', '6666', '55555']
>>> list(heapq.merge(reversed(a), reversed(b), key=len,
['55555', '6666', '777', '88', '9']
```

(Contributed by Raymond Hettinger in [bpo-13742](#) [<https://bugs.python.org/issue?@action=redirect&bpo=13742>].)

## http

A new [HTTPStatus](#) enum that defines a set of HTTP status codes, reason phrases and long descriptions written in English.

(Contributed by Demian Brecht in [bpo-21793](#) [<https://bugs.python.org/issue?@action=redirect&bpo=21793>].)

## http.client

[HTTPConnection.getresponse\(\)](#) now raises a [RemoteDisconnected](#) exception when a remote server connection is closed unexpectedly. Additionally, if a [ConnectionError](#) (of which [RemoteDisconnected](#) is a subclass) is raised, the client socket is now closed automatically, and will reconnect on the next request:

```
import http.client
conn = http.client.HTTPConnection('www.python.org')
for retries in range(3):
    try:
        conn.request('GET', '/')
        resp = conn.getresponse()
    except http.client.RemoteDisconnected:
        pass
```

(Contributed by Martin Panter in [bpo-3566](https://bugs.python.org/issue?@action=redirect&bpo=3566) [https://bugs.python.org/issue?@action=redirect&bpo=3566].)

## idlelib and IDLE

Since `idlelib` implements the IDLE shell and editor and is not intended for import by other programs, it gets improvements with every release. See `Lib/idlelib/NEWS.txt` for a cumulative list of changes since 3.4.0, as well as changes made in future 3.5.x releases. This file is also available from the IDLE *Help* ▶ *About IDLE* dialog.

## imaplib

The `IMAP4` class now supports the [context manager](https://bugs.python.org/issue?@action=redirect&bpo=4972) protocol. When used in a `with` statement, the IMAP4 `LOGOUT` command will be called automatically at the end of the block. (Contributed by Tarek Ziade and Serhiy Storchaka in [bpo-4972](https://bugs.python.org/issue?@action=redirect&bpo=4972) [https://bugs.python.org/issue?@action=redirect&bpo=4972].)

The `imaplib` module now supports [RFC 5161](https://datatracker.ietf.org/doc/html/rfc5161) [https://datatracker.ietf.org/doc/html/rfc5161.html] (ENABLE Extension) and [RFC 6855](https://datatracker.ietf.org/doc/html/rfc6855) [https://datatracker.ietf.org/doc/html/rfc6855.html] (UTF-8 Support) via the `IMAP4.enable()` method. A new `IMAP4.utf8_enabled` attribute tracks whether or not [RFC 6855](https://datatracker.ietf.org/doc/html/rfc6855) [https://datatracker.ietf.org/doc/html/rfc6855.html] support is enabled. (Contributed by Milan Oberkirch, R. David Murray, and Maciej Szulik in [bpo-21800](https://bugs.python.org/issue?@action=redirect&bpo=21800) [https://bugs.python.org/issue?@action=redirect&bpo=21800].)

The `imaplib` module now automatically encodes non-ASCII string usernames and passwords using UTF-8, as recommended by the RFCs. (Contributed by Milan Oberkirch in [bpo-21800](https://bugs.python.org/issue?@action=redirect&bpo=21800) [https://bugs.python.org/issue?@action=redirect&bpo=21800].)

## imghdr

The `what()` function now recognizes the [OpenEXR](https://www.openexr.com) [https://www.openexr.com] format (contributed by Martin Vignali and Claudiu Popa in [bpo-20295](https://bugs.python.org/issue?@action=redirect&bpo=20295) [https://bugs.python.org/issue?@action=redirect&bpo=20295].)

@action=redirect&bpo=20295]), and the [WebP](https://en.wikipedia.org/wiki/WebP) [https://en.wikipedia.org/wiki/WebP] format (contributed by Fabrice Anecche and Claudiu Popa in [bpo-20197](https://bugs.python.org/issue?@action=redirect&bpo=20197) [https://bugs.python.org/issue?@action=redirect&bpo=20197].)

## importlib

The [util.LazyLoader](https://bugs.python.org/issue?@action=redirect&bpo=17621) class allows for lazy loading of modules in applications where startup time is important. (Contributed by Brett Cannon in [bpo-17621](https://bugs.python.org/issue?@action=redirect&bpo=17621) [https://bugs.python.org/issue?@action=redirect&bpo=17621].)

The [abc.InspectLoader.source\\_to\\_code\(\)](https://bugs.python.org/issue?@action=redirect&bpo=21156) method is now a static method. This makes it easier to initialize a module object with code compiled from a string by running `exec(code, module.__dict__)`. (Contributed by Brett Cannon in [bpo-21156](https://bugs.python.org/issue?@action=redirect&bpo=21156) [https://bugs.python.org/issue?@action=redirect&bpo=21156].)

The new [util.module\\_from\\_spec\(\)](https://bugs.python.org/issue?@action=redirect&bpo=20383) function is now the preferred way to create a new module. As opposed to creating a [types.ModuleType](https://bugs.python.org/issue?@action=redirect&bpo=20383) instance directly, this new function will set the various import-controlled attributes based on the passed-in spec object. (Contributed by Brett Cannon in [bpo-20383](https://bugs.python.org/issue?@action=redirect&bpo=20383) [https://bugs.python.org/issue?@action=redirect&bpo=20383].)

## inspect

Both the [Signature](https://bugs.python.org/issue?@action=redirect&bpo=20726) and [Parameter](https://bugs.python.org/issue?@action=redirect&bpo=20726) classes are now picklable and hashable. (Contributed by Yuri Selivanov in [bpo-20726](https://bugs.python.org/issue?@action=redirect&bpo=20726) [https://bugs.python.org/issue?@action=redirect&bpo=20726] and [bpo-20334](https://bugs.python.org/issue?@action=redirect&bpo=20334) [https://bugs.python.org/issue?@action=redirect&bpo=20334].)

A new [BoundArguments.apply\\_defaults\(\)](https://bugs.python.org/issue?@action=redirect&bpo=20334) method provides a way to set default values for missing arguments:

```
>>> def foo(a, b='ham', *args): pass
>>> ba = inspect.signature(foo).bind('spam')
>>> ba.apply_defaults()
>>> ba.arguments
OrderedDict([('a', 'spam'), ('b', 'ham'), ('args', ())])
```

(Contributed by Yury Selivanov in [bpo-24190](https://bugs.python.org/issue?@action=redirect&bpo=24190) [https://bugs.python.org/issue?@action=redirect&bpo=24190].)

A new class method `Signature.from_callable()` makes subclassing of `Signature` easier. (Contributed by Yury Selivanov and Eric Snow in [bpo-17373](https://bugs.python.org/issue?@action=redirect&bpo=17373) [https://bugs.python.org/issue?@action=redirect&bpo=17373].)

The `signature()` function now accepts a *follow\_wrapped* optional keyword argument, which, when set to `False`, disables automatic following of `__wrapped__` links. (Contributed by Yury Selivanov in [bpo-20691](https://bugs.python.org/issue?@action=redirect&bpo=20691) [https://bugs.python.org/issue?@action=redirect&bpo=20691].)

A set of new functions to inspect `coroutine functions` and `coroutine objects` has been added: `iscoroutine()`, `iscoroutinefunction()`, `isawaitable()`, `getcoroutinelocals()`, and `getcoroutinestate()`. (Contributed by Yury Selivanov in [bpo-24017](https://bugs.python.org/issue?@action=redirect&bpo=24017) [https://bugs.python.org/issue?@action=redirect&bpo=24017] and [bpo-24400](https://bugs.python.org/issue?@action=redirect&bpo=24400) [https://bugs.python.org/issue?@action=redirect&bpo=24400].)

The `stack()`, `trace()`, `getouterframes()`, and `getinnerframes()` functions now return a list of named tuples. (Contributed by Daniel Shahaf in [bpo-16808](https://bugs.python.org/issue?@action=redirect&bpo=16808) [https://bugs.python.org/issue?@action=redirect&bpo=16808].)

## io

A new `BufferedIOBase.readinto1()` method, that uses at most one call to the underlying raw stream's `RawIOBase.read()` or `RawIOBase.readinto()` methods. (Contributed by Nikolaus Rath in [bpo-20578](https://bugs.python.org/issue?@action=redirect&bpo=20578) [https://bugs.python.org/issue?@action=redirect&bpo=20578].)

## ipaddress

Both the `IPv4Network` and `IPv6Network` classes now accept an `(address, netmask)` tuple argument, so as to easily construct network objects from existing addresses:

```
>>> import ipaddress
```

```
>>> ipaddress.IPv4Network(('127.0.0.0', 8))
IPv4Network('127.0.0.0/8')
>>> ipaddress.IPv4Network(('127.0.0.0', '255.0.0.0'))
IPv4Network('127.0.0.0/8')
```

(Contributed by Peter Moody and Antoine Pitrou in [bpo-16531](#))

[<https://bugs.python.org/issue?@action=redirect&bpo=16531>].)

A new `reverse_pointer` attribute for the `IPv4Network` and `IPv6Network` classes returns the name of the reverse DNS PTR record:

[illegible]

(Contributed by Leon Weber in [bpo-20480](https://bugs.python.org/issue?@action=redirect&bpo=20480) [<https://bugs.python.org/issue?@action=redirect&bpo=20480>].)

## json

The `json.tool` command line interface now preserves the order of keys in JSON objects passed in input. The new `--sort-keys` option can be used to sort the keys alphabetically. (Contributed by Berker Peksag in [bpo-21650](https://bugs.python.org/issue?@action=redirect&bpo=21650) [https://bugs.python.org/issue?@action=redirect&bpo=21650].)

JSON decoder now raises `JSONDecodeError` instead of `ValueError` to provide better context information about the error. (Contributed by Serhiy Storchaka in [bpo-19361](https://bugs.python.org/issue?@action=redirect&bpo=19361) [<https://bugs.python.org/issue?@action=redirect&bpo=19361>].)

## linecache

A new `lazycache()` function can be used to capture information about a non-file-based module to permit getting its lines later via

`getline()`. This avoids doing I/O until a line is actually needed, without having to carry the module globals around indefinitely. (Contributed by Robert Collins in [bpo-17911](https://bugs.python.org/issue?@action=redirect&bpo=17911) [https://bugs.python.org/issue?@action=redirect&bpo=17911].)

## locale

A new `delocalize()` function can be used to convert a string into a normalized number string, taking the `LC_NUMERIC` settings into account:

```
>>> import locale
>>> locale.setlocale(locale.LC_NUMERIC, 'de_DE.UTF-8')
'de_DE.UTF-8'
>>> locale.delocalize('1.234,56')
'1234.56'
>>> locale.setlocale(locale.LC_NUMERIC, 'en_US.UTF-8')
'en_US.UTF-8'
>>> locale.delocalize('1,234.56')
'1234.56'
```

(Contributed by Cédric Krier in [bpo-13918](https://bugs.python.org/issue?@action=redirect&bpo=13918) [https://bugs.python.org/issue?@action=redirect&bpo=13918].)

## logging

All logging methods (`Logger log()`, `exception()`, `critical()`, `debug()`, etc.), now accept exception instances as an `exc_info` argument, in addition to boolean values and exception tuples:

```
>>> import logging
>>> try:
...     1/0
... except ZeroDivisionError as ex:
...     logging.error('exception', exc_info=ex)
ERROR:root:exception
```

(Contributed by Yury Selivanov in [bpo-20537](https://bugs.python.org/issue?@action=redirect&bpo=20537) [https://bugs.python.org/issue?@action=redirect&bpo=20537].)

The `handlers.HTTPHandler` class now accepts an optional `ssl.SSLContext` instance to configure SSL settings used in an HTTP connection. (Contributed by Alex Gaynor in [bpo-22788](https://bugs.python.org/issue?@action=redirect&bpo=22788) [<https://bugs.python.org/issue?@action=redirect&bpo=22788>].)

The `handlers.QueueListener` class now takes a `respect_handler_level` keyword argument which, if set to `True`, will pass messages to handlers taking handler levels into account. (Contributed by Vinay Sajip.)

## lzma

The `LZMADecompressor.decompress()` method now accepts an optional `max_length` argument to limit the maximum size of decompressed data. (Contributed by Martin Panter in [bpo-15955](https://bugs.python.org/issue?@action=redirect&bpo=15955) [<https://bugs.python.org/issue?@action=redirect&bpo=15955>].)

## math

Two new constants have been added to the `math` module: `inf` and `nan`. (Contributed by Mark Dickinson in [bpo-23185](https://bugs.python.org/issue?@action=redirect&bpo=23185) [<https://bugs.python.org/issue?@action=redirect&bpo=23185>].)

A new function `isclose()` provides a way to test for approximate equality. (Contributed by Chris Barker and Tal Eilat in [bpo-24270](https://bugs.python.org/issue?@action=redirect&bpo=24270) [<https://bugs.python.org/issue?@action=redirect&bpo=24270>].)

A new `gcd()` function has been added. The `fractions.gcd()` function is now deprecated. (Contributed by Mark Dickinson and Serhiy Storchaka in [bpo-22486](https://bugs.python.org/issue?@action=redirect&bpo=22486) [<https://bugs.python.org/issue?@action=redirect&bpo=22486>].)

## multiprocessing

`sharedctypes.synchronized()` objects now support the `context manager` protocol. (Contributed by Charles-François Natali in [bpo-21565](https://bugs.python.org/issue?@action=redirect&bpo=21565) [<https://bugs.python.org/issue?@action=redirect&bpo=21565>].)

## operator

`attrgetter()`, `itemgetter()`, and `methodcaller()` objects now support pickling. (Contributed by Josh Rosenberg and Serhiy Storchaka in [bpo-22955](https://bugs.python.org/issue?@action=redirect&bpo=22955) [https://bugs.python.org/issue?@action=redirect&bpo=22955].)

New `matmul()` and `imatmul()` functions to perform matrix multiplication. (Contributed by Benjamin Peterson in [bpo-21176](https://bugs.python.org/issue?@action=redirect&bpo=21176) [https://bugs.python.org/issue?@action=redirect&bpo=21176].)

## OS

The new `scandir()` function returning an iterator of `DirEntry` objects has been added. If possible, `scandir()` extracts file attributes while scanning a directory, removing the need to perform subsequent system calls to determine file type or attributes, which may significantly improve performance. (Contributed by Ben Hoyt with the help of Victor Stinner in [bpo-22524](https://bugs.python.org/issue?@action=redirect&bpo=22524) [https://bugs.python.org/issue?@action=redirect&bpo=22524].)

On Windows, a new `stat_result.st_file_attributes` attribute is now available. It corresponds to the `dwFileAttributes` member of the `BY_HANDLE_FILE_INFORMATION` structure returned by `GetFileInformationByHandle()`. (Contributed by Ben Hoyt in [bpo-21719](https://bugs.python.org/issue?@action=redirect&bpo=21719) [https://bugs.python.org/issue?@action=redirect&bpo=21719].)

The `urandom()` function now uses the `getrandom()` syscall on Linux 3.17 or newer, and `getentropy()` on OpenBSD 5.6 and newer, removing the need to use `/dev/urandom` and avoiding failures due to potential file descriptor exhaustion. (Contributed by Victor Stinner in [bpo-22181](https://bugs.python.org/issue?@action=redirect&bpo=22181) [https://bugs.python.org/issue?@action=redirect&bpo=22181].)

New `get_blocking()` and `set_blocking()` functions allow getting and setting a file descriptor's blocking mode (`O_NONBLOCK`). (Contributed by Victor Stinner in [bpo-22054](https://bugs.python.org/issue?@action=redirect&bpo=22054) [https://bugs.python.org/issue?@action=redirect&bpo=22054].)

The `truncate()` and `ftruncate()` functions are now supported on Windows. (Contributed by Steve Dower in [bpo-23668](https://bugs.python.org/issue?@action=redirect&bpo=23668) [https://bugs.python.org/issue?@action=redirect&bpo=23668].)

There is a new `os.path.commonpath()` function returning the longest common sub-path of each passed pathname. Unlike the `os.path.commonprefix()` function, it always returns a valid path:

```
>>> os.path.commonprefix(['/usr/lib', '/usr/local/lib'])  
'/usr/l'
```

```
>>> os.path.commonpath(['/usr/lib', '/usr/local/lib'])  
'/usr'
```

(Contributed by Rafik Draoui and Serhiy Storchaka in [bpo-10395](https://bugs.python.org/issue?@action=redirect&bpo=10395) [<https://bugs.python.org/issue?@action=redirect&bpo=10395>].)

## pathlib

The new `Path.samefile()` method can be used to check whether the path points to the same file as another path, which can be either another `Path` object, or a string:

```
>>> import pathlib  
>>> p1 = pathlib.Path('/etc/hosts')  
>>> p2 = pathlib.Path('/etc/../etc/hosts')  
>>> p1.samefile(p2)  
True
```

(Contributed by Vajrasky Kok and Antoine Pitrou in [bpo-19775](https://bugs.python.org/issue?@action=redirect&bpo=19775) [<https://bugs.python.org/issue?@action=redirect&bpo=19775>].)

The `Path.mkdir()` method now accepts a new optional `exist_ok` argument to match `mkdir -p` and `os.makedirs()` functionality. (Contributed by Berker Peksag in [bpo-21539](https://bugs.python.org/issue?@action=redirect&bpo=21539) [<https://bugs.python.org/issue?@action=redirect&bpo=21539>].)

There is a new `Path.expanduser()` method to expand `~` and `~user` prefixes. (Contributed by Serhiy Storchaka and Claudiu Popa in [bpo-19776](https://bugs.python.org/issue?@action=redirect&bpo=19776) [<https://bugs.python.org/issue?@action=redirect&bpo=19776>].)

A new `Path.home()` class method can be used to get a `Path` instance representing the user's home directory. (Contributed by Victor Salgado and Mayank Tripathi in [bpo-19777](https://bugs.python.org/issue?@action=redirect&bpo=19777) [[https://](https://bugs.python.org/issue?@action=redirect&bpo=19777)]

[bugs.python.org/issue?@action=redirect&bpo=19777](https://bugs.python.org/issue?@action=redirect&bpo=19777)].)

New `Path.write_text()`, `Path.read_text()`, `Path.write_bytes()`, `Path.read_bytes()` methods to simplify read/write operations on files.

The following code snippet will create or rewrite existing file `~/spam42`:

```
>>> import pathlib
>>> p = pathlib.Path('~/spam42')
>>> p.expanduser().write_text('ham')
3
```

(Contributed by Christopher Welborn in [bpo-20218](https://bugs.python.org/issue?@action=redirect&bpo=20218) [<https://bugs.python.org/issue?@action=redirect&bpo=20218>].)

## **pickle**

Nested objects, such as unbound methods or nested classes, can now be pickled using [pickle protocols](#) older than protocol version 4. Protocol version 4 already supports these cases. (Contributed by Serhiy Storchaka in [bpo-23611](https://bugs.python.org/issue?@action=redirect&bpo=23611) [<https://bugs.python.org/issue?@action=redirect&bpo=23611>].)

## **poplib**

A new `POP3.utf8()` command enables [RFC 6856](https://datatracker.ietf.org/doc/html/rfc6856) [<https://datatracker.ietf.org/doc/html/rfc6856>] (Internationalized Email) support, if a POP server supports it. (Contributed by Milan OberKirch in [bpo-21804](https://bugs.python.org/issue?@action=redirect&bpo=21804) [<https://bugs.python.org/issue?@action=redirect&bpo=21804>].)

## **re**

References and conditional references to groups with fixed length are now allowed in lookbehind assertions:

```
>>> import re
>>> pat = re.compile(r'(a|b).(?!<=\\1)c')
```

```
>>> pat.match('aac')
<_sre.SRE_Match object; span=(0, 3), match='aac'>
>>> pat.match('bbc')
<_sre.SRE_Match object; span=(0, 3), match='bbc'>
```

(Contributed by Serhiy Storchaka in [bpo-9179](https://bugs.python.org/issue?@action=redirect&bpo=9179) [https://bugs.python.org/issue?@action=redirect&bpo=9179].)

The number of capturing groups in regular expressions is no longer limited to 100. (Contributed by Serhiy Storchaka in [bpo-22437](https://bugs.python.org/issue?@action=redirect&bpo=22437) [https://bugs.python.org/issue?@action=redirect&bpo=22437].)

The `sub()` and `subn()` functions now replace unmatched groups with empty strings instead of raising an exception. (Contributed by Serhiy Storchaka in [bpo-1519638](https://bugs.python.org/issue?@action=redirect&bpo=1519638) [https://bugs.python.org/issue?@action=redirect&bpo=1519638].)

The `re.error` exceptions have new attributes, `msg`, `pattern`, `pos`, `lineno`, and `colno`, that provide better context information about the error:

```
>>> re.compile("""
...     (?x)
...     .++
... """)
Traceback (most recent call last):
...
sre_constants.error: multiple repeat at position 16 (lin
```

(Contributed by Serhiy Storchaka in [bpo-22578](https://bugs.python.org/issue?@action=redirect&bpo=22578) [https://bugs.python.org/issue?@action=redirect&bpo=22578].)

## readline

A new `append_history_file()` function can be used to append the specified number of trailing elements in history to the given file. (Contributed by Bruno Cauet in [bpo-22940](https://bugs.python.org/issue?@action=redirect&bpo=22940) [https://bugs.python.org/issue?@action=redirect&bpo=22940].)

## selectors

The new `DevpollSelector` supports efficient `/dev/poll` polling on Solaris. (Contributed by Giampaolo Rodola' in [bpo-18931](https://bugs.python.org/issue?@action=redirect&bpo=18931) [https://bugs.python.org/issue?@action=redirect&bpo=18931].)

## shutil

The `move()` function now accepts a *copy\_function* argument, allowing, for example, the `copy()` function to be used instead of the default `copy2()` if there is a need to ignore file metadata when moving. (Contributed by Claudiu Popa in [bpo-19840](https://bugs.python.org/issue?@action=redirect&bpo=19840) [https://bugs.python.org/issue?@action=redirect&bpo=19840].)

The `make_archive()` function now supports the *xztar* format. (Contributed by Serhiy Storchaka in [bpo-5411](https://bugs.python.org/issue?@action=redirect&bpo=5411) [https://bugs.python.org/issue?@action=redirect&bpo=5411].)

## signal

On Windows, the `set_wakeup_fd()` function now also supports socket handles. (Contributed by Victor Stinner in [bpo-22018](https://bugs.python.org/issue?@action=redirect&bpo=22018) [https://bugs.python.org/issue?@action=redirect&bpo=22018].)

Various `SIG*` constants in the `signal` module have been converted into `Enums`. This allows meaningful names to be printed during debugging, instead of integer “magic numbers”. (Contributed by Giampaolo Rodola' in [bpo-21076](https://bugs.python.org/issue?@action=redirect&bpo=21076) [https://bugs.python.org/issue?@action=redirect&bpo=21076].)

## smtpd

Both the `SMTPServer` and `SMTPChannel` classes now accept a *decode\_data* keyword argument to determine if the `DATA` portion of the SMTP transaction is decoded using the `"utf-8"` codec or is instead provided to the `SMTPServer.process_message()` method as a byte string. The default is `True` for backward compatibility reasons, but will change to `False` in Python 3.6. If *decode\_data* is set to `False`, the `process_message` method must be prepared to accept keyword arguments. (Contributed by Maciej Szulik in [bpo-19662](https://bugs.python.org/issue?@action=redirect&bpo=19662) [https://bugs.python.org/issue?@action=redirect&bpo=19662].)

The **SMTPServer** class now advertises the 8BITMIME extension (**RFC 6152** [<https://datatracker.ietf.org/doc/html/rfc6152.html>]) if `decode_data` has been set `True`. If the client specifies `BODY=8BITMIME` on the `MAIL` command, it is passed to **SMTPServer.process\_message()** via the `mail_options` keyword. (Contributed by Milan Oberkirch and R. David Murray in **bpo-21795** [<https://bugs.python.org/issue?@action=redirect&bpo=21795>].)

The **SMTPServer** class now also supports the SMTPUTF8 extension (**RFC 6531** [<https://datatracker.ietf.org/doc/html/rfc6531.html>]: Internationalized Email). If the client specified `SMTPUTF8 BODY=8BITMIME` on the `MAIL` command, they are passed to **SMTPServer.process\_message()** via the `mail_options` keyword. It is the responsibility of the `process_message` method to correctly handle the SMTPUTF8 data. (Contributed by Milan Oberkirch in **bpo-21725** [<https://bugs.python.org/issue?@action=redirect&bpo=21725>].)

It is now possible to provide, directly or via name resolution, IPv6 addresses in the **SMTPServer** constructor, and have it successfully connect. (Contributed by Milan Oberkirch in **bpo-14758** [<https://bugs.python.org/issue?@action=redirect&bpo=14758>].)

## smtplib

A new **SMTP.auth()** method provides a convenient way to implement custom authentication mechanisms. (Contributed by Milan Oberkirch in **bpo-15014** [<https://bugs.python.org/issue?@action=redirect&bpo=15014>].)

The **SMTP.set\_debuglevel()** method now accepts an additional `debuglevel` (2), which enables timestamps in debug messages. (Contributed by Gavin Chappell and Maciej Szulik in **bpo-16914** [<https://bugs.python.org/issue?@action=redirect&bpo=16914>].)

Both the **SMTP.sendmail()** and **SMTP.send\_message()** methods now support **RFC 6531** [<https://datatracker.ietf.org/doc/html/rfc6531.html>] (SMTPUTF8). (Contributed by Milan Oberkirch and R. David Murray in **bpo-22027** [<https://bugs.python.org/issue?@action=redirect&bpo=22027>].)

## sndhdr

The `what()` and `whathdr()` functions now return a `namedtuple()`. (Contributed by Claudiu Popa in [bpo-18615](https://bugs.python.org/issue?@action=redirect&bpo=18615) [<https://bugs.python.org/issue?@action=redirect&bpo=18615>].)

## socket

Functions with timeouts now use a monotonic clock, instead of a system clock. (Contributed by Victor Stinner in [bpo-22043](https://bugs.python.org/issue?@action=redirect&bpo=22043) [<https://bugs.python.org/issue?@action=redirect&bpo=22043>].)

A new `socket.sendfile()` method allows sending a file over a socket by using the high-performance `os.sendfile()` function on UNIX, resulting in uploads being from 2 to 3 times faster than when using plain `socket.send()`. (Contributed by Giampaolo Rodola' in [bpo-17552](https://bugs.python.org/issue?@action=redirect&bpo=17552) [<https://bugs.python.org/issue?@action=redirect&bpo=17552>].)

The `socket.sendall()` method no longer resets the socket timeout every time bytes are received or sent. The socket timeout is now the maximum total duration to send all data. (Contributed by Victor Stinner in [bpo-23853](https://bugs.python.org/issue?@action=redirect&bpo=23853) [<https://bugs.python.org/issue?@action=redirect&bpo=23853>].)

The *backlog* argument of the `socket.listen()` method is now optional. By default it is set to `SOMAXCONN` or to 128, whichever is less. (Contributed by Charles-François Natali in [bpo-21455](https://bugs.python.org/issue?@action=redirect&bpo=21455) [<https://bugs.python.org/issue?@action=redirect&bpo=21455>].)

## ssl

### Memory BIO Support

(Contributed by Geert Jansen in [bpo-21965](https://bugs.python.org/issue?@action=redirect&bpo=21965) [<https://bugs.python.org/issue?@action=redirect&bpo=21965>].)

The new `SSLObject` class has been added to provide SSL protocol support for cases when the network I/O capabilities of `SSLSocket` are not necessary or are suboptimal. `SSLObject` represents an SSL

protocol instance, but does not implement any network I/O methods, and instead provides a memory buffer interface. The new **MemoryBIO** class can be used to pass data between Python and an SSL protocol instance.

The memory BIO SSL support is primarily intended to be used in frameworks implementing asynchronous I/O for which **SSLSocket**'s readiness model ("select/poll") is inefficient.

A new **SSLContext.wrap\_bio()** method can be used to create a new `SSLObject` instance.

## Application-Layer Protocol Negotiation Support

(Contributed by Benjamin Peterson in [bpo-20188](https://bugs.python.org/issue/?@action=redirect&bpo=20188) [https://bugs.python.org/issue/?@action=redirect&bpo=20188].)

Where OpenSSL support is present, the **ssl** module now implements the *Application-Layer Protocol Negotiation* TLS extension as described in [RFC 7301](https://datatracker.ietf.org/doc/html/rfc7301.html) [https://datatracker.ietf.org/doc/html/rfc7301.html].

The new **SSLContext.set\_alpn\_protocols()** can be used to specify which protocols a socket should advertise during the TLS handshake.

The new **SSLSocket.selected\_alpn\_protocol()** returns the protocol that was selected during the TLS handshake. The **HAS\_ALPN** flag indicates whether ALPN support is present.

## Other Changes

There is a new **SSLSocket.version()** method to query the actual protocol version in use. (Contributed by Antoine Pitrou in [bpo-20421](https://bugs.python.org/issue/?@action=redirect&bpo=20421) [https://bugs.python.org/issue/?@action=redirect&bpo=20421].)

The **SSLSocket** class now implements a **SSLSocket.sendfile()** method. (Contributed by Giampaolo Rodola' in [bpo-17552](https://bugs.python.org/issue/?@action=redirect&bpo=17552) [https://bugs.python.org/issue/?@action=redirect&bpo=17552].)

The `SSLSocket.send()` method now raises either the `ssl.SSLWantReadError` or `ssl.SSLWantWriteError` exception on a non-blocking socket if the operation would block. Previously, it would return 0. (Contributed by Nikolaus Rath in [bpo-20951](https://bugs.python.org/issue?@action=redirect&bpo=20951) [https://bugs.python.org/issue?@action=redirect&bpo=20951].)

The `cert_time_to_seconds()` function now interprets the input time as UTC and not as local time, per [RFC 5280](https://datatracker.ietf.org/doc/html/rfc5280.html) [https://datatracker.ietf.org/doc/html/rfc5280.html]. Additionally, the return value is always an `int`. (Contributed by Akira Li in [bpo-19940](https://bugs.python.org/issue?@action=redirect&bpo=19940) [https://bugs.python.org/issue?@action=redirect&bpo=19940].)

New `SSLObject.shared_ciphers()` and `SSLSocket.shared_ciphers()` methods return the list of ciphers sent by the client during the handshake. (Contributed by Benjamin Peterson in [bpo-23186](https://bugs.python.org/issue?@action=redirect&bpo=23186) [https://bugs.python.org/issue?@action=redirect&bpo=23186].)

The `SSLSocket.do_handshake()`, `SSLSocket.read()`, `SSLSocket.shutdown()`, and `SSLSocket.write()` methods of the `SSLSocket` class no longer reset the socket timeout every time bytes are received or sent. The socket timeout is now the maximum total duration of the method. (Contributed by Victor Stinner in [bpo-23853](https://bugs.python.org/issue?@action=redirect&bpo=23853) [https://bugs.python.org/issue?@action=redirect&bpo=23853].)

The `match_hostname()` function now supports matching of IP addresses. (Contributed by Antoine Pitrou in [bpo-23239](https://bugs.python.org/issue?@action=redirect&bpo=23239) [https://bugs.python.org/issue?@action=redirect&bpo=23239].)

## sqlite3

The `Row` class now fully supports the sequence protocol, in particular `reversed()` iteration and slice indexing. (Contributed by Claudiu Popa in [bpo-10203](https://bugs.python.org/issue?@action=redirect&bpo=10203) [https://bugs.python.org/issue?@action=redirect&bpo=10203]; by Lucas Sinclair, Jessica McKellar, and Serhiy Storchaka in [bpo-13583](https://bugs.python.org/issue?@action=redirect&bpo=13583) [https://bugs.python.org/issue?@action=redirect&bpo=13583].)

## subprocess

The new `run()` function has been added. It runs the specified command and returns a `CompletedProcess` object, which describes a finished process. The new API is more consistent and is the recommended approach to invoking subprocesses in Python code that does not need to maintain compatibility with earlier Python versions. (Contributed by Thomas Kluyver in [bpo-23342](https://bugs.python.org/issue?@action=redirect&bpo=23342) [<https://bugs.python.org/issue?@action=redirect&bpo=23342>].)

Examples:

```
>>> subprocess.run(["ls", "-l"]) # doesn't capture output
CompletedProcess(args=['ls', '-l'], returncode=0)
```

```
>>> subprocess.run("exit 1", shell=True, check=True)
Traceback (most recent call last):
```

```
...
```

```
subprocess.CalledProcessError: Command 'exit 1' returned non-zero exit status 1
```

```
>>> subprocess.run(["ls", "-l", "/dev/null"], stdout=subprocess.PIPE)
CompletedProcess(args=['ls', '-l', '/dev/null'], returncode=0,
stdout=b'crw-rw-rw- 1 root root 1, 3 Jan 23 16:23 /dev/null')
```

## sys

A new `set_coroutine_wrapper()` function allows setting a global hook that will be called whenever a `coroutine object` is created by an `async def` function. A corresponding `get_coroutine_wrapper()` can be used to obtain a currently set wrapper. Both functions are [provisional](https://bugs.python.org/issue?@action=redirect&bpo=24017), and are intended for debugging purposes only. (Contributed by Yuri Selivanov in [bpo-24017](https://bugs.python.org/issue?@action=redirect&bpo=24017) [<https://bugs.python.org/issue?@action=redirect&bpo=24017>].)

A new `is_finalizing()` function can be used to check if the Python interpreter is [shutting down](https://bugs.python.org/issue?@action=redirect&bpo=22696). (Contributed by Antoine Pitrou in [bpo-22696](https://bugs.python.org/issue?@action=redirect&bpo=22696) [<https://bugs.python.org/issue?@action=redirect&bpo=22696>].)

## sysconfig

The name of the user scripts directory on Windows now includes the first two components of the Python version. (Contributed by

Paul Moore in [bpo-23437](https://bugs.python.org/issue?@action=redirect&bpo=23437) [https://bugs.python.org/issue?@action=redirect&bpo=23437].)

## tarfile

The *mode* argument of the [open\(\)](#) function now accepts "x" to request exclusive creation. (Contributed by Berker Peksag in [bpo-21717](#) [https://bugs.python.org/issue?@action=redirect&bpo=21717].)

The [TarFile.extractall\(\)](#) and [TarFile.extract\(\)](#) methods now take a keyword argument *numeric\_owner*. If set to `True`, the extracted files and directories will be owned by the numeric `uid` and `gid` from the tarfile. If set to `False` (the default, and the behavior in versions prior to 3.5), they will be owned by the named user and group in the tarfile. (Contributed by Michael Vogt and Eric Smith in [bpo-23193](#) [https://bugs.python.org/issue?@action=redirect&bpo=23193].)

The [TarFile.list\(\)](#) now accepts an optional *members* keyword argument that can be set to a subset of the list returned by [TarFile.getmembers\(\)](#). (Contributed by Serhiy Storchaka in [bpo-21549](#) [https://bugs.python.org/issue?@action=redirect&bpo=21549].)

## threading

Both the [Lock.acquire\(\)](#) and [RLock.acquire\(\)](#) methods now use a monotonic clock for timeout management. (Contributed by Victor Stinner in [bpo-22043](#) [https://bugs.python.org/issue?@action=redirect&bpo=22043].)

## time

The [monotonic\(\)](#) function is now always available. (Contributed by Victor Stinner in [bpo-22043](#) [https://bugs.python.org/issue?@action=redirect&bpo=22043].)

## timeit

A new command line option `-u` or `--unit=U` can be used to specify the time unit for the timer output. Supported options are

usec, msec, or sec. (Contributed by Julian Gindi in [bpo-18983](https://bugs.python.org/issue?@action=redirect&bpo=18983) [https://bugs.python.org/issue?@action=redirect&bpo=18983].)

The `timeit()` function has a new *globals* parameter for specifying the namespace in which the code will be running. (Contributed by Ben Roberts in [bpo-2527](https://bugs.python.org/issue?@action=redirect&bpo=2527) [https://bugs.python.org/issue?@action=redirect&bpo=2527].)

## tkinter

The `tkinter._fix` module used for setting up the Tcl/Tk environment on Windows has been replaced by a private function in the `_tkinter` module which makes no permanent changes to environment variables. (Contributed by Zachary Ware in [bpo-20035](https://bugs.python.org/issue?@action=redirect&bpo=20035) [https://bugs.python.org/issue?@action=redirect&bpo=20035].)

## traceback

New `walk_stack()` and `walk_tb()` functions to conveniently traverse frame and traceback objects. (Contributed by Robert Collins in [bpo-17911](https://bugs.python.org/issue?@action=redirect&bpo=17911) [https://bugs.python.org/issue?@action=redirect&bpo=17911].)

New lightweight classes: `TracebackException`, `StackSummary`, and `FrameSummary`. (Contributed by Robert Collins in [bpo-17911](https://bugs.python.org/issue?@action=redirect&bpo=17911) [https://bugs.python.org/issue?@action=redirect&bpo=17911].)

Both the `print_tb()` and `print_stack()` functions now support negative values for the *limit* argument. (Contributed by Dmitry Kazakov in [bpo-22619](https://bugs.python.org/issue?@action=redirect&bpo=22619) [https://bugs.python.org/issue?@action=redirect&bpo=22619].)

## types

A new `coroutine()` function to transform `generator` and `generator-like` objects into `awaitables`. (Contributed by Yury Selivanov in [bpo-24017](https://bugs.python.org/issue?@action=redirect&bpo=24017) [https://bugs.python.org/issue?@action=redirect&bpo=24017].)

A new type called **CoroutineType**, which is used for **coroutine** objects created by **async def** functions. (Contributed by Yury Selivanov in [bpo-24400](https://bugs.python.org/issue?@action=redirect&bpo=24400) [https://bugs.python.org/issue?@action=redirect&bpo=24400].)

## unicodedata

The **unicodedata** module now uses data from **Unicode 8.0.0** [https://unicode.org/versions/Unicode8.0.0/].

## unittest

The **TestLoader.loadTestsFromModule()** method now accepts a keyword-only argument *pattern* which is passed to `load_tests` as the third argument. Found packages are now checked for `load_tests` regardless of whether their path matches *pattern*, because it is impossible for a package name to match the default pattern. (Contributed by Robert Collins and Barry A. Warsaw in [bpo-16662](https://bugs.python.org/issue?@action=redirect&bpo=16662) [https://bugs.python.org/issue?@action=redirect&bpo=16662].)

Unittest discovery errors now are exposed in the **TestLoader.errors** attribute of the **TestLoader** instance. (Contributed by Robert Collins in [bpo-19746](https://bugs.python.org/issue?@action=redirect&bpo=19746) [https://bugs.python.org/issue?@action=redirect&bpo=19746].)

A new command line option `--locals` to show local variables in tracebacks. (Contributed by Robert Collins in [bpo-22936](https://bugs.python.org/issue?@action=redirect&bpo=22936) [https://bugs.python.org/issue?@action=redirect&bpo=22936].)

## unittest.mock

The **Mock** class has the following improvements:

- The class constructor has a new *unsafe* parameter, which causes mock objects to raise **AttributeError** on attribute names starting with "assert". (Contributed by Kushal Das in [bpo-21238](https://bugs.python.org/issue?@action=redirect&bpo=21238) [https://bugs.python.org/issue?@action=redirect&bpo=21238].)
- A new **Mock.assert\_not\_called()** method to check if

the mock object was called. (Contributed by Kushal Das in [bpo-21262](https://bugs.python.org/issue?@action=redirect&bpo=21262) [https://bugs.python.org/issue?@action=redirect&bpo=21262].)

The `MagicMock` class now supports `__truediv__()`, `__divmod__()` and `__matmul__()` operators. (Contributed by Johannes Baiter in [bpo-20968](https://bugs.python.org/issue?@action=redirect&bpo=20968) [https://bugs.python.org/issue?@action=redirect&bpo=20968], and Håkan Lövdahl in [bpo-23581](https://bugs.python.org/issue?@action=redirect&bpo=23581) [https://bugs.python.org/issue?@action=redirect&bpo=23581] and [bpo-23568](https://bugs.python.org/issue?@action=redirect&bpo=23568) [https://bugs.python.org/issue?@action=redirect&bpo=23568].)

It is no longer necessary to explicitly pass `create=True` to the `patch()` function when patching builtin names. (Contributed by Kushal Das in [bpo-17660](https://bugs.python.org/issue?@action=redirect&bpo=17660) [https://bugs.python.org/issue?@action=redirect&bpo=17660].)

## urllib

A new `request.HTTPPasswordMgrWithPriorAuth` class allows HTTP Basic Authentication credentials to be managed so as to eliminate unnecessary 401 response handling, or to unconditionally send credentials on the first request in order to communicate with servers that return a 404 response instead of a 401 if the `Authorization` header is not sent. (Contributed by Matej Cepl in [bpo-19494](https://bugs.python.org/issue?@action=redirect&bpo=19494) [https://bugs.python.org/issue?@action=redirect&bpo=19494] and Akshit Khurana in [bpo-7159](https://bugs.python.org/issue?@action=redirect&bpo=7159) [https://bugs.python.org/issue?@action=redirect&bpo=7159].)

A new `quote_via` argument for the `parse.urlencode()` function provides a way to control the encoding of query parts if needed. (Contributed by Samwyse and Arnon Yaari in [bpo-13866](https://bugs.python.org/issue?@action=redirect&bpo=13866) [https://bugs.python.org/issue?@action=redirect&bpo=13866].)

The `request.urlopen()` function accepts an `ssl.SSLContext` object as a `context` argument, which will be used for the HTTPS connection. (Contributed by Alex Gaynor in [bpo-22366](https://bugs.python.org/issue?@action=redirect&bpo=22366) [https://bugs.python.org/issue?@action=redirect&bpo=22366].)

The `parse.urljoin()` was updated to use the [RFC 3986](https://datatracker.ietf.org/doc/html/rfc3986.html) [https://datatracker.ietf.org/doc/html/rfc3986.html] semantics for the resolution of relative URLs, rather than [RFC 1808](https://datatracker.ietf.org/doc/) [https://datatracker.ietf.org/doc/]

[html/rfc1808.html](http://html/rfc1808.html)] and [RFC 2396](https://datatracker.ietf.org/doc/html/rfc2396.html) [https://datatracker.ietf.org/doc/html/rfc2396.html]. (Contributed by Demian Brecht and Senthil Kumaran in [bpo-22118](https://bugs.python.org/issue?@action=redirect&bpo=22118) [https://bugs.python.org/issue?@action=redirect&bpo=22118].)

## wsgiref

The *headers* argument of the [headers.Headers](https://bugs.python.org/issue?@action=redirect&bpo=5800) class constructor is now optional. (Contributed by Pablo Torres Navarrete and SilentGhost in [bpo-5800](https://bugs.python.org/issue?@action=redirect&bpo=5800) [https://bugs.python.org/issue?@action=redirect&bpo=5800].)

## xmlrpc

The [client.ServerProxy](https://bugs.python.org/issue?@action=redirect&bpo=20627) class now supports the [context manager](https://bugs.python.org/issue?@action=redirect&bpo=20627) protocol. (Contributed by Claudiu Popa in [bpo-20627](https://bugs.python.org/issue?@action=redirect&bpo=20627) [https://bugs.python.org/issue?@action=redirect&bpo=20627].)

The [client.ServerProxy](https://bugs.python.org/issue?@action=redirect&bpo=22960) constructor now accepts an optional [ssl.SSLContext](https://bugs.python.org/issue?@action=redirect&bpo=22960) instance. (Contributed by Alex Gaynor in [bpo-22960](https://bugs.python.org/issue?@action=redirect&bpo=22960) [https://bugs.python.org/issue?@action=redirect&bpo=22960].)

## xml.sax

SAX parsers now support a character stream of the [xmlreader.InputSource](https://bugs.python.org/issue?@action=redirect&bpo=2175) object. (Contributed by Serhiy Storchaka in [bpo-2175](https://bugs.python.org/issue?@action=redirect&bpo=2175) [https://bugs.python.org/issue?@action=redirect&bpo=2175].)

[parseString\(\)](https://bugs.python.org/issue?@action=redirect&bpo=10590) now accepts a [str](https://bugs.python.org/issue?@action=redirect&bpo=10590) instance. (Contributed by Serhiy Storchaka in [bpo-10590](https://bugs.python.org/issue?@action=redirect&bpo=10590) [https://bugs.python.org/issue?@action=redirect&bpo=10590].)

## zipfile

ZIP output can now be written to unseekable streams. (Contributed by Serhiy Storchaka in [bpo-23252](https://bugs.python.org/issue?@action=redirect&bpo=23252) [https://bugs.python.org/issue?@action=redirect&bpo=23252].)

The *mode* argument of [ZipFile.open\(\)](https://bugs.python.org/issue?@action=redirect&bpo=23252) method now accepts "x" to request exclusive creation. (Contributed by Serhiy Storchaka

in [bpo-21717](https://bugs.python.org/issue?@action=redirect&bpo=21717) [https://bugs.python.org/issue?@action=redirect&bpo=21717].)

## Other module-level changes

Many functions in the `mmap`, `ossaudiodev`, `socket`, `ssl`, and `codecs` modules now accept writable [bytes-like objects](#).

(Contributed by Serhiy Storchaka in [bpo-23001](https://bugs.python.org/issue?@action=redirect&bpo=23001) [https://bugs.python.org/issue?@action=redirect&bpo=23001].)

## Optimizations

The `os.walk()` function has been sped up by 3 to 5 times on POSIX systems, and by 7 to 20 times on Windows. This was done using the new `os.scandir()` function, which exposes file information from the underlying `readdir` or `FindFirstFile/FindNextFile` system calls. (Contributed by Ben Hoyt with help from Victor Stinner in [bpo-23605](https://bugs.python.org/issue?@action=redirect&bpo=23605) [https://bugs.python.org/issue?@action=redirect&bpo=23605].)

Construction of `bytes(int)` (filled by zero bytes) is faster and uses less memory for large objects. `calloc()` is used instead of `malloc()` to allocate memory for these objects. (Contributed by Victor Stinner in [bpo-21233](https://bugs.python.org/issue?@action=redirect&bpo=21233) [https://bugs.python.org/issue?@action=redirect&bpo=21233].)

Some operations on `ipaddress IPv4Network` and `IPv6Network` have been massively sped up, such as `subnets()`, `supernet()`, `summarize_address_range()`, `collapse_addresses()`. The speed up can range from 3 to 15 times. (Contributed by Antoine Pitrou, Michel Albert, and Markus in [bpo-21486](https://bugs.python.org/issue?@action=redirect&bpo=21486) [https://bugs.python.org/issue?@action=redirect&bpo=21486], [bpo-21487](https://bugs.python.org/issue?@action=redirect&bpo=21487) [https://bugs.python.org/issue?@action=redirect&bpo=21487], [bpo-20826](https://bugs.python.org/issue?@action=redirect&bpo=20826) [https://bugs.python.org/issue?@action=redirect&bpo=20826], [bpo-23266](https://bugs.python.org/issue?@action=redirect&bpo=23266) [https://bugs.python.org/issue?@action=redirect&bpo=23266].)

Pickling of `ipaddress` objects was optimized to produce significantly smaller output. (Contributed by Serhiy Storchaka in [bpo-23133](https://bugs.python.org/issue?@action=redirect&bpo=23133) [https://bugs.python.org/issue?@action=redirect&bpo=23133].)

Many operations on `io.BytesIO` are now 50% to 100% faster. (Contributed by Serhiy Storchaka in [bpo-15381](https://bugs.python.org/issue?@action=redirect&bpo=15381) [https://bugs.python.org/issue?@action=redirect&bpo=15381] and David Wilson in [bpo-22003](https://bugs.python.org/issue?@action=redirect&bpo=22003) [https://bugs.python.org/issue?@action=redirect&bpo=22003].)

The `marshal.dumps()` function is now faster: 65–85% with versions 3 and 4, 20–25% with versions 0 to 2 on typical data, and up to 5 times in best cases. (Contributed by Serhiy Storchaka in [bpo-20416](https://bugs.python.org/issue?@action=redirect&bpo=20416) [https://bugs.python.org/issue?@action=redirect&bpo=20416] and [bpo-23344](https://bugs.python.org/issue?@action=redirect&bpo=23344) [https://bugs.python.org/issue?@action=redirect&bpo=23344].)

The UTF-32 encoder is now 3 to 7 times faster. (Contributed by Serhiy Storchaka in [bpo-15027](https://bugs.python.org/issue?@action=redirect&bpo=15027) [https://bugs.python.org/issue?@action=redirect&bpo=15027].)

Regular expressions are now parsed up to 10% faster. (Contributed by Serhiy Storchaka in [bpo-19380](https://bugs.python.org/issue?@action=redirect&bpo=19380) [https://bugs.python.org/issue?@action=redirect&bpo=19380].)

The `json.dumps()` function was optimized to run with `ensure_ascii=False` as fast as with `ensure_ascii=True`. (Contributed by Naoki Inada in [bpo-23206](https://bugs.python.org/issue?@action=redirect&bpo=23206) [https://bugs.python.org/issue?@action=redirect&bpo=23206].)

The `PyObject_IsInstance()` and `PyObject_IsSubclass()` functions have been sped up in the common case that the second argument has `type` as its metaclass. (Contributed Georg Brandl by in [bpo-22540](https://bugs.python.org/issue?@action=redirect&bpo=22540) [https://bugs.python.org/issue?@action=redirect&bpo=22540].)

Method caching was slightly improved, yielding up to 5% performance improvement in some benchmarks. (Contributed by Antoine Pitrou in [bpo-22847](https://bugs.python.org/issue?@action=redirect&bpo=22847) [https://bugs.python.org/issue?@action=redirect&bpo=22847].)

Objects from the `random` module now use 50% less memory on 64-bit builds. (Contributed by Serhiy Storchaka in [bpo-23488](https://bugs.python.org/issue?@action=redirect&bpo=23488) [https://bugs.python.org/issue?@action=redirect&bpo=23488].)

The `property()` getter calls are up to 25% faster. (Contributed by Joe Jevnik in [bpo-23910](https://bugs.python.org/issue?@action=redirect&bpo=23910) [https://bugs.python.org/issue?@action=redirect&bpo=23910].)

Instantiation of `fractions.Fraction` is now up to 30% faster. (Contributed by Stefan Behnel in [bpo-22464](https://bugs.python.org/issue?@action=redirect&bpo=22464) [https://bugs.python.org/issue?@action=redirect&bpo=22464].)

String methods `find()`, `rfind()`, `split()`, `partition()` and the `in` string operator are now significantly faster for searching 1-character substrings. (Contributed by Serhiy Storchaka in [bpo-23573](https://bugs.python.org/issue?@action=redirect&bpo=23573) [https://bugs.python.org/issue?@action=redirect&bpo=23573].)

## Build and C API Changes

New `calloc` functions were added:

- `PyMem_RawCalloc()`,
- `PyMem_Calloc()`,
- `PyObject_Calloc()`.

(Contributed by Victor Stinner in [bpo-21233](https://bugs.python.org/issue?@action=redirect&bpo=21233) [https://bugs.python.org/issue?@action=redirect&bpo=21233].)

New encoding/decoding helper functions:

- `Py_DecodeLocale()` (replaced `_Py_char2wchar()`),
- `Py_EncodeLocale()` (replaced `_Py_wchar2char()`).

(Contributed by Victor Stinner in [bpo-18395](https://bugs.python.org/issue?@action=redirect&bpo=18395) [https://bugs.python.org/issue?@action=redirect&bpo=18395].)

A new `PyCodec_NameReplaceErrors()` function to replace the unicode encode error with `\N{...}` escapes. (Contributed by Serhiy Storchaka in [bpo-19676](https://bugs.python.org/issue?@action=redirect&bpo=19676) [https://bugs.python.org/issue?@action=redirect&bpo=19676].)

A new `PyErr_FormatV()` function similar to `PyErr_Format()`, but accepts a `va_list` argument. (Contributed by Antoine Pitrou in [bpo-18711](https://bugs.python.org/issue?@action=redirect&bpo=18711) [https://bugs.python.org/issue?@action=redirect&bpo=18711].)

A new `PyExc_RecursionError` exception. (Contributed by Georg Brandl in [bpo-19235](https://bugs.python.org/issue?@action=redirect&bpo=19235) [https://bugs.python.org/issue?@action=redirect&bpo=19235].)

New `PyModule_FromDefAndSpec()`, `PyModule_FromDefAndSpec2()`, and `PyModule_ExecDef()` functions introduced by [PEP 489](https://peps.python.org/pep-0489/) [https://peps.python.org/pep-0489/] – multi-phase extension module initialization. (Contributed by Petr Viktorin in [bpo-24268](https://bugs.python.org/issue?@action=redirect&bpo=24268) [https://bugs.python.org/issue?@action=redirect&bpo=24268].)

New `PyNumber_MatrixMultiply()` and `PyNumber_InPlaceMatrixMultiply()` functions to perform matrix multiplication. (Contributed by Benjamin Peterson in [bpo-21176](https://bugs.python.org/issue?@action=redirect&bpo=21176) [https://bugs.python.org/issue?@action=redirect&bpo=21176]. See also [PEP 465](https://peps.python.org/pep-0465/) [https://peps.python.org/pep-0465/] for details.)

The `PyTypeObject.tp_finalize` slot is now part of the stable ABI.

Windows builds now require Microsoft Visual C++ 14.0, which is available as part of [Visual Studio 2015](https://visualstudio.microsoft.com/en/vs/older-downloads/#visual-studio-2015-and-other-products) [https://visualstudio.microsoft.com/en/vs/older-downloads/#visual-studio-2015-and-other-products].

Extension modules now include a platform information tag in their filename on some platforms (the tag is optional, and CPython will import extensions without it, although if the tag is present and mismatched, the extension won't be loaded):

- On Linux, extension module filenames end with `.cpython-  
<major><minor>m-<architecture>-<os>.pyd`:
  - `<major>` is the major number of the Python version; for Python 3.5 this is `3`.
  - `<minor>` is the minor number of the Python version; for Python 3.5 this is `5`.
  - `<architecture>` is the hardware architecture the extension module was built to run on. It's most commonly either `i386` for 32-bit Intel platforms or `x86_64` for 64-bit Intel (and AMD) platforms.
  - `<os>` is always `linux-gnu`, except for extensions built to talk to the 32-bit ABI on 64-bit platforms, in which case it is `linux-gnu32` (and `<architecture>` will be `x86_64`).
- On Windows, extension module filenames end with

`<debug>.cp<major><minor>-<platform>.pyd:`

- `<major>` is the major number of the Python version; for Python 3.5 this is 3.
  - `<minor>` is the minor number of the Python version; for Python 3.5 this is 5.
  - `<platform>` is the platform the extension module was built for, either `win32` for Win32, `win_amd64` for Win64, `win_ia64` for Windows Itanium 64, and `win_arm` for Windows on ARM.
  - If built in debug mode, `<debug>` will be `_d`, otherwise it will be blank.
- On OS X platforms, extension module filenames now end with `-darwin.so`.
  - On all other platforms, extension module filenames are the same as they were with Python 3.4.

## Deprecated

### New Keywords

`async` and `await` are not recommended to be used as variable, class, function or module names. Introduced by [PEP 492](https://peps.python.org/pep-0492/) [https://peps.python.org/pep-0492/] in Python 3.5, they will become proper keywords in Python 3.7.

### Deprecated Python Behavior

Raising the [StopIteration](#) exception inside a generator will now generate a silent [PendingDeprecationWarning](#), which will become a non-silent deprecation warning in Python 3.6 and will trigger a [RuntimeError](#) in Python 3.7. See [PEP 479: Change StopIteration handling inside generators](#) for details.

### Unsupported Operating Systems

Windows XP is no longer supported by Microsoft, thus, per [PEP 11](https://peps.python.org/pep-0011/) [https://peps.python.org/pep-0011/], CPython 3.5 is no longer officially supported on this OS.

## Deprecated Python modules, functions and methods

The **`formatter`** module has now graduated to full deprecation and is still slated for removal in Python 3.6.

The **`asyncio.async()`** function is deprecated in favor of **`ensure_future()`**.

The **`smtpd`** module has in the past always decoded the DATA portion of email messages using the `utf-8` codec. This can now be controlled by the new *decode\_data* keyword to **`SMTPServer`**. The default value is `True`, but this default is deprecated. Specify the *decode\_data* keyword with an appropriate value to avoid the deprecation warning.

Directly assigning values to the **`key`**, **`value`** and **`coded_value`** of **`http.cookies.Morsel`** objects is deprecated. Use the **`set()`** method instead. In addition, the undocumented *LegalChars* parameter of **`set()`** is deprecated, and is now ignored.

Passing a format string as keyword argument *format\_string* to the **`format()`** method of the **`string.Formatter`** class has been deprecated. (Contributed by Serhiy Storchaka in [bpo-23671](https://bugs.python.org/issue?@action=redirect&bpo=23671) [https://bugs.python.org/issue?@action=redirect&bpo=23671].)

The **`platform.dist()`** and **`platform.linux_distribution()`** functions are now deprecated. Linux distributions use too many different ways of describing themselves, so the functionality is left to a package. (Contributed by Vajrasky Kok and Berker Peksag in [bpo-1322](https://bugs.python.org/issue?@action=redirect&bpo=1322) [https://bugs.python.org/issue?@action=redirect&bpo=1322].)

The previously undocumented *from\_function* and *from\_builtin* methods of **`inspect.Signature`** are deprecated. Use the new **`Signature.from_callable()`** method instead. (Contributed by Yury Selivanov in [bpo-24248](https://bugs.python.org/issue?@action=redirect&bpo=24248) [https://bugs.python.org/issue?@action=redirect&bpo=24248].)

The **`inspect.getargspec()`** function is deprecated and scheduled to be removed in Python 3.6. (See [bpo-20438](https://bugs.python.org/issue?@action=redirect&bpo=20438) [https://bugs.python.org/issue?@action=redirect&bpo=20438] for details.)

The `inspect.getfullargspec()`, `inspect.getcallargs()`, and `inspect.formatargspec()` functions are deprecated in favor of the `inspect.signature()` API. (Contributed by Yury Selivanov in [bpo-20438](https://bugs.python.org/issue?@action=redirect&bpo=20438) [https://bugs.python.org/issue?@action=redirect&bpo=20438].)

`inspect.getargvalues()` and `inspect.formatargvalues()` functions were inadvertently marked as deprecated with the release of Python 3.5.0.

Use of `re.LOCALE` flag with str patterns or `re.ASCII` is now deprecated. (Contributed by Serhiy Storchaka in [bpo-22407](https://bugs.python.org/issue?@action=redirect&bpo=22407) [https://bugs.python.org/issue?@action=redirect&bpo=22407].)

Use of unrecognized special sequences consisting of `'\'` and an ASCII letter in regular expression patterns and replacement patterns now raises a deprecation warning and will be forbidden in Python 3.6. (Contributed by Serhiy Storchaka in [bpo-23622](https://bugs.python.org/issue?@action=redirect&bpo=23622) [https://bugs.python.org/issue?@action=redirect&bpo=23622].)

The undocumented and unofficial `unittest.load_tests` default argument of the `unittest.TestLoader.loadTestsFromModule()` method now is deprecated and ignored. (Contributed by Robert Collins and Barry A. Warsaw in [bpo-16662](https://bugs.python.org/issue?@action=redirect&bpo=16662) [https://bugs.python.org/issue?@action=redirect&bpo=16662].)

## Removed

### API and Feature Removals

The following obsolete and previously deprecated APIs and features have been removed:

- The `__version__` attribute has been dropped from the email package. The email code hasn't been shipped separately from the stdlib for a long time, and the `__version__` string was not updated in the last few releases.
- The internal `Netrc` class in the `ftplib` module was deprecated in 3.4, and has now been removed. (Contributed by Matt Chaput in [bpo-6623](https://bugs.python.org/issue?@action=redirect&bpo=6623) [https://bugs.python.org/issue?@action=redirect&bpo=6623].)

- The concept of `.pyo` files has been removed.
- The `JoinableQueue` class in the provisional `asyncio` module was deprecated in 3.4.4 and is now removed. (Contributed by A. Jesse Jiryu Davis in [bpo-23464](https://bugs.python.org/issue?@action=redirect&bpo=23464) [https://bugs.python.org/issue?@action=redirect&bpo=23464].)

## Porting to Python 3.5

This section lists previously described changes and other bugfixes that may require changes to your code.

### Changes in Python behavior

- Due to an oversight, earlier Python versions erroneously accepted the following syntax:

```
f(1 for x in [1], *args)
f(1 for x in [1], **kwargs)
```

Python 3.5 now correctly raises a `SyntaxError`, as generator expressions must be put in parentheses if not a sole argument to a function.

### Changes in the Python API

- [PEP 475](https://peps.python.org/pep-0475/) [https://peps.python.org/pep-0475/]: System calls are now retried when interrupted by a signal instead of raising `InterruptedError` if the Python signal handler does not raise an exception.
- Before Python 3.5, a `datetime.time` object was considered to be false if it represented midnight in UTC. This behavior was considered obscure and error-prone and has been removed in Python 3.5. See [bpo-13936](https://bugs.python.org/issue?@action=redirect&bpo=13936) [https://bugs.python.org/issue?@action=redirect&bpo=13936] for full details.
- The `ssl.SSLSocket.send()` method now raises either `ssl.SSLWantReadError` or `ssl.SSLWantWriteError` on a non-blocking socket if the operation would block. Previously, it would return `0`. (Contributed by Nikolaus Rath in [bpo-20951](https://bugs.python.org/issue?@action=redirect&bpo=20951) [https://bugs.python.org/issue?@action=redirect&bpo=20951].)

@action=redirect&bpo=20951].)

- The `__name__` attribute of generators is now set from the function name, instead of being set from the code name. Use `gen.gi_code.co_name` to retrieve the code name. Generators also have a new `__qualname__` attribute, the qualified name, which is now used for the representation of a generator (`repr(gen)`). (Contributed by Victor Stinner in [bpo-21205](https://bugs.python.org/issue?@action=redirect&bpo=21205) [https://bugs.python.org/issue?@action=redirect&bpo=21205].)
- The deprecated “strict” mode and argument of [HTMLParser](#), [HTMLParser.error\(\)](#), and the [HTMLParserError](#) exception have been removed. (Contributed by Ezio Melotti in [bpo-15114](https://bugs.python.org/issue?@action=redirect&bpo=15114) [https://bugs.python.org/issue?@action=redirect&bpo=15114].) The `convert_charrefs` argument of [HTMLParser](#) is now `True` by default. (Contributed by Berker Peksag in [bpo-21047](https://bugs.python.org/issue?@action=redirect&bpo=21047) [https://bugs.python.org/issue?@action=redirect&bpo=21047].)
- Although it is not formally part of the API, it is worth noting for porting purposes (ie: fixing tests) that error messages that were previously of the form “‘sometype’ does not support the buffer protocol” are now of the form “a [bytes-like object](#) is required, not ‘sometype’”. (Contributed by Ezio Melotti in [bpo-16518](https://bugs.python.org/issue?@action=redirect&bpo=16518) [https://bugs.python.org/issue?@action=redirect&bpo=16518].)
- If the current directory is set to a directory that no longer exists then [FileNotFoundError](#) will no longer be raised and instead [find\\_spec\(\)](#) will return `None` without caching `None` in [sys.path\\_importer\\_cache](#), which is different than the typical case ([bpo-22834](https://bugs.python.org/issue?@action=redirect&bpo=22834) [https://bugs.python.org/issue?@action=redirect&bpo=22834]).
- HTTP status code and messages from [http.client](#) and [http.server](#) were refactored into a common [HTTPStatus](#) enum. The values in [http.client](#) and [http.server](#) remain available for backwards compatibility. (Contributed by Demian Brecht in [bpo-21793](https://bugs.python.org/issue?@action=redirect&bpo=21793) [https://bugs.python.org/issue?@action=redirect&bpo=21793].)
- When an import loader defines [importlib.machinery.Loader.exec\\_module\(\)](#) it is now expected to also define [create\\_module\(\)](#) (raises a [DeprecationWarning](#) now, will be an error in Python 3.6).

If the loader inherits from `importlib.abc.Loader` then there is nothing to do, else simply define

`create_module()` to return `None`. (Contributed by Brett Cannon in [bpo-23014](https://bugs.python.org/issue?@action=redirect&bpo=23014) [https://bugs.python.org/issue?@action=redirect&bpo=23014].)

- The `re.split()` function always ignored empty pattern matches, so the `"x*"` pattern worked the same as `"x+"`, and the `"\b"` pattern never worked. Now `re.split()` raises a warning if the pattern could match an empty string. For compatibility, use patterns that never match an empty string (e.g. `"x+"` instead of `"x*"`). Patterns that could only match an empty string (such as `"\b"`) now raise an error. (Contributed by Serhiy Storchaka in [bpo-22818](https://bugs.python.org/issue?@action=redirect&bpo=22818) [https://bugs.python.org/issue?@action=redirect&bpo=22818].)
- The `http.cookies.Morsel` dict-like interface has been made self consistent: morsel comparison now takes the `key` and `value` into account, `copy()` now results in a `Morsel` instance rather than a `dict`, and `update()` will now raise an exception if any of the keys in the update dictionary are invalid. In addition, the undocumented `LegalChars` parameter of `set()` is deprecated and is now ignored. (Contributed by Demian Brecht in [bpo-2211](https://bugs.python.org/issue?@action=redirect&bpo=2211) [https://bugs.python.org/issue?@action=redirect&bpo=2211].)
- [PEP 488](https://peps.python.org/pep-0488/) [https://peps.python.org/pep-0488/] has removed `.pyo` files from Python and introduced the optional `opt-` tag in `.pyc` file names. The `importlib.util.cache_from_source()` has gained an *optimization* parameter to help control the `opt-` tag. Because of this, the *debug\_override* parameter of the function is now deprecated. `.pyo` files are also no longer supported as a file argument to the Python interpreter and thus serve no purpose when distributed on their own (i.e. sourceless code distribution). Due to the fact that the magic number for bytecode has changed in Python 3.5, all old `.pyo` files from previous versions of Python are invalid regardless of this PEP.
- The `socket` module now exports the `CAN_RAW_FD_FRAMES` constant on linux 3.6 and greater.
- The `ssl.cert_time_to_seconds()` function now interprets the input time as UTC and not as local time, per [RFC 5280](https://datatracker.ietf.org/doc/html/rfc5280.html) [https://datatracker.ietf.org/doc/html/rfc5280.html].

Additionally, the return value is always an `int`. (Contributed by Akira Li in [bpo-19940](https://bugs.python.org/issue?@action=redirect&bpo=19940) [https://bugs.python.org/issue?@action=redirect&bpo=19940].)

- The `pygettext.py` Tool now uses the standard `+NNNN` format for timezones in the POT-Creation-Date header.
- The `smtplib` module now uses `sys.stderr` instead of the previous module-level `stderr` variable for debug output. If your (test) program depends on patching the module-level variable to capture the debug output, you will need to update it to capture `sys.stderr` instead.
- The `str.startswith()` and `str.endswith()` methods no longer return `True` when finding the empty string and the indexes are completely out of range. (Contributed by Serhiy Storchaka in [bpo-24284](https://bugs.python.org/issue?@action=redirect&bpo=24284) [https://bugs.python.org/issue?@action=redirect&bpo=24284].)
- The `inspect.getdoc()` function now returns documentation strings inherited from base classes. Documentation strings no longer need to be duplicated if the inherited documentation is appropriate. To suppress an inherited string, an empty string must be specified (or the documentation may be filled in). This change affects the output of the `pydoc` module and the `help()` function. (Contributed by Serhiy Storchaka in [bpo-15582](https://bugs.python.org/issue?@action=redirect&bpo=15582) [https://bugs.python.org/issue?@action=redirect&bpo=15582].)
- Nested `functools.partial()` calls are now flattened. If you were relying on the previous behavior, you can now either add an attribute to a `functools.partial()` object or you can create a subclass of `functools.partial()`. (Contributed by Alexander Belopolsky in [bpo-7830](https://bugs.python.org/issue?@action=redirect&bpo=7830) [https://bugs.python.org/issue?@action=redirect&bpo=7830].)

## Changes in the C API

- The undocumented `format` member of the (non-public) `PyMemoryViewObject` structure has been removed. All extensions relying on the relevant parts in `memoryobject.h` must be rebuilt.
- The `PyMemAllocator` structure was renamed to `PyMemAllocatorEx` and a new `calloc` field was added.
- Removed non-documented macro `PyObject_REPR` which

leaked references. Use format character `%R` in `PyUnicode_FromFormat()`-like functions to format the `repr()` of the object. (Contributed by Serhiy Storchaka in [bpo-22453](https://bugs.python.org/issue?@action=redirect&bpo=22453) [https://bugs.python.org/issue?@action=redirect&bpo=22453].)

- Because the lack of the `__module__` attribute breaks pickling and introspection, a deprecation warning is now raised for builtin types without the `__module__` attribute. This would be an `AttributeError` in the future. (Contributed by Serhiy Storchaka in [bpo-20204](https://bugs.python.org/issue?@action=redirect&bpo=20204) [https://bugs.python.org/issue?@action=redirect&bpo=20204].)
- As part of the [PEP 492](https://peps.python.org/pep-0492/) [https://peps.python.org/pep-0492/] implementation, the `tp_reserved` slot of `PyTypeObject` was replaced with a `tp_as_async` slot. Refer to [Coroutine Objects](#) for new types, structures and functions.

## Notable changes in Python 3.5.4

### New `make regen-all` build target

To simplify cross-compilation, and to ensure that CPython can reliably be compiled without requiring an existing version of Python to already be available, the autotools-based build system no longer attempts to implicitly recompile generated files based on file modification times.

Instead, a new `make regen-all` command has been added to force regeneration of these files when desired (e.g. after an initial version of Python has already been built based on the pregenerated versions).

More selective regeneration targets are also defined - see [Makefile.pre.in](https://github.com/python/cpython/tree/3.11/Makefile.pre.in) [https://github.com/python/cpython/tree/3.11/Makefile.pre.in] for details.

(Contributed by Victor Stinner in [bpo-23404](https://bugs.python.org/issue?@action=redirect&bpo=23404) [https://bugs.python.org/issue?@action=redirect&bpo=23404].)

*New in version 3.5.4.*

## Removal of `make touch build` target

The `make touch build` target previously used to request implicit regeneration of generated files by updating their modification times has been removed.

It has been replaced by the new `make regen-all` target.

(Contributed by Victor Stinner in [bpo-23404](https://bugs.python.org/issue?@action=redirect&bpo=23404) [https://bugs.python.org/issue?@action=redirect&bpo=23404].)

*Changed in version 3.5.4.*

# What's New In Python 3.4

## Author

R. David Murray <[rdmurray@bitdance.com](mailto:rdmurray@bitdance.com)>  
(Editor)

This article explains the new features in Python 3.4, compared to 3.3. Python 3.4 was released on March 16, 2014. For full details, see the [changelog](https://docs.python.org/3.4/whatsnew/changelog.html) [https://docs.python.org/3.4/whatsnew/changelog.html].

## See also

[PEP 429](https://peps.python.org/pep-0429/) [https://peps.python.org/pep-0429/] – Python 3.4 Release Schedule

## Summary – Release Highlights

New syntax features:

- No new syntax features were added in Python 3.4.

Other new features:

- [pip should always be available](https://peps.python.org/pep-0453/) ([PEP 453](https://peps.python.org/pep-0453/) [https://peps.python.org/pep-0453/]).
- [Newly created file descriptors are non-inheritable](https://peps.python.org/pep-0446/) ([PEP 446](https://peps.python.org/pep-0446/) [https://peps.python.org/pep-0446/]).
- command line option for [isolated mode](https://bugs.python.org/issue?@action=redirect&bpo=16499) ([bpo-16499](https://bugs.python.org/issue?@action=redirect&bpo=16499) [https://bugs.python.org/issue?@action=redirect&bpo=16499]).
- [improvements in the handling of codecs](#) that are not text encodings (multiple issues).
- [A ModuleSpec Type](https://peps.python.org/pep-0451/) for the Import System ([PEP 451](https://peps.python.org/pep-0451/) [https://peps.python.org/pep-0451/]). (Affects importer authors.)
- The [marshal](#) format has been made [more compact and efficient](#) ([bpo-16475](https://bugs.python.org/issue?@action=redirect&bpo=16475) [https://bugs.python.org/issue?@action=redirect&bpo=16475]).

@action=redirect&bpo=16475]).

## New library modules:

- **asyncio**: New provisional API for asynchronous IO (**PEP 3156** [<https://peps.python.org/pep-3156/>]).
- **ensurepip**: Bootstrapping the pip installer (**PEP 453** [<https://peps.python.org/pep-0453/>]).
- **enum**: Support for enumeration types (**PEP 435** [<https://peps.python.org/pep-0435/>]).
- **pathlib**: Object-oriented filesystem paths (**PEP 428** [<https://peps.python.org/pep-0428/>]).
- **selectors**: High-level and efficient I/O multiplexing, built upon the **select** module primitives (part of **PEP 3156** [<https://peps.python.org/pep-3156/>]).
- **statistics**: A basic numerically stable statistics library (**PEP 450** [<https://peps.python.org/pep-0450/>]).
- **tracemalloc**: Trace Python memory allocations (**PEP 454** [<https://peps.python.org/pep-0454/>]).

## Significantly improved library modules:

- Single-dispatch generic functions in **functools** (**PEP 443** [<https://peps.python.org/pep-0443/>]).
- New **pickle protocol 4** (**PEP 3154** [<https://peps.python.org/pep-3154/>]).
- **multiprocessing** now has an option to avoid using **os.fork** on Unix (**bpo-8713** [<https://bugs.python.org/issue?@action=redirect&bpo=8713>]).
- **email** has a new submodule, **contentmanager**, and a new **Message** subclass (**EmailMessage**) that simplify MIME handling (**bpo-18891** [<https://bugs.python.org/issue?@action=redirect&bpo=18891>]).
- The **inspect** and **pydoc** modules are now capable of correct introspection of a much wider variety of callable objects, which improves the output of the Python **help()** system.
- The **ipaddress** module API has been declared stable

## Security improvements:

- [Secure and interchangeable hash algorithm \(PEP 456\)](https://peps.python.org/pep-0456/) [https://peps.python.org/pep-0456/]).
- [Make newly created file descriptors non-inheritable \(PEP 446\)](https://peps.python.org/pep-0446/) [https://peps.python.org/pep-0446/] to avoid leaking file descriptors to child processes.
- New command line option for [isolated mode](https://bugs.python.org/issue?@action=redirect&bpo=16499), ([bpo-16499](https://bugs.python.org/issue?@action=redirect&bpo=16499) [https://bugs.python.org/issue?@action=redirect&bpo=16499]).
- [multiprocessing](#) now has [an option to avoid using os.fork on Unix](#). *spawn* and *forkserver* are more secure because they avoid sharing data with child processes.
- [multiprocessing](#) child processes on Windows no longer inherit all of the parent's inheritable handles, only the necessary ones.
- A new [hashlib.pbkdf2\\_hmac\(\)](https://en.wikipedia.org/wiki/PBKDF2) function provides the PKCS#5 password-based key derivation function 2 [https://en.wikipedia.org/wiki/PBKDF2].
- TLSv1.1 and TLSv1.2 support for [ssl](#).
- Retrieving certificates from the Windows system cert store support for [ssl](#).
- Server-side SNI (Server Name Indication) support for [ssl](#).
- The [ssl.SSLContext](#) class has a [lot of improvements](#).
- All modules in the standard library that support SSL now support server certificate verification, including hostname matching ([ssl.match\\_hostname\(\)](#)) and CRLs (Certificate Revocation lists, see [ssl.SSLContext.load\\_verify\\_locations\(\)](#)).

## CPython implementation improvements:

- [Safe object finalization \(PEP 442\)](https://peps.python.org/pep-0442/) [https://peps.python.org/pep-0442/]).
- Leveraging [PEP 442](https://peps.python.org/pep-0442/) [https://peps.python.org/pep-0442/], in most cases [module globals are no longer set to None during finalization](#) ([bpo-18214](https://bugs.python.org/issue?@action=redirect&bpo=18214) [https://bugs.python.org/issue?@action=redirect&bpo=18214]).
- [Configurable memory allocators \(PEP 445\)](https://peps.python.org/pep-0445/) [https://peps.python.org/pep-0445/]).
- [Argument Clinic \(PEP 436\)](https://peps.python.org/pep-0436/) [https://peps.python.org/pep-0436/]).

Please read on for a comprehensive list of user-facing changes,

including many other smaller improvements, CPython optimizations, deprecations, and potential porting issues.

## New Features

### PEP 453: Explicit Bootstrapping of PIP in Python Installations

#### Bootstrapping pip By Default

The new **ensurepip** module (defined in **PEP 453** [<https://peps.python.org/pep-0453/>]) provides a standard cross-platform mechanism to bootstrap the pip installer into Python installations and virtual environments. The version of pip included with Python 3.4.0 is pip 1.5.4, and future 3.4.x maintenance releases will update the bundled version to the latest version of pip that is available at the time of creating the release candidate.

By default, the commands `pipX` and `pipX.Y` will be installed on all platforms (where X.Y stands for the version of the Python installation), along with the pip Python package and its dependencies. On Windows and in virtual environments on all platforms, the unversioned `pip` command will also be installed. On other platforms, the system wide unversioned `pip` command typically refers to the separately installed Python 2 version.

The `pyenv` command line utility and the **venv** module make use of the **ensurepip** module to make pip readily available in virtual environments. When using the command line utility, pip is installed by default, while when using the **venv** module **API** installation of pip must be requested explicitly.

For CPython **source builds on POSIX systems**, the `make install` and `make altinstall` commands bootstrap pip by default. This behaviour can be controlled through configure options, and overridden through Makefile options.

On Windows and Mac OS X, the CPython installers now default to installing pip along with CPython itself (users may opt out of

installing it during the installation process). Window users will need to opt in to the automatic `PATH` modifications to have `pip` available from the command line by default, otherwise it can still be accessed through the Python launcher for Windows as `py -m pip`.

As [discussed in the PEP](https://peps.python.org/pep-0453/#recommendations-for-downstream-distributors) [https://peps.python.org/pep-0453/#recommendations-for-downstream-distributors], platform packagers may choose not to install these commands by default, as long as, when invoked, they provide clear and simple directions on how to install them on that platform (usually using the system package manager).

## Note

To avoid conflicts between parallel Python 2 and Python 3 installations, only the versioned `pip3` and `pip3.4` commands are bootstrapped by default when `ensurepip` is invoked directly - the `--default-pip` option is needed to also request the unversioned `pip` command. `pyenv` and the Windows installer ensure that the unqualified `pip` command is made available in those environments, and `pip` can always be invoked via the `-m` switch rather than directly to avoid ambiguity on systems with multiple Python installations.

## Documentation Changes

As part of this change, the [Installing Python Modules](#) and [Distributing Python Modules](#) sections of the documentation have been completely redesigned as short getting started and FAQ documents. Most packaging documentation has now been moved out to the Python Packaging Authority maintained [Python Packaging User Guide](https://packaging.python.org) [https://packaging.python.org] and the documentation of the individual projects.

However, as this migration is currently still incomplete, the legacy versions of those guides remaining available as [Installing Python Modules \(Legacy version\)](#) and [Distributing Python Modules \(Legacy version\)](#).

See also

**PEP 453** [<https://peps.python.org/pep-0453/>] – **Explicit bootstrapping of pip in Python installations**

PEP written by Donald Stufft and Nick Coghlan, implemented by Donald Stufft, Nick Coghlan, Martin von Löwis and Ned Deily.

## PEP 446: Newly Created File Descriptors Are Non-Inheritable

**PEP 446** [<https://peps.python.org/pep-0446/>] makes newly created file descriptors **non-inheritable**. In general, this is the behavior an application will want: when launching a new process, having currently open files also open in the new process can lead to all sorts of hard to find bugs, and potentially to security issues.

However, there are occasions when inheritance is desired. To support these cases, the following new functions and methods are available:

- `os.get_inheritable()`, `os.set_inheritable()`
- `os.get_handle_inheritable()`, `os.set_handle_inheritable()`
- `socket.socket.get_inheritable()`, `socket.socket.set_inheritable()`

See also

**PEP 446** [<https://peps.python.org/pep-0446/>] – **Make newly created file descriptors non-inheritable**

PEP written and implemented by Victor Stinner.

## Improvements to Codec Handling

Since it was first introduced, the **codecs** module has always been intended to operate as a type-neutral dynamic encoding and decoding system. However, its close coupling with the Python text model, especially the type restricted convenience methods on the

builtin `str`, `bytes` and `bytearray` types, has historically obscured that fact.

As a key step in clarifying the situation, the `codecs.encode()` and `codecs.decode()` convenience functions are now properly documented in Python 2.7, 3.3 and 3.4. These functions have existed in the `codecs` module (and have been covered by the regression test suite) since Python 2.4, but were previously only discoverable through runtime introspection.

Unlike the convenience methods on `str`, `bytes` and `bytearray`, the `codecs` convenience functions support arbitrary codecs in both Python 2 and Python 3, rather than being limited to Unicode text encodings (in Python 3) or `basestring`  $\leftrightarrow$  `basestring` conversions (in Python 2).

In Python 3.4, the interpreter is able to identify the known non-text encodings provided in the standard library and direct users towards these general purpose convenience functions when appropriate:

```
>>> b"abcdef".decode("hex")
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
LookupError: 'hex' is not a text encoding; use codecs.de

>>> "hello".encode("rot13")
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
LookupError: 'rot13' is not a text encoding; use codecs.

>>> open("foo.txt", encoding="hex")
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
LookupError: 'hex' is not a text encoding; use codecs.op
```

In a related change, whenever it is feasible without breaking backwards compatibility, exceptions raised during encoding and decoding operations are wrapped in a chained exception of the same type that mentions the name of the codec responsible for producing the error:

```
>>> import codecs
```

```
>>> codecs.decode(b"abcdefgh", "hex")
```

```
Traceback (most recent call last):
```

```
File "/usr/lib/python3.4/encodings/hex_codec.py", line
```

```
    return (binascii.a2b_hex(input), len(input))
```

```
binascii.Error: Non-hexadecimal digit found
```

The above exception was the direct cause of the following

```
Traceback (most recent call last):
```

```
File "<stdin>", line 1, in <module>
```

```
binascii.Error: decoding with 'hex' codec failed (Error:
```

```
>>> codecs.encode("hello", "bz2")
```

```
Traceback (most recent call last):
```

```
File "/usr/lib/python3.4/encodings/bz2_codec.py", line
```

```
    return (bz2.compress(input), len(input))
```

```
File "/usr/lib/python3.4/bz2.py", line 498, in compress
```

```
    return comp.compress(data) + comp.flush()
```

```
TypeError: 'str' does not support the buffer interface
```

The above exception was the direct cause of the following

```
Traceback (most recent call last):
```

```
File "<stdin>", line 1, in <module>
```

```
TypeError: encoding with 'bz2' codec failed (TypeError:
```

Finally, as the examples above show, these improvements have permitted the restoration of the convenience aliases for the non-Unicode codecs that were themselves restored in Python 3.2. This means that encoding binary data to and from its hexadecimal representation (for example) can now be written as:

```
>>> from codecs import encode, decode
```

```
>>> encode(b"hello", "hex")
```

```
b'686556c6c6f'
```

```
>>> decode(b"686556c6c6f", "hex")
```

```
b'hello'
```

The binary and text transforms provided in the standard library are detailed in [Binary Transforms](#) and [Text Transforms](#).

(Contributed by Nick Coghlan in [bpo-7475](#) [<https://bugs.python.org/issue?@action=redirect&bpo=7475>], [bpo-17827](#) [<https://bugs.python.org/issue?@action=redirect&bpo=17827>], [bpo-17828](#) [<https://bugs.python.org/issue?@action=redirect&bpo=17828>] and [bpo-19619](#) [<https://bugs.python.org/issue?@action=redirect&bpo=19619>].)

## PEP 451: A ModuleSpec Type for the Import System

**PEP 451** [<https://peps.python.org/pep-0451/>] provides an encapsulation of the information about a module that the import machinery will use to load it (that is, a module specification). This helps simplify both the import implementation and several import-related APIs. The change is also a stepping stone for [several future import-related improvements](#) [<https://mail.python.org/pipermail/python-dev/2013-November/130111.html>].

The public-facing changes from the PEP are entirely backward-compatible. Furthermore, they should be transparent to everyone but importer authors. Key finder and loader methods have been deprecated, but they will continue working. New importers should use the new methods described in the PEP. Existing importers should be updated to implement the new methods. See the [Deprecated](#) section for a list of methods that should be replaced and their replacements.

## Other Language Changes

Some smaller changes made to the core Python language are:

- Unicode database updated to UCD version 6.3.
- `min()` and `max()` now accept a *default* keyword-only argument that can be used to specify the value they return if the iterable they are evaluating has no elements. (Contributed by Julian Berman in [bpo-18111](#) [<https://bugs.python.org/issue?@action=redirect&bpo=18111>].)
- Module objects are now [weakly referenceable](#).
- Module `__file__` attributes (and related values) should

now always contain absolute paths by default, with the sole exception of `__main__.__file__` when a script has been executed directly using a relative path. (Contributed by Brett Cannon in [bpo-18416](https://bugs.python.org/issue?@action=redirect&bpo=18416) [https://bugs.python.org/issue?@action=redirect&bpo=18416].)

- All the UTF-\* codecs (except UTF-7) now reject surrogates during both encoding and decoding unless the `surrogatepass` error handler is used, with the exception of the UTF-16 decoder (which accepts valid surrogate pairs) and the UTF-16 encoder (which produces them while encoding non-BMP characters). (Contributed by Victor Stinner, Kang-Hao (Kenny) Lu and Serhiy Storchaka in [bpo-12892](https://bugs.python.org/issue?@action=redirect&bpo=12892) [https://bugs.python.org/issue?@action=redirect&bpo=12892].)
- New German EBCDIC [codec](#) `cp273`. (Contributed by Michael Bierenfeld and Andrew Kuchling in [bpo-1097797](https://bugs.python.org/issue?@action=redirect&bpo=1097797) [https://bugs.python.org/issue?@action=redirect&bpo=1097797].)
- New Ukrainian [codec](#) `cp1125`. (Contributed by Serhiy Storchaka in [bpo-19668](https://bugs.python.org/issue?@action=redirect&bpo=19668) [https://bugs.python.org/issue?@action=redirect&bpo=19668].)
- [bytes](#).`join()` and [bytearray](#).`join()` now accept arbitrary buffer objects as arguments. (Contributed by Antoine Pitrou in [bpo-15958](https://bugs.python.org/issue?@action=redirect&bpo=15958) [https://bugs.python.org/issue?@action=redirect&bpo=15958].)
- The [int](#) constructor now accepts any object that has an `__index__` method for its *base* argument. (Contributed by Mark Dickinson in [bpo-16772](https://bugs.python.org/issue?@action=redirect&bpo=16772) [https://bugs.python.org/issue?@action=redirect&bpo=16772].)
- Frame objects now have a [clear\(\)](#) method that clears all references to local variables from the frame. (Contributed by Antoine Pitrou in [bpo-17934](https://bugs.python.org/issue?@action=redirect&bpo=17934) [https://bugs.python.org/issue?@action=redirect&bpo=17934].)
- [memoryview](#) is now registered as a [Sequence](#), and supports the [reversed\(\)](#) builtin. (Contributed by Nick Coghlan and Claudiu Popa in [bpo-18690](https://bugs.python.org/issue?@action=redirect&bpo=18690) [https://bugs.python.org/issue?@action=redirect&bpo=18690] and [bpo-19078](https://bugs.python.org/issue?@action=redirect&bpo=19078) [https://bugs.python.org/issue?@action=redirect&bpo=19078].)
- Signatures reported by [help\(\)](#) have been modified and improved in several cases as a result of the introduction of Argument Clinic and other changes to the [inspect](#) and [pydoc](#) modules.

- `__length_hint__()` is now part of the formal language specification (see [PEP 424](https://peps.python.org/pep-0424/) [https://peps.python.org/pep-0424/]). (Contributed by Armin Ronacher in [bpo-16148](https://bugs.python.org/issue?@action=redirect&bpo=16148) [https://bugs.python.org/issue?@action=redirect&bpo=16148].)

## New Modules

### asyncio

The new **asyncio** module (defined in [PEP 3156](https://peps.python.org/pep-3156/) [https://peps.python.org/pep-3156/]) provides a standard pluggable event loop model for Python, providing solid asynchronous IO support in the standard library, and making it easier for other event loop implementations to interoperate with the standard library and each other.

For Python 3.4, this module is considered a [provisional API](#).

See also

[PEP 3156](https://peps.python.org/pep-3156/) [https://peps.python.org/pep-3156/] – Asynchronous IO Support Rebooted: the “asyncio” Module

PEP written and implementation led by Guido van Rossum.

### ensurepip

The new **ensurepip** module is the primary infrastructure for the [PEP 453](https://peps.python.org/pep-0453/) [https://peps.python.org/pep-0453/] implementation. In the normal course of events end users will not need to interact with this module, but it can be used to manually bootstrap `pip` if the automated bootstrapping into an installation or virtual environment was declined.

**ensurepip** includes a bundled copy of `pip`, up-to-date as of the first release candidate of the release of CPython with which it ships (this applies to both maintenance releases and feature releases). `ensurepip` does not access the internet. If the installation has internet access, after `ensurepip` is run the bundled `pip` can be used to upgrade `pip` to a more recent release than the bundled

one. (Note that such an upgraded version of `pip` is considered to be a separately installed package and will not be removed if Python is uninstalled.)

The module is named *ensurepip* because if called when `pip` is already installed, it does nothing. It also has an `--upgrade` option that will cause it to install the bundled copy of `pip` if the existing installed version of `pip` is older than the bundled copy.

## enum

The new **enum** module (defined in **PEP 435** [<https://peps.python.org/pep-0435/>]) provides a standard implementation of enumeration types, allowing other modules (such as **socket**) to provide more informative error messages and better debugging support by replacing opaque integer constants with backwards compatible enumeration values.

### See also

**PEP 435** [<https://peps.python.org/pep-0435/>] – Adding an Enum type to the Python standard library

PEP written by Barry Warsaw, Eli Bendersky and Ethan Furman, implemented by Ethan Furman.

## pathlib

The new **pathlib** module offers classes representing filesystem paths with semantics appropriate for different operating systems. Path classes are divided between *pure paths*, which provide purely computational operations without I/O, and *concrete paths*, which inherit from pure paths but also provide I/O operations.

For Python 3.4, this module is considered a **provisional API**.

### See also

**PEP 428** [<https://peps.python.org/pep-0428/>] – The **pathlib** module – object-oriented filesystem paths

PEP written and implemented by Antoine Pitrou.

## selectors

The new **selectors** module (created as part of implementing **PEP 3156** [<https://peps.python.org/pep-3156/>]) allows high-level and efficient I/O multiplexing, built upon the **select** module primitives.

## statistics

The new **statistics** module (defined in **PEP 450** [<https://peps.python.org/pep-0450/>]) offers some core statistics functionality directly in the standard library. This module supports calculation of the mean, median, mode, variance and standard deviation of a data series.

### See also

**PEP 450** [<https://peps.python.org/pep-0450/>] – Adding A Statistics Module To The Standard Library

PEP written and implemented by Steven D'Aprano

## tracemalloc

The new **tracemalloc** module (defined in **PEP 454** [<https://peps.python.org/pep-0454/>]) is a debug tool to trace memory blocks allocated by Python. It provides the following information:

- Trace where an object was allocated
- Statistics on allocated memory blocks per filename and per line number: total size, number and average size of allocated memory blocks
- Compute the differences between two snapshots to detect memory leaks

### See also

**PEP 454** [<https://peps.python.org/pep-0454/>] – Add a new

## tracemalloc module to trace Python memory allocations

PEP written and implemented by Victor Stinner

## Improved Modules

### abc

New function `abc.get_cache_token()` can be used to know when to invalidate caches that are affected by changes in the object graph. (Contributed by Łukasz Langa in [bpo-16832](https://bugs.python.org/issue?@action=redirect&bpo=16832) [https://bugs.python.org/issue?@action=redirect&bpo=16832].)

New class `ABC` has `ABCMeta` as its meta class. Using `ABC` as a base class has essentially the same effect as specifying `metaclass=abc.ABCMeta`, but is simpler to type and easier to read. (Contributed by Bruno Dupuis in [bpo-16049](https://bugs.python.org/issue?@action=redirect&bpo=16049) [https://bugs.python.org/issue?@action=redirect&bpo=16049].)

### aifc

The `getparams()` method now returns a `namedtuple` rather than a plain tuple. (Contributed by Claudiu Popa in [bpo-17818](https://bugs.python.org/issue?@action=redirect&bpo=17818) [https://bugs.python.org/issue?@action=redirect&bpo=17818].)

`aifc.open()` now supports the context management protocol: when used in a `with` block, the `close()` method of the returned object will be called automatically at the end of the block. (Contributed by Serhiy Storchacha in [bpo-16486](https://bugs.python.org/issue?@action=redirect&bpo=16486) [https://bugs.python.org/issue?@action=redirect&bpo=16486].)

The `writeframesraw()` and `writeframes()` methods now accept any `bytes-like object`. (Contributed by Serhiy Storchaka in [bpo-8311](https://bugs.python.org/issue?@action=redirect&bpo=8311) [https://bugs.python.org/issue?@action=redirect&bpo=8311].)

### argparse

The `FileType` class now accepts *encoding* and *errors* arguments, which are passed through to `open()`. (Contributed by Lucas Maystre in [bpo-11175](https://bugs.python.org/issue?@action=redirect&bpo=11175) [https://bugs.python.org/issue?@action=redirect&bpo=11175].)

@action=redirect&bpo=11175].)

## audioop

**audioop** now supports 24-bit samples. (Contributed by Serhiy Storchaka in [bpo-12866](https://bugs.python.org/issue?@action=redirect&bpo=12866) [https://bugs.python.org/issue?@action=redirect&bpo=12866].)

New **byteswap()** function converts big-endian samples to little-endian and vice versa. (Contributed by Serhiy Storchaka in [bpo-19641](https://bugs.python.org/issue?@action=redirect&bpo=19641) [https://bugs.python.org/issue?@action=redirect&bpo=19641].)

All **audioop** functions now accept any **bytes-like object**. Strings are not accepted: they didn't work before, now they raise an error right away. (Contributed by Serhiy Storchaka in [bpo-16685](https://bugs.python.org/issue?@action=redirect&bpo=16685) [https://bugs.python.org/issue?@action=redirect&bpo=16685].)

## base64

The encoding and decoding functions in **base64** now accept any **bytes-like object** in cases where it previously required a **bytes** or **bytearray** instance. (Contributed by Nick Coghlan in [bpo-17839](https://bugs.python.org/issue?@action=redirect&bpo=17839) [https://bugs.python.org/issue?@action=redirect&bpo=17839].)

New functions **a85encode()**, **a85decode()**, **b85encode()**, and **b85decode()** provide the ability to encode and decode binary data from and to `Ascii85` and the git/mercurial `Base85` formats, respectively. The `a85` functions have options that can be used to make them compatible with the variants of the `Ascii85` encoding, including the Adobe variant. (Contributed by Martin Morrison, the Mercurial project, Serhiy Storchaka, and Antoine Pitrou in [bpo-17618](https://bugs.python.org/issue?@action=redirect&bpo=17618) [https://bugs.python.org/issue?@action=redirect&bpo=17618].)

## collections

The **ChainMap.new\_child()** method now accepts an *m* argument specifying the child map to add to the chain. This allows an existing mapping and/or a custom mapping type to be used for the child. (Contributed by Vinay Sajip in [bpo-16613](https://bugs.python.org/issue?@action=redirect&bpo=16613) [https://bugs.python.org/issue?@action=redirect&bpo=16613].)

[bugs.python.org/issue?@action=redirect&bpo=16613](https://bugs.python.org/issue?@action=redirect&bpo=16613).)

## colorsys

The number of digits in the coefficients for the RGB — YIQ conversions have been expanded so that they match the FCC NTSC versions. The change in results should be less than 1% and may better match results found elsewhere. (Contributed by Brian Landers and Serhiy Storchaka in [bpo-14323](https://bugs.python.org/issue?@action=redirect&bpo=14323) [<https://bugs.python.org/issue?@action=redirect&bpo=14323>].)

## contextlib

The new `contextlib.suppress` context manager helps to clarify the intent of code that deliberately suppresses exceptions from a single statement. (Contributed by Raymond Hettinger in [bpo-15806](https://bugs.python.org/issue?@action=redirect&bpo=15806) [<https://bugs.python.org/issue?@action=redirect&bpo=15806>] and Zero Piraeus in [bpo-19266](https://bugs.python.org/issue?@action=redirect&bpo=19266) [<https://bugs.python.org/issue?@action=redirect&bpo=19266>].)

The new `contextlib.redirect_stdout()` context manager makes it easier for utility scripts to handle inflexible APIs that write their output to `sys.stdout` and don't provide any options to redirect it. Using the context manager, the `sys.stdout` output can be redirected to any other stream or, in conjunction with `io.StringIO`, to a string. The latter can be especially useful, for example, to capture output from a function that was written to implement a command line interface. It is recommended only for utility scripts because it affects the global state of `sys.stdout`. (Contributed by Raymond Hettinger in [bpo-15805](https://bugs.python.org/issue?@action=redirect&bpo=15805) [<https://bugs.python.org/issue?@action=redirect&bpo=15805>].)

The `contextlib` documentation has also been updated to include a [discussion](#) of the differences between single use, reusable and reentrant context managers.

## dbm

`dbm.open()` objects now support the context management protocol. When used in a `with` statement, the `close` method of

the database object will be called automatically at the end of the block. (Contributed by Claudiu Popa and Nick Coghlan in [bpo-19282](https://bugs.python.org/issue?@action=redirect&bpo=19282) [https://bugs.python.org/issue?@action=redirect&bpo=19282].)

## dis

Functions `show_code()`, `dis()`, `distb()`, and `disassemble()` now accept a keyword-only *file* argument that controls where they write their output.

The `dis` module is now built around an `Instruction` class that provides object oriented access to the details of each individual bytecode operation.

A new method, `get_instructions()`, provides an iterator that emits the Instruction stream for a given piece of Python code. Thus it is now possible to write a program that inspects and manipulates a bytecode object in ways different from those provided by the `dis` module itself. For example:

```
>>> import dis
>>> for instr in dis.get_instructions(lambda x: x + 1):
...     print(instr.opname)
LOAD_FAST
LOAD_CONST
BINARY_ADD
RETURN_VALUE
```

The various display tools in the `dis` module have been rewritten to use these new components.

In addition, a new application-friendly class `Bytecode` provides an object-oriented API for inspecting bytecode in both in human-readable form and for iterating over instructions. The `Bytecode` constructor takes the same arguments that `get_instruction()` does (plus an optional *current\_offset*), and the resulting object can be iterated to produce `Instruction` objects. But it also has a `dis` method, equivalent to calling `dis` on the constructor argument, but returned as a multi-line string:

```
>>> bytecode = dis.Bytecode(lambda x: x + 1, current_off
```

```
>>> for instr in bytecode:
...     print('{} {}'.format(instr.opname, instr.opcode))
LOAD_FAST (124)
LOAD_CONST (100)
BINARY_ADD (23)
RETURN_VALUE (83)
>>> bytecode.dis().splitlines()
[' 1          0 LOAD_FAST          0 (x) ',
 '      -->  3 LOAD_CONST        1 (1) ',
 '          6 BINARY_ADD',
 '          7 RETURN_VALUE']
```

**Bytecode** also has a class method, `from_traceback()`, that provides the ability to manipulate a traceback (that is, `print(Bytecode.from_traceback(tb).dis())` is equivalent to `distb(tb)`).

(Contributed by Nick Coghlan, Ryan Kelly and Thomas Kluyver in [bpo-11816](https://bugs.python.org/issue?@action=redirect&bpo=11816) [https://bugs.python.org/issue?@action=redirect&bpo=11816] and Claudiu Popa in [bpo-17916](https://bugs.python.org/issue?@action=redirect&bpo=17916) [https://bugs.python.org/issue?@action=redirect&bpo=17916].)

New function `stack_effect()` computes the effect on the Python stack of a given opcode and argument, information that is not otherwise available. (Contributed by Larry Hastings in [bpo-19722](https://bugs.python.org/issue?@action=redirect&bpo=19722) [https://bugs.python.org/issue?@action=redirect&bpo=19722].)

## doctest

A new **option flag**, `FAIL_FAST`, halts test running as soon as the first failure is detected. (Contributed by R. David Murray and Daniel Urban in [bpo-16522](https://bugs.python.org/issue?@action=redirect&bpo=16522) [https://bugs.python.org/issue?@action=redirect&bpo=16522].)

The **doctest** command line interface now uses `argparse`, and has two new options, `-o` and `-f`. `-o` allows **doctest options** to be specified on the command line, and `-f` is a shorthand for `-o FAIL_FAST` (to parallel the similar option supported by the **unittest** CLI). (Contributed by R. David Murray in [bpo-11390](https://bugs.python.org/issue?@action=redirect&bpo=11390) [https://bugs.python.org/issue?@action=redirect&bpo=11390].)

**doctest** will now find doctests in extension module `__doc__` strings. (Contributed by Zachary Ware in [bpo-3158](https://bugs.python.org/issue?@action=redirect&bpo=3158) [https://bugs.python.org/issue?@action=redirect&bpo=3158].)

## email

**as\_string()** now accepts a *policy* argument to override the default policy of the message when generating a string representation of it. This means that `as_string` can now be used in more circumstances, instead of having to create and use a **generator** in order to pass formatting parameters to its `flatten` method. (Contributed by R. David Murray in [bpo-18600](https://bugs.python.org/issue?@action=redirect&bpo=18600) [https://bugs.python.org/issue?@action=redirect&bpo=18600].)

New method **as\_bytes()** added to produce a bytes representation of the message in a fashion similar to how `as_string` produces a string representation. It does not accept the *maxheaderlen* argument, but does accept the *unixfrom* and *policy* arguments. The **Message.\_\_bytes\_\_()** method calls it, meaning that `bytes(mymsg)` will now produce the intuitive result: a bytes object containing the fully formatted message. (Contributed by R. David Murray in [bpo-18600](https://bugs.python.org/issue?@action=redirect&bpo=18600) [https://bugs.python.org/issue?@action=redirect&bpo=18600].)

The **Message.set\_param()** message now accepts a *replace* keyword argument. When specified, the associated header will be updated without changing its location in the list of headers. For backward compatibility, the default is `False`. (Contributed by R. David Murray in [bpo-18891](https://bugs.python.org/issue?@action=redirect&bpo=18891) [https://bugs.python.org/issue?@action=redirect&bpo=18891].)

A pair of new subclasses of **Message** have been added (**EmailMessage** and **MIMEPart**), along with a new sub-module, **contentmanager** and a new **policy** attribute **content\_manager**. All documentation is currently in the new module, which is being added as part of email's new **provisional API**. These classes provide a number of new methods that make extracting content from and inserting content into email messages much easier. For details, see the **contentmanager** documentation and the **email: Examples**. These API additions complete the bulk of

the work that was planned as part of the email6 project. The currently provisional API is scheduled to become final in Python 3.5 (possibly with a few minor additions in the area of error handling). (Contributed by R. David Murray in [bpo-18891](https://bugs.python.org/issue?@action=redirect&bpo=18891) [https://bugs.python.org/issue?@action=redirect&bpo=18891].)

## filecmp

A new `clear_cache()` function provides the ability to clear the `filecmp` comparison cache, which uses `os.stat()` information to determine if the file has changed since the last compare. This can be used, for example, if the file might have been changed and re-checked in less time than the resolution of a particular filesystem's file modification time field. (Contributed by Mark Levitt in [bpo-18149](https://bugs.python.org/issue?@action=redirect&bpo=18149) [https://bugs.python.org/issue?@action=redirect&bpo=18149].)

New module attribute `DEFAULT_IGNORES` provides the list of directories that are used as the default value for the *ignore* parameter of the `dircmp()` function. (Contributed by Eli Bendersky in [bpo-15442](https://bugs.python.org/issue?@action=redirect&bpo=15442) [https://bugs.python.org/issue?@action=redirect&bpo=15442].)

## functools

The new `partialmethod()` descriptor brings partial argument application to descriptors, just as `partial()` provides for normal callables. The new descriptor also makes it easier to get arbitrary callables (including `partial()` instances) to behave like normal instance methods when included in a class definition. (Contributed by Alon Horev and Nick Coghlan in [bpo-4331](https://bugs.python.org/issue?@action=redirect&bpo=4331) [https://bugs.python.org/issue?@action=redirect&bpo=4331].)

The new `singledispatch()` decorator brings support for single-dispatch generic functions to the Python standard library. Where object oriented programming focuses on grouping multiple operations on a common set of data into a class, a generic function focuses on grouping multiple implementations of an operation that allows it to work with *different* kinds of data.

**See also**

## PEP 443 [https://peps.python.org/pep-0443/] – Single-dispatch generic functions

PEP written and implemented by Łukasz Langa.

`total_ordering()` now supports a return value of `NotImplemented` from the underlying comparison function. (Contributed by Katie Miller in [bpo-10042](https://bugs.python.org/issue?@action=redirect&bpo=10042) [https://bugs.python.org/issue?@action=redirect&bpo=10042].)

A pure-python version of the `partial()` function is now in the stdlib; in CPython it is overridden by the C accelerated version, but it is available for other implementations to use. (Contributed by Brian Thorne in [bpo-12428](https://bugs.python.org/issue?@action=redirect&bpo=12428) [https://bugs.python.org/issue?@action=redirect&bpo=12428].)

## gc

New function `get_stats()` returns a list of three per-generation dictionaries containing the collections statistics since interpreter startup. (Contributed by Antoine Pitrou in [bpo-16351](https://bugs.python.org/issue?@action=redirect&bpo=16351) [https://bugs.python.org/issue?@action=redirect&bpo=16351].)

## glob

A new function `escape()` provides a way to escape special characters in a filename so that they do not become part of the globbing expansion but are instead matched literally. (Contributed by Serhiy Storchaka in [bpo-8402](https://bugs.python.org/issue?@action=redirect&bpo=8402) [https://bugs.python.org/issue?@action=redirect&bpo=8402].)

## hashlib

A new `hashlib.pbkdf2_hmac()` function provides the [PKCS#5 password-based key derivation function 2](https://en.wikipedia.org/wiki/PBKDF2) [https://en.wikipedia.org/wiki/PBKDF2]. (Contributed by Christian Heimes in [bpo-18582](https://bugs.python.org/issue?@action=redirect&bpo=18582) [https://bugs.python.org/issue?@action=redirect&bpo=18582].)

The `name` attribute of `hashlib` hash objects is now a formally supported interface. It has always existed in CPython's `hashlib` (although it did not return lower case names for all supported

hashes), but it was not a public interface and so some other Python implementations have not previously supported it. (Contributed by Jason R. Coombs in [bpo-18532](https://bugs.python.org/issue?@action=redirect&bpo=18532) [https://bugs.python.org/issue?@action=redirect&bpo=18532].)

## hmac

**hmac** now accepts `bytearray` as well as `bytes` for the `key` argument to the `new()` function, and the `msg` parameter to both the `new()` function and the `update()` method now accepts any type supported by the `hashlib` module. (Contributed by Jonas Borgström in [bpo-18240](https://bugs.python.org/issue?@action=redirect&bpo=18240) [https://bugs.python.org/issue?@action=redirect&bpo=18240].)

The `digestmod` argument to the `hmac.new()` function may now be any hash digest name recognized by `hashlib`. In addition, the current behavior in which the value of `digestmod` defaults to `MD5` is deprecated: in a future version of Python there will be no default value. (Contributed by Christian Heimes in [bpo-17276](https://bugs.python.org/issue?@action=redirect&bpo=17276) [https://bugs.python.org/issue?@action=redirect&bpo=17276].)

With the addition of `block_size` and `name` attributes (and the formal documentation of the `digest_size` attribute), the `hmac` module now conforms fully to the [PEP 247](https://peps.python.org/pep-0247/) [https://peps.python.org/pep-0247/] API. (Contributed by Christian Heimes in [bpo-18775](https://bugs.python.org/issue?@action=redirect&bpo=18775) [https://bugs.python.org/issue?@action=redirect&bpo=18775].)

## html

New function `unescape()` function converts HTML5 character references to the corresponding Unicode characters. (Contributed by Ezio Melotti in [bpo-2927](https://bugs.python.org/issue?@action=redirect&bpo=2927) [https://bugs.python.org/issue?@action=redirect&bpo=2927].)

**HTMLParser** accepts a new keyword argument `convert_charrefs` that, when `True`, automatically converts all character references. For backward-compatibility, its value defaults to `False`, but it will change to `True` in a future version of Python, so you are invited to set it explicitly and update your code to use this new feature. (Contributed by Ezio Melotti in [bpo-13633](https://bugs.python.org/) [https://bugs.python.org/])

issue?@action=redirect&bpo=13633].)

The *strict* argument of `HTMLParser` is now deprecated.

(Contributed by Ezio Melotti in [bpo-15114](https://bugs.python.org/issue?@action=redirect&bpo=15114) [https://bugs.python.org/issue?@action=redirect&bpo=15114].)

## http

`send_error()` now accepts an optional additional *explain* parameter which can be used to provide an extended error description, overriding the hardcoded default if there is one. This extended error description will be formatted using the `error_message_format` attribute and sent as the body of the error response. (Contributed by Karl Cow in [bpo-12921](https://bugs.python.org/issue?@action=redirect&bpo=12921) [https://bugs.python.org/issue?@action=redirect&bpo=12921].)

The `http.server` command line interface now has a `-b/--bind` option that causes the server to listen on a specific address. (Contributed by Malte Swart in [bpo-17764](https://bugs.python.org/issue?@action=redirect&bpo=17764) [https://bugs.python.org/issue?@action=redirect&bpo=17764].)

## idlelib and IDLE

Since `idlelib` implements the IDLE shell and editor and is not intended for import by other programs, it gets improvements with every release. See `Lib/idlelib/NEWS.txt` for a cumulative list of changes since 3.3.0, as well as changes made in future 3.4.x releases. This file is also available from the IDLE *Help* ▶ *About IDLE* dialog.

## importlib

The `InspectLoader` ABC defines a new method, `source_to_code()` that accepts source data and a path and returns a code object. The default implementation is equivalent to `compile(data, path, 'exec', dont_inherit=True)`. (Contributed by Eric Snow and Brett Cannon in [bpo-15627](https://bugs.python.org/issue?@action=redirect&bpo=15627) [https://bugs.python.org/issue?@action=redirect&bpo=15627].)

`InspectLoader` also now has a default implementation for the

`get_code()` method. However, it will normally be desirable to override the default implementation for performance reasons. (Contributed by Brett Cannon in [bpo-18072](https://bugs.python.org/issue?@action=redirect&bpo=18072) [https://bugs.python.org/issue?@action=redirect&bpo=18072].)

The `reload()` function has been moved from `imp` to `importlib` as part of the `imp` module deprecation. (Contributed by Berker Peksag in [bpo-18193](https://bugs.python.org/issue?@action=redirect&bpo=18193) [https://bugs.python.org/issue?@action=redirect&bpo=18193].)

`importlib.util` now has a `MAGIC_NUMBER` attribute providing access to the bytecode version number. This replaces the `get_magic()` function in the deprecated `imp` module. (Contributed by Brett Cannon in [bpo-18192](https://bugs.python.org/issue?@action=redirect&bpo=18192) [https://bugs.python.org/issue?@action=redirect&bpo=18192].)

New `importlib.util` functions `cache_from_source()` and `source_from_cache()` replace the same-named functions in the deprecated `imp` module. (Contributed by Brett Cannon in [bpo-18194](https://bugs.python.org/issue?@action=redirect&bpo=18194) [https://bugs.python.org/issue?@action=redirect&bpo=18194].)

The `importlib` bootstrap `NamespaceLoader` now conforms to the `InspectLoader` ABC, which means that `runpy` and `python -m` can now be used with namespace packages. (Contributed by Brett Cannon in [bpo-18058](https://bugs.python.org/issue?@action=redirect&bpo=18058) [https://bugs.python.org/issue?@action=redirect&bpo=18058].)

`importlib.util` has a new function `decode_source()` that decodes source from bytes using universal newline processing. This is useful for implementing `InspectLoader.get_source()` methods.

`importlib.machinery.ExtensionFileLoader` now has a `get_filename()` method. This was inadvertently omitted in the original implementation. (Contributed by Eric Snow in [bpo-19152](https://bugs.python.org/issue?@action=redirect&bpo=19152) [https://bugs.python.org/issue?@action=redirect&bpo=19152].)

## inspect

The `inspect` module now offers a basic `command line interface` to quickly display source code and other information for modules,

classes and functions. (Contributed by Claudiu Popa and Nick Coghlan in [bpo-18626](https://bugs.python.org/issue?@action=redirect&bpo=18626) [https://bugs.python.org/issue?@action=redirect&bpo=18626].)

**unwrap()** makes it easy to unravel wrapper function chains created by **functools.wraps()** (and any other API that sets the `__wrapped__` attribute on a wrapper function). (Contributed by Daniel Urban, Aaron Iles and Nick Coghlan in [bpo-13266](https://bugs.python.org/issue?@action=redirect&bpo=13266) [https://bugs.python.org/issue?@action=redirect&bpo=13266].)

As part of the implementation of the new **enum** module, the **inspect** module now has substantially better support for custom `__dir__` methods and dynamic class attributes provided through metaclasses. (Contributed by Ethan Furman in [bpo-18929](https://bugs.python.org/issue?@action=redirect&bpo=18929) [https://bugs.python.org/issue?@action=redirect&bpo=18929] and [bpo-19030](https://bugs.python.org/issue?@action=redirect&bpo=19030) [https://bugs.python.org/issue?@action=redirect&bpo=19030].)

**getfullargspec()** and **getargspec()** now use the **signature()** API. This allows them to support a much broader range of callables, including those with `__signature__` attributes, those with metadata provided by argument clinic, **functools.partial()** objects and more. Note that, unlike **signature()**, these functions still ignore `__wrapped__` attributes, and report the already bound first argument for bound methods, so it is still necessary to update your code to use **signature()** directly if those features are desired. (Contributed by Yury Selivanov in [bpo-17481](https://bugs.python.org/issue?@action=redirect&bpo=17481) [https://bugs.python.org/issue?@action=redirect&bpo=17481].)

**signature()** now supports duck types of CPython functions, which adds support for functions compiled with Cython. (Contributed by Stefan Behnel and Yury Selivanov in [bpo-17159](https://bugs.python.org/issue?@action=redirect&bpo=17159) [https://bugs.python.org/issue?@action=redirect&bpo=17159].)

## ipaddress

**ipaddress** was added to the standard library in Python 3.3 as a **provisional API**. With the release of Python 3.4, this qualification has been removed: **ipaddress** is now considered a stable API, covered by the normal standard library requirements to maintain backwards compatibility.

A new `is_global` property is `True` if an address is globally routeable. (Contributed by Peter Moody in [bpo-17400](https://bugs.python.org/issue?@action=redirect&bpo=17400) [https://bugs.python.org/issue?@action=redirect&bpo=17400].)

## logging

The `TimedRotatingFileHandler` has a new `atTime` parameter that can be used to specify the time of day when rollover should happen. (Contributed by Ronald Oussoren in [bpo-9556](https://bugs.python.org/issue?@action=redirect&bpo=9556) [https://bugs.python.org/issue?@action=redirect&bpo=9556].)

`SocketHandler` and `DatagramHandler` now support Unix domain sockets (by setting `port` to `None`). (Contributed by Vinay Sajip in commit ce46195b56a9.)

`fileConfig()` now accepts a `configparser.RawConfigParser` subclass instance for the `fname` parameter. This facilitates using a configuration file when logging configuration is just a part of the overall application configuration, or where the application modifies the configuration before passing it to `fileConfig()`. (Contributed by Vinay Sajip in [bpo-16110](https://bugs.python.org/issue?@action=redirect&bpo=16110) [https://bugs.python.org/issue?@action=redirect&bpo=16110].)

Logging configuration data received from a socket via the `logging.config.listen()` function can now be validated before being processed by supplying a verification function as the argument to the new `verify` keyword argument. (Contributed by Vinay Sajip in [bpo-15452](https://bugs.python.org/issue?@action=redirect&bpo=15452) [https://bugs.python.org/issue?@action=redirect&bpo=15452].)

## marshal

The default `marshal` version has been bumped to 3. The code implementing the new version restores the Python2 behavior of recording only one copy of interned strings and preserving the interning on deserialization, and extends this “one copy” ability to any object type (including handling recursive references). This reduces both the size of `.pyc` files and the amount of memory a module occupies in memory when it is loaded from a `.pyc` (or `.pyo`) file. (Contributed by Kristján Valur Jónsson in [bpo-16475](https://bugs.python.org/issue?@action=redirect&bpo=16475) [https://bugs.python.org/issue?@action=redirect&bpo=16475].)

[<https://bugs.python.org/issue?@action=redirect&bpo=16475>], with additional speedups by Antoine Pitrou in [bpo-19219](https://bugs.python.org/issue?@action=redirect&bpo=19219) [<https://bugs.python.org/issue?@action=redirect&bpo=19219>].)

## mmap

mmap objects are now [weakly referenceable](https://bugs.python.org/issue?@action=redirect&bpo=4885). (Contributed by Valerie Lambert in [bpo-4885](https://bugs.python.org/issue?@action=redirect&bpo=4885) [<https://bugs.python.org/issue?@action=redirect&bpo=4885>].)

## multiprocessing

On Unix two new [start methods](https://bugs.python.org/issue?@action=redirect&bpo=8713), `spawn` and `forkserver`, have been added for starting processes using [multiprocessing](https://bugs.python.org/issue?@action=redirect&bpo=8713). These make the mixing of processes with threads more robust, and the `spawn` method matches the semantics that multiprocessing has always used on Windows. New function

[`get\_all\_start\_methods\(\)`](https://bugs.python.org/issue?@action=redirect&bpo=8713) reports all start methods available on the platform, [`get\_start\_method\(\)`](https://bugs.python.org/issue?@action=redirect&bpo=8713) reports the current start method, and [`set\_start\_method\(\)`](https://bugs.python.org/issue?@action=redirect&bpo=8713) sets the start method.

(Contributed by Richard Oudkerk in [bpo-8713](https://bugs.python.org/issue?@action=redirect&bpo=8713) [<https://bugs.python.org/issue?@action=redirect&bpo=8713>].)

[multiprocessing](https://bugs.python.org/issue?@action=redirect&bpo=18999) also now has the concept of a `context`, which determines how child processes are created. New function [`get\_context\(\)`](https://bugs.python.org/issue?@action=redirect&bpo=18999) returns a context that uses a specified start method. It has the same API as the [multiprocessing](https://bugs.python.org/issue?@action=redirect&bpo=18999) module itself, so you can use it to create [Pools](https://bugs.python.org/issue?@action=redirect&bpo=18999) and other objects that will operate within that context. This allows a framework and an application or different parts of the same application to use multiprocessing without interfering with each other. (Contributed by Richard Oudkerk in [bpo-18999](https://bugs.python.org/issue?@action=redirect&bpo=18999) [<https://bugs.python.org/issue?@action=redirect&bpo=18999>].)

Except when using the old *fork* start method, child processes no longer inherit unneeded handles/file descriptors from their parents (part of [bpo-8713](https://bugs.python.org/issue?@action=redirect&bpo=8713) [<https://bugs.python.org/issue?@action=redirect&bpo=8713>]).

[multiprocessing](https://bugs.python.org/issue?@action=redirect&bpo=8713) now relies on [runpy](https://bugs.python.org/issue?@action=redirect&bpo=8713) (which implements the

`-m` switch) to initialise `__main__` appropriately in child processes when using the `spawn` or `forkserver` start methods. This resolves some edge cases where combining multiprocessing, the `-m` command line switch, and explicit relative imports could cause obscure failures in child processes. (Contributed by Nick Coghlan in [bpo-19946](https://bugs.python.org/issue?@action=redirect&bpo=19946) [https://bugs.python.org/issue?@action=redirect&bpo=19946].)

## operator

New function `length_hint()` provides an implementation of the specification for how the `__length_hint__()` special method should be used, as part of the [PEP 424](https://peps.python.org/pep-0424/) [https://peps.python.org/pep-0424/] formal specification of this language feature. (Contributed by Armin Ronacher in [bpo-16148](https://bugs.python.org/issue?@action=redirect&bpo=16148) [https://bugs.python.org/issue?@action=redirect&bpo=16148].)

There is now a pure-python version of the `operator` module available for reference and for use by alternate implementations of Python. (Contributed by Zachary Ware in [bpo-16694](https://bugs.python.org/issue?@action=redirect&bpo=16694) [https://bugs.python.org/issue?@action=redirect&bpo=16694].)

## os

There are new functions to get and set the `inheritable` flag of a file descriptor (`os.get_inheritable()`, `os.set_inheritable()`) or a Windows handle (`os.get_handle_inheritable()`, `os.set_handle_inheritable()`).

New function `cpu_count()` reports the number of CPUs available on the platform on which Python is running (or `None` if the count can't be determined). The `multiprocessing.cpu_count()` function is now implemented in terms of this function). (Contributed by Trent Nelson, Yogesh Chaudhari, Victor Stinner, and Charles-François Natali in [bpo-17914](https://bugs.python.org/issue?@action=redirect&bpo=17914) [https://bugs.python.org/issue?@action=redirect&bpo=17914].)

`os.path.samestat()` is now available on the Windows platform (and the `os.path.samefile()` implementation is now shared between Unix and Windows). (Contributed by Brian Curtin in

[bpo-11939](https://bugs.python.org/issue?@action=redirect&bpo=11939) [https://bugs.python.org/issue?@action=redirect&bpo=11939].)

`os.path.ismount()` now recognizes volumes mounted below a drive root on Windows. (Contributed by Tim Golden in [bpo-9035](https://bugs.python.org/issue?@action=redirect&bpo=9035) [https://bugs.python.org/issue?@action=redirect&bpo=9035].)

`os.open()` supports two new flags on platforms that provide them, `O_PATH` (un-opened file descriptor), and `O_TMPFILE` (unnamed temporary file; as of 3.4.0 release available only on Linux systems with a kernel version of 3.11 or newer that have uapi headers). (Contributed by Christian Heimes in [bpo-18673](https://bugs.python.org/issue?@action=redirect&bpo=18673) [https://bugs.python.org/issue?@action=redirect&bpo=18673] and Benjamin Peterson, respectively.)

## pdb

`pdb` has been enhanced to handle generators, `yield`, and `yield from` in a more useful fashion. This is especially helpful when debugging `asyncio` based programs. (Contributed by Andrew Svetlov and Xavier de Gaye in [bpo-16596](https://bugs.python.org/issue?@action=redirect&bpo=16596) [https://bugs.python.org/issue?@action=redirect&bpo=16596].)

The `print` command has been removed from `pdb`, restoring access to the Python `print()` function from the `pdb` command line. Python2's `pdb` did not have a `print` command; instead, entering `print` executed the `print` statement. In Python3 `print` was mistakenly made an alias for the `pdb p` command. `p`, however, prints the `repr` of its argument, not the `str` like the Python2 `print` command did. Worse, the Python3 `pdb print` command shadowed the Python3 `print` function, making it inaccessible at the `pdb` prompt. (Contributed by Connor Osborn in [bpo-18764](https://bugs.python.org/issue?@action=redirect&bpo=18764) [https://bugs.python.org/issue?@action=redirect&bpo=18764].)

## pickle

`pickle` now supports (but does not use by default) a new pickle protocol, protocol 4. This new protocol addresses a number of issues that were present in previous protocols, such as the serialization of nested classes, very large strings and containers, and classes whose `__new__()` method takes keyword-only arguments.

It also provides some efficiency improvements.

## See also

**PEP 3154** [<https://peps.python.org/pep-3154/>] – **Pickle protocol 4**  
PEP written by Antoine Pitrou and implemented by  
Alexandre Vassalotti.

## plistlib

**plistlib** now has an API that is similar to the standard pattern for stdlib serialization protocols, with new **load()**, **dump()**, **loads()**, and **dumps()** functions. (The older API is now deprecated.) In addition to the already supported XML plist format (**FMT\_XML**), it also now supports the binary plist format (**FMT\_BINARY**). (Contributed by Ronald Oussoren and others in **bpo-14455** [<https://bugs.python.org/issue?@action=redirect&bpo=14455>].)

## poplib

Two new methods have been added to **poplib**: **capa()**, which returns the list of capabilities advertised by the POP server, and **stls()**, which switches a clear-text POP3 session into an encrypted POP3 session if the POP server supports it. (Contributed by Lorenzo Catucci in **bpo-4473** [<https://bugs.python.org/issue?@action=redirect&bpo=4473>].)

## pprint

The **pprint** module's **PrettyPrinter** class and its **pformat()**, and **pprint()** functions have a new option, *compact*, that controls how the output is formatted. Currently setting *compact* to `True` means that sequences will be printed with as many sequence elements as will fit within *width* on each (indented) line. (Contributed by Serhiy Storchaka in **bpo-19132** [<https://bugs.python.org/issue?@action=redirect&bpo=19132>].)

Long strings are now wrapped using Python's normal line continuation syntax. (Contributed by Antoine Pitrou in **bpo-17150**

[<https://bugs.python.org/issue?@action=redirect&bpo=17150>].)

## pty

`pty.spawn()` now returns the status value from `os.waitpid()` on the child process, instead of `None`. (Contributed by Gregory P. Smith.)

## pydoc

The `pydoc` module is now based directly on the `inspect.signature()` introspection API, allowing it to provide signature information for a wider variety of callable objects. This change also means that `__wrapped__` attributes are now taken into account when displaying help information. (Contributed by Larry Hastings in [bpo-19674](https://bugs.python.org/issue?@action=redirect&bpo=19674) [<https://bugs.python.org/issue?@action=redirect&bpo=19674>].)

The `pydoc` module no longer displays the `self` parameter for already bound methods. Instead, it aims to always display the exact current signature of the supplied callable. (Contributed by Larry Hastings in [bpo-20710](https://bugs.python.org/issue?@action=redirect&bpo=20710) [<https://bugs.python.org/issue?@action=redirect&bpo=20710>].)

In addition to the changes that have been made to `pydoc` directly, its handling of custom `__dir__` methods and various descriptor behaviours has also been improved substantially by the underlying changes in the `inspect` module.

As the `help()` builtin is based on `pydoc`, the above changes also affect the behaviour of `help()`.

## re

New `fullmatch()` function and `regex.fullmatch()` method anchor the pattern at both ends of the string to match. This provides a way to be explicit about the goal of the match, which avoids a class of subtle bugs where `$` characters get lost during code changes or the addition of alternatives to an existing regular expression. (Contributed by Matthew Barnett in [bpo-16203](https://bugs.python.org/issue?@action=redirect&bpo=16203) [[https://](https://bugs.python.org/issue?@action=redirect&bpo=16203)

[bugs.python.org/issue?@action=redirect&bpo=16203](https://bugs.python.org/issue?@action=redirect&bpo=16203)].)

The repr of **regex objects** now includes the pattern and the flags; the repr of **match objects** now includes the start, end, and the part of the string that matched. (Contributed by Hugo Lopes Tavares and Serhiy Storchaka in [bpo-13592](https://bugs.python.org/issue?@action=redirect&bpo=13592) [https://bugs.python.org/issue?@action=redirect&bpo=13592] and [bpo-17087](https://bugs.python.org/issue?@action=redirect&bpo=17087) [https://bugs.python.org/issue?@action=redirect&bpo=17087].)

## resource

New **prlimit()** function, available on Linux platforms with a kernel version of 2.6.36 or later and glibc of 2.13 or later, provides the ability to query or set the resource limits for processes other than the one making the call. (Contributed by Christian Heimes in [bpo-16595](https://bugs.python.org/issue?@action=redirect&bpo=16595) [https://bugs.python.org/issue?@action=redirect&bpo=16595].)

On Linux kernel version 2.6.36 or later, there are also some new Linux specific constants: **RLIMIT\_MSGQUEUE**, **RLIMIT\_NICE**, **RLIMIT\_RTPRIO**, **RLIMIT\_RTTIME**, and **RLIMIT\_SIGPENDING**. (Contributed by Christian Heimes in [bpo-19324](https://bugs.python.org/issue?@action=redirect&bpo=19324) [https://bugs.python.org/issue?@action=redirect&bpo=19324].)

On FreeBSD version 9 and later, there some new FreeBSD specific constants: **RLIMIT\_SBSIZE**, **RLIMIT\_SWAP**, and **RLIMIT\_NPTS**. (Contributed by Claudiu Popa in [bpo-19343](https://bugs.python.org/issue?@action=redirect&bpo=19343) [https://bugs.python.org/issue?@action=redirect&bpo=19343].)

## select

**epoll** objects now support the context management protocol. When used in a **with** statement, the **close()** method will be called automatically at the end of the block. (Contributed by Serhiy Storchaka in [bpo-16488](https://bugs.python.org/issue?@action=redirect&bpo=16488) [https://bugs.python.org/issue?@action=redirect&bpo=16488].)

**devpoll** objects now have **fileno()** and **close()** methods, as well as a new attribute **closed**. (Contributed by Victor Stinner in [bpo-18794](https://bugs.python.org/issue?@action=redirect&bpo=18794) [https://bugs.python.org/issue?@action=redirect&bpo=18794].)

## shelve

**Shelf** instances may now be used in **with** statements, and will be automatically closed at the end of the **with** block. (Contributed by Filip Gruszczyński in [bpo-13896](https://bugs.python.org/issue?@action=redirect&bpo=13896) [https://bugs.python.org/issue?@action=redirect&bpo=13896].)

## shutil

**copyfile()** now raises a specific **Error** subclass, **SameFileError**, when the source and destination are the same file, which allows an application to take appropriate action on this specific error. (Contributed by Atsuo Ishimoto and Hynek Schlawack in [bpo-1492704](https://bugs.python.org/issue?@action=redirect&bpo=1492704) [https://bugs.python.org/issue?@action=redirect&bpo=1492704].)

## smtpd

The **SMTPServer** and **SMTPChannel** classes now accept a *map* keyword argument which, if specified, is passed in to **asynchat.async\_chat** as its *map* argument. This allows an application to avoid affecting the global socket map. (Contributed by Vinay Sajip in [bpo-11959](https://bugs.python.org/issue?@action=redirect&bpo=11959) [https://bugs.python.org/issue?@action=redirect&bpo=11959].)

## smtplib

**SMTPException** is now a subclass of **OSError**, which allows both socket level errors and SMTP protocol level errors to be caught in one try/except statement by code that only cares whether or not an error occurred. (Contributed by Ned Jackson Lovely in [bpo-2118](https://bugs.python.org/issue?@action=redirect&bpo=2118) [https://bugs.python.org/issue?@action=redirect&bpo=2118].)

## socket

The socket module now supports the **CAN\_BCM** protocol on platforms that support it. (Contributed by Brian Thorne in [bpo-15359](https://bugs.python.org/issue?@action=redirect&bpo=15359) [https://bugs.python.org/issue?@action=redirect&bpo=15359].)

Socket objects have new methods to get or set their [inheritable flag](#), [get\\_inheritable\(\)](#) and [set\\_inheritable\(\)](#).

The `socket.AF_*` and `socket.SOCK_*` constants are now enumeration values using the new [enum](#) module. This allows meaningful names to be printed during debugging, instead of integer “magic numbers”.

The [AF\\_LINK](#) constant is now available on BSD and OSX.

[inet\\_pton\(\)](#) and [inet\\_ntop\(\)](#) are now supported on Windows. (Contributed by Atsuo Ishimoto in [bpo-7171](#) [<https://bugs.python.org/issue?@action=redirect&bpo=7171>].)

## sqlite3

A new boolean parameter to the [connect\(\)](#) function, *uri*, can be used to indicate that the *database* parameter is a `uri` (see the [SQLite URI documentation](#) [<https://www.sqlite.org/uri.html>]).

(Contributed by poq in [bpo-13773](#) [<https://bugs.python.org/issue?@action=redirect&bpo=13773>].)

## ssl

[PROTOCOL\\_TLSv1\\_1](#) and [PROTOCOL\\_TLSv1\\_2](#) (TLSv1.1 and TLSv1.2 support) have been added; support for these protocols is only available if Python is linked with OpenSSL 1.0.1 or later. (Contributed by Michele Orrù and Antoine Pitrou in [bpo-16692](#) [<https://bugs.python.org/issue?@action=redirect&bpo=16692>].)

New function [create\\_default\\_context\(\)](#) provides a standard way to obtain an [SSLContext](#) whose settings are intended to be a reasonable balance between compatibility and security. These settings are more stringent than the defaults provided by the [SSLContext](#) constructor, and may be adjusted in the future, without prior deprecation, if best-practice security requirements change. The new recommended best practice for using stdlib libraries that support SSL is to use [create\\_default\\_context\(\)](#) to obtain an [SSLContext](#) object, modify it if needed, and then pass it as the *context* argument of the appropriate stdlib API.

(Contributed by Christian Heimes in [bpo-19689](https://bugs.python.org/issue?@action=redirect&bpo=19689) [https://bugs.python.org/issue?@action=redirect&bpo=19689].)

**SSLContext** method **load\_verify\_locations()** accepts a new optional argument *cadata*, which can be used to provide PEM or DER encoded certificates directly via strings or bytes, respectively. (Contributed by Christian Heimes in [bpo-18138](https://bugs.python.org/issue?@action=redirect&bpo=18138) [https://bugs.python.org/issue?@action=redirect&bpo=18138].)

New function **get\_default\_verify\_paths()** returns a named tuple of the paths and environment variables that the **set\_default\_verify\_paths()** method uses to set OpenSSL's default *cafile* and *capath*. This can be an aid in debugging default verification issues. (Contributed by Christian Heimes in [bpo-18143](https://bugs.python.org/issue?@action=redirect&bpo=18143) [https://bugs.python.org/issue?@action=redirect&bpo=18143].)

**SSLContext** has a new method, **cert\_store\_stats()**, that reports the number of loaded X.509 certs, X.509 CA certs, and certificate revocation lists (crls), as well as a **get\_ca\_certs()** method that returns a list of the loaded CA certificates. (Contributed by Christian Heimes in [bpo-18147](https://bugs.python.org/issue?@action=redirect&bpo=18147) [https://bugs.python.org/issue?@action=redirect&bpo=18147].)

If OpenSSL 0.9.8 or later is available, **SSLContext** has a new attribute **verify\_flags** that can be used to control the certificate verification process by setting it to some combination of the new constants **VERIFY\_DEFAULT**, **VERIFY\_CRL\_CHECK\_LEAF**, **VERIFY\_CRL\_CHECK\_CHAIN**, or **VERIFY\_X509\_STRICT**. OpenSSL does not do any CRL verification by default. (Contributed by Christian Heimes in [bpo-8813](https://bugs.python.org/issue?@action=redirect&bpo=8813) [https://bugs.python.org/issue?@action=redirect&bpo=8813].)

New **SSLContext** method **load\_default\_certs()** loads a set of default “certificate authority” (CA) certificates from default locations, which vary according to the platform. It can be used to load both TLS web server authentication certificates (*purpose*=**SERVER\_AUTH**) for a client to use to verify a server, and certificates for a server to use in verifying client certificates (*purpose*=**CLIENT\_AUTH**). (Contributed by Christian Heimes in [bpo-19292](https://bugs.python.org/issue?@action=redirect&bpo=19292) [https://bugs.python.org/issue?@action=redirect&bpo=19292].)

Two new windows-only functions, `enum_certificates()` and `enum_crls()` provide the ability to retrieve certificates, certificate information, and CRLs from the Windows cert store. (Contributed by Christian Heimes in [bpo-17134](https://bugs.python.org/issue?@action=redirect&bpo=17134) [https://bugs.python.org/issue?@action=redirect&bpo=17134].)

Support for server-side SNI (Server Name Indication) using the new `ssl.SSLContext.set_servername_callback()` method. (Contributed by Daniel Black in [bpo-8109](https://bugs.python.org/issue?@action=redirect&bpo=8109) [https://bugs.python.org/issue?@action=redirect&bpo=8109].)

The dictionary returned by `SSLSocket.getpeercert()` contains additional X509v3 extension items: `crlDistributionPoints`, `caIssuers`, and `OCSP URIs`. (Contributed by Christian Heimes in [bpo-18379](https://bugs.python.org/issue?@action=redirect&bpo=18379) [https://bugs.python.org/issue?@action=redirect&bpo=18379].)

## stat

The `stat` module is now backed by a C implementation in `_stat`. A C implementation is required as most of the values aren't standardized and are platform-dependent. (Contributed by Christian Heimes in [bpo-11016](https://bugs.python.org/issue?@action=redirect&bpo=11016) [https://bugs.python.org/issue?@action=redirect&bpo=11016].)

The module supports new `ST_MODE` flags, `S_IFDOOR`, `S_IFPORT`, and `S_IFWHT`. (Contributed by Christian Hiemes in [bpo-11016](https://bugs.python.org/issue?@action=redirect&bpo=11016) [https://bugs.python.org/issue?@action=redirect&bpo=11016].)

## struct

New function `iter_unpack` and a new `struct.Struct.iter_unpack()` method on compiled formats provide streamed unpacking of a buffer containing repeated instances of a given format of data. (Contributed by Antoine Pitrou in [bpo-17804](https://bugs.python.org/issue?@action=redirect&bpo=17804) [https://bugs.python.org/issue?@action=redirect&bpo=17804].)

## subprocess

`check_output()` now accepts an *input* argument that can be used to provide the contents of `stdin` for the command that is run.

(Contributed by Zack Weinberg in [bpo-16624](https://bugs.python.org/issue?@action=redirect&bpo=16624) [https://bugs.python.org/issue?@action=redirect&bpo=16624].)

**getstatus()** and **getstatusoutput()** now work on Windows. This change was actually inadvertently made in 3.3.4. (Contributed by Tim Golden in [bpo-10197](https://bugs.python.org/issue?@action=redirect&bpo=10197) [https://bugs.python.org/issue?@action=redirect&bpo=10197].)

## sunau

The **getparams()** method now returns a namedtuple rather than a plain tuple. (Contributed by Claudiu Popa in [bpo-18901](https://bugs.python.org/issue?@action=redirect&bpo=18901) [https://bugs.python.org/issue?@action=redirect&bpo=18901].)

**sunau.open()** now supports the context management protocol: when used in a **with** block, the **close** method of the returned object will be called automatically at the end of the block. (Contributed by Serhiy Storchaka in [bpo-18878](https://bugs.python.org/issue?@action=redirect&bpo=18878) [https://bugs.python.org/issue?@action=redirect&bpo=18878].)

**AU\_write.setsampwidth()** now supports 24 bit samples, thus adding support for writing 24 sample using the module. (Contributed by Serhiy Storchaka in [bpo-19261](https://bugs.python.org/issue?@action=redirect&bpo=19261) [https://bugs.python.org/issue?@action=redirect&bpo=19261].)

The **writeframesraw()** and **writeframes()** methods now accept any **bytes-like object**. (Contributed by Serhiy Storchaka in [bpo-8311](https://bugs.python.org/issue?@action=redirect&bpo=8311) [https://bugs.python.org/issue?@action=redirect&bpo=8311].)

## sys

New function **sys.getallocatedblocks()** returns the current number of blocks allocated by the interpreter. (In CPython with the default **--with-pymalloc** setting, this is allocations made through the **PyObject\_Malloc()** API.) This can be useful for tracking memory leaks, especially if automated via a test suite. (Contributed by Antoine Pitrou in [bpo-13390](https://bugs.python.org/issue?@action=redirect&bpo=13390) [https://bugs.python.org/issue?@action=redirect&bpo=13390].)

When the Python interpreter starts in **interactive mode**, it checks for an **\_\_interactivehook\_\_** attribute on the **sys** module. If the

attribute exists, its value is called with no arguments just before interactive mode is started. The check is made after the **PYTHONSTARTUP** file is read, so it can be set there. The **site** module **sets it** to a function that enables tab completion and history saving (in `~/.python-history`) if the platform supports **readline**. If you do not want this (new) behavior, you can override it in **PYTHONSTARTUP**, **sitcustomize**, or **usercustomize** by deleting this attribute from **sys** (or setting it to some other callable). (Contributed by Éric Araujo and Antoine Pitrou in [bpo-5845](https://bugs.python.org/issue?@action=redirect&bpo=5845) [https://bugs.python.org/issue?@action=redirect&bpo=5845].)

## tarfile

The **tarfile** module now supports a simple **Command-Line Interface** when called as a script directly or via `-m`. This can be used to create and extract tarfile archives. (Contributed by Berker Peksag in [bpo-13477](https://bugs.python.org/issue?@action=redirect&bpo=13477) [https://bugs.python.org/issue?@action=redirect&bpo=13477].)

## textwrap

The **TextWrapper** class has two new attributes/constructor arguments: **max\_lines**, which limits the number of lines in the output, and **placeholder**, which is a string that will appear at the end of the output if it has been truncated because of **max\_lines**. Building on these capabilities, a new convenience function **shorten()** collapses all of the whitespace in the input to single spaces and produces a single line of a given *width* that ends with the *placeholder* (by default, `[ . . . ]`). (Contributed by Antoine Pitrou and Serhiy Storchaka in [bpo-18585](https://bugs.python.org/issue?@action=redirect&bpo=18585) [https://bugs.python.org/issue?@action=redirect&bpo=18585] and [bpo-18725](https://bugs.python.org/issue?@action=redirect&bpo=18725) [https://bugs.python.org/issue?@action=redirect&bpo=18725].)

## threading

The **Thread** object representing the main thread can be obtained from the new **main\_thread()** function. In normal conditions this will be the thread from which the Python interpreter was started. (Contributed by Andrew Svetlov in [bpo-18882](https://bugs.python.org/issue?@action=redirect&bpo=18882) [https://bugs.python.org/issue?@action=redirect&bpo=18882].)

issue?@action=redirect&bpo=18882].)

## traceback

A new `traceback.clear_frames()` function takes a traceback object and clears the local variables in all of the frames it references, reducing the amount of memory consumed.

(Contributed by Andrew Kuchling in [bpo-1565525](https://bugs.python.org/issue?@action=redirect&bpo=1565525) [https://bugs.python.org/issue?@action=redirect&bpo=1565525].)

## types

A new `DynamicClassAttribute()` descriptor provides a way to define an attribute that acts normally when looked up through an instance object, but which is routed to the class `__getattr__` when looked up through the class. This allows one to have properties active on a class, and have virtual attributes on the class with the same name (see `Enum` for an example). (Contributed by Ethan Furman in [bpo-19030](https://bugs.python.org/issue?@action=redirect&bpo=19030) [https://bugs.python.org/issue?@action=redirect&bpo=19030].)

## urllib

`urllib.request` now supports `data`: URLs via the `DataHandler` class. (Contributed by Mathias Panzenböck in [bpo-16423](https://bugs.python.org/issue?@action=redirect&bpo=16423) [https://bugs.python.org/issue?@action=redirect&bpo=16423].)

The http method that will be used by a `Request` class can now be specified by setting a `method` class attribute on the subclass. (Contributed by Jason R Coombs in [bpo-18978](https://bugs.python.org/issue?@action=redirect&bpo=18978) [https://bugs.python.org/issue?@action=redirect&bpo=18978].)

`Request` objects are now reusable: if the `full_url` or `data` attributes are modified, all relevant internal properties are updated. This means, for example, that it is now possible to use the same `Request` object in more than one `OpenerDirector.open()` call with different `data` arguments, or to modify a `Request`'s `url` rather than recomputing it from scratch. There is also a new `remove_header()` method that can be used to remove headers from a `Request`. (Contributed by Alexey Kachayev in [bpo-16464](https://bugs.python.org/issue?@action=redirect&bpo=16464)

[<https://bugs.python.org/issue?@action=redirect&bpo=16464>], Daniel Wozniak in [bpo-17485](#) [<https://bugs.python.org/issue?@action=redirect&bpo=17485>], and Damien Brecht and Senthil Kumaran in [bpo-17272](#) [<https://bugs.python.org/issue?@action=redirect&bpo=17272>].)

**HTTPError** objects now have a **headers** attribute that provides access to the HTTP response headers associated with the error. (Contributed by Berker Peksag in [bpo-15701](#) [<https://bugs.python.org/issue?@action=redirect&bpo=15701>].)

## unittest

The **TestCase** class has a new method, **subTest()**, that produces a context manager whose **with** block becomes a “sub-test”. This context manager allows a test method to dynamically generate subtests by, say, calling the `subTest` context manager inside a loop. A single test method can thereby produce an indefinite number of separately identified and separately counted tests, all of which will run even if one or more of them fail. For example:

```
class NumbersTest(unittest.TestCase):
    def test_even(self):
        for i in range(6):
            with self.subTest(i=i):
                self.assertEqual(i % 2, 0)
```

will result in six subtests, each identified in the unittest verbose output with a label consisting of the variable name `i` and a particular value for that variable (`i=0`, `i=1`, etc). See [Distinguishing test iterations using subtests](#) for the full version of this example. (Contributed by Antoine Pitrou in [bpo-16997](#) [<https://bugs.python.org/issue?@action=redirect&bpo=16997>].)

**unittest.main()** now accepts an iterable of test names for *defaultTest*, where previously it only accepted a single test name as a string. (Contributed by Jyrki Pulliainen in [bpo-15132](#) [<https://bugs.python.org/issue?@action=redirect&bpo=15132>].)

If **SkipTest** is raised during test discovery (that is, at the module level in the test file), it is now reported as a skip instead of an error. (Contributed by Zach Ware in [bpo-16935](https://bugs.python.org/issue?@action=redirect&bpo=16935) [https://bugs.python.org/issue?@action=redirect&bpo=16935].)

**discover()** now sorts the discovered files to provide consistent test ordering. (Contributed by Martin Melin and Jeff Ramnani in [bpo-16709](https://bugs.python.org/issue?@action=redirect&bpo=16709) [https://bugs.python.org/issue?@action=redirect&bpo=16709].)

**TestSuite** now drops references to tests as soon as the test has been run, if the test is successful. On Python interpreters that do garbage collection, this allows the tests to be garbage collected if nothing else is holding a reference to the test. It is possible to override this behavior by creating a **TestSuite** subclass that defines a custom `_removeTestAtIndex` method. (Contributed by Tom Wardill, Matt McClure, and Andrew Svetlov in [bpo-11798](https://bugs.python.org/issue?@action=redirect&bpo=11798) [https://bugs.python.org/issue?@action=redirect&bpo=11798].)

A new test assertion context-manager, **assertLogs()**, will ensure that a given block of code emits a log message using the **logging** module. By default the message can come from any logger and have a priority of `INFO` or higher, but both the logger name and an alternative minimum logging level may be specified. The object returned by the context manager can be queried for the **LogRecords** and/or formatted messages that were logged. (Contributed by Antoine Pitrou in [bpo-18937](https://bugs.python.org/issue?@action=redirect&bpo=18937) [https://bugs.python.org/issue?@action=redirect&bpo=18937].)

Test discovery now works with namespace packages (Contributed by Claudiu Popa in [bpo-17457](https://bugs.python.org/issue?@action=redirect&bpo=17457) [https://bugs.python.org/issue?@action=redirect&bpo=17457].)

**unittest.mock** objects now inspect their specification signatures when matching calls, which means an argument can now be matched by either position or name, instead of only by position. (Contributed by Antoine Pitrou in [bpo-17015](https://bugs.python.org/issue?@action=redirect&bpo=17015) [https://bugs.python.org/issue?@action=redirect&bpo=17015].)

**mock\_open()** objects now have `readline` and `readlines` methods. (Contributed by Toshio Kuratomi in [bpo-17467](https://bugs.python.org/issue?@action=redirect&bpo=17467) [https://bugs.python.org/issue?@action=redirect&bpo=17467].)

## venv

**venv** now includes activation scripts for the `csh` and `fish` shells. (Contributed by Andrew Svetlov in [bpo-15417](https://bugs.python.org/issue?@action=redirect&bpo=15417) [https://bugs.python.org/issue?@action=redirect&bpo=15417].)

**EnvBuilder** and the **create()** convenience function take a new keyword argument *with\_pip*, which defaults to `False`, that controls whether or not **EnvBuilder** ensures that `pip` is installed in the virtual environment. (Contributed by Nick Coghlan in [bpo-19552](https://bugs.python.org/issue?@action=redirect&bpo=19552) [https://bugs.python.org/issue?@action=redirect&bpo=19552] as part of the [PEP 453](https://peps.python.org/pep-0453/) [https://peps.python.org/pep-0453/] implementation.)

## wave

The **getparams()** method now returns a `namedtuple` rather than a plain tuple. (Contributed by Claudiu Popa in [bpo-17487](https://bugs.python.org/issue?@action=redirect&bpo=17487) [https://bugs.python.org/issue?@action=redirect&bpo=17487].)

**wave.open()** now supports the context management protocol. (Contributed by Claudiu Popa in [bpo-17616](https://bugs.python.org/issue?@action=redirect&bpo=17616) [https://bugs.python.org/issue?@action=redirect&bpo=17616].)

**wave** can now [write output to unseekable files](#). (Contributed by David Jones, Guilherme Polo, and Serhiy Storchaka in [bpo-5202](https://bugs.python.org/issue?@action=redirect&bpo=5202) [https://bugs.python.org/issue?@action=redirect&bpo=5202].)

The **writeframesraw()** and **writeframes()** methods now accept any [bytes-like object](#). (Contributed by Serhiy Storchaka in [bpo-8311](https://bugs.python.org/issue?@action=redirect&bpo=8311) [https://bugs.python.org/issue?@action=redirect&bpo=8311].)

## weakref

New **WeakMethod** class simulates weak references to bound methods. (Contributed by Antoine Pitrou in [bpo-14631](https://bugs.python.org/issue?@action=redirect&bpo=14631) [https://bugs.python.org/issue?@action=redirect&bpo=14631].)

New **finalize** class makes it possible to register a callback to be invoked when an object is garbage collected, without needing to carefully manage the lifecycle of the weak reference itself.

(Contributed by Richard Oudkerk in [bpo-15528](https://bugs.python.org/issue/?@action=redirect&bpo=15528) [https://bugs.python.org/issue/?@action=redirect&bpo=15528].)

The callback, if any, associated with a [ref](#) is now exposed via the [\\_\\_callback\\_\\_](#) attribute. (Contributed by Mark Dickinson in [bpo-17643](https://bugs.python.org/issue/?@action=redirect&bpo=17643) [https://bugs.python.org/issue/?@action=redirect&bpo=17643].)

## xml.etree

A new parser, [XMLPullParser](#), allows a non-blocking applications to parse XML documents. An example can be seen at [Pull API for non-blocking parsing](#). (Contributed by Antoine Pitrou in [bpo-17741](https://bugs.python.org/issue/?@action=redirect&bpo=17741) [https://bugs.python.org/issue/?@action=redirect&bpo=17741].)

The [xml.etree.ElementTree tostring\(\)](#) and [tostringlist\(\)](#) functions, and the [ElementTree write\(\)](#) method, now have a [short\\_empty\\_elements](#) keyword-only parameter providing control over whether elements with no content are written in abbreviated (`<tag />`) or expanded (`<tag></tag>`) form. (Contributed by Ariel Poliak and Serhiy Storchaka in [bpo-14377](https://bugs.python.org/issue/?@action=redirect&bpo=14377) [https://bugs.python.org/issue/?@action=redirect&bpo=14377].)

## zipfile

The [writepy\(\)](#) method of the [PyZipFile](#) class has a new [filterfunc](#) option that can be used to control which directories and files are added to the archive. For example, this could be used to exclude test files from the archive. (Contributed by Christian Tismer in [bpo-19274](https://bugs.python.org/issue/?@action=redirect&bpo=19274) [https://bugs.python.org/issue/?@action=redirect&bpo=19274].)

The [allowZip64](#) parameter to [ZipFile](#) and [PyZipfile](#) is now `True` by default. (Contributed by William Mallard in [bpo-17201](https://bugs.python.org/issue/?@action=redirect&bpo=17201) [https://bugs.python.org/issue/?@action=redirect&bpo=17201].)

# CPython Implementation Changes

## PEP 445: Customization of CPython Memory Allocators

**PEP 445** [<https://peps.python.org/pep-0445/>] adds new C level interfaces to customize memory allocation in the CPython interpreter.

See also

**PEP 445** [<https://peps.python.org/pep-0445/>] – Add new APIs to customize Python memory allocators

PEP written and implemented by Victor Stinner.

## PEP 442: Safe Object Finalization

**PEP 442** [<https://peps.python.org/pep-0442/>] removes the current limitations and quirks of object finalization in CPython. With it, objects with `__del__()` methods, as well as generators with **finally** clauses, can be finalized when they are part of a reference cycle.

As part of this change, module globals are no longer forcibly set to **None** during interpreter shutdown in most cases, instead relying on the normal operation of the cyclic garbage collector. This avoids a whole class of interpreter-shutdown-time errors, usually involving `__del__` methods, that have plagued Python since the cyclic GC was first introduced.

See also

**PEP 442** [<https://peps.python.org/pep-0442/>] – Safe object finalization

PEP written and implemented by Antoine Pitrou.

## PEP 456: Secure and Interchangeable Hash Algorithm

**PEP 456** [<https://peps.python.org/pep-0456/>] follows up on earlier security fix work done on Python's hash algorithm to address certain DOS attacks to which public facing APIs backed by dictionary lookups may be subject. (See [bpo-14621](https://bugs.python.org/issue?@action=redirect&bpo=14621) [<https://bugs.python.org/issue?@action=redirect&bpo=14621>] for the start of the current round of improvements.) The PEP unifies CPython's hash

code to make it easier for a packager to substitute a different hash algorithm, and switches Python's default implementation to a SipHash implementation on platforms that have a 64 bit data type. Any performance differences in comparison with the older FNV algorithm are trivial.

The PEP adds additional fields to the `sys.hash_info` named tuple to describe the hash algorithm in use by the currently executing binary. Otherwise, the PEP does not alter any existing CPython APIs.

## PEP 436: Argument Clinic

“Argument Clinic” ([PEP 436](https://peps.python.org/pep-0436/) [https://peps.python.org/pep-0436/]) is now part of the CPython build process and can be used to simplify the process of defining and maintaining accurate signatures for builtins and standard library extension modules implemented in C.

Some standard library extension modules have been converted to use Argument Clinic in Python 3.4, and `pydoc` and `inspect` have been updated accordingly.

It is expected that signature metadata for programmatic introspection will be added to additional callables implemented in C as part of Python 3.4 maintenance releases.

### Note

The Argument Clinic PEP is not fully up to date with the state of the implementation. This has been deemed acceptable by the release manager and core development team in this case, as Argument Clinic will not be made available as a public API for third party use in Python 3.4.

### See also

**PEP 436** [https://peps.python.org/pep-0436/] – The Argument Clinic DSL

PEP written and implemented by Larry Hastings.

## Other Build and C API Changes

- The new `PyType_GetSlot()` function has been added to the stable ABI, allowing retrieval of function pointers from named type slots when using the limited API. (Contributed by Martin von Löwis in [bpo-17162](https://bugs.python.org/issue?@action=redirect&bpo=17162) [https://bugs.python.org/issue?@action=redirect&bpo=17162].)
- The new `Py_SetStandardStreamEncoding()` pre-initialization API allows applications embedding the CPython interpreter to reliably force a particular encoding and error handler for the standard streams. (Contributed by Bastien Montagne and Nick Coghlan in [bpo-16129](https://bugs.python.org/issue?@action=redirect&bpo=16129) [https://bugs.python.org/issue?@action=redirect&bpo=16129].)
- Most Python C APIs that don't mutate string arguments are now correctly marked as accepting `const char *` rather than `char *`. (Contributed by Serhiy Storchaka in [bpo-1772673](https://bugs.python.org/issue?@action=redirect&bpo=1772673) [https://bugs.python.org/issue?@action=redirect&bpo=1772673].)
- A new shell version of `python-config` can be used even when a python interpreter is not available (for example, in cross compilation scenarios).
- `PyUnicode_FromFormat()` now supports width and precision specifications for `%s`, `%A`, `%U`, `%V`, `%S`, and `%R`. (Contributed by Ysj Ray and Victor Stinner in [bpo-7330](https://bugs.python.org/issue?@action=redirect&bpo=7330) [https://bugs.python.org/issue?@action=redirect&bpo=7330].)
- New function `PyStructSequence_InitType2()` supplements the existing `PyStructSequence_InitType()` function. The difference is that it returns `0` on success and `-1` on failure.
- The CPython source can now be compiled using the address sanity checking features of recent versions of GCC and clang: the false alarms in the small object allocator have been silenced. (Contributed by Dhirus Kholia in [bpo-18596](https://bugs.python.org/issue?@action=redirect&bpo=18596) [https://bugs.python.org/issue?@action=redirect&bpo=18596].)
- The Windows build now uses [Address Space Layout Randomization](https://en.wikipedia.org/wiki/Address_space_layout_randomization) [https://en.wikipedia.org/wiki/Address\_space\_layout\_randomization] and [Data Execution Prevention](https://en.wikipedia.org/wiki/Data_Execution_Prevention) [https://en.wikipedia.org/wiki/Data\_Execution\_Prevention]. (Contributed by Christian Heimes in [bpo-16632](https://bugs.python.org/issue?@action=redirect&bpo=16632) [https://bugs.python.org/issue?@action=redirect&bpo=16632].)

- New function `PyObject_LengthHint()` is the C API equivalent of `operator.length_hint()`. (Contributed by Armin Ronacher in [bpo-16148](https://bugs.python.org/issue?@action=redirect&bpo=16148) [https://bugs.python.org/issue?@action=redirect&bpo=16148].)

## Other Improvements

- The `python` command has a new option, `-I`, which causes it to run in “isolated mode”, which means that `sys.path` contains neither the script’s directory nor the user’s `site-packages` directory, and all `PYTHON*` environment variables are ignored (it implies both `-s` and `-E`). Other restrictions may also be applied in the future, with the goal being to isolate the execution of a script from the user’s environment. This is appropriate, for example, when Python is used to run a system script. On most POSIX systems it can and should be used in the `#!` line of system scripts. (Contributed by Christian Heimes in [bpo-16499](https://bugs.python.org/issue?@action=redirect&bpo=16499) [https://bugs.python.org/issue?@action=redirect&bpo=16499].)
- Tab-completion is now enabled by default in the interactive interpreter on systems that support `readline`. History is also enabled by default, and is written to (and read from) the file `~/.python-history`. (Contributed by Antoine Pitrou and Éric Araujo in [bpo-5845](https://bugs.python.org/issue?@action=redirect&bpo=5845) [https://bugs.python.org/issue?@action=redirect&bpo=5845].)
- Invoking the Python interpreter with `--version` now outputs the version to standard output instead of standard error ([bpo-18338](https://bugs.python.org/issue?@action=redirect&bpo=18338) [https://bugs.python.org/issue?@action=redirect&bpo=18338]). Similar changes were made to `argparse` ([bpo-18920](https://bugs.python.org/issue?@action=redirect&bpo=18920) [https://bugs.python.org/issue?@action=redirect&bpo=18920]) and other modules that have script-like invocation capabilities ([bpo-18922](https://bugs.python.org/issue?@action=redirect&bpo=18922) [https://bugs.python.org/issue?@action=redirect&bpo=18922]).
- The CPython Windows installer now adds `.py` to the `PATHEXT` variable when extensions are registered, allowing users to run a python script at the windows command prompt by just typing its name without the `.py` extension. (Contributed by Paul Moore in [bpo-18569](https://bugs.python.org/issue?@action=redirect&bpo=18569) [https://bugs.python.org/issue?@action=redirect&bpo=18569].)
- A new `make` target `coverage-report` [https://devguide.python.org/

`coverage/#measuring-coverage-of-c-code-with-gcov-and-lcov]` will build python, run the test suite, and generate an HTML coverage report for the C codebase using `gcov` and `lcov` [<https://ltp.sourceforge.net/coverage/lcov.php>].

- The `-R` option to the [python regression test suite](#) now also checks for memory allocation leaks, using `sys.getallocatedblocks()`. (Contributed by Antoine Pitrou in [bpo-13390](#) [<https://bugs.python.org/issue?@action=redirect&bpo=13390>].)
- `python -m` now works with namespace packages.
- The `stat` module is now implemented in C, which means it gets the values for its constants from the C header files, instead of having the values hard-coded in the python module as was previously the case.
- Loading multiple python modules from a single OS module (`.so`, `.dll`) now works correctly (previously it silently returned the first python module in the file). (Contributed by Václav Šmilauer in [bpo-16421](#) [<https://bugs.python.org/issue?@action=redirect&bpo=16421>].)
- A new opcode, `LOAD_CLASSDEREF`, has been added to fix a bug in the loading of free variables in class bodies that could be triggered by certain uses of `__prepare__`. (Contributed by Benjamin Peterson in [bpo-17853](#) [<https://bugs.python.org/issue?@action=redirect&bpo=17853>].)
- A number of MemoryError-related crashes were identified and fixed by Victor Stinner using his [PEP 445](#) [<https://peps.python.org/pep-0445/>]-based `pyfailmalloc` tool ([bpo-18408](#) [<https://bugs.python.org/issue?@action=redirect&bpo=18408>], [bpo-18520](#) [<https://bugs.python.org/issue?@action=redirect&bpo=18520>]).
- The `pyenv` command now accepts a `--copies` option to use copies rather than symlinks even on systems where symlinks are the default. (Contributed by Vinay Sajip in [bpo-18807](#) [<https://bugs.python.org/issue?@action=redirect&bpo=18807>].)
- The `pyenv` command also accepts a `--without-pip` option to suppress the otherwise-automatic bootstrapping of pip into the virtual environment. (Contributed by Nick Coghlan in [bpo-19552](#) [<https://bugs.python.org/issue?@action=redirect&bpo=19552>] as part of the [PEP 453](#) [

[peps.python.org/pep-0453/](https://peps.python.org/pep-0453/) implementation.)

- The encoding name is now optional in the value set for the **PYTHONIOENCODING** environment variable. This makes it possible to set just the error handler, without changing the default encoding. (Contributed by Serhiy Storchaka in [bpo-18818](https://bugs.python.org/issue?@action=redirect&bpo=18818) [https://bugs.python.org/issue?@action=redirect&bpo=18818].)
- The **bz2**, **lzma**, and **gzip** module open functions now support x (exclusive creation) mode. (Contributed by Tim Heaney and Vajrasky Kok in [bpo-19201](https://bugs.python.org/issue?@action=redirect&bpo=19201) [https://bugs.python.org/issue?@action=redirect&bpo=19201], [bpo-19222](https://bugs.python.org/issue?@action=redirect&bpo=19222) [https://bugs.python.org/issue?@action=redirect&bpo=19222], and [bpo-19223](https://bugs.python.org/issue?@action=redirect&bpo=19223) [https://bugs.python.org/issue?@action=redirect&bpo=19223].)

## Significant Optimizations

- The UTF-32 decoder is now 3x to 4x faster. (Contributed by Serhiy Storchaka in [bpo-14625](https://bugs.python.org/issue?@action=redirect&bpo=14625) [https://bugs.python.org/issue?@action=redirect&bpo=14625].)
- The cost of hash collisions for sets is now reduced. Each hash table probe now checks a series of consecutive, adjacent key/hash pairs before continuing to make random probes through the hash table. This exploits cache locality to make collision resolution less expensive. The collision resolution scheme can be described as a hybrid of linear probing and open addressing. The number of additional linear probes defaults to nine. This can be changed at compile-time by defining **LINEAR\_PROBES** to be any value. Set **LINEAR\_PROBES** = 0 to turn-off linear probing entirely. (Contributed by Raymond Hettinger in [bpo-18771](https://bugs.python.org/issue?@action=redirect&bpo=18771) [https://bugs.python.org/issue?@action=redirect&bpo=18771].)
- The interpreter starts about 30% faster. A couple of measures lead to the speedup. The interpreter loads fewer modules on startup, e.g. the **re**, **collections** and **locale** modules and their dependencies are no longer imported by default. The marshal module has been improved to load compiled Python code faster. (Contributed by Antoine Pitrou, Christian Heimes and Victor Stinner in [bpo-19219](https://bugs.python.org/issue?@action=redirect&bpo=19219) [https://bugs.python.org/issue?@action=redirect&bpo=19219], [bpo-19218](https://bugs.python.org/issue?@action=redirect&bpo=19218) [https://bugs.python.org/issue?@action=redirect&bpo=19218], and [bpo-19209](https://bugs.python.org/issue?@action=redirect&bpo=19209) [https://bugs.python.org/issue?@action=redirect&bpo=19209].)

- [<https://bugs.python.org/issue?@action=redirect&bpo=19209>], [bpo-19205](https://bugs.python.org/issue?@action=redirect&bpo=19205) [<https://bugs.python.org/issue?@action=redirect&bpo=19205>] and [bpo-9548](https://bugs.python.org/issue?@action=redirect&bpo=9548) [<https://bugs.python.org/issue?@action=redirect&bpo=9548>].)
- [bz2.BZ2File](#) is now as fast or faster than the Python2 version for most cases. [lzma.LZMAFile](#) has also been optimized. (Contributed by Serhiy Storchaka and Nadeem Vawda in [bpo-16034](https://bugs.python.org/issue?@action=redirect&bpo=16034) [<https://bugs.python.org/issue?@action=redirect&bpo=16034>].)
  - [random.getrandbits\(\)](#) is 20%-40% faster for small integers (the most common use case). (Contributed by Serhiy Storchaka in [bpo-16674](https://bugs.python.org/issue?@action=redirect&bpo=16674) [<https://bugs.python.org/issue?@action=redirect&bpo=16674>].)
  - By taking advantage of the new storage format for strings, pickling of strings is now significantly faster. (Contributed by Victor Stinner and Antoine Pitrou in [bpo-15596](https://bugs.python.org/issue?@action=redirect&bpo=15596) [<https://bugs.python.org/issue?@action=redirect&bpo=15596>].)
  - A performance issue in [io.FileIO.readall\(\)](#) has been solved. This particularly affects Windows, and significantly speeds up the case of piping significant amounts of data through [subprocess](#). (Contributed by Richard Oudkerk in [bpo-15758](https://bugs.python.org/issue?@action=redirect&bpo=15758) [<https://bugs.python.org/issue?@action=redirect&bpo=15758>].)
  - [html.escape\(\)](#) is now 10x faster. (Contributed by Matt Bryant in [bpo-18020](https://bugs.python.org/issue?@action=redirect&bpo=18020) [<https://bugs.python.org/issue?@action=redirect&bpo=18020>].)
  - On Windows, the native `VirtualAlloc` is now used instead of the CRT `malloc` in `obmalloc`. Artificial benchmarks show about a 3% memory savings.
  - [os.urandom\(\)](#) now uses a lazily opened persistent file descriptor so as to avoid using many file descriptors when run in parallel from multiple threads. (Contributed by Antoine Pitrou in [bpo-18756](https://bugs.python.org/issue?@action=redirect&bpo=18756) [<https://bugs.python.org/issue?@action=redirect&bpo=18756>].)

## Deprecated

This section covers various APIs and other features that have been deprecated in Python 3.4, and will be removed in Python 3.5 or

later. In most (but not all) cases, using the deprecated APIs will produce a **DeprecationWarning** when the interpreter is run with deprecation warnings enabled (for example, by using `-Wd`).

## Deprecations in the Python API

- As mentioned in [PEP 451: A ModuleSpec Type for the Import System](#), a number of `importlib` methods and functions are deprecated: `importlib.find_loader()` is replaced by `importlib.util.find_spec()`; `importlib.machinery.PathFinder.find_module()` is replaced by `importlib.machinery.PathFinder.find_spec()`; `importlib.abc.MetaPathFinder.find_module()` is replaced by `importlib.abc.MetaPathFinder.find_spec()`; `importlib.abc.PathEntryFinder.find_loader()` and `find_module()` are replaced by `importlib.abc.PathEntryFinder.find_spec()`; all of the `xxxLoader ABC load_module` methods (`importlib.abc.Loader.load_module()`, `importlib.abc.InspectLoader.load_module()`, `importlib.abc.FileLoader.load_module()`, `importlib.abc.SourceLoader.load_module()`) should no longer be implemented, instead loaders should implement an `exec_module` method (`importlib.abc.Loader.exec_module()`, `importlib.abc.InspectLoader.exec_module()`, `importlib.abc.SourceLoader.exec_module()`) and let the import system take care of the rest; and `importlib.abc.Loader.module_repr()`, `importlib.util.module_for_loader()`, `importlib.util.set_loader()`, and `importlib.util.set_package()` are no longer needed because their functions are now handled automatically by the import system.
- The `imp` module is pending deprecation. To keep compatibility with Python 2/3 code bases, the module's removal is currently not scheduled.
- The `formatter` module is pending deprecation and is slated

for removal in Python 3.6.

- MD5 as the default *digestmod* for the `hmac.new()` function is deprecated. Python 3.6 will require an explicit digest name or constructor as *digestmod* argument.
- The internal `Netrc` class in the `ftplib` module has been documented as deprecated in its docstring for quite some time. It now emits a `DeprecationWarning` and will be removed completely in Python 3.5.
- The undocumented *endtime* argument to `subprocess.Popen.wait()` should not have been exposed and is hopefully not in use; it is deprecated and will mostly likely be removed in Python 3.5.
- The *strict* argument of `HTMLParser` is deprecated.
- The `plistlib` `readPlist()`, `writePlist()`, `readPlistFromBytes()`, and `writePlistToBytes()` functions are deprecated in favor of the corresponding new functions `load()`, `dump()`, `loads()`, and `dumps()`. `Data()` is deprecated in favor of just using the `bytes` constructor.
- The `sysconfig` key `SO` is deprecated, it has been replaced by `EXT_SUFFIX`.
- The `U` mode accepted by various `open` functions is deprecated. In Python3 it does not do anything useful, and should be replaced by appropriate uses of `io.TextIOWrapper` (if needed) and its *newline* argument.
- The *parser* argument of `xml.etree.ElementTree.iterparse()` has been deprecated, as has the *html* argument of `XMLParser()`. To prepare for the removal of the latter, all arguments to `XMLParser` should be passed by keyword.

## Deprecated Features

- Running `IDLE` with the `-n` flag (no subprocess) is deprecated. However, the feature will not be removed until [bpo-18823](https://bugs.python.org/issue?@action=redirect&bpo=18823) [<https://bugs.python.org/issue?@action=redirect&bpo=18823>] is resolved.
- The `site` module adding a “site-python” directory to `sys.path`, if it exists, is deprecated ([bpo-19375](https://bugs.python.org/issue?@action=redirect&bpo=19375) [<https://bugs.python.org/issue?@action=redirect&bpo=19375>]).

# Removed

## Operating Systems No Longer Supported

Support for the following operating systems has been removed from the source and build tools:

- OS/2 ([bpo-16135](https://bugs.python.org/issue?@action=redirect&bpo=16135) [https://bugs.python.org/issue?@action=redirect&bpo=16135]).
- Windows 2000 (changeset e52df05b496a).
- Windows systems where COMSPEC points to `command.com` ([bpo-14470](https://bugs.python.org/issue?@action=redirect&bpo=14470) [https://bugs.python.org/issue?@action=redirect&bpo=14470]).
- VMS ([bpo-16136](https://bugs.python.org/issue?@action=redirect&bpo=16136) [https://bugs.python.org/issue?@action=redirect&bpo=16136]).

## API and Feature Removals

The following obsolete and previously deprecated APIs and features have been removed:

- The unmaintained `Misc/TextMate` and `Misc/vim` directories have been removed (see the [devguide](https://devguide.python.org) [https://devguide.python.org] for suggestions on what to use instead).
- The `SO` makefile macro is removed (it was replaced by the `SHLIB_SUFFIX` and `EXT_SUFFIX` macros) ([bpo-16754](https://bugs.python.org/issue?@action=redirect&bpo=16754) [https://bugs.python.org/issue?@action=redirect&bpo=16754]).
- The `PyThreadState.tick_counter` field has been removed; its value has been meaningless since Python 3.2, when the “new GIL” was introduced ([bpo-19199](https://bugs.python.org/issue?@action=redirect&bpo=19199) [https://bugs.python.org/issue?@action=redirect&bpo=19199]).
- `PyLoader` and `PyPycLoader` have been removed from [importlib](https://pypi.org/project/importlib). (Contributed by Taras Lyapun in [bpo-15641](https://bugs.python.org/issue?@action=redirect&bpo=15641) [https://bugs.python.org/issue?@action=redirect&bpo=15641]).
- The `strict` argument to [HTTPConnection](https://docs.python.org/3/library/http.client.html) and [HTTPSConnection](https://docs.python.org/3/library/http.client.html) has been removed. HTTP 0.9-style “Simple Responses” are no longer supported.
- The deprecated `urllib.request.Request` getter and setter methods `add_data`, `has_data`, `get_data`,

`get_type`, `get_host`, `get_selector`, `set_proxy`, `get_origin_req_host`, and `is_unverifiable` have been removed (use direct attribute access instead).

- Support for loading the deprecated `TYPE_INT64` has been removed from `marshal`. (Contributed by Dan Riti in [bpo-15480](https://bugs.python.org/issue?@action=redirect&bpo=15480) [https://bugs.python.org/issue?@action=redirect&bpo=15480].)
- **`inspect.Signature`**: positional-only parameters are now required to have a valid name.
- **`object.__format__()`** no longer accepts non-empty format strings, it now raises a `TypeError` instead. Using a non-empty string has been deprecated since Python 3.2. This change has been made to prevent a situation where previously working (but incorrect) code would start failing if an object gained a `__format__` method, which means that your code may now raise a `TypeError` if you are using an `'s'` format code with objects that do not have a `__format__` method that handles it. See [bpo-7994](https://bugs.python.org/issue?@action=redirect&bpo=7994) [https://bugs.python.org/issue?@action=redirect&bpo=7994] for background.
- **`difflib.SequenceMatcher.isbjunk()`** and **`difflib.SequenceMatcher.isbpopular()`** were deprecated in 3.2, and have now been removed: use `x in sm.bjunk` and `x in sm.bpopular`, where `sm` is a `SequenceMatcher` object ([bpo-13248](https://bugs.python.org/issue?@action=redirect&bpo=13248) [https://bugs.python.org/issue?@action=redirect&bpo=13248]).

## Code Cleanups

- The unused and undocumented internal `Scanner` class has been removed from the `pydoc` module.
- The private and effectively unused `_gestalt` module has been removed, along with the private `platform` functions `_mac_ver_lookup`, `_mac_ver_gestalt`, and `_bcd2str`, which would only have ever been called on badly broken OSX systems (see [bpo-18393](https://bugs.python.org/issue?@action=redirect&bpo=18393) [https://bugs.python.org/issue?@action=redirect&bpo=18393]).
- The hardcoded copies of certain `stat` constants that were included in the `tarfile` module namespace have been removed.

# Porting to Python 3.4

This section lists previously described changes and other bugfixes that may require changes to your code.

## Changes in ‘python’ Command Behavior

- In a posix shell, setting the **PATH** environment variable to an empty value is equivalent to not setting it at all. However, setting **PYTHONPATH** to an empty value was *not* equivalent to not setting it at all: setting **PYTHONPATH** to an empty value was equivalent to setting it to `.`, which leads to confusion when reasoning by analogy to how **PATH** works. The behavior now conforms to the posix convention for **PATH**.
- The [X refs, Y blocks] output of a debug (`--with-pydebug`) build of the CPython interpreter is now off by default. It can be re-enabled using the `-X showrefcount` option. (Contributed by Ezio Melotti in [bpo-17323](https://bugs.python.org/issue/?@action=redirect&bpo=17323) [<https://bugs.python.org/issue/?@action=redirect&bpo=17323>].)
- The python command and most stdlib scripts (as well as **argparse**) now output `--version` information to `stdout` instead of `stderr` (for issue list see [Other Improvements](#) above).

## Changes in the Python API

- The ABCs defined in `importlib.abc` now either raise the appropriate exception or return a default value instead of raising **NotImplementedError** blindly. This will only affect code calling `super()` and falling through all the way to the ABCs. For compatibility, catch both **NotImplementedError** or the appropriate exception as needed.
- The module type now initializes the `__package__` and `__loader__` attributes to `None` by default. To determine if these attributes were set in a backwards-compatible fashion, use e.g. `getattr(module, '__loader__', None)` is not `None`. ([bpo-17115](https://bugs.python.org/issue/?@action=redirect&bpo=17115) [<https://bugs.python.org/issue/?@action=redirect&bpo=17115>].)

- `importlib.util.module_for_loader()` now sets `__loader__` and `__package__` unconditionally to properly support reloading. If this is not desired then you will need to set these attributes manually. You can use `importlib.util.module_to_load()` for module management.
- Import now resets relevant attributes (e.g. `__name__`, `__loader__`, `__package__`, `__file__`, `__cached__`) unconditionally when reloading. Note that this restores a pre-3.3 behavior in that it means a module is re-found when re-loaded ([bpo-19413](https://bugs.python.org/issue?@action=redirect&bpo=19413) [https://bugs.python.org/issue?@action=redirect&bpo=19413]).
- Frozen packages no longer set `__path__` to a list containing the package name, they now set it to an empty list. The previous behavior could cause the import system to do the wrong thing on submodule imports if there was also a directory with the same name as the frozen package. The correct way to determine if a module is a package or not is to use `hasattr(module, '__path__')` ([bpo-18065](https://bugs.python.org/issue?@action=redirect&bpo=18065) [https://bugs.python.org/issue?@action=redirect&bpo=18065]).
- Frozen modules no longer define a `__file__` attribute. It's semantically incorrect for frozen modules to set the attribute as they are not loaded from any explicit location. If you must know that a module comes from frozen code then you can see if the module's `__spec__.location` is set to `'frozen'`, check if the loader is a subclass of `importlib.machinery.FrozenImporter`, or if Python 2 compatibility is necessary you can use `imp.is_frozen()`.
- `py_compile.compile()` now raises `FileExistsError` if the file path it would write to is a symlink or a non-regular file. This is to act as a warning that import will overwrite those files with a regular file regardless of what type of file path they were originally.
- `importlib.abc.SourceLoader.get_source()` no longer raises `ImportError` when the source code being loaded triggers a `SyntaxError` or `UnicodeDecodeError`. As `ImportError` is meant to be raised only when source code cannot be found but it should, it was felt to be over-reaching/overloading of that meaning when the source code is found but improperly structured. If you were catching

ImportError before and wish to continue to ignore syntax or decoding issues, catch all three exceptions now.

- `functools.update_wrapper()` and `functools.wraps()` now correctly set the `__wrapped__` attribute to the function being wrapped, even if that function also had its `__wrapped__` attribute set. This means `__wrapped__` attributes now correctly link a stack of decorated functions rather than every `__wrapped__` attribute in the chain referring to the innermost function. Introspection libraries that assumed the previous behaviour was intentional can use `inspect.unwrap()` to access the first function in the chain that has no `__wrapped__` attribute.
- `inspect.getfullargspec()` has been reimplemented on top of `inspect.signature()` and hence handles a much wider variety of callable objects than it did in the past. It is expected that additional builtin and extension module callables will gain signature metadata over the course of the Python 3.4 series. Code that assumes that `inspect.getfullargspec()` will fail on non-Python callables may need to be adjusted accordingly.
- `importlib.machinery.PathFinder` now passes on the current working directory to objects in `sys.path_hooks` for the empty string. This results in `sys.path_importer_cache` never containing `''`, thus iterating through `sys.path_importer_cache` based on `sys.path` will not find all keys. A module's `__file__` when imported in the current working directory will also now have an absolute path, including when using `-m` with the interpreter (except for `__main__.__file__` when a script has been executed directly using a relative path) (Contributed by Brett Cannon in [bpo-18416](https://bugs.python.org/issue?@action=redirect&bpo=18416) [https://bugs.python.org/issue?@action=redirect&bpo=18416])). is specified on the command-line) ([bpo-18416](https://bugs.python.org/issue?@action=redirect&bpo=18416) [https://bugs.python.org/issue?@action=redirect&bpo=18416])).
- The removal of the *strict* argument to `HTTPConnection` and `HTTPSConnection` changes the meaning of the remaining arguments if you are specifying them positionally rather than by keyword. If you've been paying attention to deprecation warnings your code should already be specifying any

additional arguments via keywords.

- Strings between `from __future__ import ...` statements now *always* raise a **SyntaxError**. Previously if there was no leading docstring, an interstitial string would sometimes be ignored. This brings CPython into compliance with the language spec; Jython and PyPy already were. ([bpo-17434](https://bugs.python.org/issue?@action=redirect&bpo=17434) [<https://bugs.python.org/issue?@action=redirect&bpo=17434>]).
- **ssl.SSLSocket.getpeercert()** and **ssl.SSLSocket.do\_handshake()** now raise an **OSError** with `ENOTCONN` when the **SSLSocket** is not connected, instead of the previous behavior of raising an **AttributeError**. In addition, **getpeercert()** will raise a **ValueError** if the handshake has not yet been done.
- **base64.b32decode()** now raises a **binascii.Error** when the input string contains non-b32-alphabet characters, instead of a **TypeError**. This particular **TypeError** was missed when the other **TypeError**s were converted. (Contributed by Serhiy Storchaka in [bpo-18011](https://bugs.python.org/issue?@action=redirect&bpo=18011) [<https://bugs.python.org/issue?@action=redirect&bpo=18011>].) Note: this change was also inadvertently applied in Python 3.3.3.
- The **file** attribute is now automatically closed when the creating **cgi.FieldStorage** instance is garbage collected. If you were pulling the file object out separately from the **cgi.FieldStorage** instance and not keeping the instance alive, then you should either store the entire **cgi.FieldStorage** instance or read the contents of the file before the **cgi.FieldStorage** instance is garbage collected.
- Calling **read** or **write** on a closed SSL socket now raises an informative **ValueError** rather than the previous more mysterious **AttributeError** ([bpo-9177](https://bugs.python.org/issue?@action=redirect&bpo=9177) [<https://bugs.python.org/issue?@action=redirect&bpo=9177>]).
- **slice.indices()** no longer produces an **OverflowError** for huge values. As a consequence of this fix, **slice.indices()** now raises a **ValueError** if given a negative length; previously it returned nonsense values ([bpo-14794](https://bugs.python.org/issue?@action=redirect&bpo=14794) [<https://bugs.python.org/issue?@action=redirect&bpo=14794>]).
- The **complex** constructor, unlike the **cmath** functions, was

incorrectly accepting **float** values if an object's `__complex__` special method returned one. This now raises a **TypeError**. ([bpo-16290](https://bugs.python.org/issue?@action=redirect&bpo=16290) [https://bugs.python.org/issue?@action=redirect&bpo=16290]).

- The **int** constructor in 3.2 and 3.3 erroneously accepts **float** values for the *base* parameter. It is unlikely anyone was doing this, but if so, it will now raise a **TypeError** ([bpo-16772](https://bugs.python.org/issue?@action=redirect&bpo=16772) [https://bugs.python.org/issue?@action=redirect&bpo=16772]).
- Defaults for keyword-only arguments are now evaluated *after* defaults for regular keyword arguments, instead of before. Hopefully no one wrote any code that depends on the previous buggy behavior ([bpo-16967](https://bugs.python.org/issue?@action=redirect&bpo=16967) [https://bugs.python.org/issue?@action=redirect&bpo=16967]).
- Stale thread states are now cleared after **fork()**. This may cause some system resources to be released that previously were incorrectly kept perpetually alive (for example, database connections kept in thread-local storage). ([bpo-17094](https://bugs.python.org/issue?@action=redirect&bpo=17094) [https://bugs.python.org/issue?@action=redirect&bpo=17094]).
- Parameter names in `__annotations__` dicts are now mangled properly, similarly to `__kwdefaults__`. (Contributed by Yuri Selivanov in [bpo-20625](https://bugs.python.org/issue?@action=redirect&bpo=20625) [https://bugs.python.org/issue?@action=redirect&bpo=20625]).
- **hashlib.hash.name** now always returns the identifier in lower case. Previously some builtin hashes had uppercase names, but now that it is a formal public interface the naming has been made consistent ([bpo-18532](https://bugs.python.org/issue?@action=redirect&bpo=18532) [https://bugs.python.org/issue?@action=redirect&bpo=18532]).
- Because **unittest.TestSuite** now drops references to tests after they are run, test harnesses that re-use a **TestSuite** to re-run a set of tests may fail. Test suites should not be re-used in this fashion since it means state is retained between test runs, breaking the test isolation that **unittest** is designed to provide. However, if the lack of isolation is considered acceptable, the old behavior can be restored by creating a **TestSuite** subclass that defines a `_removeTestAtIndex` method that does nothing (see **TestSuite.\_\_iter\_\_()**) ([bpo-11798](https://bugs.python.org/issue?@action=redirect&bpo=11798) [https://bugs.python.org/issue?@action=redirect&bpo=11798]).
- **unittest** now uses **argparse** for command line parsing.

There are certain invalid command forms that used to work that are no longer allowed; in theory this should not cause backward compatibility issues since the disallowed command forms didn't make any sense and are unlikely to be in use.

- The `re.split()`, `re.findall()`, and `re.sub()` functions, and the `group()` and `groups()` methods of `match` objects now always return a `bytes` object when the string to be matched is a `bytes-like object`. Previously the return type matched the input type, so if your code was depending on the return value being, say, a `bytearray`, you will need to change your code.
- `audioop` functions now raise an error immediately if passed string input, instead of failing randomly later on ([bpo-16685](https://bugs.python.org/issue?@action=redirect&bpo=16685) [<https://bugs.python.org/issue?@action=redirect&bpo=16685>]).
- The new `convert_charrefs` argument to `HTMLParser` currently defaults to `False` for backward compatibility, but will eventually be changed to default to `True`. It is recommended that you add this keyword, with the appropriate value, to any `HTMLParser` calls in your code ([bpo-13633](https://bugs.python.org/issue?@action=redirect&bpo=13633) [<https://bugs.python.org/issue?@action=redirect&bpo=13633>]).
- Since the `digestmod` argument to the `hmac.new()` function will in the future have no default, all calls to `hmac.new()` should be changed to explicitly specify a `digestmod` ([bpo-17276](https://bugs.python.org/issue?@action=redirect&bpo=17276) [<https://bugs.python.org/issue?@action=redirect&bpo=17276>]).
- Calling `sysconfig.get_config_var()` with the `SO` key, or looking `SO` up in the results of a call to `sysconfig.get_config_vars()` is deprecated. This key should be replaced by `EXT_SUFFIX` or `SHLIB_SUFFIX`, depending on the context ([bpo-19555](https://bugs.python.org/issue?@action=redirect&bpo=19555) [<https://bugs.python.org/issue?@action=redirect&bpo=19555>]).
- Any calls to `open` functions that specify `U` should be modified. `U` is ineffective in Python3 and will eventually raise an error if used. Depending on the function, the equivalent of its old Python2 behavior can be achieved using either a `newline` argument, or if necessary by wrapping the stream in `TextIOWrapper` to use its `newline` argument ([bpo-15204](https://bugs.python.org/issue?@action=redirect&bpo=15204) [<https://bugs.python.org/issue?@action=redirect&bpo=15204>]).
- If you use `pyvenv` in a script and desire that `pip` *not* be

installed, you must add `--without-pip` to your command invocation.

- The default behavior of `json.dump()` and `json.dumps()` when an indent is specified has changed: it no longer produces trailing spaces after the item separating commas at the ends of lines. This will matter only if you have tests that are doing white-space-sensitive comparisons of such output ([bpo-16333](https://bugs.python.org/issue?@action=redirect&bpo=16333) [https://bugs.python.org/issue?@action=redirect&bpo=16333]).
- `doctest` now looks for doctests in extension module `__doc__` strings, so if your doctest test discovery includes extension modules that have things that look like doctests in them you may see test failures you've never seen before when running your tests ([bpo-3158](https://bugs.python.org/issue?@action=redirect&bpo=3158) [https://bugs.python.org/issue?@action=redirect&bpo=3158]).
- The `collections.abc` module has been slightly refactored as part of the Python startup improvements. As a consequence of this, it is no longer the case that importing `collections` automatically imports `collections.abc`. If your program depended on the (undocumented) implicit import, you will need to add an explicit `import collections.abc` ([bpo-20784](https://bugs.python.org/issue?@action=redirect&bpo=20784) [https://bugs.python.org/issue?@action=redirect&bpo=20784]).

## Changes in the C API

- `PyEval_EvalFrameEx()`, `PyObject_Repr()`, and `PyObject_Str()`, along with some other internal C APIs, now include a debugging assertion that ensures they are not used in situations where they may silently discard a currently active exception. In cases where discarding the active exception is expected and desired (for example, because it has already been saved locally with `PyErr_Fetch()` or is being deliberately replaced with a different exception), an explicit `PyErr_Clear()` call will be needed to avoid triggering the assertion when invoking these operations (directly or indirectly) and running against a version of Python that is compiled with assertions enabled.
- `PyErr_SetImportError()` now sets `TypeError` when its `msg` argument is not set. Previously only `NULL` was returned

with no exception set.

- The result of the `PyOS_ReadlineFunctionPointer` callback must now be a string allocated by `PyMem_RawMalloc()` or `PyMem_RawRealloc()`, or `NULL` if an error occurred, instead of a string allocated by `PyMem_Malloc()` or `PyMem_Realloc()` (bpo-16742 [https://bugs.python.org/issue?@action=redirect&bpo=16742])
- `PyThread_set_key_value()` now always set the value. In Python 3.3, the function did nothing if the key already exists (if the current value is a non-`NULL` pointer).
- The `f_tstate` (thread state) field of the `PyFrameObject` structure has been removed to fix a bug: see bpo-14432 [https://bugs.python.org/issue?@action=redirect&bpo=14432] for the rationale.

## Changed in 3.4.3

### PEP 476: Enabling certificate verification by default for stdlib http clients

`http.client` and modules which use it, such as `urllib.request` and `xmlrpc.client`, will now verify that the server presents a certificate which is signed by a CA in the platform trust store and whose hostname matches the hostname being requested by default, significantly improving security for many applications.

For applications which require the old previous behavior, they can pass an alternate context:

```
import urllib.request
import ssl
```

```
# This disables all verification
context = ssl._create_unverified_context()
```

```
# This allows using a specific certificate for the host,
# to be in the trust store
context = ssl.create_default_context(cafile="/path/to/ffi
```

```
urllib.request.urlopen("https://invalid-cert", context=c
```

# What's New In Python 3.3

This article explains the new features in Python 3.3, compared to 3.2. Python 3.3 was released on September 29, 2012. For full details, see the [changelog](https://docs.python.org/3.3/whatsnew/changelog.html) [https://docs.python.org/3.3/whatsnew/changelog.html].

## See also

**PEP 398** [https://peps.python.org/pep-0398/] - Python 3.3 Release Schedule

## Summary – Release highlights

New syntax features:

- New `yield from` expression for [generator delegation](#).
- The `u'unicode'` syntax is accepted again for [str](#) objects.

New library modules:

- [faulthandler](#) (helps debugging low-level crashes)
- [ipaddress](#) (high-level objects representing IP addresses and masks)
- [lzma](#) (compress data using the XZ / LZMA algorithm)
- [unittest.mock](#) (replace parts of your system under test with mock objects)
- [venv](#) (Python [virtual environments](#), as in the popular `virtualenv` package)

New built-in features:

- Reworked [I/O exception hierarchy](#).

Implementation improvements:

- Rewritten `import machinery` based on `importlib`.
- More compact `unicode strings`.
- More compact `attribute dictionaries`.

Significantly Improved Library Modules:

- C Accelerator for the `decimal` module.
- Better unicode handling in the `email` module (`provisional`).

Security improvements:

- Hash randomization is switched on by default.

Please read on for a comprehensive list of user-facing changes.

## PEP 405: Virtual Environments

Virtual environments help create separate Python setups while sharing a system-wide base install, for ease of maintenance. Virtual environments have their own set of private site packages (i.e. locally installed libraries), and are optionally segregated from the system-wide site packages. Their concept and implementation are inspired by the popular `virtualenv` third-party package, but benefit from tighter integration with the interpreter core.

This PEP adds the `venv` module for programmatic access, and the `pyvenv` script for command-line access and administration. The Python interpreter checks for a `pyvenv.cfg` file whose existence signals the base of a virtual environment's directory tree.

## PEP 420: Implicit Namespace Packages

Native support for package directories that don't require `__init__.py` marker files and can automatically span multiple path segments (inspired by various third party approaches to namespace packages, as described in [PEP 420](https://peps.python.org/pep-0420/) [https://peps.python.org/pep-0420/])

## See also

[PEP 420](https://peps.python.org/pep-0420/) [https://peps.python.org/pep-0420/] - **Implicit Namespace Packages**

PEP written by Eric V. Smith; implementation by Eric V. Smith and Barry Warsaw

# PEP 3118: New memoryview implementation and buffer protocol documentation

The implementation of [PEP 3118](https://peps.python.org/pep-3118/) [https://peps.python.org/pep-3118/] has been significantly improved.

The new memoryview implementation comprehensively fixes all ownership and lifetime issues of dynamically allocated fields in the `Py_buffer` struct that led to multiple crash reports. Additionally, several functions that crashed or returned incorrect results for non-contiguous or multi-dimensional input have been fixed.

The memoryview object now has a PEP-3118 compliant `getbufferproc()` that checks the consumer's request type. Many new features have been added, most of them work in full generality for non-contiguous arrays and arrays with suboffsets.

The documentation has been updated, clearly spelling out responsibilities for both exporters and consumers. Buffer request flags are grouped into basic and compound flags. The memory layout of non-contiguous and multi-dimensional NumPy-style arrays is explained.

## Features

- All native single character format specifiers in struct module syntax (optionally prefixed with '@') are now supported.
- With some restrictions, the cast() method allows changing of format and shape of C-contiguous arrays.
- Multi-dimensional list representations are supported for any array type.
- Multi-dimensional comparisons are supported for any array type.
- One-dimensional memoryviews of hashable (read-only) types with formats B, b or c are now hashable. (Contributed by Antoine Pitrou in [bpo-13411](https://bugs.python.org/issue?@action=redirect&bpo=13411) [https://bugs.python.org/issue?@action=redirect&bpo=13411].)
- Arbitrary slicing of any 1-D arrays type is supported. For example, it is now possible to reverse a memoryview in O(1) by using a negative step.

## API changes

- The maximum number of dimensions is officially limited to 64.
- The representation of empty shape, strides and suboffsets is now an empty tuple instead of `None`.
- Accessing a memoryview element with format 'B' (unsigned bytes) now returns an integer (in accordance with the struct module syntax). For returning a bytes object the view must be cast to 'c' first.
- memoryview comparisons now use the logical structure of the operands and compare all array elements by value. All format strings in struct module syntax are supported. Views with unrecognised format strings are still permitted, but will always compare as unequal, regardless of view contents.
- For further changes see [Build and C API Changes](#) and [Porting C code](#).

(Contributed by Stefan Krah in [bpo-10181](https://bugs.python.org/issue?@action=redirect&bpo=10181) [https://bugs.python.org/issue?@action=redirect&bpo=10181].)

## PEP 393: Flexible String Representation

The Unicode string type is changed to support multiple internal representations, depending on the character with the largest Unicode ordinal (1, 2, or 4 bytes) in the represented string. This allows a space-efficient representation in common cases, but gives access to full UCS-4 on all systems. For compatibility with existing APIs, several representations may exist in parallel; over time, this compatibility should be phased out.

On the Python side, there should be no downside to this change.

On the C API side, [PEP 393](https://peps.python.org/pep-0393/) [https://peps.python.org/pep-0393/] is fully backward compatible. The legacy API should remain available at least five years. Applications using the legacy API will not fully benefit of the memory reduction, or - worse - may use a bit more memory, because Python may have to maintain two versions of each string (in the legacy format and in the new efficient storage).

### Functionality

Changes introduced by [PEP 393](https://peps.python.org/pep-0393/) [https://peps.python.org/pep-0393/] are the following:

- Python now always supports the full range of Unicode code points, including non-BMP ones (i.e. from U+0000 to U+10FFFF). The distinction between narrow and wide builds no longer exists and Python now behaves like a wide build, even under Windows.
- With the death of narrow builds, the problems specific to narrow builds have also been fixed, for example:
  - `len()` now always returns 1 for non-BMP characters, so `len('\U0010FFFF') == 1`;
  - surrogate pairs are not recombined in string literals, so `'\uDBFF\uDFFF' != '\U0010FFFF'`;
  - indexing or slicing non-BMP characters returns the expected value, so `'\U0010FFFF'[0]` now returns

- '\U0010FFFF' and not '\uDBFF';
  - all other functions in the standard library now correctly handle non-BMP code points.
- The value of `sys.maxunicode` is now always 1114111 (0x10FFFF in hexadecimal). The `PyUnicode_GetMax()` function still returns either 0xFFFF or 0x10FFFF for backward compatibility, and it should not be used with the new Unicode API (see [bpo-13054](https://bugs.python.org/issue?@action=redirect&bpo=13054) [https://bugs.python.org/issue?@action=redirect&bpo=13054]).
- The `./configure` flag `--with-wide-unicode` has been removed.

## Performance and resource usage

The storage of Unicode strings now depends on the highest code point in the string:

- pure ASCII and Latin1 strings (U+0000–U+00FF) use 1 byte per code point;
- BMP strings (U+0000–U+FFFF) use 2 bytes per code point;
- non-BMP strings (U+10000–U+10FFFF) use 4 bytes per code point.

The net effect is that for most applications, memory usage of string storage should decrease significantly - especially compared to former wide unicode builds - as, in many cases, strings will be pure ASCII even in international contexts (because many strings store non-human language data, such as XML fragments, HTTP headers, JSON-encoded data, etc.). We also hope that it will, for the same reasons, increase CPU cache efficiency on non-trivial applications. The memory usage of Python 3.3 is two to three times smaller than Python 3.2, and a little bit better than Python 2.7, on a Django benchmark (see the PEP for details).

**PEP 393** [https://peps.python.org/pep-0393/] - Flexible String Representation

PEP written by Martin von Löwis; implementation by Torsten Becker and Martin von Löwis.

# PEP 397: Python Launcher for Windows

The Python 3.3 Windows installer now includes a `py` launcher application that can be used to launch Python applications in a version independent fashion.

This launcher is invoked implicitly when double-clicking `*.py` files. If only a single Python version is installed on the system, that version will be used to run the file. If multiple versions are installed, the most recent version is used by default, but this can be overridden by including a Unix-style “shebang line” in the Python script.

The launcher can also be used explicitly from the command line as the `py` application. Running `py` follows the same version selection rules as implicitly launching scripts, but a more specific version can be selected by passing appropriate arguments (such as `-3` to request Python 3 when Python 2 is also installed, or `-2.6` to specifically request an earlier Python version when a more recent version is installed).

In addition to the launcher, the Windows installer now includes an option to add the newly installed Python to the system PATH. (Contributed by Brian Curtin in [bpo-3561](https://bugs.python.org/issue?@action=redirect&bpo=3561) [https://bugs.python.org/issue?@action=redirect&bpo=3561].)

# PEP 3151: Reworking the OS and IO

# exception hierarchy

The hierarchy of exceptions raised by operating system errors is now both simplified and finer-grained.

You don't have to worry anymore about choosing the appropriate exception type between `OSError`, `IOError`, `EnvironmentError`, `WindowsError`, `mmap.error`, `socket.error` or `select.error`. All these exception types are now only one: `OSError`. The other names are kept as aliases for compatibility reasons.

Also, it is now easier to catch a specific error condition. Instead of inspecting the `errno` attribute (or `args[0]`) for a particular constant from the `errno` module, you can catch the adequate `OSError` subclass. The available subclasses are the following:

- `BlockingIOError`
- `ChildProcessError`
- `ConnectionError`
- `FileExistsError`
- `FileNotFoundError`
- `InterruptedError`
- `IsADirectoryError`
- `NotADirectoryError`
- `PermissionError`
- `ProcessLookupError`
- `TimeoutError`

And the `ConnectionError` itself has finer-grained subclasses:

- `BrokenPipeError`
- `ConnectionAbortedError`
- `ConnectionRefusedError`
- `ConnectionResetError`

Thanks to the new exceptions, common usages of the `errno` can now be avoided. For example, the following code written for Python 3.2:

```
from errno import ENOENT, EACCES, EPERM
```

```
try:
    with open("document.txt") as f:
        content = f.read()
except IOError as err:
    if err.errno == ENOENT:
        print("document.txt file is missing")
    elif err.errno in (EACCES, EPERM):
        print("You are not allowed to read document.txt")
    else:
        raise
```

can now be written without the `errno` import and without manual inspection of exception attributes:

```
try:
    with open("document.txt") as f:
        content = f.read()
except FileNotFoundError:
    print("document.txt file is missing")
except PermissionError:
    print("You are not allowed to read document.txt")
```

PEP written and implemented by Antoine Pitrou

## PEP 380: Syntax for Delegating to a Subgenerator

PEP 380 adds the `yield from` expression, allowing a [generator](#) to delegate part of its operations to another generator. This allows a section of code containing `yield` to be factored out and placed in another generator. Additionally, the subgenerator is allowed to return with a value, and the value is made available to the delegating generator.

While designed primarily for use in delegating to a subgenerator, the `yield from` expression actually allows delegation to arbitrary subiterators.

For simple iterators, `yield from iterable` is essentially just a shortened form of `for item in iterable: yield item`:

```
>>> def g(x):
...     yield from range(x, 0, -1)
...     yield from range(x)
...
>>> list(g(5))
[5, 4, 3, 2, 1, 0, 1, 2, 3, 4]
```

However, unlike an ordinary loop, `yield from` allows subgenerators to receive sent and thrown values directly from the calling scope, and return a final value to the outer generator:

```
>>> def accumulate():
...     tally = 0
...     while 1:
...         next = yield
...         if next is None:
...             return tally
...         tally += next
...
>>> def gather_tallies(tallies):
...     while 1:
...         tally = yield from accumulate()
...         tallies.append(tally)
...
>>> tallies = []
>>> acc = gather_tallies(tallies)
>>> next(acc) # Ensure the accumulator is ready to accept
>>> for i in range(4):
...     acc.send(i)
...
>>> acc.send(None) # Finish the first tally
>>> for i in range(5):
```

```

...     acc.send(i)
...
>>> acc.send(None) # Finish the second tally
>>> tallies
[6, 10]

```

The main principle driving this change is to allow even generators that are designed to be used with the `send` and `throw` methods to be split into multiple subgenerators as easily as a single large function can be split into multiple subfunctions.

#### **PEP 380** [<https://peps.python.org/pep-0380/>] - Syntax for Delegating to a Subgenerator

PEP written by Greg Ewing; implementation by Greg Ewing, integrated into 3.3 by Renaud Blanch, Ryan Kelly and Nick Coghlan; documentation by Zbigniew Jędrzejewski-Szmek and Nick Coghlan

## PEP 409: Suppressing exception context

PEP 409 introduces new syntax that allows the display of the chained exception context to be disabled. This allows cleaner error messages in applications that convert between exception types:

```

>>> class D:
...     def __init__(self, extra):
...         self._extra_attributes = extra
...     def __getattr__(self, attr):
...         try:
...             return self._extra_attributes[attr]
...         except KeyError:
...             raise AttributeError(attr) from None
...
>>> D({}).x
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>

```

```
File "<stdin>", line 8, in __getattr__
AttributeError: x
```

Without the `from None` suffix to suppress the cause, the original exception would be displayed by default:

```
>>> class C:
...     def __init__(self, extra):
...         self._extra_attributes = extra
...     def __getattr__(self, attr):
...         try:
...             return self._extra_attributes[attr]
...         except KeyError:
...             raise AttributeError(attr)
...
>>> C({}).x
Traceback (most recent call last):
  File "<stdin>", line 6, in __getattr__
KeyError: 'x'
```

During handling of the above exception, another exception occurred:

```
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
  File "<stdin>", line 8, in __getattr__
AttributeError: x
```

No debugging capability is lost, as the original exception context remains available if needed (for example, if an intervening library has incorrectly suppressed valuable underlying details):

```
>>> try:
...     D({}).x
... except AttributeError as exc:
...     print(repr(exc.__context__))
...
KeyError('x',)
```

PEP written by Ethan Furman; implemented by Ethan Furman and Nick Coghlan.

## **PEP 414: Explicit Unicode literals**

To ease the transition from Python 2 for Unicode aware Python applications that make heavy use of Unicode literals, Python 3.3 once again supports the “u” prefix for string literals. This prefix has no semantic significance in Python 3, it is provided solely to reduce the number of purely mechanical changes in migrating to Python 3, making it easier for developers to focus on the more significant semantic changes (such as the stricter default separation of binary and text data).

PEP written by Armin Ronacher.

## **PEP 3155: Qualified name for classes and functions**

Functions and class objects have a new `__qualname__` attribute representing the “path” from the module top-level to their definition. For global functions and classes, this is the same as `__name__`. For other functions and classes, it provides better information about where they were actually defined, and how they might be accessible from the global scope.

Example with (non-bound) methods:

```
>>> class C:
...     def meth(self):
...         pass
```

```
>>> C.meth.__name__
'meth'
>>> C.meth.__qualname__
'C.meth'
```

**Example with nested classes:**

```
>>> class C:
...     class D:
...         def meth(self):
...             pass
...
>>> C.D.__name__
'D'
>>> C.D.__qualname__
'C.D'
>>> C.D.meth.__name__
'meth'
>>> C.D.meth.__qualname__
'C.D.meth'
```

**Example with nested functions:**

```
>>> def outer():
...     def inner():
...         pass
...     return inner
...
>>> outer().__name__
'inner'
>>> outer().__qualname__
'outer.<locals>.inner'
```

The string representation of those objects is also changed to include the new, more precise information:

```
>>> str(C.D)
"<class '.__main__.C.D'>"
>>> str(C.D.meth)
'<function C.D.meth at 0x7f46b9fe31e0>'
```

See also

**PEP 3155** [<https://peps.python.org/pep-3155/>] - Qualified name for classes and functions

PEP written and implemented by Antoine Pitrou.

## PEP 412: Key-Sharing Dictionary

Dictionaries used for the storage of objects' attributes are now able to share part of their internal storage between each other (namely, the part which stores the keys and their respective hashes). This reduces the memory consumption of programs creating many instances of non-builtin types.

See also

**PEP 412** [<https://peps.python.org/pep-0412/>] - Key-Sharing Dictionary

PEP written and implemented by Mark Shannon.

## PEP 362: Function Signature Object

A new function `inspect.signature()` makes introspection of python callables easy and straightforward. A broad range of callables is supported: python functions, decorated or not, classes, and `functools.partial()` objects. New classes `inspect.Signature`, `inspect.Parameter` and `inspect.BoundsArguments` hold information about the call signatures, such as, annotations, default values, parameters kinds, and bound arguments, which considerably simplifies writing decorators and any code that validates or amends calling signatures or arguments.

See also

**PEP 362** [<https://peps.python.org/pep-0362/>]: - Function Signature Object

PEP written by Brett Cannon, Yury Selivanov, Larry Hastings, Jiwon Seo; implemented by Yury Selivanov.

## PEP 421: Adding `sys.implementation`

A new attribute on the `sys` module exposes details specific to the implementation of the currently running interpreter. The initial set of attributes on `sys.implementation` are `name`, `version`, `hexversion`, and `cache_tag`.

The intention of `sys.implementation` is to consolidate into one namespace the implementation-specific data used by the standard library. This allows different Python implementations to share a single standard library code base much more easily. In its initial state, `sys.implementation` holds only a small portion of the implementation-specific data. Over time that ratio will shift in order to make the standard library more portable.

One example of improved standard library portability is `cache_tag`. As of Python 3.3, `sys.implementation.cache_tag` is used by `importlib` to support [PEP 3147](https://peps.python.org/pep-3147/) [https://peps.python.org/pep-3147/] compliance. Any Python implementation that uses `importlib` for its built-in import system may use `cache_tag` to control the caching behavior for modules.

### SimpleNamespace

The implementation of `sys.implementation` also introduces a new type to Python: `types.SimpleNamespace`. In contrast to a mapping-based namespace, like `dict`, `SimpleNamespace` is attribute-based, like `object`. However, unlike `object`, `SimpleNamespace` instances are writable. This means that you can add, remove, and modify the namespace through normal attribute access.

## sys.implementation

PEP written and implemented by Eric Snow.

# Using importlib as the Implementation of Import

[bpo-2377](https://bugs.python.org/issue?@action=redirect&bpo=2377) [https://bugs.python.org/issue?@action=redirect&bpo=2377] - Replace `__import__` w/ `importlib.__import__` [bpo-13959](https://bugs.python.org/issue?@action=redirect&bpo=13959) [https://bugs.python.org/issue?@action=redirect&bpo=13959] - Re-implement parts of `imp` in pure Python [bpo-14605](https://bugs.python.org/issue?@action=redirect&bpo=14605) [https://bugs.python.org/issue?@action=redirect&bpo=14605] - Make import machinery explicit [bpo-14646](https://bugs.python.org/issue?@action=redirect&bpo=14646) [https://bugs.python.org/issue?@action=redirect&bpo=14646] - Require loaders set `__loader__` and `__package__`

The `__import__()` function is now powered by `importlib.__import__()`. This work leads to the completion of “phase 2” of [PEP 302](https://peps.python.org/pep-0302/) [https://peps.python.org/pep-0302/]. There are multiple benefits to this change. First, it has allowed for more of the machinery powering import to be exposed instead of being implicit and hidden within the C code. It also provides a single implementation for all Python VMs supporting Python 3.3 to use, helping to end any VM-specific deviations in import semantics. And finally it eases the maintenance of import, allowing for future growth to occur.

For the common user, there should be no visible change in semantics. For those whose code currently manipulates import or calls import programmatically, the code changes that might possibly be required are covered in the [Porting Python code](#) section of this document.

## New APIs

One of the large benefits of this work is the exposure of what goes into making the import statement work. That means the various importers that were once implicit are now fully exposed as part of the `importlib` package.

The abstract base classes defined in `importlib.abc` have been

expanded to properly delineate between `meta path finders` and `path entry finders` by introducing `importlib.abc.MetaPathFinder` and `importlib.abc.PathEntryFinder`, respectively. The old ABC of `importlib.abc.Finder` is now only provided for backwards-compatibility and does not enforce any method requirements.

In terms of finders, `importlib.machinery.FileFinder` exposes the mechanism used to search for source and bytecode files of a module. Previously this class was an implicit member of `sys.path_hooks`.

For loaders, the new abstract base class `importlib.abc.FileLoader` helps write a loader that uses the file system as the storage mechanism for a module's code. The loader for source files (`importlib.machinery.SourceFileLoader`), sourceless bytecode files (`importlib.machinery.SourcelessFileLoader`), and extension modules (`importlib.machinery.ExtensionFileLoader`) are now available for direct use.

`ImportError` now has `name` and `path` attributes which are set when there is relevant data to provide. The message for failed imports will also provide the full name of the module now instead of just the tail end of the module's name.

The `importlib.invalidate_caches()` function will now call the method with the same name on all finders cached in `sys.path_importer_cache` to help clean up any stored state as necessary.

## Visible Changes

For potential required changes to code, see the [Porting Python code](#) section.

Beyond the expanse of what `importlib` now exposes, there are other visible changes to import. The biggest is that `sys.meta_path` and `sys.path_hooks` now store all of the meta

path finders and path entry hooks used by import. Previously the finders were implicit and hidden within the C code of import instead of being directly exposed. This means that one can now easily remove or change the order of the various finders to fit one's needs.

Another change is that all modules have a `__loader__` attribute, storing the loader used to create the module. [PEP 302](https://peps.python.org/pep-0302/) [https://peps.python.org/pep-0302/] has been updated to make this attribute mandatory for loaders to implement, so in the future once 3rd-party loaders have been updated people will be able to rely on the existence of the attribute. Until such time, though, import is setting the module post-load.

Loaders are also now expected to set the `__package__` attribute from [PEP 366](https://peps.python.org/pep-0366/) [https://peps.python.org/pep-0366/]. Once again, import itself is already setting this on all loaders from `importlib` and import itself is setting the attribute post-load.

`None` is now inserted into `sys.path_importer_cache` when no finder can be found on `sys.path_hooks`. Since `imp.NullImporter` is not directly exposed on `sys.path_hooks` it could no longer be relied upon to always be available to use as a value representing no finder found.

All other changes relate to semantic changes which should be taken into consideration when updating code for Python 3.3, and thus should be read about in the [Porting Python code](#) section of this document.

(Implementation by Brett Cannon)

## Other Language Changes

Some smaller changes made to the core Python language are:

- Added support for Unicode name aliases and named sequences. Both `unicodedata.lookup()` and `'\N{...}'` now resolve name aliases, and `unicodedata.lookup()` resolves named sequences too.

(Contributed by Ezio Melotti in [bpo-12753](https://bugs.python.org/issue/?@action=redirect&bpo=12753) [https://bugs.python.org/issue/?@action=redirect&bpo=12753].)

- Unicode database updated to UCD version 6.1.0
- Equality comparisons on `range()` objects now return a result reflecting the equality of the underlying sequences generated by those range objects. ([bpo-13201](https://bugs.python.org/issue/?@action=redirect&bpo=13201) [https://bugs.python.org/issue/?@action=redirect&bpo=13201])
- The `count()`, `find()`, `rfind()`, `index()` and `rindex()` methods of `bytes` and `bytearray` objects now accept an integer between 0 and 255 as their first argument.

(Contributed by Petri Lehtinen in [bpo-12170](https://bugs.python.org/issue/?@action=redirect&bpo=12170) [https://bugs.python.org/issue/?@action=redirect&bpo=12170].)

- The `rjust()`, `ljust()`, and `center()` methods of `bytes` and `bytearray` now accept a `bytearray` for the `fill` argument. (Contributed by Petri Lehtinen in [bpo-12380](https://bugs.python.org/issue/?@action=redirect&bpo=12380) [https://bugs.python.org/issue/?@action=redirect&bpo=12380].)
- New methods have been added to `list` and `bytearray`: `copy()` and `clear()` ([bpo-10516](https://bugs.python.org/issue/?@action=redirect&bpo=10516) [https://bugs.python.org/issue/?@action=redirect&bpo=10516]). Consequently, `MutableSequence` now also defines a `clear()` method ([bpo-11388](https://bugs.python.org/issue/?@action=redirect&bpo=11388) [https://bugs.python.org/issue/?@action=redirect&bpo=11388]).
- Raw bytes literals can now be written `rb"..."` as well as `br"..."`.

(Contributed by Antoine Pitrou in [bpo-13748](https://bugs.python.org/issue/?@action=redirect&bpo=13748) [https://bugs.python.org/issue/?@action=redirect&bpo=13748].)

- `dict.setdefault()` now does only one lookup for the given key, making it atomic when used with built-in types.

(Contributed by Filip Gruszczyński in [bpo-13521](https://bugs.python.org/issue/?@action=redirect&bpo=13521) [https://bugs.python.org/issue/?@action=redirect&bpo=13521].)

- The error messages produced when a function call does not

match the function signature have been significantly improved.

(Contributed by Benjamin Peterson.)

## A Finer-Grained Import Lock

Previous versions of CPython have always relied on a global import lock. This led to unexpected annoyances, such as deadlocks when importing a module would trigger code execution in a different thread as a side-effect. Clumsy workarounds were sometimes employed, such as the `PyImport_ImportModuleNoBlock()` C API function.

In Python 3.3, importing a module takes a per-module lock. This correctly serializes importation of a given module from multiple threads (preventing the exposure of incompletely initialized modules), while eliminating the aforementioned annoyances.

(Contributed by Antoine Pitrou in [bpo-9260](https://bugs.python.org/issue?@action=redirect&bpo=9260) [<https://bugs.python.org/issue?@action=redirect&bpo=9260>].)

## Builtin functions and types

- `open()` gets a new *opener* parameter: the underlying file descriptor for the file object is then obtained by calling *opener* with (*file*, *flags*). It can be used to use custom flags like `os.O_CLOEXEC` for example. The 'x' mode was added: open for exclusive creation, failing if the file already exists.
- `print()`: added the *flush* keyword argument. If the *flush* keyword argument is true, the stream is forcibly flushed.
- `hash()`: hash randomization is enabled by default, see `object.__hash__()` and `PYTHONHASHSEED`.
- The `str` type gets a new `casefold()` method: return a casefolded copy of the string, casefolded strings may be used for caseless matching. For example, `'ß'.casefold()` returns `'ss'`.
- The sequence documentation has been substantially rewritten to better explain the binary/text sequence distinction and to

provide specific documentation sections for the individual builtin sequence types ([bpo-4966](https://bugs.python.org/issue?@action=redirect&bpo=4966) [https://bugs.python.org/issue?@action=redirect&bpo=4966]).

## New Modules

### faulthandler

This new debug module **faulthandler** contains functions to dump Python tracebacks explicitly, on a fault (a crash like a segmentation fault), after a timeout, or on a user signal. Call **faulthandler.enable()** to install fault handlers for the **SIGSEGV**, **SIGFPE**, **SIGABRT**, **SIGBUS**, and **SIGILL** signals. You can also enable them at startup by setting the **PYTHONFAULTHANDLER** environment variable or by using **-X faulthandler** command line option.

Example of a segmentation fault on Linux:

```
$ python -q -X faulthandler
>>> import ctypes
>>> ctypes.string_at(0)
Fatal Python error: Segmentation fault
```

```
Current thread 0x00007fb899f39700:
```

```
  File "/home/python/cpython/Lib/ctypes/__init__.py", li
```

```
  File "<stdin>", line 1 in <module>
```

```
Segmentation fault
```

### ipaddress

The new **ipaddress** module provides tools for creating and manipulating objects representing IPv4 and IPv6 addresses, networks and interfaces (i.e. an IP address associated with a specific IP subnet).

(Contributed by Google and Peter Moody in [PEP 3144](https://peps.python.org/pep-3144/) [https://peps.python.org/pep-3144/].)

## lzma

The newly added `lzma` module provides data compression and decompression using the LZMA algorithm, including support for the `.xz` and `.lzma` file formats.

(Contributed by Nadeem Vawda and Per Øyvind Karlsen in [bpo-6715](https://bugs.python.org/issue?@action=redirect&bpo=6715) [https://bugs.python.org/issue?@action=redirect&bpo=6715].)

## Improved Modules

### abc

Improved support for abstract base classes containing descriptors composed with abstract methods. The recommended approach to declaring abstract descriptors is now to provide `__isabstractmethod__` as a dynamically updated property. The built-in descriptors have been updated accordingly.

- `abc.abstractproperty` has been deprecated, use `property` with `abc.abstractmethod()` instead.
- `abc.abstractclassmethod` has been deprecated, use `classmethod` with `abc.abstractmethod()` instead.
- `abc.abstractstaticmethod` has been deprecated, use `staticmethod` with `abc.abstractmethod()` instead.

(Contributed by Darren Dale in [bpo-11610](https://bugs.python.org/issue?@action=redirect&bpo=11610) [https://bugs.python.org/issue?@action=redirect&bpo=11610].)

`abc.ABCMeta.register()` now returns the registered subclass, which means it can now be used as a class decorator ([bpo-10868](https://bugs.python.org/issue?@action=redirect&bpo=10868) [https://bugs.python.org/issue?@action=redirect&bpo=10868]).

### array

The `array` module supports the long long type using `q` and `Q` type codes.

(Contributed by Oren Tirosh and Hirokazu Yamamoto in [bpo-1172711](https://bugs.python.org/issue?@action=redirect&bpo=1172711) [https://bugs.python.org/issue?@action=redirect&bpo=1172711].)

## base64

ASCII-only Unicode strings are now accepted by the decoding functions of the [base64](#) modern interface. For example, `base64.b64decode('YWJj')` returns `b'abc'`. (Contributed by Catalin Iacob in [bpo-13641](https://bugs.python.org/issue?@action=redirect&bpo=13641) [https://bugs.python.org/issue?@action=redirect&bpo=13641].)

## binascii

In addition to the binary objects they normally accept, the `a2b_` functions now all also accept ASCII-only strings as input. (Contributed by Antoine Pitrou in [bpo-13637](https://bugs.python.org/issue?@action=redirect&bpo=13637) [https://bugs.python.org/issue?@action=redirect&bpo=13637].)

## bz2

The [bz2](#) module has been rewritten from scratch. In the process, several new features have been added:

- New [bz2.open\(\)](#) function: open a bzip2-compressed file in binary or text mode.
- [bz2.BZ2File](#) can now read from and write to arbitrary file-like objects, by means of its constructor's *fileobj* argument.

(Contributed by Nadeem Vawda in [bpo-5863](https://bugs.python.org/issue?@action=redirect&bpo=5863) [https://bugs.python.org/issue?@action=redirect&bpo=5863].)

- [bz2.BZ2File](#) and [bz2.decompress\(\)](#) can now decompress multi-stream inputs (such as those produced by the `pbzip2` tool). [bz2.BZ2File](#) can now also be used to create this type of file, using the `'a'` (append) mode.

(Contributed by Nir Aides in [bpo-1625](https://bugs.python.org/issue?@action=redirect&bpo=1625) [https://bugs.python.org/issue?@action=redirect&bpo=1625].)

- `bz2.BZ2File` now implements all of the `io.BufferedIOBase` API, except for the `detach()` and `truncate()` methods.

## codecs

The `mbcs` codec has been rewritten to handle correctly `replace` and `ignore` error handlers on all Windows versions. The `mbcs` codec now supports all error handlers, instead of only `replace` to encode and `ignore` to decode.

A new Windows-only codec has been added: `cp65001` ([bpo-13216](https://bugs.python.org/issue?@action=redirect&bpo=13216) [https://bugs.python.org/issue?@action=redirect&bpo=13216]). It is the Windows code page 65001 (Windows UTF-8, `CP_UTF8`). For example, it is used by `sys.stdout` if the console output code page is set to `cp65001` (e.g., using `chcp 65001` command).

Multibyte CJK decoders now resynchronize faster. They only ignore the first byte of an invalid byte sequence. For example, `b'\xff\n'.decode('gb2312', 'replace')` now returns a `\n` after the replacement character.

([bpo-12016](https://bugs.python.org/issue?@action=redirect&bpo=12016) [https://bugs.python.org/issue?@action=redirect&bpo=12016])

Incremental CJK codec encoders are no longer reset at each call to their `encode()` methods. For example:

```
>>> import codecs
>>> encoder = codecs.getincrementalencoder('hz')('strict')
>>> b''.join(encoder.encode(x) for x in '\u52ff\u65bd\u6b~{NpJ}l6HK!#~} Bye.')
```

This example gives `b'~{Np~}~{J}~}~{l6~}~{HK~}~{!#~} Bye.'` with older Python versions.

([bpo-12100](https://bugs.python.org/issue?@action=redirect&bpo=12100) [https://bugs.python.org/issue?@action=redirect&bpo=12100])

The `unicode_internal` codec has been deprecated.

## collections

Addition of a new **ChainMap** class to allow treating a number of mappings as a single unit. (Written by Raymond Hettinger for [bpo-11089](https://bugs.python.org/issue?@action=redirect&bpo=11089) [https://bugs.python.org/issue?@action=redirect&bpo=11089], made public in [bpo-11297](https://bugs.python.org/issue?@action=redirect&bpo=11297) [https://bugs.python.org/issue?@action=redirect&bpo=11297].)

The abstract base classes have been moved in a new **collections.abc** module, to better differentiate between the abstract and the concrete collections classes. Aliases for ABCs are still present in the **collections** module to preserve existing imports. ([bpo-11085](https://bugs.python.org/issue?@action=redirect&bpo=11085) [https://bugs.python.org/issue?@action=redirect&bpo=11085])

The **Counter** class now supports the unary `+` and `-` operators, as well as the in-place operators `+=`, `-=`, `|=`, and `&=`. (Contributed by Raymond Hettinger in [bpo-13121](https://bugs.python.org/issue?@action=redirect&bpo=13121) [https://bugs.python.org/issue?@action=redirect&bpo=13121].)

## contextlib

**ExitStack** now provides a solid foundation for programmatic manipulation of context managers and similar cleanup functionality. Unlike the previous `contextlib.nested` API (which was deprecated and removed), the new API is designed to work correctly regardless of whether context managers acquire their resources in their `__init__` method (for example, file objects) or in their `__enter__` method (for example, synchronisation objects from the **threading** module).

([bpo-13585](https://bugs.python.org/issue?@action=redirect&bpo=13585) [https://bugs.python.org/issue?@action=redirect&bpo=13585])

## crypt

Addition of salt and modular crypt format (hashing method) and the **mksalt()** function to the **crypt** module.

([bpo-10924](https://bugs.python.org/issue?@action=redirect&bpo=10924) [https://bugs.python.org/issue?@action=redirect&bpo=10924])

## curses

- If the `curses` module is linked to the `ncursesw` library, use Unicode functions when Unicode strings or characters are passed (e.g. `waddwstr()`), and bytes functions otherwise (e.g. `waddstr()`).
- Use the locale encoding instead of `utf-8` to encode Unicode strings.
- `curses.window` has a new `curses.window.encoding` attribute.
- The `curses.window` class has a new `get_wch()` method to get a wide character
- The `curses` module has a new `unget_wch()` function to push a wide character so the next `get_wch()` will return it

(Contributed by Iñigo Serna in [bpo-6755](https://bugs.python.org/issue?@action=redirect&bpo=6755) [https://bugs.python.org/issue?@action=redirect&bpo=6755].)

## datetime

- Equality comparisons between naive and aware `datetime` instances now return `False` instead of raising `TypeError` ([bpo-15006](https://bugs.python.org/issue?@action=redirect&bpo=15006) [https://bugs.python.org/issue?@action=redirect&bpo=15006]).
- New `datetime.datetime.timestamp()` method: Return POSIX timestamp corresponding to the `datetime` instance.
- The `datetime.datetime.strptime()` method supports formatting years older than 1000.
- The `datetime.datetime.astimezone()` method can now be called without arguments to convert datetime instance to the system timezone.

## decimal

[bpo-7652](https://bugs.python.org/issue?@action=redirect&bpo=7652) [https://bugs.python.org/issue?@action=redirect&bpo=7652] -

- In the context templates (`DefaultContext`, `BasicContext` and `ExtendedContext`) the magnitude of `Emax` and `Emin` has changed to `999999`.
- The `Decimal` constructor in `decimal.py` does not observe the context limits and converts values with arbitrary exponents or precision exactly. Since the C version has internal limits, the following scheme is used: If possible, values are converted exactly, otherwise `InvalidOperation` is raised and the result is NaN. In the latter case it is always possible to use `create_decimal()` in order to obtain a rounded or inexact value.
- The power function in `decimal.py` is always correctly rounded. In the C version, it is defined in terms of the correctly rounded `exp()` and `ln()` functions, but the final result is only “almost always correctly rounded”.
- In the C version, the context dictionary containing the signals is a `MutableMapping`. For speed reasons, `flags` and `traps` always refer to the same `MutableMapping` that the context was initialized with. If a new signal dictionary is assigned, `flags` and `traps` are updated with the new values, but they do not reference the RHS dictionary.
- Pickling a `Context` produces a different output in order to have a common interchange format for the Python and C versions.
- The order of arguments in the `Context` constructor has been changed to match the order displayed by `repr()`.
- The `watchexp` parameter in the `quantize()` method is deprecated.

**email**

## Policy Framework

The email package now has a **policy** framework. A **Policy** is an object with several methods and properties that control how the email package behaves. The primary policy for Python 3.3 is the **Compat32** policy, which provides backward compatibility with the email package in Python 3.2. A **policy** can be specified when an email message is parsed by a **parser**, or when a **Message** object is created, or when an email is serialized using a **generator**. Unless overridden, a policy passed to a **parser** is inherited by all the **Message** object and sub-objects created by the **parser**. By default a **generator** will use the policy of the **Message** object it is serializing. The default policy is **compat32**.

The minimum set of controls implemented by all **policy** objects are:

---

~~The maximum~~ **linelength**, excluding the **linesep** character(s), individual lines may have when a **Message** is serialized. Defaults to 78.

---

~~These~~ **character** used to separate individual lines when a **Message** is serialized. Defaults to `\n`.

---

~~Of type~~ **8bit**. **8bit** applies only to a **Bytes** generator, and means that non-ASCII may be used where allowed by the protocol (or where it exists in the original input).

---

~~Raises an~~ **error** to raise error when defects are encountered instead of adding them to the **Message** object's **defects** list.

---

A new policy instance, with new settings, is created using the **clone()** method of policy objects. **clone** takes any of the above controls as keyword arguments. Any control not specified in the call retains its default value. Thus you can create a policy that uses `\r\n` **linesep** characters like this:

```
mypolicy = compat32.clone(linesep='\r\n')
```

Policies can be used to make the generation of messages in the format needed by your application simpler. Instead of having to remember to specify `linesep='\r\n'` in all the places you call a **generator**, you can specify it once, when you set the policy used by the **parser** or the **Message**, whichever your program uses to

create `Message` objects. On the other hand, if you need to generate messages in multiple forms, you can still specify the parameters in the appropriate `generator` call. Or you can have custom policy instances for your different cases, and pass those in when you create the `generator`.

## Provisional Policy with New Header API

While the policy framework is worthwhile all by itself, the main motivation for introducing it is to allow the creation of new policies that implement new features for the email package in a way that maintains backward compatibility for those who do not use the new policies. Because the new policies introduce a new API, we are releasing them in Python 3.3 as a [provisional policy](#). Backwards incompatible changes (up to and including removal of the code) may occur if deemed necessary by the core developers.

The new policies are instances of [EmailPolicy](#), and add the following additional controls:

---

~~Control whether or not headers parsed by a~~  
[parser](#) are refolded by the [generator](#). It can be `none`, `long`, or `all`. The default is `long`, which means that source headers with a line longer than `max_line_length` get refolded. `none` means no line get refolded, and `all` means that all lines get refolded.

---

~~Header factory~~  
A [header factory](#) take a `name` and `value` and produces a custom header object.

---

The `header_factory` is the key to the new features provided by the new policies. When one of the new policies is used, any header retrieved from a `Message` object is an object produced by the `header_factory`, and any time you set a header on a `Message` it becomes an object produced by `header_factory`. All such header objects have a `name` attribute equal to the header name. Address and Date headers have additional attributes that give you access to the parsed data of the header. This means you can now do things like this:

```

>>> m = Message(policy=SMTP)
>>> m['To'] = 'Éric <foo@example.com>'
>>> m['to']
'Éric <foo@example.com>'
>>> m['to'].addresses
(Address(display_name='Éric', username='foo', domain='example.com'))
>>> m['to'].addresses[0].username
'foo'
>>> m['to'].addresses[0].display_name
'Éric'
>>> m['Date'] = email.utils.localtime()
>>> m['Date'].datetime
datetime.datetime(2012, 5, 25, 21, 39, 24, 465484, tzinfo=tzinfo.local)
>>> m['Date']
'Fri, 25 May 2012 21:44:27 -0400'
>>> print(m)
To: =?utf-8?q?=C3=89ric?= <foo@example.com>
Date: Fri, 25 May 2012 21:44:27 -0400

```

You will note that the unicode display name is automatically encoded as `utf-8` when the message is serialized, but that when the header is accessed directly, you get the unicode version. This eliminates any need to deal with the `email.header.decode_header()` or `make_header()` functions.

You can also create addresses from parts:

```

>>> m['cc'] = [Group('pals', [Address('Bob', 'bob', 'example.com'),
...                               Address('Sally', 'sally', 'example.com'),
...                               Address('Bonzo', 'bonzo', 'example.com')])
>>> print(m)
To: =?utf-8?q?=C3=89ric?= <foo@example.com>
Date: Fri, 25 May 2012 21:44:27 -0400
cc: pals: Bob <bob@example.com>, Sally <sally@example.com>, Bonzo <bonzo@example.com>

```

Decoding to unicode is done automatically:

```

>>> m2 = message_from_string(str(m))
>>> m2['to']
'Éric <foo@example.com>'

```

When you parse a message, you can use the `addresses` and `groups` attributes of the header objects to access the groups and individual addresses:

```
>>> m2['cc'].addresses
(Address(display_name='Bob', username='bob', domain='example.com'))
>>> m2['cc'].groups
(Group(display_name='pals', addresses=(Address(display_name='Bob', username='bob', domain='example.com'))))
```

In summary, if you use one of the new policies, header manipulation works the way it ought to: your application works with unicode strings, and the email package transparently encodes and decodes the unicode to and from the RFC standard Content Transfer Encodings.

## Other API Changes

New [BytesHeaderParser](#), added to the [parser](#) module to complement [HeaderParser](#) and complete the Bytes API.

New utility functions:

- [format\\_datetime\(\)](#): given a [datetime](#), produce a string formatted for use in an email header.
- [parsedate\\_to\\_datetime\(\)](#): given a date string from an email header, convert it into an aware [datetime](#), or a naive [datetime](#) if the offset is `-0000`.
- [localtime\(\)](#): With no argument, returns the current local time as an aware [datetime](#) using the local [timezone](#). Given an aware [datetime](#), converts it into an aware [datetime](#) using the local [timezone](#).

## ftplib

- [ftplib.FTP](#) now accepts a `source_address` keyword argument to specify the (host, port) to use as the source

address in the bind call when creating the outgoing socket.

(Contributed by Giampaolo Rodolà in [bpo-8594](https://bugs.python.org/issue?@action=redirect&bpo=8594) [https://bugs.python.org/issue?@action=redirect&bpo=8594].)

- The `FTP_TLS` class now provides a new `ccc()` function to revert control channel back to plaintext. This can be useful to take advantage of firewalls that know how to handle NAT with non-secure FTP without opening fixed ports.

(Contributed by Giampaolo Rodolà in [bpo-12139](https://bugs.python.org/issue?@action=redirect&bpo=12139) [https://bugs.python.org/issue?@action=redirect&bpo=12139].)

- Added `ftplib.FTP.mlsd()` method which provides a parsable directory listing format and deprecates `ftplib.FTP.nlst()` and `ftplib.FTP.dir()`.

(Contributed by Giampaolo Rodolà in [bpo-11072](https://bugs.python.org/issue?@action=redirect&bpo=11072) [https://bugs.python.org/issue?@action=redirect&bpo=11072].)

## functools

The `functools.lru_cache()` decorator now accepts a `typed` keyword argument (that defaults to `False` to ensure that it caches values of different types that compare equal in separate cache slots.

(Contributed by Raymond Hettinger in [bpo-13227](https://bugs.python.org/issue?@action=redirect&bpo=13227) [https://bugs.python.org/issue?@action=redirect&bpo=13227].)

## gc

It is now possible to register callbacks invoked by the garbage collector before and after collection using the new `callbacks` list.

## hmac

A new `compare_digest()` function has been added to prevent side channel attacks on digests through timing analysis.

(Contributed by Nick Coghlan and Christian Heimes in [bpo-15061](https://bugs.python.org/issue?@action=redirect&bpo=15061) [https://bugs.python.org/issue?@action=redirect&bpo=15061].)

## http

`http.server.BaseHTTPRequestHandler` now buffers the headers and writes them all at once when `end_headers()` is

called. A new method `flush_headers()` can be used to directly manage when the accumulated headers are sent. (Contributed by Andrew Schaaf in [bpo-3709](https://bugs.python.org/issue?@action=redirect&bpo=3709) [https://bugs.python.org/issue?@action=redirect&bpo=3709].)

`http.server` now produces valid `HTML 4.01 strict` output. (Contributed by Ezio Melotti in [bpo-13295](https://bugs.python.org/issue?@action=redirect&bpo=13295) [https://bugs.python.org/issue?@action=redirect&bpo=13295].)

`http.client.HTTPResponse` now has a `readinto()` method, which means it can be used as an `io.RawIOBase` class. (Contributed by John Kuhn in [bpo-13464](https://bugs.python.org/issue?@action=redirect&bpo=13464) [https://bugs.python.org/issue?@action=redirect&bpo=13464].)

## html

`html.parser.HTMLParser` is now able to parse broken markup without raising errors, therefore the `strict` argument of the constructor and the `HTMLParseError` exception are now deprecated. The ability to parse broken markup is the result of a number of bug fixes that are also available on the latest bug fix releases of Python 2.7/3.2. (Contributed by Ezio Melotti in [bpo-15114](https://bugs.python.org/issue?@action=redirect&bpo=15114) [https://bugs.python.org/issue?@action=redirect&bpo=15114], and [bpo-14538](https://bugs.python.org/issue?@action=redirect&bpo=14538) [https://bugs.python.org/issue?@action=redirect&bpo=14538], [bpo-13993](https://bugs.python.org/issue?@action=redirect&bpo=13993) [https://bugs.python.org/issue?@action=redirect&bpo=13993], [bpo-13960](https://bugs.python.org/issue?@action=redirect&bpo=13960) [https://bugs.python.org/issue?@action=redirect&bpo=13960], [bpo-13358](https://bugs.python.org/issue?@action=redirect&bpo=13358) [https://bugs.python.org/issue?@action=redirect&bpo=13358], [bpo-1745761](https://bugs.python.org/issue?@action=redirect&bpo=1745761) [https://bugs.python.org/issue?@action=redirect&bpo=1745761], [bpo-755670](https://bugs.python.org/issue?@action=redirect&bpo=755670) [https://bugs.python.org/issue?@action=redirect&bpo=755670], [bpo-13357](https://bugs.python.org/issue?@action=redirect&bpo=13357) [https://bugs.python.org/issue?@action=redirect&bpo=13357], [bpo-12629](https://bugs.python.org/issue?@action=redirect&bpo=12629) [https://bugs.python.org/issue?@action=redirect&bpo=12629], [bpo-1200313](https://bugs.python.org/issue?@action=redirect&bpo=1200313) [https://bugs.python.org/issue?@action=redirect&bpo=1200313], [bpo-670664](https://bugs.python.org/issue?@action=redirect&bpo=670664) [https://bugs.python.org/issue?@action=redirect&bpo=670664], [bpo-13273](https://bugs.python.org/issue?@action=redirect&bpo=13273) [https://bugs.python.org/issue?@action=redirect&bpo=13273], [bpo-12888](https://bugs.python.org/issue?@action=redirect&bpo=12888) [https://bugs.python.org/issue?@action=redirect&bpo=12888], [bpo-7311](https://bugs.python.org/issue?@action=redirect&bpo=7311) [https://bugs.python.org/issue?@action=redirect&bpo=7311].)

A new `html5` dictionary that maps HTML5 named character references to the equivalent Unicode character(s) (e.g.

`html5['gt;'] == '>')` has been added to the [html.entities](#) module. The dictionary is now also used by [HTMLParser](#).  
(Contributed by Ezio Melotti in [bpo-11113](#) [<https://bugs.python.org/issue?@action=redirect&bpo=11113>] and [bpo-15156](#) [<https://bugs.python.org/issue?@action=redirect&bpo=15156>].)

## imaplib

The [IMAP4\\_SSL](#) constructor now accepts an `SSLContext` parameter to control parameters of the secure channel.

(Contributed by Sijin Joseph in [bpo-8808](#) [<https://bugs.python.org/issue?@action=redirect&bpo=8808>].)

## inspect

A new [getclosurevars\(\)](#) function has been added. This function reports the current binding of all names referenced from the function body and where those names were resolved, making it easier to verify correct internal state when testing code that relies on stateful closures.

(Contributed by Meador Inge and Nick Coghlan in [bpo-13062](#) [<https://bugs.python.org/issue?@action=redirect&bpo=13062>].)

A new [getgeneratorlocals\(\)](#) function has been added. This function reports the current binding of local variables in the generator's stack frame, making it easier to verify correct internal state when testing generators.

(Contributed by Meador Inge in [bpo-15153](#) [<https://bugs.python.org/issue?@action=redirect&bpo=15153>].)

## io

The [open\(\)](#) function has a new `'x'` mode that can be used to exclusively create a new file, and raise a [FileExistsError](#) if the file already exists. It is based on the C11 `'x'` mode to `fopen()`.

(Contributed by David Townshend in [bpo-12760](#) [<https://>]

[bugs.python.org/issue?@action=redirect&bpo=12760](https://bugs.python.org/issue?@action=redirect&bpo=12760)].)

The constructor of the `TextIOWrapper` class has a new `write_through` optional argument. If `write_through` is `True`, calls to `write()` are guaranteed not to be buffered: any data written on the `TextIOWrapper` object is immediately handled to its underlying binary buffer.

## itertools

`accumulate()` now takes an optional `func` argument for providing a user-supplied binary function.

## logging

The `basicConfig()` function now supports an optional `handlers` argument taking an iterable of handlers to be added to the root logger.

A class level attribute `append_nul` has been added to `SysLogHandler` to allow control of the appending of the `NUL` (`\000`) byte to syslog records, since for some daemons it is required while for others it is passed through to the log.

## math

The `math` module has a new function, `log2()`, which returns the base-2 logarithm of `x`.

(Written by Mark Dickinson in [bpo-11888](https://bugs.python.org/issue?@action=redirect&bpo=11888) [<https://bugs.python.org/issue?@action=redirect&bpo=11888>].)

## mmap

The `read()` method is now more compatible with other file-like objects: if the argument is omitted or specified as `None`, it returns the bytes from the current file position to the end of the mapping. (Contributed by Petri Lehtinen in [bpo-12021](https://bugs.python.org/issue?@action=redirect&bpo=12021) [<https://bugs.python.org/issue?@action=redirect&bpo=12021>].)

## multiprocessing

The new `multiprocessing.connection.wait()` function allows polling multiple objects (such as connections, sockets and pipes) with a timeout. (Contributed by Richard Oudkerk in [bpo-12328](https://bugs.python.org/issue/?@action=redirect&bpo=12328) [https://bugs.python.org/issue/?@action=redirect&bpo=12328].)

`multiprocessing.Connection` objects can now be transferred over multiprocessing connections. (Contributed by Richard Oudkerk in [bpo-4892](https://bugs.python.org/issue/?@action=redirect&bpo=4892) [https://bugs.python.org/issue/?@action=redirect&bpo=4892].)

`multiprocessing.Process` now accepts a `daemon` keyword argument to override the default behavior of inheriting the `daemon` flag from the parent process ([bpo-6064](https://bugs.python.org/issue/?@action=redirect&bpo=6064) [https://bugs.python.org/issue/?@action=redirect&bpo=6064]).

New attribute `multiprocessing.Process.sentinel` allows a program to wait on multiple `Process` objects at one time using the appropriate OS primitives (for example, `select` on posix systems).

New methods `multiprocessing.pool.Pool.starmap()` and `starmap_async()` provide `itertools.starmap()` equivalents to the existing `multiprocessing.pool.Pool.map()` and `map_async()` functions. (Contributed by Hynek Schlawack in [bpo-12708](https://bugs.python.org/issue/?@action=redirect&bpo=12708) [https://bugs.python.org/issue/?@action=redirect&bpo=12708].)

## nntplib

The `nntplib.NNTP` class now supports the context management protocol to unconditionally consume `socket.error` exceptions and to close the NNTP connection when done:

```
>>> from nntplib import NNTP
>>> with NNTP('news.gmane.org') as n:
...     n.group('gmane.comp.python.committers')
...
('211 1755 1 1755 gmane.comp.python.committers', 1755, 1)
>>>
```

(Contributed by Giampaolo Rodolà in [bpo-9795](https://bugs.python.org/issue?@action=redirect&bpo=9795) [https://bugs.python.org/issue?@action=redirect&bpo=9795].)

## os

- The `os` module has a new `pipe2()` function that makes it possible to create a pipe with `O_CLOEXEC` or `O_NONBLOCK` flags set atomically. This is especially useful to avoid race conditions in multi-threaded programs.
- The `os` module has a new `sendfile()` function which provides an efficient “zero-copy” way for copying data from one file (or socket) descriptor to another. The phrase “zero-copy” refers to the fact that all of the copying of data between the two descriptors is done entirely by the kernel, with no copying of data into userspace buffers. `sendfile()` can be used to efficiently copy data from a file on disk to a network socket, e.g. for downloading a file.

(Patch submitted by Ross Lagerwall and Giampaolo Rodolà in [bpo-10882](https://bugs.python.org/issue?@action=redirect&bpo=10882) [https://bugs.python.org/issue?@action=redirect&bpo=10882].)

- To avoid race conditions like symlink attacks and issues with temporary files and directories, it is more reliable (and also faster) to manipulate file descriptors instead of file names. Python 3.3 enhances existing functions and introduces new functions to work on file descriptors ([bpo-4761](https://bugs.python.org/issue?@action=redirect&bpo=4761) [https://bugs.python.org/issue?@action=redirect&bpo=4761], [bpo-10755](https://bugs.python.org/issue?@action=redirect&bpo=10755) [https://bugs.python.org/issue?@action=redirect&bpo=10755] and [bpo-14626](https://bugs.python.org/issue?@action=redirect&bpo=14626) [https://bugs.python.org/issue?@action=redirect&bpo=14626]).
  - The `os` module has a new `fwalk()` function similar to `walk()` except that it also yields file descriptors referring to the directories visited. This is especially useful to avoid symlink races.
  - The following functions get new optional `dirfd` ([paths relative to directory descriptors](#)) and/or `follow_symlinks` (not following symlinks): `access()`, `chflags()`, `chmod()`, `chown()`, `link()`, `lstat()`, `makedirs()`,

`mkfifo()`, `mknod()`, `open()`, `readlink()`,  
`remove()`, `rename()`, `replace()`, `rmdir()`,  
`stat()`, `symlink()`, `unlink()`, `utime()`.

Platform support for using these parameters can be checked via the sets `os.supports_dir_fd` and `os.supports_follows_symlinks`.

- The following functions now support a file descriptor for their path argument: `chdir()`, `chmod()`, `chown()`, `execve()`, `listdir()`, `pathconf()`, `exists()`, `stat()`, `statvfs()`, `utime()`.

Platform support for this can be checked via the `os.supports_fd` set.

- `access()` accepts an `effective_ids` keyword argument to turn on using the effective uid/gid rather than the real uid/gid in the access check. Platform support for this can be checked via the `supports_effective_ids` set.
- The `os` module has two new functions: `getpriority()` and `setpriority()`. They can be used to get or set process niceness/priority in a fashion similar to `os.nice()` but extended to all processes instead of just the current one.

(Patch submitted by Giampaolo Rodolà in [bpo-10784](https://bugs.python.org/issue?@action=redirect&bpo=10784) [https://bugs.python.org/issue?@action=redirect&bpo=10784].)

- The new `os.replace()` function allows cross-platform renaming of a file with overwriting the destination. With `os.rename()`, an existing destination file is overwritten under POSIX, but raises an error under Windows.

(Contributed by Antoine Pitrou in [bpo-8828](https://bugs.python.org/issue?@action=redirect&bpo=8828) [https://bugs.python.org/issue?@action=redirect&bpo=8828].)

- The stat family of functions (`stat()`, `fstat()`, and `lstat()`) now support reading a file's timestamps with nanosecond precision. Symmetrically, `utime()` can now write file timestamps with nanosecond precision.

(Contributed by Larry Hastings in [bpo-14127](https://bugs.python.org/issue?@action=redirect&bpo=14127) [https://bugs.python.org/issue?@action=redirect&bpo=14127].)

- The new `os.get_terminal_size()` function queries the

size of the terminal attached to a file descriptor. See also `shutil.get_terminal_size()`. (Contributed by Zbigniew Jędrzejewski-Szmek in [bpo-13609](https://bugs.python.org/issue?@action=redirect&bpo=13609) [https://bugs.python.org/issue?@action=redirect&bpo=13609].)

- New functions to support Linux extended attributes ([bpo-12720](https://bugs.python.org/issue?@action=redirect&bpo=12720) [https://bugs.python.org/issue?@action=redirect&bpo=12720]): `getxattr()`, `listxattr()`, `removexattr()`, `setxattr()`.
- New interface to the scheduler. These functions control how a process is allocated CPU time by the operating system. New functions: `sched_get_priority_max()`, `sched_get_priority_min()`, `sched_getaffinity()`, `sched_getparam()`, `sched_getscheduler()`, `sched_rr_get_interval()`, `sched_setaffinity()`, `sched_setparam()`, `sched_setscheduler()`, `sched_yield()`,
- New functions to control the file system:
  - `posix_fadvise()`: Announces an intention to access data in a specific pattern thus allowing the kernel to make optimizations.
  - `posix_fallocate()`: Ensures that enough disk space is allocated for a file.
  - `sync()`: Force write of everything to disk.
- Additional new posix functions:
  - `lockf()`: Apply, test or remove a POSIX lock on an open file descriptor.
  - `pread()`: Read from a file descriptor at an offset, the file offset remains unchanged.
  - `pwrite()`: Write to a file descriptor from an offset, leaving the file offset unchanged.
  - `readv()`: Read from a file descriptor into a number of writable buffers.
  - `truncate()`: Truncate the file corresponding to *path*, so that it is at most *length* bytes in size.
  - `waitid()`: Wait for the completion of one or more child processes.
  - `writew()`: Write the contents of *buffers* to a file descriptor, where *buffers* is an arbitrary sequence of buffers.

- `getgrouplist()` ([bpo-9344](https://bugs.python.org/issue?@action=redirect&bpo=9344) [https://bugs.python.org/issue?@action=redirect&bpo=9344]): Return list of group ids that specified user belongs to.
- `times()` and `uname()`: Return type changed from a tuple to a tuple-like object with named attributes.
- Some platforms now support additional constants for the `lseek()` function, such as `os.SEEK_HOLE` and `os.SEEK_DATA`.
- New constants `RTLD_LAZY`, `RTLD_NOW`, `RTLD_GLOBAL`, `RTLD_LOCAL`, `RTLD_NODELETE`, `RTLD_NOLOAD`, and `RTLD_DEEPBIND` are available on platforms that support them. These are for use with the `sys.setdlopenflags()` function, and supersede the similar constants defined in `ctypes` and `DLFCN`. (Contributed by Victor Stinner in [bpo-13226](https://bugs.python.org/issue?@action=redirect&bpo=13226) [https://bugs.python.org/issue?@action=redirect&bpo=13226].)
- `os.symlink()` now accepts (and ignores) the `target_is_directory` keyword argument on non-Windows platforms, to ease cross-platform support.

## pdb

Tab-completion is now available not only for command names, but also their arguments. For example, for the `break` command, function and file names are completed.

(Contributed by Georg Brandl in [bpo-14210](https://bugs.python.org/issue?@action=redirect&bpo=14210) [https://bugs.python.org/issue?@action=redirect&bpo=14210])

## pickle

`pickle.Pickler` objects now have an optional `dispatch_table` attribute allowing per-pickler reduction functions to be set.

(Contributed by Richard Oudkerk in [bpo-14166](https://bugs.python.org/issue?@action=redirect&bpo=14166) [https://bugs.python.org/issue?@action=redirect&bpo=14166].)

## pydoc

The Tk GUI and the `serve()` function have been removed from the `pydoc` module: `pydoc -g` and `serve()` have been deprecated in Python 3.2.

## re

`str` regular expressions now support `\u` and `\U` escapes.

(Contributed by Serhiy Storchaka in [bpo-3665](https://bugs.python.org/issue?@action=redirect&bpo=3665) [https://bugs.python.org/issue?@action=redirect&bpo=3665].)

## sched

- `run()` now accepts a *blocking* parameter which when set to false makes the method execute the scheduled events due to expire soonest (if any) and then return immediately. This is useful in case you want to use the `scheduler` in non-blocking applications. (Contributed by Giampaolo Rodolà in [bpo-13449](https://bugs.python.org/issue?@action=redirect&bpo=13449) [https://bugs.python.org/issue?@action=redirect&bpo=13449].)
- `scheduler` class can now be safely used in multi-threaded environments. (Contributed by Josiah Carlson and Giampaolo Rodolà in [bpo-8684](https://bugs.python.org/issue?@action=redirect&bpo=8684) [https://bugs.python.org/issue?@action=redirect&bpo=8684].)
- *timefunc* and *delayfunc* parameters of `scheduler` class constructor are now optional and defaults to `time.time()` and `time.sleep()` respectively. (Contributed by Chris Clark in [bpo-13245](https://bugs.python.org/issue?@action=redirect&bpo=13245) [https://bugs.python.org/issue?@action=redirect&bpo=13245].)
- `enter()` and `enterabs()` *argument* parameter is now optional. (Contributed by Chris Clark in [bpo-13245](https://bugs.python.org/issue?@action=redirect&bpo=13245) [https://bugs.python.org/issue?@action=redirect&bpo=13245].)
- `enter()` and `enterabs()` now accept a *kwargs* parameter. (Contributed by Chris Clark in [bpo-13245](https://bugs.python.org/issue?@action=redirect&bpo=13245) [https://bugs.python.org/issue?@action=redirect&bpo=13245].)

## select

Solaris and derivative platforms have a new class `select.devpoll` for high performance asynchronous sockets via

/dev/poll. (Contributed by Jesús Cea Avi3n in [bpo-6397](https://bugs.python.org/issue?@action=redirect&bpo=6397) [https://bugs.python.org/issue?@action=redirect&bpo=6397].)

## shlex

The previously undocumented helper function `quote` from the `pipes` module has been moved to the `shlex` module and documented. `quote()` properly escapes all characters in a string that might be otherwise given special meaning by the shell.

## shutil

- New functions:
  - `disk_usage()`: provides total, used and free disk space statistics. (Contributed by Giampaolo Rodol3 in [bpo-12442](https://bugs.python.org/issue?@action=redirect&bpo=12442) [https://bugs.python.org/issue?@action=redirect&bpo=12442].)
  - `chown()`: allows one to change user and/or group of the given path also specifying the user/group names and not only their numeric ids. (Contributed by Sandro Tosi in [bpo-12191](https://bugs.python.org/issue?@action=redirect&bpo=12191) [https://bugs.python.org/issue?@action=redirect&bpo=12191].)
  - `shutil.get_terminal_size()`: returns the size of the terminal window to which the interpreter is attached. (Contributed by Zbigniew J3drzejewski-Szmek in [bpo-13609](https://bugs.python.org/issue?@action=redirect&bpo=13609) [https://bugs.python.org/issue?@action=redirect&bpo=13609].)
- `copy2()` and `copystat()` now preserve file timestamps with nanosecond precision on platforms that support it. They also preserve file “extended attributes” on Linux. (Contributed by Larry Hastings in [bpo-14127](https://bugs.python.org/issue?@action=redirect&bpo=14127) [https://bugs.python.org/issue?@action=redirect&bpo=14127] and [bpo-15238](https://bugs.python.org/issue?@action=redirect&bpo=15238) [https://bugs.python.org/issue?@action=redirect&bpo=15238].)
- Several functions now take an optional `symlinks` argument: when that parameter is true, symlinks aren’t dereferenced and the operation instead acts on the symlink itself (or creates one, if relevant). (Contributed by Hynek Schlawack in [bpo-12715](https://bugs.python.org/issue?@action=redirect&bpo=12715) [https://bugs.python.org/issue?@action=redirect&bpo=12715].)
- When copying files to a different file system, `move()` now

handles symlinks the way the `posix mv` command does, recreating the symlink rather than copying the target file contents. (Contributed by Jonathan Niehof in [bpo-9993](https://bugs.python.org/issue?@action=redirect&bpo=9993) [https://bugs.python.org/issue?@action=redirect&bpo=9993].) `move()` now also returns the `dst` argument as its result.

- `rmtree()` is now resistant to symlink attacks on platforms which support the new `dir_fd` parameter in `os.open()` and `os.unlink()`. (Contributed by Martin von Löwis and Hynek Schlawack in [bpo-4489](https://bugs.python.org/issue?@action=redirect&bpo=4489) [https://bugs.python.org/issue?@action=redirect&bpo=4489].)

## signal

- The `signal` module has new functions:
  - `pthread_sigmask()`: fetch and/or change the signal mask of the calling thread (Contributed by Jean-Paul Calderone in [bpo-8407](https://bugs.python.org/issue?@action=redirect&bpo=8407) [https://bugs.python.org/issue?@action=redirect&bpo=8407]);
  - `pthread_kill()`: send a signal to a thread;
  - `sigpending()`: examine pending functions;
  - `sigwait()`: wait a signal;
  - `sigwaitinfo()`: wait for a signal, returning detailed information about it;
  - `sigtimedwait()`: like `sigwaitinfo()` but with a timeout.
- The signal handler writes the signal number as a single byte instead of a nul byte into the wakeup file descriptor. So it is possible to wait more than one signal and know which signals were raised.
- `signal.signal()` and `signal.siginterrupt()` raise an `OSError`, instead of a `RuntimeError`: `OSError` has an `errno` attribute.

## smtpd

The `smtpd` module now supports [RFC 5321](https://datatracker.ietf.org/doc/html/rfc5321) [https://datatracker.ietf.org/doc/html/rfc5321] (extended SMTP) and [RFC 1870](https://datatracker.ietf.org/doc/html/rfc1870) [https://datatracker.ietf.org/doc/html/rfc1870] (size extension). Per the standard, these extensions are enabled if and only if the client initiates the session with an `EHLO` command.

(Initial `ELHO` support by Alberto Trevino. Size extension by Juhana Jauhiainen. Substantial additional work on the patch contributed by Michele Orrù and Dan Boswell. [bpo-8739](https://bugs.python.org/issue?@action=redirect&bpo=8739) [https://bugs.python.org/issue?@action=redirect&bpo=8739])

## smtpplib

The `SMTP`, `SMTP_SSL`, and `LMTP` classes now accept a `source_address` keyword argument to specify the `(host, port)` to use as the source address in the `bind` call when creating the outgoing socket. (Contributed by Paulo Scardine in [bpo-11281](https://bugs.python.org/issue?@action=redirect&bpo=11281) [https://bugs.python.org/issue?@action=redirect&bpo=11281].)

`SMTP` now supports the context management protocol, allowing an `SMTP` instance to be used in a `with` statement. (Contributed by Giampaolo Rodolà in [bpo-11289](https://bugs.python.org/issue?@action=redirect&bpo=11289) [https://bugs.python.org/issue?@action=redirect&bpo=11289].)

The `SMTP_SSL` constructor and the `starttls()` method now accept an `SSLContext` parameter to control parameters of the secure channel. (Contributed by Kasun Herath in [bpo-8809](https://bugs.python.org/issue?@action=redirect&bpo=8809) [https://bugs.python.org/issue?@action=redirect&bpo=8809].)

## socket

- The `socket` class now exposes additional methods to process ancillary data when supported by the underlying platform:

- `sendmsg()`
- `recvmsg()`
- `recvmsg_into()`

(Contributed by David Watson in [bpo-6560](https://bugs.python.org/issue?@action=redirect&bpo=6560) [https://bugs.python.org/issue?@action=redirect&bpo=6560], based on an earlier patch by Heiko Wundram)

- The `socket` class now supports the `PF_CAN` protocol family (<https://en.wikipedia.org/wiki/Socketcan>), on Linux (<https://lwn.net/Articles/253425>).

(Contributed by Matthias Fuchs, updated by Tiago Gonçalves in [bpo-10141](https://bugs.python.org/issue?@action=redirect&bpo=10141) [https://bugs.python.org/issue?@action=redirect&bpo=10141].)

- The `socket` class now supports the PF\_RDS protocol family ([https://en.wikipedia.org/wiki/Reliable\\_Datagram\\_Sockets](https://en.wikipedia.org/wiki/Reliable_Datagram_Sockets) and <https://oss.oracle.com/projects/rds> [https://web.archive.org/web/20130115155505/https://oss.oracle.com/projects/rds/]).
- The `socket` class now supports the PF\_SYSTEM protocol family on OS X. (Contributed by Michael Goderbauer in [bpo-13777](https://bugs.python.org/issue?@action=redirect&bpo=13777) [https://bugs.python.org/issue?@action=redirect&bpo=13777].)
- New function `sethostname()` allows the hostname to be set on Unix systems if the calling process has sufficient privileges. (Contributed by Ross Lagerwall in [bpo-10866](https://bugs.python.org/issue?@action=redirect&bpo=10866) [https://bugs.python.org/issue?@action=redirect&bpo=10866].)

## socketserver

`BaseServer` now has an overridable method `service_actions()` that is called by the `serve_forever()` method in the service loop. `ForkingMixIn` now uses this to clean up zombie child processes. (Contributed by Justin Warkentin in [bpo-11109](https://bugs.python.org/issue?@action=redirect&bpo=11109) [https://bugs.python.org/issue?@action=redirect&bpo=11109].)

## sqlite3

New `sqlite3.Connection` method `set_trace_callback()` can be used to capture a trace of all sql commands processed by sqlite. (Contributed by Torsten Landschoff in [bpo-11688](https://bugs.python.org/issue?@action=redirect&bpo=11688) [https://bugs.python.org/issue?@action=redirect&bpo=11688].)

## ssl

- The `ssl` module has two new random generation functions:
  - `RAND_bytes()`: generate cryptographically strong pseudo-random bytes.

- `RAND_pseudo_bytes()`: generate pseudo-random bytes.

(Contributed by Victor Stinner in [bpo-12049](https://bugs.python.org/issue?@action=redirect&bpo=12049) [https://bugs.python.org/issue?@action=redirect&bpo=12049].)

- The `ssl` module now exposes a finer-grained exception hierarchy in order to make it easier to inspect the various kinds of errors. (Contributed by Antoine Pitrou in [bpo-11183](https://bugs.python.org/issue?@action=redirect&bpo=11183) [https://bugs.python.org/issue?@action=redirect&bpo=11183].)
- `load_cert_chain()` now accepts a *password* argument to be used if the private key is encrypted. (Contributed by Adam Simpkins in [bpo-12803](https://bugs.python.org/issue?@action=redirect&bpo=12803) [https://bugs.python.org/issue?@action=redirect&bpo=12803].)
- Diffie-Hellman key exchange, both regular and Elliptic Curve-based, is now supported through the `load_dh_params()` and `set_ecdh_curve()` methods. (Contributed by Antoine Pitrou in [bpo-13626](https://bugs.python.org/issue?@action=redirect&bpo=13626) [https://bugs.python.org/issue?@action=redirect&bpo=13626] and [bpo-13627](https://bugs.python.org/issue?@action=redirect&bpo=13627) [https://bugs.python.org/issue?@action=redirect&bpo=13627].)
- SSL sockets have a new `get_channel_binding()` method allowing the implementation of certain authentication mechanisms such as SCRAM-SHA-1-PLUS. (Contributed by Jacek Konieczny in [bpo-12551](https://bugs.python.org/issue?@action=redirect&bpo=12551) [https://bugs.python.org/issue?@action=redirect&bpo=12551].)
- You can query the SSL compression algorithm used by an SSL socket, thanks to its new `compression()` method. The new attribute `OP_NO_COMPRESSION` can be used to disable compression. (Contributed by Antoine Pitrou in [bpo-13634](https://bugs.python.org/issue?@action=redirect&bpo=13634) [https://bugs.python.org/issue?@action=redirect&bpo=13634].)
- Support has been added for the Next Protocol Negotiation extension using the `ssl.SSLContext.set_npn_protocols()` method. (Contributed by Colin Marc in [bpo-14204](https://bugs.python.org/issue?@action=redirect&bpo=14204) [https://bugs.python.org/issue?@action=redirect&bpo=14204].)

- SSL errors can now be introspected more easily thanks to **library** and **reason** attributes. (Contributed by Antoine Pitrou in [bpo-14837](https://bugs.python.org/issue?@action=redirect&bpo=14837) [https://bugs.python.org/issue?@action=redirect&bpo=14837].)
- The **get\_server\_certificate()** function now supports IPv6. (Contributed by Charles-François Natali in [bpo-11811](https://bugs.python.org/issue?@action=redirect&bpo=11811) [https://bugs.python.org/issue?@action=redirect&bpo=11811].)
- New attribute **OP\_CIPHER\_SERVER\_PREFERENCE** allows setting SSLv3 server sockets to use the server's cipher ordering preference rather than the client's ([bpo-13635](https://bugs.python.org/issue?@action=redirect&bpo=13635) [https://bugs.python.org/issue?@action=redirect&bpo=13635]).

## stat

The undocumented `tarfile.filemode` function has been moved to **stat.filemode()**. It can be used to convert a file's mode to a string of the form `'-rwxrwxrwx'`.

(Contributed by Giampaolo Rodolà in [bpo-14807](https://bugs.python.org/issue?@action=redirect&bpo=14807) [https://bugs.python.org/issue?@action=redirect&bpo=14807].)

## struct

The **struct** module now supports `ssize_t` and `size_t` via the new codes `n` and `N`, respectively. (Contributed by Antoine Pitrou in [bpo-3163](https://bugs.python.org/issue?@action=redirect&bpo=3163) [https://bugs.python.org/issue?@action=redirect&bpo=3163].)

## subprocess

Command strings can now be bytes objects on posix platforms. (Contributed by Victor Stinner in [bpo-8513](https://bugs.python.org/issue?@action=redirect&bpo=8513) [https://bugs.python.org/issue?@action=redirect&bpo=8513].)

A new constant **DEVNULL** allows suppressing output in a platform-independent fashion. (Contributed by Ross Lagerwall in [bpo-5870](https://bugs.python.org/issue?@action=redirect&bpo=5870) [https://bugs.python.org/issue?@action=redirect&bpo=5870].)

## sys

The **sys** module has a new **thread\_info** named tuple holding information about the thread implementation ([bpo-11223](https://bugs.python.org/issue?@action=redirect&bpo=11223) [https://bugs.python.org/issue?@action=redirect&bpo=11223]).

## tarfile

**tarfile** now supports **lzma** encoding via the **lzma** module. (Contributed by Lars Gustäbel in [bpo-5689](https://bugs.python.org/issue?@action=redirect&bpo=5689) [https://bugs.python.org/issue?@action=redirect&bpo=5689].)

## tempfile

**tempfile.SpooledTemporaryFile**'s **truncate()** method now accepts a **size** parameter. (Contributed by Ryan Kelly in [bpo-9957](https://bugs.python.org/issue?@action=redirect&bpo=9957) [https://bugs.python.org/issue?@action=redirect&bpo=9957].)

## textwrap

The **textwrap** module has a new **indent()** that makes it straightforward to add a common prefix to selected lines in a block of text ([bpo-13857](https://bugs.python.org/issue?@action=redirect&bpo=13857) [https://bugs.python.org/issue?@action=redirect&bpo=13857]).

## threading

**threading.Condition**, **threading.Semaphore**, **threading.BoundedSemaphore**, **threading.Event**, and **threading.Timer**, all of which used to be factory functions returning a class instance, are now classes and may be subclassed. (Contributed by Éric Araujo in [bpo-10968](https://bugs.python.org/issue?@action=redirect&bpo=10968) [https://bugs.python.org/issue?@action=redirect&bpo=10968].)

The **threading.Thread** constructor now accepts a **daemon** keyword argument to override the default behavior of inheriting the **daemon** flag value from the parent thread ([bpo-6064](https://bugs.python.org/issue?@action=redirect&bpo=6064) [https://bugs.python.org/issue?@action=redirect&bpo=6064]).

The formerly private function **\_thread.get\_ident** is now available as the public function **threading.get\_ident()**. This eliminates several cases of direct access to the **\_thread** module in

the `stdlib`. Third party code that used `_thread.get_ident` should likewise be changed to use the new public interface.

## time

The **PEP 418** [<https://peps.python.org/pep-0418/>] added new functions to the `time` module:

- `get_clock_info()`: Get information on a clock.
- `monotonic()`: Monotonic clock (cannot go backward), not affected by system clock updates.
- `perf_counter()`: Performance counter with the highest available resolution to measure a short duration.
- `process_time()`: Sum of the system and user CPU time of the current process.

Other new functions:

- `clock_getres()`, `clock_gettime()` and `clock_settime()` functions with `CLOCK_XXX` constants. (Contributed by Victor Stinner in **bpo-10278** [<https://bugs.python.org/issue?@action=redirect&bpo=10278>].)

To improve cross platform consistency, `sleep()` now raises a **ValueError** when passed a negative sleep value. Previously this was an error on posix, but produced an infinite sleep on Windows.

## types

Add a new `types.MappingProxyType` class: Read-only proxy of a mapping. (**bpo-14386** [<https://bugs.python.org/issue?@action=redirect&bpo=14386>])

The new functions `types.new_class()` and `types.prepare_class()` provide support for **PEP 3115** [<https://peps.python.org/pep-3115/>] compliant dynamic type creation. (**bpo-14588** [<https://bugs.python.org/issue?@action=redirect&bpo=14588>])

## unittest

`assertRaises()`, `assertRaisesRegex()`, `assertWarns()`, and `assertWarnsRegex()` now accept a keyword argument `msg` when used as context managers. (Contributed by Ezio Melotti and Winston Ewert in [bpo-10775](https://bugs.python.org/issue?@action=redirect&bpo=10775) [https://bugs.python.org/issue?@action=redirect&bpo=10775].)

`unittest.TestCase.run()` now returns the `TestResult` object.

## urllib

The `Request` class, now accepts a `method` argument used by `get_method()` to determine what HTTP method should be used. For example, this will send a 'HEAD' request:

```
>>> urlopen(Request('https://www.python.org', method='HEAD'))
(bpo-1673007 [https://bugs.python.org/issue?@action=redirect&bpo=1673007])
```

## webbrowser

The `webbrowser` module supports more “browsers”: Google Chrome (named `chrome`, `chromium`, `chrome-browser` or `chromium-browser` depending on the version and operating system), and the generic launchers `xdg-open`, from the FreeDesktop.org project, and `gvfs-open`, which is the default URI handler for GNOME 3. (The former contributed by Arnaud Calmettes in [bpo-13620](https://bugs.python.org/issue?@action=redirect&bpo=13620) [https://bugs.python.org/issue?@action=redirect&bpo=13620], the latter by Matthias Klose in [bpo-14493](https://bugs.python.org/issue?@action=redirect&bpo=14493) [https://bugs.python.org/issue?@action=redirect&bpo=14493].)

## xml.etree.ElementTree

The `xml.etree.ElementTree` module now imports its C accelerator by default; there is no longer a need to explicitly import `xml.etree.cElementTree` (this module stays for backwards compatibility, but is now deprecated). In addition, the `iter` family of methods of `Element` has been optimized (rewritten in C). The module’s documentation has also been greatly improved with added

examples and a more detailed reference.

## **zlib**

New attribute `zlib.Decompress.eof` makes it possible to distinguish between a properly formed compressed stream and an incomplete or truncated one. (Contributed by Nadeem Vawda in [bpo-12646](https://bugs.python.org/issue?@action=redirect&bpo=12646) [https://bugs.python.org/issue?@action=redirect&bpo=12646].)

New attribute `zlib.ZLIB_RUNTIME_VERSION` reports the version string of the underlying `zlib` library that is loaded at runtime. (Contributed by Torsten Landschoff in [bpo-12306](https://bugs.python.org/issue?@action=redirect&bpo=12306) [https://bugs.python.org/issue?@action=redirect&bpo=12306].)

## **Optimizations**

Major performance enhancements have been added:

- Thanks to [PEP 393](https://peps.python.org/pep-0393/) [https://peps.python.org/pep-0393/], some operations on Unicode strings have been optimized:
  - the memory footprint is divided by 2 to 4 depending on the text
  - encode an ASCII string to UTF-8 doesn't need to encode characters anymore, the UTF-8 representation is shared with the ASCII representation
  - the UTF-8 encoder has been optimized
  - repeating a single ASCII letter and getting a substring of an ASCII string is 4 times faster
- UTF-8 is now 2x to 4x faster. UTF-16 encoding is now up to 10x faster.

(Contributed by Serhiy Storchaka, [bpo-14624](https://bugs.python.org/issue?@action=redirect&bpo=14624) [https://bugs.python.org/issue?@action=redirect&bpo=14624], [bpo-14738](https://bugs.python.org/issue?@action=redirect&bpo=14738) [https://bugs.python.org/issue?@action=redirect&bpo=14738] and [bpo-15026](https://bugs.python.org/issue?@action=redirect&bpo=15026) [https://bugs.python.org/issue?@action=redirect&bpo=15026].)

## **Build and C API Changes**

Changes to Python's build process and to the C API include:

- New **PEP 3118** [<https://peps.python.org/pep-3118/>] related function:
  - **PyMemoryView\_FromMemory()**
- **PEP 393** [<https://peps.python.org/pep-0393/>] added new Unicode types, macros and functions:
  - High-level API:
    - **PyUnicode\_CopyCharacters()**
    - **PyUnicode\_FindChar()**
    - **PyUnicode\_GetLength()**,  
**PyUnicode\_GET\_LENGTH**
    - **PyUnicode\_New()**
    - **PyUnicode\_Substring()**
    - **PyUnicode\_ReadChar()**,  
**PyUnicode\_WriteChar()**
  - Low-level API:
    - **Py\_UCS1**, **Py\_UCS2**, **Py\_UCS4** types
    - **PyASCIIObject** and **PyCompactUnicodeObject** structures
    - **PyUnicode\_READY**
    - **PyUnicode\_FromKindAndData()**
    - **PyUnicode\_AsUCS4()**,  
**PyUnicode\_AsUCS4Copy()**
    - **PyUnicode\_DATA**, **PyUnicode\_1BYTE\_DATA**,  
**PyUnicode\_2BYTE\_DATA**,  
**PyUnicode\_4BYTE\_DATA**
    - **PyUnicode\_KIND** with **PyUnicode\_Kind** enum: **PyUnicode\_WCHAR\_KIND**,  
**PyUnicode\_1BYTE\_KIND**,  
**PyUnicode\_2BYTE\_KIND**,  
**PyUnicode\_4BYTE\_KIND**
    - **PyUnicode\_READ**, **PyUnicode\_READ\_CHAR**,  
**PyUnicode\_WRITE**
    - **PyUnicode\_MAX\_CHAR\_VALUE**
- **PyArg\_ParseTuple** now accepts a **bytearray** for the `c` format (**bpo-12380** [<https://bugs.python.org/issue?@action=redirect&bpo=12380>]).

## Deprecated

## Unsupported Operating Systems

OS/2 and VMS are no longer supported due to the lack of a maintainer.

Windows 2000 and Windows platforms which set `COMSPEC` to `command.com` are no longer supported due to maintenance burden.

OSF support, which was deprecated in 3.2, has been completely removed.

## Deprecated Python modules, functions and methods

- Passing a non-empty string to `object.__format__()` is deprecated, and will produce a **`TypeError`** in Python 3.4 ([bpo-9856](https://bugs.python.org/issue?@action=redirect&bpo=9856) [<https://bugs.python.org/issue?@action=redirect&bpo=9856>]).
- The `unicode_internal` codec has been deprecated because of the [PEP 393](https://peps.python.org/pep-0393/) [<https://peps.python.org/pep-0393/>], use UTF-8, UTF-16 (`utf-16-le` or `utf-16-be`), or UTF-32 (`utf-32-le` or `utf-32-be`)
- `ftplib.FTP.nlst()` and `ftplib.FTP.dir()`: use `ftplib.FTP.mlsd()`
- `platform.popen()`: use the `subprocess` module. Check especially the [Replacing Older Functions with the subprocess Module](#) section ([bpo-11377](https://bugs.python.org/issue?@action=redirect&bpo=11377) [<https://bugs.python.org/issue?@action=redirect&bpo=11377>]).
- [bpo-13374](https://bugs.python.org/issue?@action=redirect&bpo=13374) [<https://bugs.python.org/issue?@action=redirect&bpo=13374>]: The Windows bytes API has been deprecated in the `os` module. Use Unicode filenames, instead of bytes filenames, to not depend on the ANSI code page anymore and to support any filename.
- [bpo-13988](https://bugs.python.org/issue?@action=redirect&bpo=13988) [<https://bugs.python.org/issue?@action=redirect&bpo=13988>]: The `xml.etree.cElementTree` module is deprecated. The accelerator is used automatically whenever available.
- The behaviour of `time.clock()` depends on the platform: use the new `time.perf_counter()` or `time.process_time()` function instead, depending on your requirements, to have a well defined behaviour.

- The `os.stat_float_times()` function is deprecated.
- `abc` module:
  - `abc.abstractproperty` has been deprecated, use `property` with `abc.abstractmethod()` instead.
  - `abc.abstractclassmethod` has been deprecated, use `classmethod` with `abc.abstractmethod()` instead.
  - `abc.abstractstaticmethod` has been deprecated, use `staticmethod` with `abc.abstractmethod()` instead.
- `importlib` package:
  - `importlib.abc.SourceLoader.path_mtime()` is now deprecated in favour of `importlib.abc.SourceLoader.path_stats()` as bytecode files now store both the modification time and size of the source file the bytecode file was compiled from.

## Deprecated functions and types of the C API

The `Py_UNICODE` has been deprecated by [PEP 393](https://peps.python.org/pep-0393/) [https://peps.python.org/pep-0393/] and will be removed in Python 4. All functions using this type are deprecated:

Unicode functions and methods using `Py_UNICODE` and `Py_UNICODE*` types:

- `PyUnicode_FromUnicode`: use `PyUnicode_FromWideChar()` or `PyUnicode_FromKindAndData()`
- `PyUnicode_AS_UNICODE`, `PyUnicode_AsUnicode()`, `PyUnicode_AsUnicodeAndSize()`: use `PyUnicode_AsWideCharString()`
- `PyUnicode_AS_DATA`: use `PyUnicode_DATA` with `PyUnicode_READ` and `PyUnicode_WRITE`
- `PyUnicode_GET_SIZE`, `PyUnicode_GetSize()`: use `PyUnicode_GET_LENGTH` or `PyUnicode_GetLength()`
- `PyUnicode_GET_DATA_SIZE`: use `PyUnicode_GET_LENGTH(str) *`  
`PyUnicode_KIND(str)` (only work on ready strings)

- `PyUnicode_AsUnicodeCopy()`: use `PyUnicode_AsUCS4Copy()` or `PyUnicode_AsWideCharString()`
- `PyUnicode_GetMax()`

Functions and macros manipulating `Py_UNICODE*` strings:

- `Py_UNICODE_strlen`: use `PyUnicode_GetLength()` or `PyUnicode_GET_LENGTH`
- `Py_UNICODE_strcat`: use `PyUnicode_CopyCharacters()` or `PyUnicode_FromFormat()`
- `Py_UNICODE_strcpy`, `Py_UNICODE_strncpy`, `Py_UNICODE_COPY`: use `PyUnicode_CopyCharacters()` or `PyUnicode_Substring()`
- `Py_UNICODE_strcmp`: use `PyUnicode_Compare()`
- `Py_UNICODE_strncmp`: use `PyUnicode_Tailmatch()`
- `Py_UNICODE_strchr`, `Py_UNICODE_strrchr`: use `PyUnicode_FindChar()`
- `Py_UNICODE_FILL`: use `PyUnicode_Fill()`
- `Py_UNICODE_MATCH`

Encoders:

- `PyUnicode_Encode()`: use `PyUnicode_AsEncodedObject()`
- `PyUnicode_EncodeUTF7()`
- `PyUnicode_EncodeUTF8()`: use `PyUnicode_AsUTF8()` or `PyUnicode_AsUTF8String()`
- `PyUnicode_EncodeUTF32()`
- `PyUnicode_EncodeUTF16()`
- `PyUnicode_EncodeUnicodeEscape()` use `PyUnicode_AsUnicodeEscapeString()`
- `PyUnicode_EncodeRawUnicodeEscape()` use `PyUnicode_AsRawUnicodeEscapeString()`
- `PyUnicode_EncodeLatin1()`: use `PyUnicode_AsLatin1String()`
- `PyUnicode_EncodeASCII()`: use `PyUnicode_AsASCIIString()`
- `PyUnicode_EncodeCharmap()`
- `PyUnicode_TranslateCharmap()`

- `PyUnicode_EncodeMBCS()`: use `PyUnicode_AsMBCSString()` or `PyUnicode_EncodeCodePage()` (with `CP_ACP` `code_page`)
- `PyUnicode_EncodeDecimal()`, `PyUnicode_TransformDecimalToASCII()`

## Deprecated features

The `array` module's `'u'` format code is now deprecated and will be removed in Python 4 together with the rest of the (`Py_UNICODE`) API.

## Porting to Python 3.3

This section lists previously described changes and other bugfixes that may require changes to your code.

### Porting Python code

- Hash randomization is enabled by default. Set the `PYTHONHASHSEED` environment variable to `0` to disable hash randomization. See also the `object.__hash__()` method.
- [bpo-12326](https://bugs.python.org/issue?@action=redirect&bpo=12326) [https://bugs.python.org/issue?@action=redirect&bpo=12326]: On Linux, `sys.platform` doesn't contain the major version anymore. It is now always `'linux'`, instead of `'linux2'` or `'linux3'` depending on the Linux version used to build Python. Replace `sys.platform == 'linux2'` with `sys.platform.startswith('linux')`, or directly `sys.platform == 'linux'` if you don't need to support older Python versions.
- [bpo-13847](https://bugs.python.org/issue?@action=redirect&bpo=13847) [https://bugs.python.org/issue?@action=redirect&bpo=13847], [bpo-14180](https://bugs.python.org/issue?@action=redirect&bpo=14180) [https://bugs.python.org/issue?@action=redirect&bpo=14180]: `time` and `datetime: OverflowError` is now raised instead of `ValueError` if a timestamp is out of range. `OSError` is now raised if C functions `gmtime()` or `localtime()` failed.
- The default finders used by `import` now utilize a cache of what is contained within a specific directory. If you create a Python source file or sourceless bytecode file, make sure to call `importlib.invalidate_caches()` to clear out the

cache for the finders to notice the new file.

- `ImportError` now uses the full name of the module that was attempted to be imported. Doctests that check `ImportErrors`' message will need to be updated to use the full name of the module instead of just the tail of the name.
- The `index` argument to `__import__()` now defaults to 0 instead of -1 and no longer support negative values. It was an oversight when [PEP 328](https://peps.python.org/pep-0328/) [https://peps.python.org/pep-0328/] was implemented that the default value remained -1. If you need to continue to perform a relative import followed by an absolute import, then perform the relative import using an index of 1, followed by another import using an index of 0. It is preferred, though, that you use `importlib.import_module()` rather than call `__import__()` directly.
- `__import__()` no longer allows one to use an index value other than 0 for top-level modules. E.g. `__import__('sys', level=1)` is now an error.
- Because `sys.meta_path` and `sys.path_hooks` now have finders on them by default, you will most likely want to use `list.insert()` instead of `list.append()` to add to those lists.
- Because `None` is now inserted into `sys.path_importer_cache`, if you are clearing out entries in the dictionary of paths that do not have a finder, you will need to remove keys paired with values of `None` and `imp.NullImporter` to be backwards-compatible. This will lead to extra overhead on older versions of Python that re-insert `None` into `sys.path_importer_cache` where it represents the use of implicit finders, but semantically it should not change anything.
- `importlib.abc.Finder` no longer specifies a `find_module()` abstract method that must be implemented. If you were relying on subclasses to implement that method, make sure to check for the method's existence first. You will probably want to check for `find_loader()` first, though, in the case of working with [path entry finders](#).
- `pkgutil` has been converted to use `importlib` internally. This eliminates many edge cases where the old behaviour of the [PEP 302](https://peps.python.org/pep-0302/) [https://peps.python.org/pep-0302/] import emulation

failed to match the behaviour of the real import system. The import emulation itself is still present, but is now deprecated. The `pkgutil.iter_importers()` and `pkgutil.walk_packages()` functions special case the standard import hooks so they are still supported even though they do not provide the non-standard `iter_modules()` method.

- A longstanding RFC-compliance bug ([bpo-1079](https://bugs.python.org/issue?@action=redirect&bpo=1079) [https://bugs.python.org/issue?@action=redirect&bpo=1079]) in the parsing done by `email.header.decode_header()` has been fixed. Code that uses the standard idiom to convert encoded headers into unicode (`str(make_header(decode_header(h)))`) will see no change, but code that looks at the individual tuples returned by `decode_header` will see that whitespace that precedes or follows ASCII sections is now included in the ASCII section. Code that builds headers using `make_header` should also continue to work without change, since `make_header` continues to add whitespace between ASCII and non-ASCII sections if it is not already present in the input strings.
- `email.utils.formataddr()` now does the correct content transfer encoding when passed non-ASCII display names. Any code that depended on the previous buggy behavior that preserved the non-ASCII unicode in the formatted output string will need to be changed ([bpo-1690608](https://bugs.python.org/issue?@action=redirect&bpo=1690608) [https://bugs.python.org/issue?@action=redirect&bpo=1690608]).
- `poplib.POP3.quit()` may now raise protocol errors like all other `poplib` methods. Code that assumes `quit` does not raise `poplib.error_proto` errors may need to be changed if errors on `quit` are encountered by a particular application ([bpo-11291](https://bugs.python.org/issue?@action=redirect&bpo=11291) [https://bugs.python.org/issue?@action=redirect&bpo=11291]).
- The `strict` argument to `email.parser.Parser`, deprecated since Python 2.4, has finally been removed.
- The deprecated method `unittest.TestCase.assertSameElements` has been removed.
- The deprecated variable `time.accept2dayear` has been removed.

- The deprecated `Context._clamp` attribute has been removed from the `decimal` module. It was previously replaced by the public attribute `clamp`. (See [bpo-8540](https://bugs.python.org/issue?@action=redirect&bpo=8540) [<https://bugs.python.org/issue?@action=redirect&bpo=8540>].)
- The undocumented internal helper class `SSLFakeFile` has been removed from `smtplib`, since its functionality has long been provided directly by `socket.socket.makefile()`.
- Passing a negative value to `time.sleep()` on Windows now raises an error instead of sleeping forever. It has always raised an error on posix.
- The `ast.__version__` constant has been removed. If you need to make decisions affected by the AST version, use `sys.version_info` to make the decision.
- Code that used to work around the fact that the `threading` module used factory functions by subclassing the private classes will need to change to subclass the now-public classes.
- The undocumented debugging machinery in the `threading` module has been removed, simplifying the code. This should have no effect on production code, but is mentioned here in case any application debug frameworks were interacting with it ([bpo-13550](https://bugs.python.org/issue?@action=redirect&bpo=13550) [<https://bugs.python.org/issue?@action=redirect&bpo=13550>]).

## Porting C code

- In the course of changes to the buffer API the undocumented `smalltable` member of the `Py_buffer` structure has been removed and the layout of the `PyMemoryViewObject` has changed.

All extensions relying on the relevant parts in `memoryobject.h` or `object.h` must be rebuilt.

- Due to [PEP 393](https://peps.python.org/pep-0393/), the `Py_UNICODE` type and all functions using this type are deprecated (but will stay available for at least five years). If you were using low-level Unicode APIs to construct and access unicode objects and you want to benefit of the memory footprint reduction provided by [PEP 393](https://peps.python.org/pep-0393/) [<https://peps.python.org/pep-0393/>], you have to convert your code to the new [Unicode API](#).

However, if you only have been using high-level functions such as `PyUnicode_Concat()`, `PyUnicode_Join()` or `PyUnicode_FromFormat()`, your code will automatically take advantage of the new unicode representations.

- `PyImport_GetMagicNumber()` now returns `-1` upon failure.
- As a negative value for the `level` argument to `__import__()` is no longer valid, the same now holds for `PyImport_ImportModuleLevel()`. This also means that the value of `level` used by `PyImport_ImportModuleEx()` is now `0` instead of `-1`.

## Building C extensions

- The range of possible file names for C extensions has been narrowed. Very rarely used spellings have been suppressed: under POSIX, files named `xxxmodule.so`, `xxxmodule.abi3.so` and `xxxmodule.cpython-*.so` are no longer recognized as implementing the `xxx` module. If you had been generating such files, you have to switch to the other spellings (i.e., remove the `module` string from the file names).

(implemented in [bpo-14040](https://bugs.python.org/issue?@action=redirect&bpo=14040) [https://bugs.python.org/issue?@action=redirect&bpo=14040].)

## Command Line Switch Changes

- The `-Q` command-line flag and related artifacts have been removed. Code checking `sys.flags.division_warning` will need updating.

([bpo-10998](https://bugs.python.org/issue?@action=redirect&bpo=10998) [https://bugs.python.org/issue?@action=redirect&bpo=10998], contributed by Éric Araujo.)

- When `python` is started with `-S`, `import site` will no longer add site-specific paths to the module search paths. In previous versions, it did.

([bpo-11591](https://bugs.python.org/issue?@action=redirect&bpo=11591) [https://bugs.python.org/issue?

@action=redirect&bpo=11591], contributed by Carl Meyer with  
editions by Éric Araujo.)

# What's New In Python 3.2

## Author

Raymond Hettinger

This article explains the new features in Python 3.2 as compared to 3.1. Python 3.2 was released on February 20, 2011. It focuses on a few highlights and gives a few examples. For full details, see the [Misc/NEWS](https://github.com/python/cpython/blob/076ca6c3c8df30307e548d9be792ce3c1c6eea/Misc/NEWS) [https://github.com/python/cpython/blob/076ca6c3c8df30307e548d9be792ce3c1c6eea/Misc/NEWS] file.

[PEP 392](https://peps.python.org/pep-0392/) [https://peps.python.org/pep-0392/] - Python 3.2 Release Schedule

## PEP 384: Defining a Stable ABI

In the past, extension modules built for one Python version were often not usable with other Python versions. Particularly on Windows, every feature release of Python required rebuilding all extension modules that one wanted to use. This requirement was the result of the free access to Python interpreter internals that extension modules could use.

With Python 3.2, an alternative approach becomes available: extension modules which restrict themselves to a limited API (by defining `Py_LIMITED_API`) cannot use many of the internals, but are constrained to a set of API functions that are promised to be stable for several releases. As a consequence, extension modules built for 3.2 in that mode will also work with 3.3, 3.4, and so on. Extension modules that make use of details of memory structures can still be built, but will need to be recompiled for every feature release.

PEP written by Martin von Löwis.

## PEP 389: Argparse Command Line Parsing Module

A new module for command line parsing, **argparse**, was introduced to overcome the limitations of **optparse** which did not provide support for positional arguments (not just options), subcommands, required options and other common patterns of specifying and validating options.

This module has already had widespread success in the community as a third-party module. Being more fully featured than its predecessor, the **argparse** module is now the preferred module for command-line processing. The older module is still being kept available because of the substantial amount of legacy code that depends on it.

Here's an annotated example parser showing features like limiting results to a set of choices, specifying a *metavar* in the help screen, validating that one or more positional arguments is present, and making a required option:

```
import argparse
parser = argparse.ArgumentParser(
    description = 'Manage servers',
    epilog = 'Tested on Solaris and Linux')
parser.add_argument('action',
    choices = ['deploy', 'start', 'stop'],
    help = 'action on each target')
parser.add_argument('targets',
    metavar = 'HOSTNAME',
    nargs = '+',
    help = 'url for target machines')
parser.add_argument('-u', '--user',
```

```
        required = True,  
        help = 'login as user')
```

```
# ma
```

Example of calling the parser on a command string:

```
>>> cmd = 'deploy sneezy.example.com sleepy.example.com'  
>>> result = parser.parse_args(cmd.split())  
>>> result.action  
'deploy'  
>>> result.targets  
['sneezy.example.com', 'sleepy.example.com']  
>>> result.user  
'skycaptain'
```

Example of the parser's automatically generated help:

```
>>> parser.parse_args('-h'.split())
```

```
usage: manage_cloud.py [-h] -u USER  
                        {deploy,start,stop} HOSTNAME [HOSTNAME...]
```

Manage servers

positional arguments:

{deploy,start,stop}	action on each target
HOSTNAME	url for target machines

optional arguments:

-h, --help	show this help message and exit
-u USER, --user USER	login as user

Tested on Solaris and Linux

An especially nice **argparse** feature is the ability to define subparsers, each with their own argument patterns and help displays:

```
import argparse  
parser = argparse.ArgumentParser(prog='HELM')  
subparsers = parser.add_subparsers()
```

```

parser_l = subparsers.add_parser('launch', help='Launch
parser_l.add_argument('-m', '--missiles', action='store_
parser_l.add_argument('-t', '--torpedos', action='store_

parser_m = subparsers.add_parser('move', help='Move Vess
                                aliases=('steer', 'turn
parser_m.add_argument('-c', '--course', type=int, requir
parser_m.add_argument('-s', '--speed', type=int, default

$ ./helm.py --help                # top level h
$ ./helm.py launch --help         # help for la
$ ./helm.py launch --missiles     # set missile
$ ./helm.py steer --course 180 --speed 5  # set movemen

```

PEP written by Steven Bethard.

[Upgrading optparse code](#) for details on the differences from [optparse](#).

# PEP 391: Dictionary Based Configuration for Logging

The [logging](#) module provided two kinds of configuration, one style with function calls for each option or another style driven by an external file saved in a **ConfigParser** format. Those options did not provide the flexibility to create configurations from JSON or YAML files, nor did they support incremental configuration, which is needed for specifying logger options from a command line.

To support a more flexible style, the module now offers [logging.config.dictConfig\(\)](#) for specifying logging configuration with plain Python dictionaries. The configuration options include formatters, handlers, filters, and loggers. Here's a

working example of a configuration dictionary:

```
{"version": 1,
 "formatters": {"brief": {"format": "%(levelname)-8s: %(message)s"},
                 "full": {"format": "%(asctime)s %(name)-15s %(levelname)-8s: %(message)s"}},
 "handlers": {"console": {
                 "class": "logging.StreamHandler",
                 "formatter": "brief",
                 "level": "INFO",
                 "stream": "ext://sys.stdout"},
               "console_priority": {
                 "class": "logging.StreamHandler",
                 "formatter": "full",
                 "level": "ERROR",
                 "stream": "ext://sys.stderr"}},
 "root": {"level": "DEBUG", "handlers": ["console", "console_priority"]}}
```

If that dictionary is stored in a file called `conf.json`, it can be loaded and called with code like this:

```
>>> import json, logging.config
>>> with open('conf.json') as f:
...     conf = json.load(f)
...
>>> logging.config.dictConfig(conf)
>>> logging.info("Transaction completed normally")
INFO      : root : Transaction completed normally
>>> logging.critical("Abnormal termination")
2011-02-17 11:14:36,694 root : CRITICAL Abnormal termination
```

# PEP 3148: The `concurrent.futures` module

Code for creating and managing concurrency is being collected in a new top-level namespace, *concurrent*. Its first member is a *futures* package which provides a uniform high-level interface for managing threads and processes.

The design for `concurrent.futures` was inspired by the *java.util.concurrent* package. In that model, a running call and its result are represented by a `Future` object that abstracts features common to threads, processes, and remote procedure calls. That object supports status checks (running or done), timeouts, cancellations, adding callbacks, and access to results or exceptions.

The primary offering of the new module is a pair of executor classes for launching and managing calls. The goal of the executors is to make it easier to use existing tools for making parallel calls. They save the effort needed to setup a pool of resources, launch the calls, create a results queue, add time-out handling, and limit the total number of threads, processes, or remote procedure calls.

Ideally, each application should share a single executor across multiple components so that process and thread limits can be centrally managed. This solves the design challenge that arises when each component has its own competing strategy for resource management.

Both classes share a common interface with three methods: `submit()` for scheduling a callable and returning a `Future` object; `map()` for scheduling many asynchronous calls at a time, and `shutdown()` for freeing resources. The class is a `context manager` and can be used in a `with` statement to assure that resources are automatically released when currently pending futures are done executing.

A simple of example of `ThreadPoolExecutor` is a launch of four parallel threads for copying files:

```
import concurrent.futures, shutil
```

```
with concurrent.futures.ThreadPoolExecutor(max_workers=4):
    e.submit(shutil.copy, 'src1.txt', 'dest1.txt')
    e.submit(shutil.copy, 'src2.txt', 'dest2.txt')
    e.submit(shutil.copy, 'src3.txt', 'dest3.txt')
    e.submit(shutil.copy, 'src3.txt', 'dest4.txt')
```

## PEP 3147: PYC Repository Directories

Python’s scheme for caching bytecode in `.pyc` files did not work well in environments with multiple Python interpreters. If one interpreter encountered a cached file created by another interpreter, it would recompile the source and overwrite the cached file, thus losing the benefits of caching.

The issue of “pyc fights” has become more pronounced as it has become commonplace for Linux distributions to ship with multiple versions of Python. These conflicts also arise with CPython alternatives such as Unladen Swallow.

To solve this problem, Python’s import machinery has been extended to use distinct filenames for each interpreter. Instead of Python 3.2 and Python 3.3 and Unladen Swallow each competing for a file called “`mymodule.pyc`”, they will now look for “`mymodule.cpython-32.pyc`”, “`mymodule.cpython-33.pyc`”, and “`mymodule.unladen10.pyc`”. And to prevent all of these new files from cluttering source directories, the `pyc` files are now collected in a “`__pycache__`” directory stored under the package directory.

Aside from the filenames and target directories, the new scheme has a few aspects that are visible to the programmer:

- Imported modules now have a `__cached__` attribute which stores the name of the actual file that was imported:

```
>>> import collections
>>> collections.__cached__
'c:/py32/lib/__pycache__/collections.cpython-32.pyc'
```

- The tag that is unique to each interpreter is accessible from the `imp` module:

```
>>> import imp
>>> imp.get_tag()
'cpython-32'
```

- Scripts that try to deduce source filename from the imported file now need to be smarter. It is no longer sufficient to simply strip the “c” from a “.pyc” filename. Instead, use the new functions in the `imp` module:

```
>>> imp.source_from_cache('c:/py32/lib/__pycache__/'
'c:/py32/lib/collections.py')
>>> imp.cache_from_source('c:/py32/lib/collections.'
'c:/py32/lib/__pycache__/collections.cpython-32.pyc')
```

- The `py_compile` and `compileall` modules have been updated to reflect the new naming convention and target directory. The command-line invocation of `compileall` has new options: `-i` for specifying a list of files and directories to compile and `-b` which causes bytecode files to be written to their legacy location rather than `__pycache__`.
- The `importlib.abc` module has been updated with new [abstract base classes](#) for loading bytecode files. The obsolete ABCs, `PyLoader` and `PyPycLoader`, have been deprecated (instructions on how to stay Python 3.1 compatible are included with the documentation).

## PEP 3147 [<https://peps.python.org/pep-3147/>] - PYC Repository Directories

PEP written by Barry Warsaw.

## PEP 3149: ABI Version Tagged .so Files

The PYC repository directory allows multiple bytecode cache files to be co-located. This PEP implements a similar mechanism for shared object files by giving them a common directory and distinct names for each version.

The common directory is “pyshared” and the file names are made distinct by identifying the Python implementation (such as CPython, PyPy, Jython, etc.), the major and minor version numbers, and optional build flags (such as “d” for debug, “m” for pymalloc, “u” for wide-unicode). For an arbitrary package “foo”, you may see these files when the distribution package is installed:

```
/usr/share/pyshared/foo.cpython-32m.so  
/usr/share/pyshared/foo.cpython-33md.so
```

In Python itself, the tags are accessible from functions in the **sysconfig** module:

```
>>> import sysconfig  
>>> sysconfig.get_config_var('SOABI')           # find the v  
'cpython-32mu'  
>>> sysconfig.get_config_var('EXT_SUFFIX')      # find the f  
'cpython-32mu.so'
```

## PEP 3149 [<https://peps.python.org/pep-3149/>] - ABI Version Tagged .so Files

PEP written by Barry Warsaw.

## PEP 3333: Python Web Server Gateway

# Interface v1.0.1

This informational PEP clarifies how bytes/text issues are to be handled by the WSGI protocol. The challenge is that string handling in Python 3 is most conveniently handled with the `str` type even though the HTTP protocol is itself bytes oriented.

The PEP differentiates so-called *native strings* that are used for request/response headers and metadata versus *byte strings* which are used for the bodies of requests and responses.

The *native strings* are always of type `str` but are restricted to code points between  $U+0000$  through  $U+00FF$  which are translatable to bytes using *Latin-1* encoding. These strings are used for the keys and values in the environment dictionary and for response headers and statuses in the `start_response()` function. They must follow [RFC 2616](https://datatracker.ietf.org/doc/html/rfc2616.html) with respect to encoding. That is, they must either be *ISO-8859-1* characters or use [RFC 2047](https://datatracker.ietf.org/doc/html/rfc2047.html) MIME encoding.

For developers porting WSGI applications from Python 2, here are the salient points:

- If the app already used strings for headers in Python 2, no change is needed.
- If instead, the app encoded output headers or decoded input headers, then the headers will need to be re-encoded to Latin-1. For example, an output header encoded in utf-8 was using `h.encode('utf-8')` now needs to convert from bytes to native strings using `h.encode('utf-8').decode('latin-1')`.
- Values yielded by an application or sent using the `write()` method must be byte strings. The `start_response()` function and `environ` must use native strings. The two cannot be mixed.

For server implementers writing CGI-to-WSGI pathways or other CGI-style protocols, the users must be able access the environment using native strings even though the underlying

platform may have a different convention. To bridge this gap, the `wsgiref` module has a new function, `wsgiref.handlers.read_environ()` for transcoding CGI variables from `os.environ` into native strings and returning a new dictionary.

**PEP 3333** [<https://peps.python.org/pep-3333/>] - Python Web Server Gateway Interface v1.0.1

PEP written by Phillip Eby.

## Other Language Changes

Some smaller changes made to the core Python language are:

- String formatting for `format()` and `str.format()` gained new capabilities for the format character `#`. Previously, for integers in binary, octal, or hexadecimal, it caused the output to be prefixed with `'0b'`, `'0o'`, or `'0x'` respectively. Now it can also handle floats, complex, and Decimal, causing the output to always have a decimal point even when no digits follow it.

```
>>> format(20, '#o')
'0o24'
>>> format(12.34, '#5.0f')
' 12.'
```

(Suggested by Mark Dickinson and implemented by Eric Smith in [bpo-7094](https://bugs.python.org/issue?@action=redirect&bpo=7094) [<https://bugs.python.org/issue?@action=redirect&bpo=7094>].)

- There is also a new `str.format_map()` method that extends the capabilities of the existing `str.format()` method by accepting arbitrary `mapping` objects. This new method makes it possible to use string formatting with any of Python's many dictionary-like objects such as `defaultdict`, `Shelf`, `ConfigParser`, or `dbm`. It is also useful with custom `dict` subclasses that normalize keys

before look-up or that supply a `__missing__()` method for unknown keys:

```
>>> import shelve
>>> d = shelve.open('tmp.shl')
>>> 'The {project_name} status is {status} as of {d
'The testing project status is green as of February

>>> class LowerCasedDict(dict):
...     def __getitem__(self, key):
...         return dict.__getitem__(self, key.lower)
>>> lcd = LowerCasedDict(part='widgets', quantity=10)
>>> 'There are {QUANTITY} {Part} in stock'.format_m
'There are 10 widgets in stock'

>>> class PlaceholderDict(dict):
...     def __missing__(self, key):
...         return '<{}>'.format(key)
>>> 'Hello {name}, welcome to {location}'.format_ma
'Hello <name>, welcome to <location>'
```

(Suggested by Raymond Hettinger and  
implemented by Eric Smith in [bpo-6081](https://bugs.python.org/issue/?@action=redirect&bpo=6081) [https://  
bugs.python.org/issue/?@action=redirect&bpo=6081].)

- The interpreter can now be started with a quiet option, `-q`, to prevent the copyright and version information from being displayed in the interactive mode. The option can be introspected using the `sys.flags` attribute:

```
$ python -q
>>> sys.flags
sys.flags(debug=0, division_warning=0, inspect=0, i
optimize=0, dont_write_bytecode=0, no_user_site=0,
ignore_environment=0, verbose=0, bytes_warning=0, q
```

(Contributed by Marcin Wojdyr in [bpo-1772833](https://bugs.python.org/issue/?@action=redirect&bpo=1772833) [https://  
bugs.python.org/issue/?@action=redirect&bpo=1772833]).

- The `hasattr()` function works by calling `getattr()` and

detecting whether an exception is raised. This technique allows it to detect methods created dynamically by `__getattr__()` or `__getattribute__()` which would otherwise be absent from the class dictionary. Formerly, *hasattr* would catch any exception, possibly masking genuine errors. Now, *hasattr* has been tightened to only catch **AttributeError** and let other exceptions pass through:

```
>>> class A:
...     @property
...     def f(self):
...         return 1 // 0
...
>>> a = A()
>>> hasattr(a, 'f')
Traceback (most recent call last):
...
ZeroDivisionError: integer division or modulo by zero
```

(Discovered by Yury Selivanov and fixed by Benjamin Peterson; [bpo-9666](https://bugs.python.org/issue?@action=redirect&bpo=9666) [https://bugs.python.org/issue?@action=redirect&bpo=9666].)

- The **str()** of a float or complex number is now the same as its **repr()**. Previously, the **str()** form was shorter but that just caused confusion and is no longer needed now that the shortest possible **repr()** is displayed by default:

```
>>> import math
>>> repr(math.pi)
'3.141592653589793'
>>> str(math.pi)
'3.141592653589793'
```

(Proposed and implemented by Mark Dickinson; [bpo-9337](https://bugs.python.org/issue?@action=redirect&bpo=9337) [https://bugs.python.org/issue?@action=redirect&bpo=9337].)

- **memoryview** objects now have a **release()** method and they also now support the context management protocol. This allows timely release of any resources that were acquired

when requesting a buffer from the original object.

```
>>> with memoryview(b'abcdefgh') as v:  
...     print(v.tolist())  
[97, 98, 99, 100, 101, 102, 103, 104]
```

(Added by Antoine Pitrou; [bpo-9757](https://bugs.python.org/issue?@action=redirect&bpo=9757) [https://bugs.python.org/issue?@action=redirect&bpo=9757].)

- Previously it was illegal to delete a name from the local namespace if it occurs as a free variable in a nested block:

```
def outer(x):  
    def inner():  
        return x  
    inner()  
    del x
```

This is now allowed. Remember that the target of an **except** clause is cleared, so this code which used to work with Python 2.6, raised a **SyntaxError** with Python 3.1 and now works again:

```
def f():  
    def print_error():  
        print(e)  
    try:  
        something  
    except Exception as e:  
        print_error()  
        # implicit "del e" here
```

(See [bpo-4617](https://bugs.python.org/issue?@action=redirect&bpo=4617) [https://bugs.python.org/issue?@action=redirect&bpo=4617].)

- The internal **structsequence** tool now creates subclasses of tuple. This means that C structures like those returned by **os.stat()**, **time.gmtime()**, and **sys.version\_info** now work like a **named tuple** and now work with functions and methods that expect a tuple as an argument. This is a big step forward in making the C structures as flexible as their

pure Python counterparts:

```
>>> import sys
>>> isinstance(sys.version_info, tuple)
True
>>> 'Version %d.%d.%d %s(%d)' % sys.version_info
'Version 3.2.0 final(0)'
```

(Suggested by Arfrever Frehtes Taifersar Arahesis and implemented by Benjamin Peterson in [bpo-8413](https://bugs.python.org/issue?@action=redirect&bpo=8413) [https://bugs.python.org/issue?@action=redirect&bpo=8413].)

- Warnings are now easier to control using the **PYTHONWARNINGS** environment variable as an alternative to using `-W` at the command line:

```
$ export PYTHONWARNINGS='ignore::RuntimeWarning::,o
```

(Suggested by Barry Warsaw and implemented by Philip Jenvey in [bpo-7301](https://bugs.python.org/issue?@action=redirect&bpo=7301) [https://bugs.python.org/issue?@action=redirect&bpo=7301].)

- A new warning category, **ResourceWarning**, has been added. It is emitted when potential issues with resource consumption or cleanup are detected. It is silenced by default in normal release builds but can be enabled through the means provided by the **warnings** module, or on the command line.

A **ResourceWarning** is issued at interpreter shutdown if the **gc.garbage** list isn't empty, and if **gc.DEBUG\_UNCOLLECTABLE** is set, all uncollectable objects are printed. This is meant to make the programmer aware that their code contains object finalization issues.

A **ResourceWarning** is also issued when a **file object** is destroyed without having been explicitly closed. While the deallocator for such object ensures it closes the underlying operating system resource (usually, a file descriptor), the delay in deallocating the object could produce various issues, especially under Windows. Here is an example of enabling the

warning from the command line:

```
$ python -q -Wdefault
>>> f = open("foo", "wb")
>>> del f
__main__:1: ResourceWarning: unclosed file <_io.BufferedWriter object at 0x0000000000000000>
```

(Added by Antoine Pitrou and Georg Brandl in [bpo-10093](https://bugs.python.org/issue?@action=redirect&bpo=10093) [<https://bugs.python.org/issue?@action=redirect&bpo=10093>] and [bpo-477863](https://bugs.python.org/issue?@action=redirect&bpo=477863) [<https://bugs.python.org/issue?@action=redirect&bpo=477863>].)

- **range** objects now support *index* and *count* methods. This is part of an effort to make more objects fully implement the **collections.Sequence** [abstract base class](#). As a result, the language will have a more uniform API. In addition, **range** objects now support slicing and negative indices, even with values larger than **sys.maxsize**. This makes *range* more interoperable with lists:

```
>>> range(0, 100, 2).count(10)
1
>>> range(0, 100, 2).index(10)
5
>>> range(0, 100, 2)[5]
10
>>> range(0, 100, 2)[0:5]
range(0, 10, 2)
```

(Contributed by Daniel Stutzbach in [bpo-9213](https://bugs.python.org/issue?@action=redirect&bpo=9213) [<https://bugs.python.org/issue?@action=redirect&bpo=9213>], by Alexander Belopolsky in [bpo-2690](https://bugs.python.org/issue?@action=redirect&bpo=2690) [<https://bugs.python.org/issue?@action=redirect&bpo=2690>], and by Nick Coghlan in [bpo-10889](https://bugs.python.org/issue?@action=redirect&bpo=10889) [<https://bugs.python.org/issue?@action=redirect&bpo=10889>].)

- The **callable()** builtin function from Py2.x was resurrected. It provides a concise, readable alternative to using an [abstract base class](#) in an expression like `isinstance(x, collections.Callable)`:

```
>>> callable(max)
```

```
True
>>> callable(20)
False
```

(See [bpo-10518](https://bugs.python.org/issue?@action=redirect&bpo=10518) [https://bugs.python.org/issue?@action=redirect&bpo=10518].)

- Python's import mechanism can now load modules installed in directories with non-ASCII characters in the path name. This solved an aggravating problem with home directories for users with non-ASCII characters in their usernames.

(Required extensive work by Victor Stinner in [bpo-9425](https://bugs.python.org/issue?@action=redirect&bpo=9425) [https://bugs.python.org/issue?@action=redirect&bpo=9425].)

## New, Improved, and Deprecated Modules

Python's standard library has undergone significant maintenance efforts and quality improvements.

The biggest news for Python 3.2 is that the [email](#) package, [mailbox](#) module, and [nntplib](#) modules now work correctly with the bytes/text model in Python 3. For the first time, there is correct handling of messages with mixed encodings.

Throughout the standard library, there has been more careful attention to encodings and text versus bytes issues. In particular, interactions with the operating system are now better able to exchange non-ASCII data using the Windows MBCS encoding, locale-aware encodings, or UTF-8.

Another significant win is the addition of substantially better support for *SSL* connections and security certificates.

In addition, more classes now implement a [context manager](#) to support convenient and reliable resource clean-up using a [with](#) statement.

### email

The usability of the `email` package in Python 3 has been mostly fixed by the extensive efforts of R. David Murray. The problem was that emails are typically read and stored in the form of `bytes` rather than `str` text, and they may contain multiple encodings within a single email. So, the email package had to be extended to parse and generate email messages in bytes format.

- New functions `message_from_bytes()` and `message_from_binary_file()`, and new classes `BytesFeedParser` and `BytesParser` allow binary message data to be parsed into model objects.
- Given bytes input to the model, `get_payload()` will by default decode a message body that has a *Content-Transfer-Encoding* of *8bit* using the charset specified in the MIME headers and return the resulting string.
- Given bytes input to the model, `Generator` will convert message bodies that have a *Content-Transfer-Encoding* of *8bit* to instead have a *7bit Content-Transfer-Encoding*.

Headers with unencoded non-ASCII bytes are deemed to be [RFC 2047](https://datatracker.ietf.org/doc/html/rfc2047.html) [https://datatracker.ietf.org/doc/html/rfc2047.html]-encoded using the *unknown-8bit* character set.

- A new class `BytesGenerator` produces bytes as output, preserving any unchanged non-ASCII data that was present in the input used to build the model, including message bodies with a *Content-Transfer-Encoding* of *8bit*.
- The `smtplib SMTP` class now accepts a byte string for the `msg` argument to the `sendmail()` method, and a new method, `send_message()` accepts a `Message` object and can optionally obtain the `from_addr` and `to_addrs` addresses directly from the object.

(Proposed and implemented by R. David Murray, [bpo-4661](https://bugs.python.org/issue/?@action=redirect&bpo=4661) [https://bugs.python.org/issue/?@action=redirect&bpo=4661] and [bpo-10321](https://bugs.python.org/issue/?@action=redirect&bpo=10321) [https://bugs.python.org/issue/?@action=redirect&bpo=10321].)

The `xml.etree.ElementTree` package and its `xml.etree.cElementTree` counterpart have been updated to version 1.3.

Several new and useful functions and methods have been added:

- `xml.etree.ElementTree.fromstringlist()` which builds an XML document from a sequence of fragments
- `xml.etree.ElementTree.register_namespace()` for registering a global namespace prefix
- `xml.etree.ElementTree.tostringlist()` for string representation including all sublists
- `xml.etree.ElementTree.Element.extend()` for appending a sequence of zero or more elements
- `xml.etree.ElementTree.Element.iterfind()` searches an element and subelements
- `xml.etree.ElementTree.Element.itertext()` creates a text iterator over an element and its subelements
- `xml.etree.ElementTree.TreeBuilder.end()` closes the current element
- `xml.etree.ElementTree.TreeBuilder.doctype()` handles a doctype declaration

Two methods have been deprecated:

- `xml.etree.ElementTree.getchildren()` use `list(elem)` instead.
- `xml.etree.ElementTree.getiterator()` use `Element.iter` instead.

For details of the update, see [Introducing ElementTree](https://web.archive.org/web/20200703234532/http://effbot.org/zone/elementtree-13-intro.htm) [https://web.archive.org/web/20200703234532/http://effbot.org/zone/elementtree-13-intro.htm] on Fredrik Lundh's website.

(Contributed by Florent Xicluna and Fredrik Lundh, [bpo-6472](https://bugs.python.org/issue?@action=redirect&bpo=6472) [https://bugs.python.org/issue?@action=redirect&bpo=6472].)

## functools

- The `functools` module includes a new decorator for caching function calls. `functools.lru_cache()` can save

repeated queries to an external resource whenever the results are expected to be the same.

For example, adding a caching decorator to a database query function can save database accesses for popular searches:

```
>>> import functools
>>> @functools.lru_cache(maxsize=300)
... def get_phone_number(name):
...     c = conn.cursor()
...     c.execute('SELECT phonenumber FROM phonelist
...     return c.fetchone()[0]

>>> for name in user_requests:
...     get_phone_number(name)           # cached look
```

To help with choosing an effective cache size, the wrapped function is instrumented for tracking cache statistics:

```
>>> get_phone_number.cache_info()
CacheInfo(hits=4805, misses=980, maxsize=300, currsize=0)
```

If the phonelist table gets updated, the outdated contents of the cache can be cleared with:

```
>>> get_phone_number.cache_clear()
```

(Contributed by Raymond Hettinger and incorporating design ideas from Jim Baker, Miki Tebeka, and Nick Coghlan; see [recipe 498245](https://code.activestate.com/recipes/498245/) [https://code.activestate.com/recipes/498245/], [recipe 577479](https://code.activestate.com/recipes/577479/) [https://code.activestate.com/recipes/577479/], [bpo-10586](https://bugs.python.org/issue?@action=redirect&bpo=10586) [https://bugs.python.org/issue?@action=redirect&bpo=10586], and [bpo-10593](https://bugs.python.org/issue?@action=redirect&bpo=10593) [https://bugs.python.org/issue?@action=redirect&bpo=10593].)

- The `functools.wraps()` decorator now adds a `__wrapped__` attribute pointing to the original callable function. This allows wrapped functions to be introspected. It also copies `__annotations__` if defined. And now it also gracefully skips over missing attributes such as `__doc__` which might not be defined for the wrapped callable.

In the above example, the cache can be removed by recovering the original function:

```
>>> get_phone_number = get_phone_number.__wrapped__
```

(By Nick Coghlan and Terrence Cole; [bpo-9567](https://bugs.python.org/issue?@action=redirect&bpo=9567) [https://bugs.python.org/issue?@action=redirect&bpo=9567], [bpo-3445](https://bugs.python.org/issue?@action=redirect&bpo=3445) [https://bugs.python.org/issue?@action=redirect&bpo=3445], and [bpo-8814](https://bugs.python.org/issue?@action=redirect&bpo=8814) [https://bugs.python.org/issue?@action=redirect&bpo=8814].)

- To help write classes with rich comparison methods, a new decorator `functools.total_ordering()` will use existing equality and inequality methods to fill in the remaining methods.

For example, supplying `_eq_` and `_lt_` will enable `total_ordering()` to fill-in `_le_`, `_gt_` and `_ge_`:

```
@total_ordering
class Student:
    def __eq__(self, other):
        return ((self.lastname.lower(), self.firstname.lower())
                (other.lastname.lower(), other.firstname.lower()))

    def __lt__(self, other):
        return ((self.lastname.lower(), self.firstname.lower())
                (other.lastname.lower(), other.firstname.lower()))
```

With the `total_ordering` decorator, the remaining comparison methods are filled in automatically.

(Contributed by Raymond Hettinger.)

- To aid in porting programs from Python 2, the `functools.cmp_to_key()` function converts an old-style comparison function to modern [key function](#):

```
>>> # locale-aware sort order
>>> sorted(iterable, key=cmp_to_key(locale.strcoll))
```

For sorting examples and a brief sorting tutorial, see the [Sorting HowTo](https://wiki.python.org/moin/HowTo/Sorting/) [https://wiki.python.org/moin/HowTo/Sorting/] tutorial.

(Contributed by Raymond Hettinger.)

## itertools

- The `itertools` module has a new `accumulate()` function modeled on APL's *scan* operator and Numpy's *accumulate* function:

```
>>> from itertools import accumulate
>>> list(accumulate([8, 2, 50]))
[8, 10, 60]

>>> prob_dist = [0.1, 0.4, 0.2, 0.3]
>>> list(accumulate(prob_dist))          # cumulative p
[0.1, 0.5, 0.7, 1.0]
```

For an example using `accumulate()`, see the [examples for the random module](#).

(Contributed by Raymond Hettinger and incorporating design suggestions from Mark Dickinson.)

## collections

- The `collections.Counter` class now has two forms of in-place subtraction, the existing `-=` operator for [saturating subtraction](https://en.wikipedia.org/wiki/Saturation_arithmetic) [https://en.wikipedia.org/wiki/Saturation\_arithmetic] and the new `subtract()` method for regular subtraction. The former is suitable for [multisets](https://en.wikipedia.org/wiki/Multiset) [https://en.wikipedia.org/wiki/Multiset] which only have positive counts, and the latter is more suitable for use cases that allow negative counts:

```
>>> from collections import Counter
>>> tally = Counter(dogs=5, cats=3)
>>> tally -= Counter(dogs=2, cats=8)      # saturatin
>>> tally
```

```
Counter({'dogs': 3})
```

```
>>> tally = Counter(dogs=5, cats=3)
>>> tally.subtract(dogs=2, cats=8)          # regular s
>>> tally
Counter({'dogs': 3, 'cats': -5})
```

(Contributed by Raymond Hettinger.)

- The `collections.OrderedDict` class has a new method `move_to_end()` which takes an existing key and moves it to either the first or last position in the ordered sequence.

The default is to move an item to the last position. This is equivalent of renewing an entry with `od[k] = od.pop(k)`.

A fast move-to-end operation is useful for resequencing entries. For example, an ordered dictionary can be used to track order of access by aging entries from the oldest to the most recently accessed.

```
>>> from collections import OrderedDict
>>> d = OrderedDict.fromkeys(['a', 'b', 'X', 'd', 'e'])
>>> list(d)
['a', 'b', 'X', 'd', 'e']
>>> d.move_to_end('X')
>>> list(d)
['a', 'b', 'd', 'e', 'X']
```

(Contributed by Raymond Hettinger.)

- The `collections.deque` class grew two new methods `count()` and `reverse()` that make them more substitutable for `list` objects:

```
>>> from collections import deque
>>> d = deque('simsalabim')
>>> d.count('s')
2
>>> d.reverse()
>>> d
```

```
deque(['m', 'i', 'b', 'a', 'l', 'a', 's', 'm', 'i',
```

(Contributed by Raymond Hettinger.)

## threading

The **threading** module has a new **Barrier** synchronization class for making multiple threads wait until all of them have reached a common barrier point. Barriers are useful for making sure that a task with multiple preconditions does not run until all of the predecessor tasks are complete.

Barriers can work with an arbitrary number of threads. This is a generalization of a **Rendezvous** [[https://en.wikipedia.org/wiki/Synchronous\\_rendezvous](https://en.wikipedia.org/wiki/Synchronous_rendezvous)] which is defined for only two threads.

Implemented as a two-phase cyclic barrier, **Barrier** objects are suitable for use in loops. The separate *filling* and *draining* phases assure that all threads get released (drained) before any one of them can loop back and re-enter the barrier. The barrier fully resets after each cycle.

Example of using barriers:

```
from threading import Barrier, Thread

def get_votes(site):
    ballots = conduct_election(site)
    all_polls_closed.wait()          # do not count until
    totals = summarize(ballots)
    publish(site, totals)

all_polls_closed = Barrier(len(sites))
for site in sites:
    Thread(target=get_votes, args=(site,)).start()
```

In this example, the barrier enforces a rule that votes cannot be counted at any polling site until all polls are closed. Notice how a solution with a barrier is similar to one with **threading.Thread.join()**, but the threads stay alive and

continue to do work (summarizing ballots) after the barrier point is crossed.

If any of the predecessor tasks can hang or be delayed, a barrier can be created with an optional *timeout* parameter. Then if the timeout period elapses before all the predecessor tasks reach the barrier point, all waiting threads are released and a **BrokenBarrierError** exception is raised:

```
def get_votes(site):
    ballots = conduct_election(site)
    try:
        all_polls_closed.wait(timeout=midnight - time.no
    except BrokenBarrierError:
        lockbox = seal_ballots(ballots)
        queue.put(lockbox)
    else:
        totals = summarize(ballots)
        publish(site, totals)
```

In this example, the barrier enforces a more robust rule. If some election sites do not finish before midnight, the barrier times-out and the ballots are sealed and deposited in a queue for later handling.

See [Barrier Synchronization Patterns](https://osl.cs.illinois.edu/media/papers/karmani-2009-barrier_synchronization_pattern.pdf) [https://osl.cs.illinois.edu/media/papers/karmani-2009-barrier\_synchronization\_pattern.pdf] for more examples of how barriers can be used in parallel computing. Also, there is a simple but thorough explanation of barriers in [The Little Book of Semaphores](https://greenteapress.com/semaphores/LittleBookOfSemaphores.pdf) [https://greenteapress.com/semaphores/LittleBookOfSemaphores.pdf], *section 3.6*.

(Contributed by Kristján Valur Jónsson with an API review by Jeffrey Yasskin in [bpo-8777](https://bugs.python.org/issue?@action=redirect&bpo=8777) [https://bugs.python.org/issue?@action=redirect&bpo=8777].)

## datetime and time

- The **datetime** module has a new type **timezone** that implements the **tzinfo** interface by returning a fixed UTC

offset and timezone name. This makes it easier to create timezone-aware datetime objects:

```
>>> from datetime import datetime, timezone
```

```
>>> datetime.now(timezone.utc)
```

```
datetime.datetime(2010, 12, 8, 21, 4, 2, 923754, tzinfo=timezone.utc)
```

```
>>> datetime.strptime("01/01/2000 12:00 +0000", "%m/%d/%Y %H:%M %z")
```

```
datetime.datetime(2000, 1, 1, 12, 0, tzinfo=datetime.timezone.utc)
```

- Also, `timedelta` objects can now be multiplied by `float` and divided by `float` and `int` objects. And `timedelta` objects can now divide one another.
- The `datetime.date.strptime()` method is no longer restricted to years after 1900. The new supported year range is from 1000 to 9999 inclusive.
- Whenever a two-digit year is used in a time tuple, the interpretation has been governed by `time.accept2dyear`. The default is `True` which means that for a two-digit year, the century is guessed according to the POSIX rules governing the `%Y` `strptime` format.

Starting with Py3.2, use of the century guessing heuristic will emit a `DeprecationWarning`. Instead, it is recommended that `time.accept2dyear` be set to `False` so that large date ranges can be used without guesswork:

```
>>> import time, warnings
```

```
>>> warnings.resetwarnings() # remove the default warnings
```

```
>>> time.accept2dyear = True # guess whether 11 is 2011 or 1911
```

```
>>> time.asctime((11, 1, 1, 12, 34, 56, 4, 1, 0))
```

```
Warning (from warnings module):
```

```
...
```

```
DeprecationWarning: Century info guessed for a 2-digit year
```

```
'Fri Jan  1 12:34:56 2011'
```

```
>>> time.accept2dyear = False      # use the full range
>>> time.asctime((11, 1, 1, 12, 34, 56, 4, 1, 0))
'Fri Jan  1 12:34:56 11'
```

Several functions now have significantly expanded date ranges. When `time.accept2dyear` is false, the `time.asctime()` function will accept any year that fits in a C int, while the `time.mktime()` and `time.strftime()` functions will accept the full range supported by the corresponding operating system functions.

## math

The `math` module has been updated with six new functions inspired by the C99 standard.

The `isfinite()` function provides a reliable and fast way to detect special values. It returns `True` for regular numbers and `False` for *Nan* or *Infinity*:

```
>>> from math import isfinite
>>> [isfinite(x) for x in (123, 4.56, float('Nan'), float('inf'))]
[True, True, False, False]
```

The `expm1()` function computes  $e^{**x}-1$  for small values of  $x$  without incurring the loss of precision that usually accompanies the subtraction of nearly equal quantities:

```
>>> from math import expm1
>>> expm1(0.013671875)    # more accurate way to compute e^x-1
```

0.013765762467652909

The `erf()` function computes a probability integral or [Gaussian error function](https://en.wikipedia.org/wiki/Error_function) [https://en.wikipedia.org/wiki/Error\_function]. The complementary error function, `erfc()`, is  $1 - \text{erf}(x)$ :

```
>>> from math import erf, erfc, sqrt
>>> erf(1.0/sqrt(2.0))    # portion of normal distribution
0.682689492137086
>>> erfc(1.0/sqrt(2.0))   # portion of normal distribution
0.31731050786291404
>>> erf(1.0/sqrt(2.0)) + erfc(1.0/sqrt(2.0))
1.0
```

The `gamma()` function is a continuous extension of the factorial function. See [https://en.wikipedia.org/wiki/Gamma\\_function](https://en.wikipedia.org/wiki/Gamma_function) for details. Because the function is related to factorials, it grows large even for small values of  $x$ , so there is also a `lgamma()` function for computing the natural logarithm of the gamma function:

```
>>> from math import gamma, lgamma
>>> gamma(7.0)              # six factorial
720.0
>>> lgamma(801.0)          # log(800 factorial)
4551.950730698041
```

(Contributed by Mark Dickinson.)

## abc

The `abc` module now supports `abstractclassmethod()` and `abstractstaticmethod()`.

These tools make it possible to define an [abstract base class](#) that requires a particular `classmethod()` or `staticmethod()` to be implemented:

```
class Temperature(metaclass=abc.ABCMeta):
    @abc.abstractclassmethod
    def from_fahrenheit(cls, t):
```

```

...
@abc.abstractclassmethod
def from_celsius(cls, t):
...

```

(Patch submitted by Daniel Urban; [bpo-5867](https://bugs.python.org/issue?@action=redirect&bpo=5867) [https://bugs.python.org/issue?@action=redirect&bpo=5867].)

## io

The `io.BytesIO` has a new method, `getbuffer()`, which provides functionality similar to `memoryview()`. It creates an editable view of the data without making a copy. The buffer's random access and support for slice notation are well-suited to in-place editing:

```

>>> REC_LEN, LOC_START, LOC_LEN = 34, 7, 11

>>> def change_location(buffer, record_number, location)
...     start = record_number * REC_LEN + LOC_START
...     buffer[start: start+LOC_LEN] = location

>>> import io

>>> byte_stream = io.BytesIO(
...     b'G3805 storeroom Main chassis '
...     b'X7899 shipping Reserve cog '
...     b'L6988 receiving Primary sprocket'
... )
>>> buffer = byte_stream.getbuffer()
>>> change_location(buffer, 1, b'warehouse ')
>>> change_location(buffer, 0, b'showroom ')
>>> print(byte_stream.getvalue())
b'G3805 showroom Main chassis '
b'X7899 warehouse Reserve cog '
b'L6988 receiving Primary sprocket'

```

(Contributed by Antoine Pitrou in [bpo-5506](https://bugs.python.org/issue?@action=redirect&bpo=5506) [https://bugs.python.org/issue?@action=redirect&bpo=5506].)

## reprlib

When writing a `__repr__()` method for a custom container, it is easy to forget to handle the case where a member refers back to the container itself. Python's builtin objects such as `list` and `set` handle self-reference by displaying “...” in the recursive part of the representation string.

To help write such `__repr__()` methods, the `reprlib` module has a new decorator, `recursive_repr()`, for detecting recursive calls to `__repr__()` and substituting a placeholder string instead:

```
>>> class MyList(list):
...     @recursive_repr()
...     def __repr__(self):
...         return '<' + '|' .join(map(repr, self)) + '>'
...
>>> m = MyList('abc')
>>> m.append(m)
>>> m.append('x')
>>> print(m)
<'a'|'b'|'c'|...|'x'>
```

(Contributed by Raymond Hettinger in [bpo-9826](https://bugs.python.org/issue/?@action=redirect&bpo=9826) [https://bugs.python.org/issue/?@action=redirect&bpo=9826] and [bpo-9840](https://bugs.python.org/issue/?@action=redirect&bpo=9840) [https://bugs.python.org/issue/?@action=redirect&bpo=9840].)

## logging

In addition to dictionary-based configuration described above, the `logging` package has many other improvements.

The logging documentation has been augmented by a [basic tutorial](#), an [advanced tutorial](#), and a [cookbook](#) of logging recipes. These documents are the fastest way to learn about logging.

The `logging.basicConfig()` set-up function gained a *style* argument to support three different types of string formatting. It defaults to “%” for traditional %-formatting, can be set to “{” for the new `str.format()` style, or can be set to “\$” for the shell-

style formatting provided by `string.Template`. The following three configurations are equivalent:

```
>>> from logging import basicConfig
>>> basicConfig(style='%', format="% (name)s -> %(levelname)s")
>>> basicConfig(style='{', format="{name} -> {levelname}")
>>> basicConfig(style='$', format="$name -> $levelname: ")
```

If no configuration is set-up before a logging event occurs, there is now a default configuration using a `StreamHandler` directed to `sys.stderr` for events of `WARNING` level or higher. Formerly, an event occurring before a configuration was set-up would either raise an exception or silently drop the event depending on the value of `logging.raiseExceptions`. The new default handler is stored in `logging.lastResort`.

The use of filters has been simplified. Instead of creating a `Filter` object, the predicate can be any Python callable that returns `True` or `False`.

There were a number of other improvements that add flexibility and simplify configuration. See the module documentation for a full listing of changes in Python 3.2.

## CSV

The `csv` module now supports a new dialect, `unix_dialect`, which applies quoting for all fields and a traditional Unix style with `'\n'` as the line terminator. The registered dialect name is `unix`.

The `csv.DictWriter` has a new method, `writeheader()` for writing-out an initial row to document the field names:

```
>>> import csv, sys
>>> w = csv.DictWriter(sys.stdout, ['name', 'dept'], dialect='unix')
>>> w.writeheader()
"name", "dept"
>>> w.writerows([
...     {'name': 'tom', 'dept': 'accounting'},
...     {'name': 'susan', 'dept': 'Sales1'}])
```

```
"tom", "accounting"  
"susan", "sales"
```

(New dialect suggested by Jay Talbot in [bpo-5975](https://bugs.python.org/issue?@action=redirect&bpo=5975) [https://bugs.python.org/issue?@action=redirect&bpo=5975], and the new method suggested by Ed Abraham in [bpo-1537721](https://bugs.python.org/issue?@action=redirect&bpo=1537721) [https://bugs.python.org/issue?@action=redirect&bpo=1537721].)

## contextlib

There is a new and slightly mind-blowing tool **ContextDecorator** that is helpful for creating a **context manager** that does double duty as a function decorator.

As a convenience, this new functionality is used by **contextmanager()** so that no extra effort is needed to support both roles.

The basic idea is that both context managers and function decorators can be used for pre-action and post-action wrappers. Context managers wrap a group of statements using a **with** statement, and function decorators wrap a group of statements enclosed in a function. So, occasionally there is a need to write a pre-action or post-action wrapper that can be used in either role.

For example, it is sometimes useful to wrap functions or groups of statements with a logger that can track the time of entry and time of exit. Rather than writing both a function decorator and a context manager for the task, the **contextmanager()** provides both capabilities in a single definition:

```
from contextlib import contextmanager  
import logging  
  
logging.basicConfig(level=logging.INFO)  
  
@contextmanager  
def track_entry_and_exit(name):  
    logging.info('Entering: %s', name)  
    yield
```

```
logging.info('Exiting: %s', name)
```

Formerly, this would have only been usable as a context manager:

```
with track_entry_and_exit('widget loader'):  
    print('Some time consuming activity goes here')  
    load_widget()
```

Now, it can be used as a decorator as well:

```
@track_entry_and_exit('widget loader')  
def activity():  
    print('Some time consuming activity goes here')  
    load_widget()
```

Trying to fulfill two roles at once places some limitations on the technique. Context managers normally have the flexibility to return an argument usable by a **with** statement, but there is no parallel for function decorators.

In the above example, there is not a clean way for the *track\_entry\_and\_exit* context manager to return a logging instance for use in the body of enclosed statements.

(Contributed by Michael Foord in [bpo-9110](https://bugs.python.org/issue?@action=redirect&bpo=9110) [https://bugs.python.org/issue?@action=redirect&bpo=9110].)

## decimal and fractions

Mark Dickinson crafted an elegant and efficient scheme for assuring that different numeric datatypes will have the same hash value whenever their actual values are equal ([bpo-8188](https://bugs.python.org/issue?@action=redirect&bpo=8188) [https://bugs.python.org/issue?@action=redirect&bpo=8188]):

```
assert hash(Fraction(3, 2)) == hash(1.5) == \  
    hash(Decimal("1.5")) == hash(complex(1.5, 0))
```

Some of the hashing details are exposed through a new attribute, **sys.hash\_info**, which describes the bit width of the hash value, the prime modulus, the hash values for *infinity* and *nan*, and the multiplier used for the imaginary part of a number:

```
>>> sys.hash_info
sys.hash_info(width=64, modulus=2305843009213693951, info=)
```

An early decision to limit the inter-operability of various numeric types has been relaxed. It is still unsupported (and ill-advised) to have implicit mixing in arithmetic expressions such as `Decimal('1.1') + float('1.1')` because the latter loses information in the process of constructing the binary float. However, since existing floating point value can be converted losslessly to either a decimal or rational representation, it makes sense to add them to the constructor and to support mixed-type comparisons.

- The `decimal.Decimal` constructor now accepts `float` objects directly so there is no longer a need to use the `from_float()` method ([bpo-8257](https://bugs.python.org/issue?@action=redirect&bpo=8257) [<https://bugs.python.org/issue?@action=redirect&bpo=8257>]).
- Mixed type comparisons are now fully supported so that `Decimal` objects can be directly compared with `float` and `fractions.Fraction` ([bpo-2531](https://bugs.python.org/issue?@action=redirect&bpo=2531) [<https://bugs.python.org/issue?@action=redirect&bpo=2531>] and [bpo-8188](https://bugs.python.org/issue?@action=redirect&bpo=8188) [<https://bugs.python.org/issue?@action=redirect&bpo=8188>]).

Similar changes were made to `fractions.Fraction` so that the `from_float()` and `from_decimal()` methods are no longer needed ([bpo-8294](https://bugs.python.org/issue?@action=redirect&bpo=8294) [<https://bugs.python.org/issue?@action=redirect&bpo=8294>]):

```
>>> from decimal import Decimal
>>> from fractions import Fraction
>>> Decimal(1.1)
Decimal('1.1000000000000000088817841970012523233890533447')
>>> Fraction(1.1)
Fraction(2476979795053773, 2251799813685248)
```

Another useful change for the `decimal` module is that the `Context.clamp` attribute is now public. This is useful in creating contexts that correspond to the decimal interchange formats specified in IEEE 754 (see [bpo-8540](https://bugs.python.org/issue?@action=redirect&bpo=8540) [<https://bugs.python.org/issue?@action=redirect&bpo=8540>]).

(Contributed by Mark Dickinson and Raymond Hettinger.)

## ftp

The `ftplib.FTP` class now supports the context management protocol to unconditionally consume `socket.error` exceptions and to close the FTP connection when done:

```
>>> from ftplib import FTP
>>> with FTP("ftp1.at.proftpd.org") as ftp:
        ftp.login()
        ftp.dir()
```

```
'230 Anonymous login ok, restrictions apply.'
dr-xr-xr-x   9 ftp      ftp          154 May  6 10:43 .
dr-xr-xr-x   9 ftp      ftp          154 May  6 10:43 ..
dr-xr-xr-x   5 ftp      ftp         4096 May  6 10:43 C
dr-xr-xr-x   3 ftp      ftp          18 Jul 10 2008 F
```

Other file-like objects such as `mmap.mmap` and `fileinput.input()` also grew auto-closing context managers:

```
with fileinput.input(files=('log1.txt', 'log2.txt')) as
    for line in f:
        process(line)
```

(Contributed by Tarek Ziade and Giampaolo Rodolà in [bpo-4972](https://bugs.python.org/issue?@action=redirect&bpo=4972) [https://bugs.python.org/issue?@action=redirect&bpo=4972], and by Georg Brandl in [bpo-8046](https://bugs.python.org/issue?@action=redirect&bpo=8046) [https://bugs.python.org/issue?@action=redirect&bpo=8046] and [bpo-1286](https://bugs.python.org/issue?@action=redirect&bpo=1286) [https://bugs.python.org/issue?@action=redirect&bpo=1286].)

The `FTP_TLS` class now accepts a `context` parameter, which is a `ssl.SSLContext` object allowing bundling SSL configuration options, certificates and private keys into a single (potentially long-lived) structure.

(Contributed by Giampaolo Rodolà; [bpo-8806](https://bugs.python.org/issue?@action=redirect&bpo=8806) [https://bugs.python.org/issue?@action=redirect&bpo=8806].)

**popen**

The `os.popen()` and `subprocess.Popen()` functions now support `with` statements for auto-closing of the file descriptors.

(Contributed by Antoine Pitrou and Brian Curtin in [bpo-7461](https://bugs.python.org/issue?@action=redirect&bpo=7461) [<https://bugs.python.org/issue?@action=redirect&bpo=7461>] and [bpo-10554](https://bugs.python.org/issue?@action=redirect&bpo=10554) [<https://bugs.python.org/issue?@action=redirect&bpo=10554>].)

## select

The `select` module now exposes a new, constant attribute, `PIPE_BUF`, which gives the minimum number of bytes which are guaranteed not to block when `select.select()` says a pipe is ready for writing.

```
>>> import select
>>> select.PIPE_BUF
512
```

(Available on Unix systems. Patch by Sébastien Sablé in [bpo-9862](https://bugs.python.org/issue?@action=redirect&bpo=9862) [<https://bugs.python.org/issue?@action=redirect&bpo=9862>])

## gzip and zipfile

`gzip.GzipFile` now implements the `io.BufferedIOBase` abstract base class (except for `truncate()`). It also has a `peek()` method and supports unseekable as well as zero-padded file objects.

The `gzip` module also gains the `compress()` and `decompress()` functions for easier in-memory compression and decompression. Keep in mind that text needs to be encoded as `bytes` before compressing and decompressing:

```
>>> import gzip
>>> s = 'Three shall be the number thou shalt count, '
>>> s += 'and the number of the counting shall be three'
>>> b = s.encode() # convert to utf-8
>>> len(b)
89
```

```
>>> c = gzip.compress(b)
>>> len(c)
77
>>> gzip.decompress(c).decode()[:42]          # decompress a
'Three shall be the number thou shalt count'
```

(Contributed by Anand B. Pillai in [bpo-3488](https://bugs.python.org/issue?@action=redirect&bpo=3488) [https://bugs.python.org/issue?@action=redirect&bpo=3488]; and by Antoine Pitrou, Nir Aides and Brian Curtin in [bpo-9962](https://bugs.python.org/issue?@action=redirect&bpo=9962) [https://bugs.python.org/issue?@action=redirect&bpo=9962], [bpo-1675951](https://bugs.python.org/issue?@action=redirect&bpo=1675951) [https://bugs.python.org/issue?@action=redirect&bpo=1675951], [bpo-7471](https://bugs.python.org/issue?@action=redirect&bpo=7471) [https://bugs.python.org/issue?@action=redirect&bpo=7471] and [bpo-2846](https://bugs.python.org/issue?@action=redirect&bpo=2846) [https://bugs.python.org/issue?@action=redirect&bpo=2846].)

Also, the `zipfile.ZipExtFile` class was reworked internally to represent files stored inside an archive. The new implementation is significantly faster and can be wrapped in an `io.BufferedReader` object for more speedups. It also solves an issue where interleaved calls to *read* and *readline* gave the wrong results.

(Patch submitted by Nir Aides in [bpo-7610](https://bugs.python.org/issue?@action=redirect&bpo=7610) [https://bugs.python.org/issue?@action=redirect&bpo=7610].)

## tarfile

The `TarFile` class can now be used as a context manager. In addition, its `add()` method has a new option, *filter*, that controls which files are added to the archive and allows the file metadata to be edited.

The new *filter* option replaces the older, less flexible *exclude* parameter which is now deprecated. If specified, the optional *filter* parameter needs to be a [keyword argument](#). The user-supplied filter function accepts a `TarInfo` object and returns an updated `TarInfo` object, or if it wants the file to be excluded, the function can return `None`:

```
>>> import tarfile, glob
```

```
>>> def myfilter(tarinfo):
...     if tarinfo.isfile():                # only save regular files
...         tarinfo.uname = 'monty'        # redact the username
...         return tarinfo

>>> with tarfile.open(name='myarchive.tar.gz', mode='w'):
...     for filename in glob.glob('*.*txt'):
...         tf.add(filename, filter=myfilter)
...     tf.list()
-rw-r--r-- monty/501          902 2011-01-26 17:59:11 anno
-rw-r--r-- monty/501          123 2011-01-26 17:59:11 gene
-rw-r--r-- monty/501        3514 2011-01-26 17:59:11 pric
-rw-r--r-- monty/501          124 2011-01-26 17:59:11 py_t
-rw-r--r-- monty/501        1399 2011-01-26 17:59:11 sema
```

(Proposed by Tarek Ziadé and implemented by Lars Gustäbel in [bpo-6856](https://bugs.python.org/issue?@action=redirect&bpo=6856) [https://bugs.python.org/issue?@action=redirect&bpo=6856].)

## hashlib

The [hashlib](#) module has two new constant attributes listing the hashing algorithms guaranteed to be present in all implementations and those available on the current implementation:

```
>>> import hashlib

>>> hashlib.algorithms_guaranteed
{'sha1', 'sha224', 'sha384', 'sha256', 'sha512', 'md5'}

>>> hashlib.algorithms_available
{'md2', 'SHA256', 'SHA512', 'dsaWithSHA', 'mdc2', 'SHA224',
'sha512', 'ripemd160', 'SHA1', 'MDC2', 'SHA', 'SHA384',
'ecdsa-with-SHA1', 'md4', 'md5', 'sha1', 'DSA-SHA', 'sha256',
'dsaEncryption', 'DSA', 'RIPEMD160', 'sha', 'MD5', 'sha384'}
```

(Suggested by Carl Chenet in [bpo-7418](https://bugs.python.org/issue?@action=redirect&bpo=7418) [https://bugs.python.org/issue?@action=redirect&bpo=7418].)

## ast

The **ast** module has a wonderful a general-purpose tool for safely evaluating expression strings using the Python literal syntax. The **ast.literal\_eval()** function serves as a secure alternative to the builtin **eval()** function which is easily abused. Python 3.2 adds **bytes** and **set** literals to the list of supported types: strings, bytes, numbers, tuples, lists, dicts, sets, booleans, and **None**.

```
>>> from ast import literal_eval

>>> request = '{"req": 3, "func": "pow", "args": (2, 0.5)
>>> literal_eval(request)
{"args": (2, 0.5), "req": 3, "func": "pow"}

>>> request = "os.system('do something harmful')"
>>> literal_eval(request)
Traceback (most recent call last):
...
ValueError: malformed node or string: <_ast.Call object
(Implemented by Benjamin Peterson and Georg Brandl.)
```

## os

Different operating systems use various encodings for filenames and environment variables. The **os** module provides two new functions, **fsencode()** and **fsdecode()**, for encoding and decoding filenames:

```
>>> import os
>>> filename = 'Sehenswürdigkeiten'
>>> os.fsencode(filename)
b'Sehensw\xc3\xbcrdigkeiten'
```

Some operating systems allow direct access to encoded bytes in the environment. If so, the **os.supports\_bytes\_environ** constant will be true.

For direct access to encoded environment variables (if available), use the new **os.getenvb()** function or use **os.environb** which is a bytes version of **os.environ**.

(Contributed by Victor Stinner.)

## shutil

The `shutil.copytree()` function has two new options:

- *ignore\_dangling\_symlinks*: when `symlinks=False` so that the function copies a file pointed to by a symlink, not the symlink itself. This option will silence the error raised if the file doesn't exist.
- *copy\_function*: is a callable that will be used to copy files. `shutil.copy2()` is used by default.

(Contributed by Tarek Ziade.)

In addition, the `shutil` module now supports [archiving operations](#) for zipfiles, uncompressed tarfiles, gzipped tarfiles, and bziped tarfiles. And there are functions for registering additional archiving file formats (such as xz compressed tarfiles or custom formats).

The principal functions are `make_archive()` and `unpack_archive()`. By default, both operate on the current directory (which can be set by `os.chdir()`) and on any sub-directories. The archive filename needs to be specified with a full pathname. The archiving step is non-destructive (the original files are left unchanged).

```
>>> import shutil, pprint

>>> os.chdir('mydata')    # change to the source directory
>>> f = shutil.make_archive('/var/backup/mydata',
...                          'zip')          # archive the current directory
>>> f                        # show the name of the archive
'/var/backup/mydata.zip'
>>> os.chdir('tmp')        # change to an unarchived directory
>>> shutil.unpack_archive('/var/backup/mydata.zip') # unpack the archive

>>> pprint.pprint(shutil.get_archive_formats()) # display the supported formats
[('bztar', 'bzip2'ed tar-file'),
 ('gztar', 'gzip'ed tar-file),
```

```

('tar', 'uncompressed tar file'),
('zip', 'ZIP file')]

>>> shutil.register_archive_format(      # register a new
...     name='xz',
...     function=xz.compress,           # callable archi
...     extra_args=[('level', 8)],      # arguments to t
...     description='xz compression'
... )

```

(Contributed by Tarek Ziadé.)

## sqlite3

The **sqlite3** module was updated to pysqlite version 2.6.0. It has two new capabilities.

- The **sqlite3.Connection.in\_transit** attribute is true if there is an active transaction for uncommitted changes.
- The **sqlite3.Connection.enable\_load\_extension()** and **sqlite3.Connection.load\_extension()** methods allows you to load SQLite extensions from “.so” files. One well-known extension is the fulltext-search extension distributed with SQLite.

(Contributed by R. David Murray and Shashwat Anand; [bpo-8845](https://bugs.python.org/issue?@action=redirect&bpo=8845) [<https://bugs.python.org/issue?@action=redirect&bpo=8845>].)

## html

A new **html** module was introduced with only a single function, **escape()**, which is used for escaping reserved characters from HTML markup:

```

>>> import html
>>> html.escape('x > 2 && x < 7')
'x &gt; 2 &amp;&amp; x &lt; 7'

```

## socket

The `socket` module has two new improvements.

- Socket objects now have a `detach()` method which puts the socket into closed state without actually closing the underlying file descriptor. The latter can then be reused for other purposes. (Added by Antoine Pitrou; [bpo-8524](https://bugs.python.org/issue?@action=redirect&bpo=8524) [https://bugs.python.org/issue?@action=redirect&bpo=8524].)
- `socket.create_connection()` now supports the context management protocol to unconditionally consume `socket.error` exceptions and to close the socket when done. (Contributed by Giampaolo Rodolà; [bpo-9794](https://bugs.python.org/issue?@action=redirect&bpo=9794) [https://bugs.python.org/issue?@action=redirect&bpo=9794].)

## ssl

The `ssl` module added a number of features to satisfy common requirements for secure (encrypted, authenticated) internet connections:

- A new class, `SSLContext`, serves as a container for persistent SSL data, such as protocol settings, certificates, private keys, and various other options. It includes a `wrap_socket()` for creating an SSL socket from an SSL context.
- A new function, `ssl.match_hostname()`, supports server identity verification for higher-level protocols by implementing the rules of HTTPS (from [RFC 2818](https://datatracker.ietf.org/doc/html/rfc2818) [https://datatracker.ietf.org/doc/html/rfc2818.html]) which are also suitable for other protocols.
- The `ssl.wrap_socket()` constructor function now takes a *ciphers* argument. The *ciphers* string lists the allowed encryption algorithms using the format described in the [OpenSSL documentation](https://www.openssl.org/docs/man1.0.2/man1/ciphers.html#CIPHER-LIST-FORMAT) [https://www.openssl.org/docs/man1.0.2/man1/ciphers.html#CIPHER-LIST-FORMAT].
- When linked against recent versions of OpenSSL, the `ssl` module now supports the Server Name Indication extension to the TLS protocol, allowing multiple “virtual hosts” using different certificates on a single IP port. This extension is only supported in client mode, and is activated by passing the *server\_hostname* argument to

`ssl.SSLContext.wrap_socket()`.

- Various options have been added to the `ssl` module, such as `OP_NO_SSLv2` which disables the insecure and obsolete SSLv2 protocol.
- The extension now loads all the OpenSSL ciphers and digest algorithms. If some SSL certificates cannot be verified, they are reported as an “unknown algorithm” error.
- The version of OpenSSL being used is now accessible using the module attributes `ssl.OPENSSL_VERSION` (a string), `ssl.OPENSSL_VERSION_INFO` (a 5-tuple), and `ssl.OPENSSL_VERSION_NUMBER` (an integer).

(Contributed by Antoine Pitrou in [bpo-8850](https://bugs.python.org/issue?@action=redirect&bpo=8850) [https://bugs.python.org/issue?@action=redirect&bpo=8850], [bpo-1589](https://bugs.python.org/issue?@action=redirect&bpo=1589) [https://bugs.python.org/issue?@action=redirect&bpo=1589], [bpo-8322](https://bugs.python.org/issue?@action=redirect&bpo=8322) [https://bugs.python.org/issue?@action=redirect&bpo=8322], [bpo-5639](https://bugs.python.org/issue?@action=redirect&bpo=5639) [https://bugs.python.org/issue?@action=redirect&bpo=5639], [bpo-4870](https://bugs.python.org/issue?@action=redirect&bpo=4870) [https://bugs.python.org/issue?@action=redirect&bpo=4870], [bpo-8484](https://bugs.python.org/issue?@action=redirect&bpo=8484) [https://bugs.python.org/issue?@action=redirect&bpo=8484], and [bpo-8321](https://bugs.python.org/issue?@action=redirect&bpo=8321) [https://bugs.python.org/issue?@action=redirect&bpo=8321].)

## nntp

The `nntplib` module has a revamped implementation with better bytes and text semantics as well as more practical APIs. These improvements break compatibility with the `nntplib` version in Python 3.1, which was partly dysfunctional in itself.

Support for secure connections through both implicit (using `nntplib.NNTP_SSL`) and explicit (using `nntplib.NNTP.starttls()`) TLS has also been added.

(Contributed by Antoine Pitrou in [bpo-9360](https://bugs.python.org/issue?@action=redirect&bpo=9360) [https://bugs.python.org/issue?@action=redirect&bpo=9360] and Andrew Vant in [bpo-1926](https://bugs.python.org/issue?@action=redirect&bpo=1926) [https://bugs.python.org/issue?@action=redirect&bpo=1926].)

## certificates

`http.client.HTTPSConnection`,  
`urllib.request.HTTPSHandler` and

`urllib.request.urlopen()` now take optional arguments to allow for server certificate checking against a set of Certificate Authorities, as recommended in public uses of HTTPS.

(Added by Antoine Pitrou, [bpo-9003](https://bugs.python.org/issue?@action=redirect&bpo=9003) [https://bugs.python.org/issue?@action=redirect&bpo=9003].)

## imaplib

Support for explicit TLS on standard IMAP4 connections has been added through the new `imaplib.IMAP4.starttls` method.

(Contributed by Lorenzo M. Catucci and Antoine Pitrou, [bpo-4471](https://bugs.python.org/issue?@action=redirect&bpo=4471) [https://bugs.python.org/issue?@action=redirect&bpo=4471].)

## http.client

There were a number of small API improvements in the `http.client` module. The old-style HTTP 0.9 simple responses are no longer supported and the *strict* parameter is deprecated in all classes.

The `HTTPConnection` and `HTTPSConnection` classes now have a *source\_address* parameter for a (host, port) tuple indicating where the HTTP connection is made from.

Support for certificate checking and HTTPS virtual hosts were added to `HTTPSConnection`.

The `request()` method on connection objects allowed an optional *body* argument so that a *file object* could be used to supply the content of the request. Conveniently, the *body* argument now also accepts an *iterable* object so long as it includes an explicit Content-Length header. This extended interface is much more flexible than before.

To establish an HTTPS connection through a proxy server, there is a new `set_tunnel()` method that sets the host and port for HTTP Connect tunneling.

To match the behavior of `http.server`, the HTTP client library

now also encodes headers with ISO-8859-1 (Latin-1) encoding. It was already doing that for incoming headers, so now the behavior is consistent for both incoming and outgoing traffic. (See work by Armin Ronacher in [bpo-10980](https://bugs.python.org/issue?@action=redirect&bpo=10980) [https://bugs.python.org/issue?@action=redirect&bpo=10980].)

## unittest

The unittest module has a number of improvements supporting test discovery for packages, easier experimentation at the interactive prompt, new testcase methods, improved diagnostic messages for test failures, and better method names.

- The command-line call `python -m unittest` can now accept file paths instead of module names for running specific tests ([bpo-10620](https://bugs.python.org/issue?@action=redirect&bpo=10620) [https://bugs.python.org/issue?@action=redirect&bpo=10620]). The new test discovery can find tests within packages, locating any test importable from the top-level directory. The top-level directory can be specified with the `-t` option, a pattern for matching files with `-p`, and a directory to start discovery with `-s`:

```
$ python -m unittest discover -s my_proj_dir -p _te
```

(Contributed by Michael Foord.)

- Experimentation at the interactive prompt is now easier because the `unittest.case.TestCase` class can now be instantiated without arguments:

```
>>> from unittest import TestCase
>>> TestCase().assertEqual(pow(2, 3), 8)
```

(Contributed by Michael Foord.)

- The `unittest` module has two new methods, `assertWarns()` and `assertWarnsRegex()` to verify that a given warning type is triggered by the code under test:

```
with self.assertWarns(DeprecationWarning):
    legacy_function('XYZ')
```

(Contributed by Antoine Pitrou, [bpo-9754](https://bugs.python.org/issue/?@action=redirect&bpo=9754) [https://bugs.python.org/issue/?@action=redirect&bpo=9754].)

Another new method, `assertCountEqual()` is used to compare two iterables to determine if their element counts are equal (whether the same elements are present with the same number of occurrences regardless of order):

```
def test_anagram(self):  
    self.assertCountEqual('algorithm', 'logarithm')
```

(Contributed by Raymond Hettinger.)

- A principal feature of the unittest module is an effort to produce meaningful diagnostics when a test fails. When possible, the failure is recorded along with a diff of the output. This is especially helpful for analyzing log files of failed test runs. However, since diffs can sometime be voluminous, there is a new `maxDiff` attribute that sets maximum length of diffs displayed.
- In addition, the method names in the module have undergone a number of clean-ups.

For example, `assertRegex()` is the new name for `assertRegexpMatches()` which was misnamed because the test uses `re.search()`, not `re.match()`. Other methods using regular expressions are now named using short form “Regex” in preference to “Regexp” – this matches the names used in other unittest implementations, matches Python’s old name for the `re` module, and it has unambiguous camel-casing.

(Contributed by Raymond Hettinger and implemented by Ezio Melotti.)

- To improve consistency, some long-standing method aliases are being deprecated in favor of the preferred names:

Old Name	New Name
<code>assertTrue()</code>	<code>assertIsTrue()</code>

<code>assertEqual\$()</code>
<code>assertNotEqual\$()</code>
<code>assertAlmostEqual\$()</code>
<code>assertNotAlmostEqual\$()</code>

Likewise, the `TestCase.fail*` methods deprecated in Python 3.1 are expected to be removed in Python 3.3. Also see the [Deprecated aliases](#) section in the [unittest](#) documentation.

(Contributed by Ezio Melotti; [bpo-9424](#) [<https://bugs.python.org/issue?@action=redirect&bpo=9424>].)

- The `assertDictContainsSubset()` method was deprecated because it was misimplemented with the arguments in the wrong order. This created hard-to-debug optical illusions where tests like `TestCase().assertDictContainsSubset({'a':1, 'b':2}, {'a':1})` would fail.

(Contributed by Raymond Hettinger.)

## random

The integer methods in the [random](#) module now do a better job of producing uniform distributions. Previously, they computed selections with `int(n*random())` which had a slight bias whenever  $n$  was not a power of two. Now, multiple selections are made from a range up to the next power of two and a selection is kept only when it falls within the range  $0 \leq x < n$ . The functions and methods affected are [randrange\(\)](#), [randint\(\)](#), [choice\(\)](#), [shuffle\(\)](#) and [sample\(\)](#).

(Contributed by Raymond Hettinger; [bpo-9025](#) [<https://bugs.python.org/issue?@action=redirect&bpo=9025>].)

## poplib

[POP3\\_SSL](#) class now accepts a *context* parameter, which is a [ssl.SSLContext](#) object allowing bundling SSL configuration options, certificates and private keys into a single (potentially long-

lived) structure.

(Contributed by Giampaolo Rodolà; [bpo-8807](https://bugs.python.org/issue?@action=redirect&bpo=8807) [https://bugs.python.org/issue?@action=redirect&bpo=8807].)

## asyncore

`asyncore.dispatcher` now provides a `handle_accepted()` method returning a `(sock, addr)` pair which is called when a connection has actually been established with a new remote endpoint. This is supposed to be used as a replacement for old `handle_accept()` and avoids the user to call `accept()` directly.

(Contributed by Giampaolo Rodolà; [bpo-6706](https://bugs.python.org/issue?@action=redirect&bpo=6706) [https://bugs.python.org/issue?@action=redirect&bpo=6706].)

## tempfile

The `tempfile` module has a new context manager, `TemporaryDirectory` which provides easy deterministic cleanup of temporary directories:

```
with tempfile.TemporaryDirectory() as tmpdirname:
    print('created temporary dir:', tmpdirname)
```

(Contributed by Neil Schemenauer and Nick Coghlan; [bpo-5178](https://bugs.python.org/issue?@action=redirect&bpo=5178) [https://bugs.python.org/issue?@action=redirect&bpo=5178].)

## inspect

- The `inspect` module has a new function `getgeneratorstate()` to easily identify the current state of a generator-iterator:

```
>>> from inspect import getgeneratorstate
>>> def gen():
...     yield 'demo'
>>> g = gen()
>>> getgeneratorstate(g)
'GEN_CREATED'
```

```
>>> next(g)
'demo'
>>> getgeneratorstate(g)
'GEN_SUSPENDED'
>>> next(g, None)
>>> getgeneratorstate(g)
'GEN_CLOSED'
```

(Contributed by Rodolpho Eckhardt and Nick Coghlan,  
[bpo-10220](https://bugs.python.org/issue?@action=redirect&bpo=10220) [https://bugs.python.org/issue?  
 @action=redirect&bpo=10220].)

- To support lookups without the possibility of activating a dynamic attribute, the `inspect` module has a new function, `getattr_static()`. Unlike `hasattr()`, this is a true read-only search, guaranteed not to change state while it is searching:

```
>>> class A:
...     @property
...     def f(self):
...         print('Running')
...         return 10
...
>>> a = A()
>>> getattr(a, 'f')
Running
10
>>> inspect.getattr_static(a, 'f')
<property object at 0x1022bd788>
```

(Contributed by Michael Foord.)

## pydoc

The `pydoc` module now provides a much-improved web server interface, as well as a new command-line option `-b` to automatically open a browser window to display that server:

```
$ pydoc3.2 -b
```

(Contributed by Ron Adam; [bpo-2001](https://bugs.python.org/issue?@action=redirect&bpo=2001) [https://bugs.python.org/issue?@action=redirect&bpo=2001].)

## dis

The `dis` module gained two new functions for inspecting code, `code_info()` and `show_code()`. Both provide detailed code object information for the supplied function, method, source code string or code object. The former returns a string and the latter prints it:

```
>>> import dis, random
>>> dis.show_code(random.choice)
Name:                choice
Filename:            /Library/Frameworks/Python.framework/V...
Argument count:      2
Kw-only arguments:   0
Number of locals:    3
Stack size:          11
Flags:               OPTIMIZED, NEWLOCALS, NOFREE
Constants:
    0: 'Choose a random element from a non-empty sequence'
    1: 'Cannot choose from an empty sequence'
Names:
    0: _randbelow
    1: len
    2: ValueError
    3: IndexError
Variable names:
    0: self
    1: seq
    2: i
```

In addition, the `dis()` function now accepts string arguments so that the common idiom `dis(compile(s, '', 'eval'))` can be shortened to `dis(s)`:

```
>>> dis('3*x+1 if x%2==1 else x//2')
1                0 LOAD_NAME                0 (x)
```

```

3 LOAD_CONST          0 (2)
6 BINARY_MODULO
7 LOAD_CONST          1 (1)
10 COMPARE_OP         2 (==)
13 POP_JUMP_IF_FALSE  28
16 LOAD_CONST          2 (3)
19 LOAD_NAME           0 (x)
22 BINARY_MULTIPLY
23 LOAD_CONST          1 (1)
26 BINARY_ADD
27 RETURN_VALUE
>> 28 LOAD_NAME           0 (x)
31 LOAD_CONST          0 (2)
34 BINARY_FLOOR_DIVIDE
35 RETURN_VALUE

```

Taken together, these improvements make it easier to explore how CPython is implemented and to see for yourself what the language syntax does under-the-hood.

(Contributed by Nick Coghlan in [bpo-9147](https://bugs.python.org/issue?@action=redirect&bpo=9147) [https://bugs.python.org/issue?@action=redirect&bpo=9147].)

## dbm

All database modules now support the **get()** and **setdefault()** methods.

(Suggested by Ray Allen in [bpo-9523](https://bugs.python.org/issue?@action=redirect&bpo=9523) [https://bugs.python.org/issue?@action=redirect&bpo=9523].)

## ctypes

A new type, **ctypes.c\_ssize\_t** represents the C **ssize\_t** datatype.

## site

The **site** module has three new functions useful for reporting on

the details of a given Python installation.

- `getsitepackages()` lists all global site-packages directories.
- `getuserbase()` reports on the user's base directory where data can be stored.
- `getusersitepackages()` reveals the user-specific site-packages directory path.

```
>>> import site
>>> site.getsitepackages()
['/Library/Frameworks/Python.framework/Versions/3.2/lib/
'/Library/Frameworks/Python.framework/Versions/3.2/lib/
'/Library/Python/3.2/site-packages']
>>> site.getuserbase()
'/Users/raymondhettinger/Library/Python/3.2'
>>> site.getusersitepackages()
'/Users/raymondhettinger/Library/Python/3.2/lib/python/s
```

Conveniently, some of site's functionality is accessible directly from the command-line:

```
$ python -m site --user-base
/Users/raymondhettinger/.local
$ python -m site --user-site
/Users/raymondhettinger/.local/lib/python3.2/site-packag
```

(Contributed by Tarek Ziadé in [bpo-6693](https://bugs.python.org/issue?@action=redirect&bpo=6693) [https://bugs.python.org/issue?@action=redirect&bpo=6693].)

## sysconfig

The new `sysconfig` module makes it straightforward to discover installation paths and configuration variables that vary across platforms and installations.

The module offers access simple access functions for platform and version information:

- `get_platform()` returning values like *linux-i586* or

*macosx-10.6-ppc.*

- `get_python_version()` returns a Python version string such as "3.2".

It also provides access to the paths and variables corresponding to one of seven named schemes used by `distutils`. Those include *posix\_prefix*, *posix\_home*, *posix\_user*, *nt*, *nt\_user*, *os2*, *os2\_home*:

- `get_paths()` makes a dictionary containing installation paths for the current installation scheme.
- `get_config_vars()` returns a dictionary of platform specific variables.

There is also a convenient command-line interface:

```
C:\Python32>python -m sysconfig
Platform: "win32"
Python version: "3.2"
Current installation scheme: "nt"
```

Paths:

```
data = "C:\Python32"
include = "C:\Python32\Include"
platinclude = "C:\Python32\Include"
platlib = "C:\Python32\Lib\site-packages"
platstdlib = "C:\Python32\Lib"
purelib = "C:\Python32\Lib\site-packages"
scripts = "C:\Python32\Scripts"
stdlib = "C:\Python32\Lib"
```

Variables:

```
BINDIR = "C:\Python32"
BINLIBDEST = "C:\Python32\Lib"
EXE = ".exe"
INCLUDEPY = "C:\Python32\Include"
LIBDEST = "C:\Python32\Lib"
SO = ".pyd"
VERSION = "32"
abiflags = ""
base = "C:\Python32"
```

```
exec_prefix = "C:\\Python32"
platbase = "C:\\Python32"
prefix = "C:\\Python32"
projectbase = "C:\\Python32"
py_version = "3.2"
py_version_nodot = "32"
py_version_short = "3.2"
srcdir = "C:\\Python32"
userbase = "C:\\Documents and Settings\\Raymond\\Ap
```

(Moved out of Distutils by Tarek Ziadé.)

## pdb

The **pdb** debugger module gained a number of usability improvements:

- `pdb.py` now has a `-c` option that executes commands as given in a `.pdbrc` script file.
- A `.pdbrc` script file can contain `continue` and `next` commands that continue debugging.
- The **Pdb** class constructor now accepts a *nosigint* argument.
- New commands: `l` (list), `ll` (long list) and `source` for listing source code.
- New commands: `display` and `undisplay` for showing or hiding the value of an expression if it has changed.
- New command: `interact` for starting an interactive interpreter containing the global and local names found in the current scope.
- Breakpoints can be cleared by breakpoint number.

(Contributed by Georg Brandl, Antonio Cuni and Ilya Sandler.)

## configparser

The **configparser** module was modified to improve usability and predictability of the default parser and its supported INI syntax. The old **ConfigParser** class was removed in favor of **SafeConfigParser** which has in turn been renamed to **ConfigParser**. Support for inline comments is now turned off by

default and section or option duplicates are not allowed in a single configuration source.

Config parsers gained a new API based on the mapping protocol:

```
>>> parser = ConfigParser()
>>> parser.read_string("""
... [DEFAULT]
... location = upper left
... visible = yes
... editable = no
... color = blue
...
... [main]
... title = Main Menu
... color = green
...
... [options]
... title = Options
... """)
>>> parser['main']['color']
'green'
>>> parser['main']['editable']
'no'
>>> section = parser['options']
>>> section['title']
'Options'
>>> section['title'] = 'Options (editable: %(editable)s)'
>>> section['title']
'Options (editable: no)'
```

The new API is implemented on top of the classical API, so custom parser subclasses should be able to use it without modifications.

The INI file structure accepted by config parsers can now be customized. Users can specify alternative option/value delimiters and comment prefixes, change the name of the *DEFAULT* section or switch the interpolation syntax.

There is support for pluggable interpolation including an additional

interpolation handler **ExtendedInterpolation:**

```
>>> parser = ConfigParser(interpolation=ExtendedInterpolation)
>>> parser.read_dict({'buildout': {'directory': '/home/ambv',
...                               'custom': {'prefix': '/usr/local'}}})
>>> parser.read_string("""
... [buildout]
... parts =
...     zope9
...     instance
... find-links =
...     ${buildout:directory}/downloads/dist
...
... [zope9]
... recipe = plone.recipe.zope9install
... location = /opt/zope
...
... [instance]
... recipe = plone.recipe.zope9instance
... zope9-location = ${zope9:location}
... zope-conf = ${custom:prefix}/etc/zope.conf
... """)
>>> parser['buildout']['find-links']
'\n/home/ambv/zope9/downloads/dist'
>>> parser['instance']['zope-conf']
'/usr/local/etc/zope.conf'
>>> instance = parser['instance']
>>> instance['zope-conf']
'/usr/local/etc/zope.conf'
>>> instance['zope9-location']
'/opt/zope'
```

A number of smaller features were also introduced, like support for specifying encoding in read operations, specifying fallback values for get-functions, or reading directly from dictionaries and strings.

(All changes contributed by Łukasz Langa.)

**urllib.parse**

A number of usability improvements were made for the `urllib.parse` module.

The `urlparse()` function now supports [IPv6](https://en.wikipedia.org/wiki/IPv6) [https://en.wikipedia.org/wiki/IPv6] addresses as described in [RFC 2732](https://datatracker.ietf.org/doc/html/rfc2732.html) [https://datatracker.ietf.org/doc/html/rfc2732.html]:

```
>>> import urllib.parse
>>> urllib.parse.urlparse('http://[dead:beef:cafe:5417:a
ParseResult(scheme='http',
            netloc='[dead:beef:cafe:5417:affe:8FA3:deaf:
            path='/foo/',
            params='',
            query='',
            fragment='')
```

The `urldefrag()` function now returns a [named tuple](#):

```
>>> r = urllib.parse.urldefrag('http://python.org/about/
>>> r
DefragResult(url='http://python.org/about/', fragment='t
>>> r[0]
'http://python.org/about/'
>>> r.fragment
'target'
```

And, the `urlencode()` function is now much more flexible, accepting either a string or bytes type for the *query* argument. If it is a string, then the *safe*, *encoding*, and *error* parameters are sent to `quote_plus()` for encoding:

```
>>> urllib.parse.urlencode([
...     ('type', 'telenovela'),
...     ('name', '¿Dónde Está Elisa?')],
...     encoding='latin-1')
'type=telenovela&name=%BFD%F3nde+Est%E1+Elisa%3F'
```

As detailed in [Parsing ASCII Encoded Bytes](#), all the `urllib.parse` functions now accept ASCII-encoded byte strings as input, so long as they are not mixed with regular strings. If ASCII-encoded byte

strings are given as parameters, the return types will also be an ASCII-encoded byte strings:

```
>>> urllib.parse.urlparse(b'http://www.python.org:80/about/')
```

ParseResultBytes(scheme=b'http', netloc=b'www.python.org', path=b'/about/', params=b'', query=b'',

(Work by Nick Coghlan, Dan Mahn, and Senthil Kumaran in [bpo-2987](https://bugs.python.org/issue?@action=redirect&bpo=2987) [https://bugs.python.org/issue?@action=redirect&bpo=2987], [bpo-5468](https://bugs.python.org/issue?@action=redirect&bpo=5468) [https://bugs.python.org/issue?@action=redirect&bpo=5468], and [bpo-9873](https://bugs.python.org/issue?@action=redirect&bpo=9873) [https://bugs.python.org/issue?@action=redirect&bpo=9873].)

## mailbox

Thanks to a concerted effort by R. David Murray, the [mailbox](#) module has been fixed for Python 3.2. The challenge was that mailbox had been originally designed with a text interface, but email messages are best represented with [bytes](#) because various parts of a message may have different encodings.

The solution harnessed the [email](#) package's binary support for parsing arbitrary email messages. In addition, the solution required a number of API changes.

As expected, the [add\(\)](#) method for [mailbox.Mailbox](#) objects now accepts binary input.

[StringIO](#) and text file input are deprecated. Also, string input will fail early if non-ASCII characters are used. Previously it would fail when the email was processed in a later step.

There is also support for binary output. The [get\\_file\(\)](#) method now returns a file in the binary mode (where it used to incorrectly set the file to text-mode). There is also a new [get\\_bytes\(\)](#) method that returns a [bytes](#) representation of a message corresponding to a given *key*.

It is still possible to get non-binary output using the old API's [get\\_string\(\)](#) method, but that approach is not very useful. Instead, it is best to extract messages from a [Message](#) object or to load them from binary input.

(Contributed by R. David Murray, with efforts from Steffen Daode Nurpmeso and an initial patch by Victor Stinner in [bpo-9124](https://bugs.python.org/issue?@action=redirect&bpo=9124) [<https://bugs.python.org/issue?@action=redirect&bpo=9124>].)

## turtledemo

The demonstration code for the `turtle` module was moved from the *Demo* directory to main library. It includes over a dozen sample scripts with lively displays. Being on `sys.path`, it can now be run directly from the command-line:

```
$ python -m turtledemo
```

(Moved from the Demo directory by Alexander Belopolsky in [bpo-10199](https://bugs.python.org/issue?@action=redirect&bpo=10199) [<https://bugs.python.org/issue?@action=redirect&bpo=10199>].)

## Multi-threading

- The mechanism for serializing execution of concurrently running Python threads (generally known as the `GIL` or Global Interpreter Lock) has been rewritten. Among the objectives were more predictable switching intervals and reduced overhead due to lock contention and the number of ensuing system calls. The notion of a “check interval” to allow thread switches has been abandoned and replaced by an absolute duration expressed in seconds. This parameter is tunable through `sys.setswitchinterval()`. It currently defaults to 5 milliseconds.

Additional details about the implementation can be read from a [python-dev mailing-list message](https://mail.python.org/pipermail/python-dev/2009-October/093321.html) [<https://mail.python.org/pipermail/python-dev/2009-October/093321.html>] (however, “priority requests” as exposed in this message have not been kept for inclusion).

(Contributed by Antoine Pitrou.)

- Regular and recursive locks now accept an optional *timeout* argument to their `acquire()` method. (Contributed by Antoine Pitrou; [bpo-7316](https://bugs.python.org/issue?@action=redirect&bpo=7316) [<https://bugs.python.org/issue?@action=redirect&bpo=7316>]

@action=redirect&bpo=7316].)

- Similarly, `threading.Semaphore.acquire()` also gained a *timeout* argument. (Contributed by Torsten Landschoff; [bpo-850728](https://bugs.python.org/issue?@action=redirect&bpo=850728) [https://bugs.python.org/issue?@action=redirect&bpo=850728].)
- Regular and recursive lock acquisitions can now be interrupted by signals on platforms using Pthreads. This means that Python programs that deadlock while acquiring locks can be successfully killed by repeatedly sending SIGINT to the process (by pressing `Ctrl+C` in most shells). (Contributed by Reid Kleckner; [bpo-8844](https://bugs.python.org/issue?@action=redirect&bpo=8844) [https://bugs.python.org/issue?@action=redirect&bpo=8844].)

## Optimizations

A number of small performance enhancements have been added:

- Python's peephole optimizer now recognizes patterns such as `x in {1, 2, 3}` as being a test for membership in a set of constants. The optimizer recasts the `set` as a `frozenset` and stores the pre-built constant.

Now that the speed penalty is gone, it is practical to start writing membership tests using set-notation. This style is both semantically clear and operationally fast:

```
extension = name.rpartition('.')[2]
if extension in {'xml', 'html', 'xhtml', 'css'}:
    handle(name)
```

(Patch and additional tests contributed by Dave Malcolm; [bpo-6690](https://bugs.python.org/issue?@action=redirect&bpo=6690) [https://bugs.python.org/issue?@action=redirect&bpo=6690]).

- Serializing and unserializing data using the `pickle` module is now several times faster.

(Contributed by Alexandre Vassalotti, Antoine Pitrou and the Unladen Swallow team in [bpo-9410](https://bugs.python.org/issue?@action=redirect&bpo=9410) [https://bugs.python.org/issue?@action=redirect&bpo=9410]).

@action=redirect&bpo=9410] and [bpo-3873](https://bugs.python.org/issue?@action=redirect&bpo=3873) [https://bugs.python.org/issue?@action=redirect&bpo=3873].)

- The [Timsort algorithm](https://en.wikipedia.org/wiki/Timsort) [https://en.wikipedia.org/wiki/Timsort] used in `list.sort()` and `sorted()` now runs faster and uses less memory when called with a [key function](#). Previously, every element of a list was wrapped with a temporary object that remembered the key value associated with each element. Now, two arrays of keys and values are sorted in parallel. This saves the memory consumed by the sort wrappers, and it saves time lost to delegating comparisons.

(Patch by Daniel Stutzbach in [bpo-9915](https://bugs.python.org/issue?@action=redirect&bpo=9915) [https://bugs.python.org/issue?@action=redirect&bpo=9915].)

- JSON decoding performance is improved and memory consumption is reduced whenever the same string is repeated for multiple keys. Also, JSON encoding now uses the C speedups when the `sort_keys` argument is true.

(Contributed by Antoine Pitrou in [bpo-7451](https://bugs.python.org/issue?@action=redirect&bpo=7451) [https://bugs.python.org/issue?@action=redirect&bpo=7451] and by Raymond Hettinger and Antoine Pitrou in [bpo-10314](https://bugs.python.org/issue?@action=redirect&bpo=10314) [https://bugs.python.org/issue?@action=redirect&bpo=10314].)

- Recursive locks (created with the [threading.RLock\(\)](#) API) now benefit from a C implementation which makes them as fast as regular locks, and between 10x and 15x faster than their previous pure Python implementation.

(Contributed by Antoine Pitrou; [bpo-3001](https://bugs.python.org/issue?@action=redirect&bpo=3001) [https://bugs.python.org/issue?@action=redirect&bpo=3001].)

- The fast-search algorithm in stringlib is now used by the `split()`, `rsplit()`, `splitlines()` and `replace()` methods on [bytes](#), [bytearray](#) and [str](#) objects. Likewise, the algorithm is also used by `rfind()`, `rindex()`, `rsplit()` and `rpartition()`.

(Patch by Florent Xicluna in [bpo-7622](https://bugs.python.org/issue?@action=redirect&bpo=7622) [https://bugs.python.org/issue?@action=redirect&bpo=7622] and [bpo-7462](https://bugs.python.org/issue?@action=redirect&bpo=7462) [https://

[bugs.python.org/issue?@action=redirect&bpo=7462](https://bugs.python.org/issue?@action=redirect&bpo=7462)].)

- Integer to string conversions now work two “digits” at a time, reducing the number of division and modulo operations.

([bpo-6713](https://bugs.python.org/issue?@action=redirect&bpo=6713) [<https://bugs.python.org/issue?@action=redirect&bpo=6713>] by Gawain Bolton, Mark Dickinson, and Victor Stinner.)

There were several other minor optimizations. Set differencing now runs faster when one operand is much larger than the other (patch by Andress Bennetts in [bpo-8685](https://bugs.python.org/issue?@action=redirect&bpo=8685) [<https://bugs.python.org/issue?@action=redirect&bpo=8685>]). The **`array.repeat()`** method has a faster implementation ([bpo-1569291](https://bugs.python.org/issue?@action=redirect&bpo=1569291) [<https://bugs.python.org/issue?@action=redirect&bpo=1569291>] by Alexander Belopolsky). The **`BaseHTTPRequestHandler`** has more efficient buffering ([bpo-3709](https://bugs.python.org/issue?@action=redirect&bpo=3709) [<https://bugs.python.org/issue?@action=redirect&bpo=3709>] by Andrew Schaaf). The **`operator.attrgetter()`** function has been sped-up ([bpo-10160](https://bugs.python.org/issue?@action=redirect&bpo=10160) [<https://bugs.python.org/issue?@action=redirect&bpo=10160>] by Christos Georgiou). And **`ConfigParser`** loads multi-line arguments a bit faster ([bpo-7113](https://bugs.python.org/issue?@action=redirect&bpo=7113) [<https://bugs.python.org/issue?@action=redirect&bpo=7113>] by Łukasz Langa).

## Unicode

Python has been updated to [Unicode 6.0.0](https://unicode.org/versions/Unicode6.0.0/) [<https://unicode.org/versions/Unicode6.0.0/>]. The update to the standard adds over 2,000 new characters including [emoji](https://en.wikipedia.org/wiki/Emoji) [<https://en.wikipedia.org/wiki/Emoji>] symbols which are important for mobile phones.

In addition, the updated standard has altered the character properties for two Kannada characters (U + 0CF1, U + 0CF2) and one New Tai Lue numeric character (U + 19DA), making the former eligible for use in identifiers while disqualifying the latter. For more information, see [Unicode Character Database Changes](https://www.unicode.org/versions/Unicode6.0.0/#Database_Changes) [[https://www.unicode.org/versions/Unicode6.0.0/#Database\\_Changes](https://www.unicode.org/versions/Unicode6.0.0/#Database_Changes)].

## Codecs

Support was added for cp720 Arabic DOS encoding ([bpo-1616979](https://bugs.python.org/issue?@action=redirect&bpo=1616979) [<https://bugs.python.org/issue?@action=redirect&bpo=1616979>]).

MBCS encoding no longer ignores the error handler argument. In the default strict mode, it raises an `UnicodeDecodeError` when it encounters an undecodable byte sequence and an `UnicodeEncodeError` for an unencodable character.

The MBCS codec supports `'strict'` and `'ignore'` error handlers for decoding, and `'strict'` and `'replace'` for encoding.

To emulate Python3.1 MBCS encoding, select the `'ignore'` handler for decoding and the `'replace'` handler for encoding.

On Mac OS X, Python decodes command line arguments with `'utf-8'` rather than the locale encoding.

By default, `tarfile` uses `'utf-8'` encoding on Windows (instead of `'mbcs'`) and the `'surrogateescape'` error handler on all operating systems.

## Documentation

The documentation continues to be improved.

- A table of quick links has been added to the top of lengthy sections such as [Built-in Functions](#). In the case of [itertools](#), the links are accompanied by tables of cheatsheet-style summaries to provide an overview and memory jog without having to read all of the docs.
- In some cases, the pure Python source code can be a helpful adjunct to the documentation, so now many modules now feature quick links to the latest version of the source code. For example, the [functools](#) module documentation has a quick link at the top labeled:

**Source code** [Lib/functools.py](https://github.com/python/cpython/tree/3.11/Lib/functools.py) [<https://github.com/python/cpython/tree/3.11/Lib/functools.py>].

(Contributed by Raymond Hettinger; see [rationale](https://rhettinger.wordpress.com/2011/01/28/open-your-source-more/) [https://rhettinger.wordpress.com/2011/01/28/open-your-source-more/].)

- The docs now contain more examples and recipes. In particular, `re` module has an extensive section, [Regular Expression Examples](#). Likewise, the `itertools` module continues to be updated with new [Itertools Recipes](#).
- The `datetime` module now has an auxiliary implementation in pure Python. No functionality was changed. This just provides an easier-to-read alternate implementation.

(Contributed by Alexander Belopolsky in [bpo-9528](https://bugs.python.org/issue/?@action=redirect&bpo=9528) [https://bugs.python.org/issue/?@action=redirect&bpo=9528].)

- The unmaintained `Demo` directory has been removed. Some demos were integrated into the documentation, some were moved to the `Tools/demo` directory, and others were removed altogether.

(Contributed by Georg Brandl in [bpo-7962](https://bugs.python.org/issue/?@action=redirect&bpo=7962) [https://bugs.python.org/issue/?@action=redirect&bpo=7962].)

## IDLE

- The format menu now has an option to clean source files by stripping trailing whitespace.

(Contributed by Raymond Hettinger; [bpo-5150](https://bugs.python.org/issue/?@action=redirect&bpo=5150) [https://bugs.python.org/issue/?@action=redirect&bpo=5150].)

- IDLE on Mac OS X now works with both Carbon AquaTk and Cocoa AquaTk.

(Contributed by Kevin Walzer, Ned Deily, and Ronald Oussoren; [bpo-6075](https://bugs.python.org/issue/?@action=redirect&bpo=6075) [https://bugs.python.org/issue/?@action=redirect&bpo=6075].)

## Code Repository

In addition to the existing Subversion code repository at <https://svn.python.org> there is now a **Mercurial** [<https://www.mercurial-scm.org/>] repository at <https://hg.python.org/>.

After the 3.2 release, there are plans to switch to Mercurial as the primary repository. This distributed version control system should make it easier for members of the community to create and share external changesets. See **PEP 385** [<https://peps.python.org/pep-0385/>] for details.

To learn to use the new version control system, see the **Quick Start** [<https://www.mercurial-scm.org/wiki/QuickStart>] or the **Guide to Mercurial Workflows** [<https://www.mercurial-scm.org/guide/>].

## Build and C API Changes

Changes to Python's build process and to the C API include:

- The *idle*, *pydoc* and *2to3* scripts are now installed with a version-specific suffix on `make altinstall` ([bpo-10679](https://bugs.python.org/issue?@action=redirect&bpo=10679) [<https://bugs.python.org/issue?@action=redirect&bpo=10679>]).
- The C functions that access the Unicode Database now accept and return characters from the full Unicode range, even on narrow unicode builds (`Py_UNICODE_TOLOWER`, `Py_UNICODE_ISDECIMAL`, and others). A visible difference in Python is that `unicodedata.numeric()` now returns the correct value for large code points, and `repr()` may consider more characters as printable.

(Reported by Bupjoe Lee and fixed by Amaury Forgeot D'Arc; [bpo-5127](https://bugs.python.org/issue?@action=redirect&bpo=5127) [<https://bugs.python.org/issue?@action=redirect&bpo=5127>].)

- Computed gotos are now enabled by default on supported compilers (which are detected by the configure script). They can still be disabled selectively by specifying `--without-computed-gotos`.

(Contributed by Antoine Pitrou; [bpo-9203](https://bugs.python.org/issue?@action=redirect&bpo=9203) [<https://bugs.python.org/issue?@action=redirect&bpo=9203>].)

- The option `--with-wctype-functions` was removed. The built-in unicode database is now used for all functions.

(Contributed by Amaury Forgeot D’Arc; [bpo-9210](https://bugs.python.org/issue?@action=redirect&bpo=9210) [https://bugs.python.org/issue?@action=redirect&bpo=9210].)

- Hash values are now values of a new type, **`Py_hash_t`**, which is defined to be the same size as a pointer. Previously they were of type `long`, which on some 64-bit operating systems is still only 32 bits long. As a result of this fix, **`set`** and **`dict`** can now hold more than  $2^{32}$  entries on builds with 64-bit pointers (previously, they could grow to that size but their performance degraded catastrophically).

(Suggested by Raymond Hettinger and implemented by Benjamin Peterson; [bpo-9778](https://bugs.python.org/issue?@action=redirect&bpo=9778) [https://bugs.python.org/issue?@action=redirect&bpo=9778].)

- A new macro **`Py_VA_COPY`** copies the state of the variable argument list. It is equivalent to C99 `va_copy` but available on all Python platforms ([bpo-2443](https://bugs.python.org/issue?@action=redirect&bpo=2443) [https://bugs.python.org/issue?@action=redirect&bpo=2443]).
- A new C API function **`PySys_SetArgvEx()`** allows an embedded interpreter to set **`sys.argv`** without also modifying **`sys.path`** ([bpo-5753](https://bugs.python.org/issue?@action=redirect&bpo=5753) [https://bugs.python.org/issue?@action=redirect&bpo=5753]).
- **`PyEval_CallObject`** is now only available in macro form. The function declaration, which was kept for backwards compatibility reasons, is now removed – the macro was introduced in 1997 ([bpo-8276](https://bugs.python.org/issue?@action=redirect&bpo=8276) [https://bugs.python.org/issue?@action=redirect&bpo=8276]).
- There is a new function **`PyLong_AsLongLongAndOverflow()`** which is analogous to **`PyLong_AsLongAndOverflow()`**. They both serve to convert Python **`int`** into a native fixed-width type while providing detection of cases where the conversion won’t fit ([bpo-7767](https://bugs.python.org/issue?@action=redirect&bpo=7767) [https://bugs.python.org/issue?@action=redirect&bpo=7767]).

- The `PyUnicode_CompareWithASCIIString()` function now returns *not equal* if the Python string is *NUL* terminated.
- There is a new function `PyErr_NewExceptionWithDoc()` that is like `PyErr_NewException()` but allows a docstring to be specified. This lets C exceptions have the same self-documenting capabilities as their pure Python counterparts ([bpo-7033](https://bugs.python.org/issue?@action=redirect&bpo=7033) [https://bugs.python.org/issue?@action=redirect&bpo=7033]).
- When compiled with the `--with-valgrind` option, the pymalloc allocator will be automatically disabled when running under Valgrind. This gives improved memory leak detection when running under Valgrind, while taking advantage of pymalloc at other times ([bpo-2422](https://bugs.python.org/issue?@action=redirect&bpo=2422) [https://bugs.python.org/issue?@action=redirect&bpo=2422]).
- Removed the `o?` format from the `PyArg_Parse` functions. The format is no longer used and it had never been documented ([bpo-8837](https://bugs.python.org/issue?@action=redirect&bpo=8837) [https://bugs.python.org/issue?@action=redirect&bpo=8837]).

There were a number of other small changes to the C-API. See the [Misc/NEWS](https://github.com/python/cpython/blob/v3.2.6/Misc/NEWS) [https://github.com/python/cpython/blob/v3.2.6/Misc/NEWS] file for a complete list.

Also, there were a number of updates to the Mac OS X build, see [Mac/BuildScript/README.txt](https://github.com/python/cpython/blob/v3.2.6/Mac/BuildScript/README.txt) [https://github.com/python/cpython/blob/v3.2.6/Mac/BuildScript/README.txt] for details. For users running a 32/64-bit build, there is a known problem with the default Tcl/Tk on Mac OS X 10.6. Accordingly, we recommend installing an updated alternative such as [ActiveState Tcl/Tk 8.5.9](https://web.archive.org/web/20101208191259/https://www.activestate.com/activetcl/downloads) [https://web.archive.org/web/20101208191259/https://www.activestate.com/activetcl/downloads]. See <https://www.python.org/download/mac/tcltk/> for additional details.

## Porting to Python 3.2

This section lists previously described changes and other bugfixes that may require changes to your code:

- The `configparser` module has a number of clean-ups. The major change is to replace the old `ConfigParser` class with long-standing preferred alternative `SafeConfigParser`. In addition there are a number of smaller incompatibilities:
  - The interpolation syntax is now validated on `get()` and `set()` operations. In the default interpolation scheme, only two tokens with percent signs are valid: `%(name)s` and `%%`, the latter being an escaped percent sign.
  - The `set()` and `add_section()` methods now verify that values are actual strings. Formerly, unsupported types could be introduced unintentionally.
  - Duplicate sections or options from a single source now raise either `DuplicateSectionError` or `DuplicateOptionError`. Formerly, duplicates would silently overwrite a previous entry.
  - Inline comments are now disabled by default so now the `;` character can be safely used in values.
  - Comments now can be indented. Consequently, for `;` or `#` to appear at the start of a line in multiline values, it has to be interpolated. This keeps comment prefix characters in values from being mistaken as comments.
  - `""` is now a valid value and is no longer automatically converted to an empty string. For empty strings, use `"option ="` in a line.
- The `nntplib` module was reworked extensively, meaning that its APIs are often incompatible with the 3.1 APIs.
- `bytearray` objects can no longer be used as filenames; instead, they should be converted to `bytes`.
- The `array.toString()` and `array.fromstring()` have been renamed to `array.tobytes()` and `array.frombytes()` for clarity. The old names have been deprecated. (See [bpo-8990](https://bugs.python.org/issue?@action=redirect&bpo=8990) [https://bugs.python.org/issue?@action=redirect&bpo=8990].)
- `PyArg_Parse*` functions:

- “t#” format has been removed: use “s#” or “s\*” instead
- “w” and “w#” formats has been removed: use “w\*” instead
- The **PyCObject** type, deprecated in 3.1, has been removed. To wrap opaque C pointers in Python objects, the **PyCapsule** API should be used instead; the new type has a well-defined interface for passing typing safety information and a less complicated signature for calling a destructor.
- The **sys.setfilesystemencoding()** function was removed because it had a flawed design.
- The **random.seed()** function and method now salt string seeds with an sha512 hash function. To access the previous version of *seed* in order to reproduce Python 3.1 sequences, set the *version* argument to 1, `random.seed(s, version=1)`.
- The previously deprecated **string.maketrans()** function has been removed in favor of the static methods **bytes.maketrans()** and **bytearray.maketrans()**. This change solves the confusion around which types were supported by the **string** module. Now, **str**, **bytes**, and **bytearray** each have their own **maketrans** and **translate** methods with intermediate translation tables of the appropriate type.

(Contributed by Georg Brandl; [bpo-5675](https://bugs.python.org/issue?@action=redirect&bpo=5675) [https://bugs.python.org/issue?@action=redirect&bpo=5675].)

- The previously deprecated **contextlib.nested()** function has been removed in favor of a plain **with** statement which can accept multiple context managers. The latter technique is faster (because it is built-in), and it does a better job finalizing multiple context managers when one of them raises an exception:

```
with open('mylog.txt') as infile, open('a.out', 'w') as outfile:
    for line in infile:
        if '<critical>' in line:
```

```
outfile.write(line)
```

(Contributed by Georg Brandl and Mattias Brändström;  
[appspot issue 53094](https://codereview.appspot.com/53094) [https://codereview.appspot.com/53094].)

- `struct.pack()` now only allows bytes for the `s` string pack code. Formerly, it would accept text arguments and implicitly encode them to bytes using UTF-8. This was problematic because it made assumptions about the correct encoding and because a variable-length encoding can fail when writing to fixed length segment of a structure.

Code such as `struct.pack('<6sHHBBB', 'GIF87a', x, y)` should be rewritten with to use bytes instead of text, `struct.pack('<6sHHBBB', b'GIF87a', x, y)`.

(Discovered by David Beazley and fixed by Victor Stinner;  
[bpo-10783](https://bugs.python.org/issue?@action=redirect&bpo=10783) [https://bugs.python.org/issue?@action=redirect&bpo=10783].)

- The `xml.etree.ElementTree` class now raises an `xml.etree.ElementTree.ParseError` when a parse fails. Previously it raised an `xml.parsers.expat.ExpatError`.
- The new, longer `str()` value on floats may break doctests which rely on the old output format.
- In `subprocess.Popen`, the default value for `close_fds` is now `True` under Unix; under Windows, it is `True` if the three standard streams are set to `None`, `False` otherwise. Previously, `close_fds` was always `False` by default, which produced difficult to solve bugs or race conditions when open file descriptors would leak into the child process.
- Support for legacy HTTP 0.9 has been removed from `urllib.request` and `http.client`. Such support is still present on the server side (in `http.server`).

(Contributed by Antoine Pitrou, [bpo-10711](https://bugs.python.org/issue?@action=redirect&bpo=10711) [https://bugs.python.org/issue?@action=redirect&bpo=10711].)

- SSL sockets in timeout mode now raise `socket.timeout` when a timeout occurs, rather than a generic `SSLError`.

(Contributed by Antoine Pitrou, [bpo-10272](https://bugs.python.org/issue?@action=redirect&bpo=10272) [https://bugs.python.org/issue?@action=redirect&bpo=10272].)

- The misleading functions `PyEval_AcquireLock()` and `PyEval_ReleaseLock()` have been officially deprecated. The thread-state aware APIs (such as `PyEval_SaveThread()` and `PyEval_RestoreThread()`) should be used instead.
- Due to security risks, `asyncore.handle_accept()` has been deprecated, and a new function, `asyncore.handle_accepted()`, was added to replace it.

(Contributed by Giampaolo Rodola in [bpo-6706](https://bugs.python.org/issue?@action=redirect&bpo=6706) [https://bugs.python.org/issue?@action=redirect&bpo=6706].)

- Due to the new [GIL](#) implementation, `PyEval_InitThreads()` cannot be called before `Py_Initialize()` anymore.

# What's New In Python 3.1

Author

Raymond Hettinger

This article explains the new features in Python 3.1, compared to 3.0. Python 3.1 was released on June 27, 2009.

## PEP 372: Ordered Dictionaries

Regular Python dictionaries iterate over key/value pairs in arbitrary order. Over the years, a number of authors have written alternative implementations that remember the order that the keys were originally inserted. Based on the experiences from those implementations, a new `collections.OrderedDict` class has been introduced.

The `OrderedDict` API is substantially the same as regular dictionaries but will iterate over keys and values in a guaranteed order depending on when a key was first inserted. If a new entry overwrites an existing entry, the original insertion position is left unchanged. Deleting an entry and reinserting it will move it to the end.

The standard library now supports use of ordered dictionaries in several modules. The `configparser` module uses them by default. This lets configuration files be read, modified, and then written back in their original order. The `_asdict()` method for `collections.namedtuple()` now returns an ordered dictionary with the values appearing in the same order as the underlying tuple indices. The `json` module is being built-out with an `object_pairs_hook` to allow `OrderedDicts` to be built by the decoder. Support was also added for third-party tools like `PyYAML` [<https://pyyaml.org/>].

PEP written by Armin Ronacher and Raymond Hettinger.  
Implementation written by Raymond Hettinger.

## PEP 378: Format Specifier for Thousands Separator

The built-in `format()` function and the `str.format()` method use a mini-language that now includes a simple, non-locale aware way to format a number with a thousands separator. That provides a way to humanize a program's output, improving its professional appearance and readability:

```
>>> format(1234567, ',d')
'1,234,567'
>>> format(1234567.89, ',.2f')
'1,234,567.89'
>>> format(12345.6 + 8901234.12j, ',f')
'12,345.600000+8,901,234.120000j'
>>> format(Decimal('1234567.89'), ',f')
'1,234,567.89'
```

The supported types are `int`, `float`, `complex` and `decimal.Decimal`.

Discussions are underway about how to specify alternative separators like dots, spaces, apostrophes, or underscores. Locale-aware applications should use the existing `n` format specifier which already has some support for thousands separators.

See also

**PEP 378** [<https://peps.python.org/pep-0378/>] - **Format Specifier for Thousands Separator**

PEP written by Raymond Hettinger and implemented by

## Other Language Changes

Some smaller changes made to the core Python language are:

- Directories and zip archives containing a `__main__.py` file can now be executed directly by passing their name to the interpreter. The directory/zipfile is automatically inserted as the first entry in `sys.path`. (Suggestion and initial patch by Andy Chu; revised patch by Phillip J. Eby and Nick Coghlan; [bpo-1739468](https://bugs.python.org/issue?@action=redirect&bpo=1739468) [https://bugs.python.org/issue?@action=redirect&bpo=1739468].)
- The `int()` type gained a `bit_length` method that returns the number of bits necessary to represent its argument in binary:

```
>>> n = 37
>>> bin(37)
'0b100101'
>>> n.bit_length()
6
>>> n = 2**123-1
>>> n.bit_length()
123
>>> (n+1).bit_length()
124
```

(Contributed by Fredrik Johansson, Victor Stinner, Raymond Hettinger, and Mark Dickinson; [bpo-3439](https://bugs.python.org/issue?@action=redirect&bpo=3439) [https://bugs.python.org/issue?@action=redirect&bpo=3439].)

- The fields in `format()` strings can now be automatically numbered:

```
>>> 'Sir {} of {}'.format('Gallahad', 'Camelot')
'Sir Gallahad of Camelot'
```

Formerly, the string would have required numbered fields

such as: `'Sir {0} of {1}'`.

(Contributed by Eric Smith; [bpo-5237](https://bugs.python.org/issue?@action=redirect&bpo=5237) [https://bugs.python.org/issue?@action=redirect&bpo=5237].)

- The `string.maketrans()` function is deprecated and is replaced by new static methods, `bytes.maketrans()` and `bytearray.maketrans()`. This change solves the confusion around which types were supported by the `string` module. Now, `str`, `bytes`, and `bytearray` each have their own `maketrans` and `translate` methods with intermediate translation tables of the appropriate type.

(Contributed by Georg Brandl; [bpo-5675](https://bugs.python.org/issue?@action=redirect&bpo=5675) [https://bugs.python.org/issue?@action=redirect&bpo=5675].)

- The syntax of the `with` statement now allows multiple context managers in a single statement:

```
>>> with open('mylog.txt') as infile, open('a.out',
...      for line in infile:
...          if '<critical>' in line:
...              outfile.write(line)
```

With the new syntax, the `contextlib.nested()` function is no longer needed and is now deprecated.

(Contributed by Georg Brandl and Mattias Brändström; [appspot issue 53094](https://codereview.appspot.com/53094) [https://codereview.appspot.com/53094].)

- `round(x, n)` now returns an integer if `x` is an integer. Previously it returned a float:

```
>>> round(1123, -2)
1100
```

(Contributed by Mark Dickinson; [bpo-4707](https://bugs.python.org/issue?@action=redirect&bpo=4707) [https://bugs.python.org/issue?@action=redirect&bpo=4707].)

- Python now uses David Gay's algorithm for finding the shortest floating point representation that doesn't change its value. This should help mitigate some of the confusion

surrounding binary floating point numbers.

The significance is easily seen with a number like `1.1` which does not have an exact equivalent in binary floating point. Since there is no exact equivalent, an expression like `float('1.1')` evaluates to the nearest representable value which is `0x1.199999999999ap+0` in hex or `1.1000000000000000888178419700125232338905334472656` in decimal. That nearest value was and still is used in subsequent floating point calculations.

What is new is how the number gets displayed. Formerly, Python used a simple approach. The value of `repr(1.1)` was computed as `format(1.1, '.17g')` which evaluated to `'1.1000000000000001'`. The advantage of using 17 digits was that it relied on IEEE-754 guarantees to assure that `eval(repr(1.1))` would round-trip exactly to its original value. The disadvantage is that many people found the output to be confusing (mistaking intrinsic limitations of binary floating point representation as being a problem with Python itself).

The new algorithm for `repr(1.1)` is smarter and returns `'1.1'`. Effectively, it searches all equivalent string representations (ones that get stored with the same underlying float value) and returns the shortest representation.

The new algorithm tends to emit cleaner representations when possible, but it does not change the underlying values. So, it is still the case that `1.1 + 2.2 != 3.3` even though the representations may suggest otherwise.

The new algorithm depends on certain features in the underlying floating point implementation. If the required features are not found, the old algorithm will continue to be used. Also, the text pickle protocols assure cross-platform portability by using the old algorithm.

(Contributed by Eric Smith and Mark Dickinson; [bpo-1580](https://bugs.python.org/issue?@action=redirect&bpo=1580)  
[<https://bugs.python.org/issue?@action=redirect&bpo=1580>])

# New, Improved, and Deprecated Modules

- Added a `collections.Counter` class to support convenient counting of unique items in a sequence or iterable:

```
>>> Counter(['red', 'blue', 'red', 'green', 'blue',  
Counter({'blue': 3, 'red': 2, 'green': 1})
```

(Contributed by Raymond Hettinger; [bpo-1696199](https://bugs.python.org/issue?@action=redirect&bpo=1696199) [https://bugs.python.org/issue?@action=redirect&bpo=1696199].)

- Added a new module, `tkinter.ttk` for access to the Tk themed widget set. The basic idea of ttk is to separate, to the extent possible, the code implementing a widget's behavior from the code implementing its appearance.

(Contributed by Guilherme Polo; [bpo-2983](https://bugs.python.org/issue?@action=redirect&bpo=2983) [https://bugs.python.org/issue?@action=redirect&bpo=2983].)

- The `gzip.GzipFile` and `bz2.BZ2File` classes now support the context management protocol:

```
>>> # Automatically close file after writing  
>>> with gzip.GzipFile(filename, "wb") as f:  
...     f.write(b"xxx")
```

(Contributed by Antoine Pitrou.)

- The `decimal` module now supports methods for creating a decimal object from a binary `float`. The conversion is exact but can sometimes be surprising:

```
>>> Decimal.from_float(1.1)  
Decimal('1.1000000000000000888178419700125232338905
```

The long decimal result shows the actual binary fraction being stored for *1.1*. The fraction has many digits because *1.1* cannot be exactly represented in binary.

(Contributed by Raymond Hettinger and Mark Dickinson.)

- The `itertools` module grew two new functions. The `itertools.combinations_with_replacement()` function is one of four for generating combinatorics including permutations and Cartesian products. The `itertools.compress()` function mimics its namesake from APL. Also, the existing `itertools.count()` function now has an optional `step` argument and can accept any type of counting sequence including `fractions.Fraction` and `decimal.Decimal`:

(Contributed by Raymond Hettinger.)

```
>>> query = input()
SELECT region, dept, count(*) FROM main GROUPBY reg

>>> cursor.execute(query)
>>> query_fields = [desc[0] for desc in cursor.description]
>>> UserQuery = namedtuple('UserQuery', query_fields)
>>> pprint.pprint([UserQuery(*row) for row in cursor.fetchall()])
[UserQuery(region='South', dept='Shipping', _2=185)
 UserQuery(region='North', dept='Accounting', _2=37)
 UserQuery(region='West', dept='Sales', _2=419)]
```

(Contributed by Raymond Hettinger; [bpo-1818](https://bugs.python.org/issue?@action=redirect&bpo=1818) [https://bugs.python.org/issue?@action=redirect&bpo=1818].)

- The `re.sub()`, `re.subn()` and `re.split()` functions now accept a flags parameter.

(Contributed by Gregory Smith.)

- The `logging` module now implements a simple `logging.NullHandler` class for applications that are not using logging but are calling library code that does. Setting-up a null handler will suppress spurious warnings such as “No handlers could be found for logger foo”:

```
>>> h = logging.NullHandler()
>>> logging.getLogger("foo").addHandler(h)
```

(Contributed by Vinay Sajip; [bpo-4384](https://bugs.python.org/issue?@action=redirect&bpo=4384) [https://bugs.python.org/issue?@action=redirect&bpo=4384]).

- The `runpy` module which supports the `-m` command line switch now supports the execution of packages by looking for and executing a `__main__` submodule when a package name is supplied.

(Contributed by Andi Vajda; [bpo-4195](https://bugs.python.org/issue?@action=redirect&bpo=4195) [https://bugs.python.org/issue?@action=redirect&bpo=4195].)

- The `pdb` module can now access and display source code loaded via `zipimport` (or any other conformant [PEP 302](https://peps.python.org/pep-0302/) [https://peps.python.org/pep-0302/] loader).

(Contributed by Alexander Belopolsky; [bpo-4201](https://bugs.python.org/issue?@action=redirect&bpo=4201) [https://bugs.python.org/issue?@action=redirect&bpo=4201].)

- `functools.partial` objects can now be pickled.

(Suggested by Antoine Pitrou and Jesse Noller.  
Implemented by Jack Diederich; [bpo-5228](https://bugs.python.org/issue?@action=redirect&bpo=5228) [https://bugs.python.org/issue?@action=redirect&bpo=5228].)

- Add `pydoc` help topics for symbols so that `help('@')`

works as expected in the interactive environment.

(Contributed by David Laban; [bpo-4739](https://bugs.python.org/issue?@action=redirect&bpo=4739) [https://bugs.python.org/issue?@action=redirect&bpo=4739].)

- The `unittest` module now supports skipping individual tests or classes of tests. And it supports marking a test as an expected failure, a test that is known to be broken, but shouldn't be counted as a failure on a `TestResult`:

```
class TestGizmo(unittest.TestCase):

    @unittest.skipUnless(sys.platform.startswith("w")
    def test_gizmo_on_windows(self):
        ...

    @unittest.expectedFailure
    def test_gimzo_without_required_library(self):
        ...
```

Also, tests for exceptions have been builtout to work with context managers using the `with` statement:

```
def test_division_by_zero(self):
    with self.assertRaises(ZeroDivisionError):
        x / 0
```

In addition, several new assertion methods were added including `assertSetEqual()`, `assertDictEqual()`, `assertDictContainsSubset()`, `assertListEqual()`, `assertTupleEqual()`, `assertSequenceEqual()`, `assertRaisesRegexp()`, `assertIsNone()`, and `assertIsNotNone()`.

(Contributed by Benjamin Peterson and Antoine Pitrou.)

- The `io` module has three new constants for the `seek()` method `SEEK_SET`, `SEEK_CUR`, and `SEEK_END`.
- The `sys.version_info` tuple is now a named tuple:

```
>>> sys.version_info
sys.version_info(major=3, minor=1, micro=0, release
```

(Contributed by Ross Light; [bpo-4285](https://bugs.python.org/issue?@action=redirect&bpo=4285) [https://bugs.python.org/issue?@action=redirect&bpo=4285].)

- The [nntplib](#) and [imaplib](#) modules now support IPv6.

(Contributed by Derek Morr; [bpo-1655](https://bugs.python.org/issue?@action=redirect&bpo=1655) [https://bugs.python.org/issue?@action=redirect&bpo=1655] and [bpo-1664](https://bugs.python.org/issue?@action=redirect&bpo=1664) [https://bugs.python.org/issue?@action=redirect&bpo=1664].)

- The [pickle](#) module has been adapted for better interoperability with Python 2.x when used with protocol 2 or lower. The reorganization of the standard library changed the formal reference for many objects. For example, `__builtin__.set` in Python 2 is called `builtins.set` in Python 3. This change confounded efforts to share data between different versions of Python. But now when protocol 2 or lower is selected, the pickler will automatically use the old Python 2 names for both loading and dumping. This remapping is turned-on by default but can be disabled with the *fix\_imports* option:

```
>>> s = {1, 2, 3}
>>> pickle.dumps(s, protocol=0)
b'c__builtin__\nset\np0\n((lp1\nL1L\naL2L\naL3L\natp2\n'
>>> pickle.dumps(s, protocol=0, fix_imports=False)
b'cbuiltins\nset\np0\n((lp1\nL1L\naL2L\naL3L\natp2\n'
```

An unfortunate but unavoidable side-effect of this change is that protocol 2 pickles produced by Python 3.1 won't be readable with Python 3.0. The latest pickle protocol, protocol 3, should be used when migrating data between Python 3.x implementations, as it doesn't attempt to remain compatible with Python 2.x.

(Contributed by Alexandre Vassalotti and Antoine Pitrou, [bpo-6137](https://bugs.python.org/issue?@action=redirect&bpo=6137) [https://bugs.python.org/issue?@action=redirect&bpo=6137].)

- A new module, `importlib` was added. It provides a complete, portable, pure Python reference implementation of the `import` statement and its counterpart, the `__import__()` function. It represents a substantial step forward in documenting and defining the actions that take place during imports.

(Contributed by Brett Cannon.)

## Optimizations

Major performance enhancements have been added:

- The new I/O library (as defined in [PEP 3116](https://peps.python.org/pep-3116/) [https://peps.python.org/pep-3116/]) was mostly written in Python and quickly proved to be a problematic bottleneck in Python 3.0. In Python 3.1, the I/O library has been entirely rewritten in C and is 2 to 20 times faster depending on the task at hand. The pure Python version is still available for experimentation purposes through the `_pyio` module.

(Contributed by Amaury Forgeot d'Arc and Antoine Pitrou.)

- Added a heuristic so that tuples and dicts containing only untrackable objects are not tracked by the garbage collector. This can reduce the size of collections and therefore the garbage collection overhead on long-running programs, depending on their particular use of datatypes.

(Contributed by Antoine Pitrou, [bpo-4688](https://bugs.python.org/issue?@action=redirect&bpo=4688) [https://bugs.python.org/issue?@action=redirect&bpo=4688].)

- Enabling a configure option named `--with-computed-gotos` on compilers that support it (notably: gcc, SunPro, icc), the bytecode evaluation loop is compiled with a new dispatch mechanism which gives speedups of up to 20%, depending on the system, the compiler, and the benchmark.

(Contributed by Antoine Pitrou along with a number of other participants, [bpo-4753](https://bugs.python.org/issue?@action=redirect&bpo=4753) [https://bugs.python.org/issue?@action=redirect&bpo=4753]).

- The decoding of UTF-8, UTF-16 and LATIN-1 is now two to four times faster.

(Contributed by Antoine Pitrou and Amaury Forgeot d'Arc, [bpo-4868](https://bugs.python.org/issue?@action=redirect&bpo=4868) [https://bugs.python.org/issue?@action=redirect&bpo=4868].)

- The **json** module now has a C extension to substantially improve its performance. In addition, the API was modified so that json works only with **str**, not with **bytes**. That change makes the module closely match the **JSON specification** [https://json.org/] which is defined in terms of Unicode.

(Contributed by Bob Ippolito and converted to Py3.1 by Antoine Pitrou and Benjamin Peterson; [bpo-4136](https://bugs.python.org/issue?@action=redirect&bpo=4136) [https://bugs.python.org/issue?@action=redirect&bpo=4136].)

- Unpickling now interns the attribute names of pickled objects. This saves memory and allows pickles to be smaller.

(Contributed by Jake McGuire and Antoine Pitrou; [bpo-5084](https://bugs.python.org/issue?@action=redirect&bpo=5084) [https://bugs.python.org/issue?@action=redirect&bpo=5084].)

## IDLE

- IDLE's format menu now provides an option to strip trailing whitespace from a source file.

(Contributed by Roger D. Serwy; [bpo-5150](https://bugs.python.org/issue?@action=redirect&bpo=5150) [https://bugs.python.org/issue?@action=redirect&bpo=5150].)

## Build and C API Changes

Changes to Python's build process and to the C API include:

- Integers are now stored internally either in base  $2^{**15}$  or in base  $2^{**30}$ , the base being determined at build time. Previously, they were always stored in base  $2^{**15}$ . Using base  $2^{**30}$  gives significant performance improvements on

64-bit machines, but benchmark results on 32-bit machines have been mixed. Therefore, the default is to use base `2**30` on 64-bit machines and base `2**15` on 32-bit machines; on Unix, there's a new configure option `--enable-big-digits` that can be used to override this default.

Apart from the performance improvements this change should be invisible to end users, with one exception: for testing and debugging purposes there's a new `sys.int_info` that provides information about the internal format, giving the number of bits per digit and the size in bytes of the C type used to store each digit:

```
>>> import sys
>>> sys.int_info
sys.int_info(bits_per_digit=30, sizeof_digit=4)
```

(Contributed by Mark Dickinson; [bpo-4258](https://bugs.python.org/issue?@action=redirect&bpo=4258) [https://bugs.python.org/issue?@action=redirect&bpo=4258].)

- The `PyLong_AsUnsignedLongLong()` function now handles a negative *pylong* by raising `OverflowError` instead of `TypeError`.

(Contributed by Mark Dickinson and Lisandro Dalcrin; [bpo-5175](https://bugs.python.org/issue?@action=redirect&bpo=5175) [https://bugs.python.org/issue?@action=redirect&bpo=5175].)

- Deprecated `PyNumber_Int()`. Use `PyNumber_Long()` instead.

(Contributed by Mark Dickinson; [bpo-4910](https://bugs.python.org/issue?@action=redirect&bpo=4910) [https://bugs.python.org/issue?@action=redirect&bpo=4910].)

- Added a new `PyOS_string_to_double()` function to replace the deprecated functions `PyOS_ascii_strtod()` and `PyOS_ascii_atof()`.

(Contributed by Mark Dickinson; [bpo-5914](https://bugs.python.org/issue?@action=redirect&bpo=5914) [https://bugs.python.org/issue?@action=redirect&bpo=5914].)

- Added **PyCapsule** as a replacement for the **PyCObject** API. The principal difference is that the new type has a well defined interface for passing typing safety information and a less complicated signature for calling a destructor. The old type had a problematic API and is now deprecated.

(Contributed by Larry Hastings; [bpo-5630](https://bugs.python.org/issue/?@action=redirect&bpo=5630) [https://bugs.python.org/issue/?@action=redirect&bpo=5630].)

## Porting to Python 3.1

This section lists previously described changes and other bugfixes that may require changes to your code:

- The new floating point string representations can break existing doctests. For example:

```
def e():
    '''Compute the base of natural logarithms.

    >>> e()
    2.7182818284590451

    '''
    return sum(1/math.factorial(x) for x in reverse

doctest.testmod()

*****
Failed example:
    e()
Expected:
    2.7182818284590451
Got:
    2.718281828459045
*****
```

- The automatic name remapping in the pickle module for protocol 2 or lower can make Python 3.1 pickles unreadable

in Python 3.0. One solution is to use protocol 3. Another solution is to set the *fix\_imports* option to `False`. See the discussion above for more details.

# What's New In Python 3.0

## Author

Guido van Rossum

This article explains the new features in Python 3.0, compared to 2.6. Python 3.0, also known as “Python 3000” or “Py3K”, is the first ever *intentionally backwards incompatible* Python release. Python 3.0 was released on December 3, 2008. There are more changes than in a typical release, and more that are important for all Python users. Nevertheless, after digesting the changes, you’ll find that Python really hasn’t changed all that much – by and large, we’re mostly fixing well-known annoyances and warts, and removing a lot of old cruft.

This article doesn’t attempt to provide a complete specification of all new features, but instead tries to give a convenient overview. For full details, you should refer to the documentation for Python 3.0, and/or the many PEPs referenced in the text. If you want to understand the complete implementation and design rationale for a particular feature, PEPs usually have more details than the regular documentation; but note that PEPs usually are not kept up-to-date once a feature has been fully implemented.

Due to time constraints this document is not as complete as it should have been. As always for a new release, the `Misc/NEWS` file in the source distribution contains a wealth of detailed information about every small thing that was changed.

## Common Stumbling Blocks

This section lists those few changes that are most likely to trip you up if you’re used to Python 2.5.

## Print Is A Function

The `print` statement has been replaced with a `print()` function, with keyword arguments to replace most of the special syntax of the old `print` statement ([PEP 3105](https://peps.python.org/pep-3105/) [https://peps.python.org/pep-3105/]).

Examples:

```
Old: print "The answer is", 2*2
```

```
New: print("The answer is", 2*2)
```

```
Old: print x,                # Trailing comma suppresses newline
```

```
New: print(x, end=" ")      # Appends a space instead of a newline
```

```
Old: print                  # Prints a newline
```

```
New: print()                # You must call the function!
```

```
Old: print >>sys.stderr, "fatal error"
```

```
New: print("fatal error", file=sys.stderr)
```

```
Old: print (x, y)           # prints repr((x, y))
```

```
New: print((x, y))          # Not the same as print(x, y)!
```

You can also customize the separator between items, e.g.:

```
print("There are <", 2**32, "> possibilities!", sep="")
```

which produces:

```
There are <4294967296> possibilities!
```

Note:

- The `print()` function doesn't support the "softspace" feature of the old `print` statement. For example, in Python 2.x, `print "A\n", "B"` would write `"A\nB\n"`; but in Python 3.0, `print("A\n", "B")` writes `"A\n B\n"`.
- Initially, you'll be finding yourself typing the old `print x a` lot in interactive mode. Time to retrain your fingers to type `print(x)` instead!
- When using the `2to3` source-to-source conversion tool, all `print` statements are automatically converted to `print()` function calls, so this is mostly a non-issue for larger projects.

## Views And Iterators Instead Of Lists

Some well-known APIs no longer return lists:

- `dict` methods `dict.keys()`, `dict.items()` and `dict.values()` return “views” instead of lists. For example, this no longer works: `k = d.keys(); k.sort()`. Use `k = sorted(d)` instead (this works in Python 2.5 too and is just as efficient).
- Also, the `dict.iterkeys()`, `dict.iteritems()` and `dict.itervalues()` methods are no longer supported.
- `map()` and `filter()` return iterators. If you really need a list and the input sequences are all of equal length, a quick fix is to wrap `map()` in `list()`, e.g. `list(map(...))`, but a better fix is often to use a list comprehension (especially when the original code uses `lambda`), or rewriting the code so it doesn’t need a list at all. Particularly tricky is `map()` invoked for the side effects of the function; the correct transformation is to use a regular `for` loop (since creating a list would just be wasteful).

If the input sequences are not of equal length, `map()` will stop at the termination of the shortest of the sequences. For full compatibility with `map()` from Python 2.x, also wrap the sequences in `itertools.zip_longest()`, e.g.  
`map(func, *sequences)` becomes `list(map(func, itertools.zip_longest(*sequences)))`.

- `range()` now behaves like `xrange()` used to behave, except it works with values of arbitrary size. The latter no longer exists.
- `zip()` now returns an iterator.

## Ordering Comparisons

Python 3.0 has simplified the rules for ordering comparisons:

- The ordering comparison operators (`<`, `<=`, `>=`, `>`) raise a

`TypeError` exception when the operands don't have a meaningful natural ordering. Thus, expressions like `1 < ''`, `0 > None` or `len <= len` are no longer valid, and e.g. `None < None` raises **`TypeError`** instead of returning `False`. A corollary is that sorting a heterogeneous list no longer makes sense – all the elements must be comparable to each other. Note that this does not apply to the `==` and `!=` operators: objects of different incomparable types always compare unequal to each other.

- **`builtin.sorted()`** and **`list.sort()`** no longer accept the *cmp* argument providing a comparison function. Use the *key* argument instead. N.B. the *key* and *reverse* arguments are now “keyword-only”.
- The **`cmp()`** function should be treated as gone, and the **`__cmp__()`** special method is no longer supported. Use **`__lt__()`** for sorting, **`__eq__()`** with **`__hash__()`**, and other rich comparisons as needed. (If you really need the **`cmp()`** functionality, you could use the expression `(a > b) - (a < b)` as the equivalent for `cmp(a, b)`.)

## Integers

- **PEP 237** [<https://peps.python.org/pep-0237/>]: Essentially, **`long`** renamed to **`int`**. That is, there is only one built-in integral type, named **`int`**; but it behaves mostly like the old **`long`** type.
- **PEP 238** [<https://peps.python.org/pep-0238/>]: An expression like `1/2` returns a float. Use `1//2` to get the truncating behavior. (The latter syntax has existed for years, at least since Python 2.2.)
- The **`sys.maxint`** constant was removed, since there is no longer a limit to the value of integers. However, **`sys.maxsize`** can be used as an integer larger than any practical list or string index. It conforms to the implementation's “natural” integer size and is typically the same as **`sys.maxint`** in previous releases on the same platform (assuming the same build options).
- The **`repr()`** of a long integer doesn't include the trailing `L` anymore, so code that unconditionally strips that character will chop off the last digit instead. (Use **`str()`** instead.)

- Octal literals are no longer of the form `0720`; use `0o720` instead.

## Text Vs. Data Instead Of Unicode Vs. 8-bit

Everything you thought you knew about binary data and Unicode has changed.

- Python 3.0 uses the concepts of *text* and (binary) *data* instead of Unicode strings and 8-bit strings. All text is Unicode; however *encoded* Unicode is represented as binary data. The type used to hold text is `str`, the type used to hold data is `bytes`. The biggest difference with the 2.x situation is that any attempt to mix text and data in Python 3.0 raises `TypeError`, whereas if you were to mix Unicode and 8-bit strings in Python 2.x, it would work if the 8-bit string happened to contain only 7-bit (ASCII) bytes, but you would get `UnicodeDecodeError` if it contained non-ASCII values. This value-specific behavior has caused numerous sad faces over the years.
- As a consequence of this change in philosophy, pretty much all code that uses Unicode, encodings or binary data most likely has to change. The change is for the better, as in the 2.x world there were numerous bugs having to do with mixing encoded and unencoded text. To be prepared in Python 2.x, start using `unicode` for all unencoded text, and `str` for binary or encoded data only. Then the `2to3` tool will do most of the work for you.
- You can no longer use `u"..."` literals for Unicode text. However, you must use `b"..."` literals for binary data.
- As the `str` and `bytes` types cannot be mixed, you must always explicitly convert between them. Use `str.encode()` to go from `str` to `bytes`, and `bytes.decode()` to go from `bytes` to `str`. You can also use `bytes(s, encoding=...)` and `str(b, encoding=...)`, respectively.
- Like `str`, the `bytes` type is immutable. There is a separate *mutable* type to hold buffered binary data, `bytearray`. Nearly all APIs that accept `bytes` also accept `bytearray`. The mutable API is based on

### **`collections.MutableSequence`.**

- All backslashes in raw string literals are interpreted literally. This means that `'\u'` and `'\u'` escapes in raw strings are not treated specially. For example, `r'\u20ac'` is a string of 6 characters in Python 3.0, whereas in 2.6, `ur'\u20ac'` was the single “euro” character. (Of course, this change only affects raw string literals; the euro character is `'\u20ac'` in Python 3.0.)
- The built-in **`basestring`** abstract type was removed. Use **`str`** instead. The **`str`** and **`bytes`** types don’t have functionality enough in common to warrant a shared base class. The `2to3` tool (see below) replaces every occurrence of **`basestring`** with **`str`**.
- Files opened as text files (still the default mode for **`open()`**) always use an encoding to map between strings (in memory) and bytes (on disk). Binary files (opened with a `b` in the mode argument) always use bytes in memory. This means that if a file is opened using an incorrect mode or encoding, I/O will likely fail loudly, instead of silently producing incorrect data. It also means that even Unix users will have to specify the correct mode (text or binary) when opening a file. There is a platform-dependent default encoding, which on Unixy platforms can be set with the `LANG` environment variable (and sometimes also with some other platform-specific locale-related environment variables). In many cases, but not all, the system default is UTF-8; you should never count on this default. Any application reading or writing more than pure ASCII text should probably have a way to override the encoding. There is no longer any need for using the encoding-aware streams in the **`codecs`** module.
- The initial values of **`sys.stdin`**, **`sys.stdout`** and **`sys.stderr`** are now unicode-only text files (i.e., they are instances of **`io.TextIOBase`**). To read and write bytes data with these streams, you need to use their **`io.TextIOBase.buffer`** attribute.
- Filenames are passed to and returned from APIs as (Unicode) strings. This can present platform-specific problems because on some platforms filenames are arbitrary byte strings. (On the other hand, on Windows filenames are natively stored as Unicode.) As a work-around, most APIs (e.g. **`open()`** and

many functions in the `os` module) that take filenames accept `bytes` objects as well as strings, and a few APIs have a way to ask for a `bytes` return value. Thus, `os.listdir()` returns a list of `bytes` instances if the argument is a `bytes` instance, and `os.getcwd()` returns the current working directory as a `bytes` instance. Note that when `os.listdir()` returns a list of strings, filenames that cannot be decoded properly are omitted rather than raising `UnicodeError`.

- Some system APIs like `os.environ` and `sys.argv` can also present problems when the bytes made available by the system is not interpretable using the default encoding. Setting the `LANG` variable and rerunning the program is probably the best approach.
- **PEP 3138** [<https://peps.python.org/pep-3138/>]: The `repr()` of a string no longer escapes non-ASCII characters. It still escapes control characters and code points with non-printable status in the Unicode standard, however.
- **PEP 3120** [<https://peps.python.org/pep-3120/>]: The default source encoding is now UTF-8.
- **PEP 3131** [<https://peps.python.org/pep-3131/>]: Non-ASCII letters are now allowed in identifiers. (However, the standard library remains ASCII-only with the exception of contributor names in comments.)
- The `StringIO` and `cStringIO` modules are gone. Instead, import the `io` module and use `io.StringIO` or `io.BytesIO` for text and data respectively.
- See also the [Unicode HOWTO](#), which was updated for Python 3.0.

## Overview Of Syntax Changes

This section gives a brief overview of every *syntactic* change in Python 3.0.

### New Syntax

- **PEP 3107** [<https://peps.python.org/pep-3107/>]: Function argument and return value annotations. This provides a standardized

way of annotating a function's parameters and return value. There are no semantics attached to such annotations except that they can be introspected at runtime using the `__annotations__` attribute. The intent is to encourage experimentation through metaclasses, decorators or frameworks.

- **PEP 3102** [<https://peps.python.org/pep-3102/>]: Keyword-only arguments. Named parameters occurring after `*args` in the parameter list *must* be specified using keyword syntax in the call. You can also use a bare `*` in the parameter list to indicate that you don't accept a variable-length argument list, but you do have keyword-only arguments.
- Keyword arguments are allowed after the list of base classes in a class definition. This is used by the new convention for specifying a metaclass (see next section), but can be used for other purposes as well, as long as the metaclass supports it.
- **PEP 3104** [<https://peps.python.org/pep-3104/>]: **nonlocal** statement. Using `nonlocal x` you can now assign directly to a variable in an outer (but non-global) scope. **nonlocal** is a new reserved word.
- **PEP 3132** [<https://peps.python.org/pep-3132/>]: Extended Iterable Unpacking. You can now write things like `a, b, *rest = some_sequence`. And even `*rest, a = stuff`. The `rest` object is always a (possibly empty) list; the right-hand side may be any iterable. Example:

```
(a, *rest, b) = range(5)
```

This sets `a` to 0, `b` to 4, and `rest` to `[1, 2, 3]`.

- Dictionary comprehensions: `{k: v for k, v in stuff}` means the same thing as `dict(stuff)` but is more flexible. (This is **PEP 274** [<https://peps.python.org/pep-0274/>] vindicated. :-)
- Set literals, e.g. `{1, 2}`. Note that `{}` is an empty dictionary; use `set()` for an empty set. Set comprehensions are also supported; e.g., `{x for x in stuff}` means the

same thing as `set(stuff)` but is more flexible.

- New octal literals, e.g. `0o720` (already in 2.6). The old octal literals (`0720`) are gone.
- New binary literals, e.g. `0b1010` (already in 2.6), and there is a new corresponding built-in function, `bin()`.
- Bytes literals are introduced with a leading `b` or `B`, and there is a new corresponding built-in function, `bytes()`.

## Changed Syntax

- **PEP 3109** [<https://peps.python.org/pep-3109/>] and **PEP 3134** [<https://peps.python.org/pep-3134/>]: new `raise` statement syntax: `raise [expr [from expr]]`. See below.
- `as` and `with` are now reserved words. (Since 2.6, actually.)
- `True`, `False`, and `None` are reserved words. (2.6 partially enforced the restrictions on `None` already.)
- Change from `except exc, var` to `except exc as var`. See **PEP 3110** [<https://peps.python.org/pep-3110/>].
- **PEP 3115** [<https://peps.python.org/pep-3115/>]: New Metaclass Syntax. Instead of:

```
class C:
    __metaclass__ = M
    ...
```

you must now use:

```
class C(metaclass=M):
    ...
```

The module-global `__metaclass__` variable is no longer supported. (It was a crutch to make it easier to default to new-style classes without deriving every class from `object`.)

- List comprehensions no longer support the syntactic form

[... for var in item1, item2, ...]. Use [... for var in (item1, item2, ...)] instead. Also note that list comprehensions have different semantics: they are closer to syntactic sugar for a generator expression inside a `list()` constructor, and in particular the loop control variables are no longer leaked into the surrounding scope.

- The *ellipsis* (...) can be used as an atomic expression anywhere. (Previously it was only allowed in slices.) Also, it *must* now be spelled as ... (Previously it could also be spelled as . . ., by a mere accident of the grammar.)

## Removed Syntax

- **PEP 3113** [<https://peps.python.org/pep-3113/>]: Tuple parameter unpacking removed. You can no longer write `def foo(a, (b, c)): ...`. Use `def foo(a, b_c): b, c = b_c` instead.
- Removed backticks (use `repr()` instead).
- Removed `<>` (use `!=` instead).
- Removed keyword: `exec()` is no longer a keyword; it remains as a function. (Fortunately the function syntax was also accepted in 2.x.) Also note that `exec()` no longer takes a stream argument; instead of `exec(f)` you can use `exec(f.read())`.
- Integer literals no longer support a trailing `l` or `L`.
- String literals no longer support a leading `u` or `U`.
- The `from module import *` syntax is only allowed at the module level, no longer inside functions.
- The only acceptable syntax for relative imports is `from . [module] import name`. All `import` forms not starting with `.` are interpreted as absolute imports. (**PEP 328** [<https://peps.python.org/pep-0328/>])
- Classic classes are gone.

## Changes Already Present In Python 2.6

Since many users presumably make the jump straight from Python 2.5 to Python 3.0, this section reminds the reader of new features

that were originally designed for Python 3.0 but that were backported to Python 2.6. The corresponding sections in [What's New in Python 2.6](#) should be consulted for longer descriptions.

- [PEP 343: The 'with' statement](#). The **with** statement is now a standard feature and no longer needs to be imported from the `__future__`. Also check out [Writing Context Managers](#) and [The contextlib module](#).
- [PEP 366: Explicit Relative Imports From a Main Module](#). This enhances the usefulness of the `-m` option when the referenced module lives in a package.
- [PEP 370: Per-user site-packages Directory](#).
- [PEP 371: The multiprocessing Package](#).
- [PEP 3101: Advanced String Formatting](#). Note: the 2.6 description mentions the `format()` method for both 8-bit and Unicode strings. In 3.0, only the `str` type (text strings with Unicode support) supports this method; the `bytes` type does not. The plan is to eventually make this the only API for string formatting, and to start deprecating the `%` operator in Python 3.1.
- [PEP 3105: print As a Function](#). This is now a standard feature and no longer needs to be imported from `__future__`. More details were given above.
- [PEP 3110: Exception-Handling Changes](#). The `except exc as var` syntax is now standard and `except exc, var` is no longer supported. (Of course, the `as var` part is still optional.)
- [PEP 3112: Byte Literals](#). The `b"..."` string literal notation (and its variants like `b'...'`, `b"""..."""`, and `br"..."`) now produces a literal of type `bytes`.
- [PEP 3116: New I/O Library](#). The `io` module is now the standard way of doing file I/O. The built-in `open()` function is now an alias for `io.open()` and has additional keyword arguments *encoding*, *errors*, *newline* and *closefd*. Also note that an invalid *mode* argument now raises `ValueError`, not `IOError`. The binary file object underlying a text file object can be accessed as `f.buffer` (but beware that the text object maintains a buffer of itself in order to speed up the encoding and decoding operations).
- [PEP 3118: Revised Buffer Protocol](#). The old builtin `buffer()` is now really gone; the new builtin

`memoryview()` provides (mostly) similar functionality.

- [PEP 3119: Abstract Base Classes](#). The `abc` module and the ABCs defined in the `collections` module plays a somewhat more prominent role in the language now, and built-in collection types like `dict` and `list` conform to the `collections.MutableMapping` and `collections.MutableSequence` ABCs, respectively.
- [PEP 3127: Integer Literal Support and Syntax](#). As mentioned above, the new octal literal notation is the only one supported, and binary literals have been added.
- [PEP 3129: Class Decorators](#).
- [PEP 3141: A Type Hierarchy for Numbers](#). The `numbers` module is another new use of ABCs, defining Python's "numeric tower". Also note the new `fractions` module which implements `numbers.Rational`.

## Library Changes

Due to time constraints, this document does not exhaustively cover the very extensive changes to the standard library. [PEP 3108](#) [<https://peps.python.org/pep-3108/>] is the reference for the major changes to the library. Here's a capsule review:

- Many old modules were removed. Some, like `gopherlib` (no longer used) and `md5` (replaced by `hashlib`), were already deprecated by [PEP 4](#) [<https://peps.python.org/pep-0004/>]. Others were removed as a result of the removal of support for various platforms such as Irix, BeOS and Mac OS 9 (see [PEP 11](#) [<https://peps.python.org/pep-0011/>]). Some modules were also selected for removal in Python 3.0 due to lack of use or because a better replacement exists. See [PEP 3108](#) [<https://peps.python.org/pep-3108/>] for an exhaustive list.
- The `bsddb3` package was removed because its presence in the core standard library has proved over time to be a particular burden for the core developers due to testing instability and Berkeley DB's release schedule. However, the package is alive and well, externally maintained at <https://www.jcea.es/programacion/pybsddb.htm>.

- Some modules were renamed because their old name disobeyed **PEP 8** [<https://peps.python.org/pep-0008/>], or for various other reasons. Here's the list:

Old Name
<code>winreg</code>
<code>ConfigParser</code>
<code>copyreg</code>
<code>Queue</code>
<code>SocketServer</code>
<code>markupbase</code>
<code>reprlib</code>
<code>test.support</code>

- A common pattern in Python 2.x is to have one version of a module implemented in pure Python, with an optional accelerated version implemented as a C extension; for example, `pickle` and `cPickle`. This places the burden of importing the accelerated version and falling back on the pure Python version on each user of these modules. In Python 3.0, the accelerated versions are considered implementation details of the pure Python versions. Users should always import the standard version, which attempts to import the accelerated version and falls back to the pure Python version. The `pickle` / `cPickle` pair received this treatment. The `profile` module is on the list for 3.1. The `StringIO` module has been turned into a class in the `io` module.
- Some related modules have been grouped into packages, and usually the submodule names have been simplified. The resulting new packages are:
  - `dbm` (`anydbm`, `dbhash`, `dbm`, `dumbdbm`, `gdbm`, `whichdb`).
  - `html` (`HTMLParser`, `htmlentitydefs`).
  - `http` (`httplib`, `BaseHTTPServer`, `CGIHTTPServer`, `SimpleHTTPServer`, `Cookie`, `cookielib`).
  - `tkinter` (all `Tkinter`-related modules except `turtle`). The target audience of `turtle` doesn't really care about `tkinter`. Also note that as of Python

2.6, the functionality of `turtle` has been greatly enhanced.

- `urllib` (`urllib`, `urllib2`, `urlparse`, `robotparse`).
- `xmlrpc` (`xmlrpclib`, `DocXMLRPCServer`, `SimpleXMLRPCServer`).

Some other changes to standard library modules, not covered by [PEP 3108](https://peps.python.org/pep-3108/) [https://peps.python.org/pep-3108/]:

- Killed `sets`. Use the built-in `set()` class.
- Cleanup of the `sys` module: removed `sys.exitfunc()`, `sys.exc_clear()`, `sys.exc_type`, `sys.exc_value`, `sys.exc_traceback`. (Note that `sys.last_type` etc. remain.)
- Cleanup of the `array.array` type: the `read()` and `write()` methods are gone; use `fromfile()` and `tofile()` instead. Also, the `'c'` typecode for array is gone – use either `'b'` for bytes or `'u'` for Unicode characters.
- Cleanup of the `operator` module: removed `sequenceIncludes()` and `isCallable()`.
- Cleanup of the `thread` module: `acquire_lock()` and `release_lock()` are gone; use `acquire()` and `release()` instead.
- Cleanup of the `random` module: removed the `jumpahead()` API.
- The `new` module is gone.
- The functions `os.tmpnam()`, `os.tempnam()` and `os.tmpfile()` have been removed in favor of the `tempfile` module.
- The `tokenize` module has been changed to work with bytes. The main entry point is now `tokenize.tokenize()`, instead of `generate_tokens`.
- `string.letters` and its friends (`string.lowercase` and `string.uppercase`) are gone. Use `string.ascii_letters` etc. instead. (The reason for the removal is that `string.letters` and friends had locale-specific behavior, which is a bad idea for such attractively named global “constants”.)
- Renamed module `__builtin__` to `builtins` (removing

the underscores, adding an 's'). The `__builtins__` variable found in most global namespaces is unchanged. To modify a builtin, you should use `builtins`, not `__builtins__`!

## PEP 3101 [https://peps.python.org/pep-3101/]: A New Approach To String Formatting

- A new system for built-in string formatting operations replaces the `%` string formatting operator. (However, the `%` operator is still supported; it will be deprecated in Python 3.1 and removed from the language at some later time.) Read [PEP 3101](https://peps.python.org/pep-3101/) [https://peps.python.org/pep-3101/] for the full scoop.

## Changes To Exceptions

The APIs for raising and catching exception have been cleaned up and new powerful features added:

- [PEP 352](https://peps.python.org/pep-0352/) [https://peps.python.org/pep-0352/]: All exceptions must be derived (directly or indirectly) from `BaseException`. This is the root of the exception hierarchy. This is not new as a recommendation, but the *requirement* to inherit from `BaseException` is new. (Python 2.6 still allowed classic classes to be raised, and placed no restriction on what you can catch.) As a consequence, string exceptions are finally truly and utterly dead.
- Almost all exceptions should actually derive from `Exception`; `BaseException` should only be used as a base class for exceptions that should only be handled at the top level, such as `SystemExit` or `KeyboardInterrupt`. The recommended idiom for handling all exceptions except for this latter category is to use `except Exception`.
- `StandardError` was removed.
- Exceptions no longer behave as sequences. Use the `args` attribute instead.

- **PEP 3109** [<https://peps.python.org/pep-3109/>]: Raising exceptions. You must now use `raise Exception(args)` instead of `raise Exception, args`. Additionally, you can no longer explicitly specify a traceback; instead, if you *have* to do this, you can assign directly to the `__traceback__` attribute (see below).
- **PEP 3110** [<https://peps.python.org/pep-3110/>]: Catching exceptions. You must now use `except SomeException as variable` instead of `except SomeException, variable`. Moreover, the *variable* is explicitly deleted when the `except` block is left.
- **PEP 3134** [<https://peps.python.org/pep-3134/>]: Exception chaining. There are two cases: implicit chaining and explicit chaining. Implicit chaining happens when an exception is raised in an `except` or `finally` handler block. This usually happens due to a bug in the handler block; we call this a *secondary* exception. In this case, the original exception (that was being handled) is saved as the `__context__` attribute of the secondary exception. Explicit chaining is invoked with this syntax:

```
raise SecondaryException() from primary_exception
```

(where *primary\_exception* is any expression that produces an exception object, probably an exception that was previously caught). In this case, the primary exception is stored on the `__cause__` attribute of the secondary exception. The traceback printed when an unhandled exception occurs walks the chain of `__cause__` and `__context__` attributes and prints a separate traceback for each component of the chain, with the primary exception at the top. (Java users may recognize this behavior.)

- **PEP 3134** [<https://peps.python.org/pep-3134/>]: Exception objects now store their traceback as the `__traceback__` attribute. This means that an exception object now contains all the information pertaining to an exception, and there are fewer reasons to use `sys.exc_info()` (though the latter is not removed).

- A few exception messages are improved when Windows fails to load an extension module. For example, error code 193 is now %1 is not a valid Win32 application. Strings now deal with non-English locales.

## Miscellaneous Other Changes

### Operators And Special Methods

- `!=` now returns the opposite of `==`, unless `==` returns **NotImplemented**.
- The concept of “unbound methods” has been removed from the language. When referencing a method as a class attribute, you now get a plain function object.
- `__getslice__()`, `__setslice__()` and `__delslice__()` were killed. The syntax `a[i:j]` now translates to `a.__getitem__(slice(i, j))` (or `__setitem__()` or `__delitem__()`, when used as an assignment or deletion target, respectively).
- **PEP 3114** [<https://peps.python.org/pep-3114/>]: the standard `next()` method has been renamed to `__next__()`.
- The `__oct__()` and `__hex__()` special methods are removed – `oct()` and `hex()` use `__index__()` now to convert the argument to an integer.
- Removed support for `__members__` and `__methods__`.
- The function attributes named `func_X` have been renamed to use the `__X__` form, freeing up these names in the function attribute namespace for user-defined attributes. To wit, `func_closure`, `func_code`, `func_defaults`, `func_dict`, `func_doc`, `func_globals`, `func_name` were renamed to `__closure__`, `__code__`, `__defaults__`, `__dict__`, `__doc__`, `__globals__`, `__name__`, respectively.
- `__nonzero__()` is now `__bool__()`.

### Builtins

- **PEP 3135** [<https://peps.python.org/pep-3135/>]: New `super()`. You can now invoke `super()` without arguments and

(assuming this is in a regular instance method defined inside a `class` statement) the right class and instance will automatically be chosen. With arguments, the behavior of `super()` is unchanged.

- **PEP 3111** [<https://peps.python.org/pep-3111/>]: `raw_input()` was renamed to `input()`. That is, the new `input()` function reads a line from `sys.stdin` and returns it with the trailing newline stripped. It raises `EOFError` if the input is terminated prematurely. To get the old behavior of `input()`, use `eval(input())`.
- A new built-in function `next()` was added to call the `__next__()` method on an object.
- The `round()` function rounding strategy and return type have changed. Exact halfway cases are now rounded to the nearest even result instead of away from zero. (For example, `round(2.5)` now returns `2` rather than `3`.) `round(x[, n])` now delegates to `x.__round__([n])` instead of always returning a float. It generally returns an integer when called with a single argument and a value of the same type as `x` when called with two arguments.
- Moved `intern()` to `sys.intern()`.
- Removed: `apply()`. Instead of `apply(f, args)` use `f(*args)`.
- Removed `callable()`. Instead of `callable(f)` you can use `isinstance(f, collections.Callable)`. The `operator.isCallable()` function is also gone.
- Removed `coerce()`. This function no longer serves a purpose now that classic classes are gone.
- Removed `execfile()`. Instead of `execfile(fn)` use `exec(open(fn).read())`.
- Removed the `file` type. Use `open()`. There are now several different kinds of streams that `open` can return in the `io` module.
- Removed `reduce()`. Use `functools.reduce()` if you really need it; however, 99 percent of the time an explicit `for` loop is more readable.
- Removed `reload()`. Use `imp.reload()`.
- Removed. `dict.has_key()` – use the `in` operator instead.

# Build and C API Changes

Due to time constraints, here is a *very* incomplete list of changes to the C API.

- Support for several platforms was dropped, including but not limited to Mac OS 9, BeOS, RISCOS, Irix, and Tru64.
- **PEP 3118** [<https://peps.python.org/pep-3118/>]: New Buffer API.
- **PEP 3121** [<https://peps.python.org/pep-3121/>]: Extension Module Initialization & Finalization.
- **PEP 3123** [<https://peps.python.org/pep-3123/>]: Making **PyObject\_HEAD** conform to standard C.
- No more C API support for restricted execution.
- **PyNumber\_Coerce()**, **PyNumber\_CoerceEx()**, **PyMember\_Get()**, and **PyMember\_Set()** C APIs are removed.
- New C API **PyImport\_ImportModuleNoBlock()**, works like **PyImport\_ImportModule()** but won't block on the import lock (returning an error instead).
- Renamed the boolean conversion C-level slot and method: `nb_nonzero` is now `nb_bool`.
- Removed **METH\_OLDARGS** and **WITH\_CYCLE\_GC** from the C API.

## Performance

The net result of the 3.0 generalizations is that Python 3.0 runs the pystone benchmark around 10% slower than Python 2.5. Most likely the biggest cause is the removal of special-casing for small integers. There's room for improvement, but it will happen after 3.0 is released!

## Porting To Python 3.0

For porting existing Python 2.5 or 2.6 source code to Python 3.0, the best strategy is the following:

1. (Prerequisite:) Start with excellent test coverage.
2. Port to Python 2.6. This should be no more work than the

average port from Python 2.x to Python 2.(x + 1). Make sure all your tests pass.

3. (Still using 2.6:) Turn on the `-3` command line switch. This enables warnings about features that will be removed (or change) in 3.0. Run your test suite again, and fix code that you get warnings about until there are no warnings left, and all your tests still pass.
4. Run the `2to3` source-to-source translator over your source code tree. (See [2to3 — Automated Python 2 to 3 code translation](#) for more on this tool.) Run the result of the translation under Python 3.0. Manually fix up any remaining issues, fixing problems until all tests pass again.

It is not recommended to try to write source code that runs unchanged under both Python 2.6 and 3.0; you'd have to use a very contorted coding style, e.g. avoiding `print` statements, metaclasses, and much more. If you are maintaining a library that needs to support both Python 2.6 and Python 3.0, the best approach is to modify step 3 above by editing the 2.6 version of the source code and running the `2to3` translator again, rather than editing the 3.0 version of the source code.

For porting C extensions to Python 3.0, please see [Porting Extension Modules to Python 3](#).

# What's New in Python 2.7

## Author

A.M. Kuchling (amk at amk.ca)

This article explains the new features in Python 2.7. Python 2.7 was released on July 3, 2010.

Numeric handling has been improved in many ways, for both floating-point numbers and for the `Decimal` class. There are some useful additions to the standard library, such as a greatly enhanced `unittest` module, the `argparse` module for parsing command-line options, convenient `OrderedDict` and `Counter` classes in the `collections` module, and many other improvements.

Python 2.7 is planned to be the last of the 2.x releases, so we worked on making it a good release for the long term. To help with porting to Python 3, several new features from the Python 3.x series have been included in 2.7.

This article doesn't attempt to provide a complete specification of the new features, but instead provides a convenient overview. For full details, you should refer to the documentation for Python 2.7 at <https://docs.python.org>. If you want to understand the rationale for the design and implementation, refer to the PEP for a particular new feature or the issue on <https://bugs.python.org> in which a change was discussed. Whenever possible, "What's New in Python" links to the bug/patch item for each change.

## The Future for Python 2.x

Python 2.7 is the last major release in the 2.x series, as the Python maintainers have shifted the focus of their new feature development efforts to the Python 3.x series. This means that while Python 2 continues to receive bug fixes, and to be updated to build correctly on new hardware and versions of supported operated systems, there

will be no new full feature releases for the language or standard library.

However, while there is a large common subset between Python 2.7 and Python 3, and many of the changes involved in migrating to that common subset, or directly to Python 3, can be safely automated, some other changes (notably those associated with Unicode handling) may require careful consideration, and preferably robust automated regression test suites, to migrate effectively.

This means that Python 2.7 will remain in place for a long time, providing a stable and supported base platform for production systems that have not yet been ported to Python 3. The full expected lifecycle of the Python 2.7 series is detailed in [PEP 373](https://peps.python.org/pep-0373/) [https://peps.python.org/pep-0373/].

Some key consequences of the long-term significance of 2.7 are:

- As noted above, the 2.7 release has a much longer period of maintenance when compared to earlier 2.x versions. Python 2.7 is currently expected to remain supported by the core development team (receiving security updates and other bug fixes) until at least 2020 (10 years after its initial release, compared to the more typical support period of 18–24 months).
- As the Python 2.7 standard library ages, making effective use of the Python Package Index (either directly or via a redistributor) becomes more important for Python 2 users. In addition to a wide variety of third party packages for various tasks, the available packages include backports of new modules and features from the Python 3 standard library that are compatible with Python 2, as well as various tools and libraries that can make it easier to migrate to Python 3. The [Python Packaging User Guide](https://packaging.python.org/) [https://packaging.python.org/] provides guidance on downloading and installing software from the Python Package Index.
- While the preferred approach to enhancing Python 2 is now the publication of new packages on the Python Package Index, this approach doesn't necessarily work in all cases, especially those related to network security. In exceptional

cases that cannot be handled adequately by publishing new or updated packages on PyPI, the Python Enhancement Proposal process may be used to make the case for adding new features directly to the Python 2 standard library. Any such additions, and the maintenance releases where they were added, will be noted in the [New Features Added to Python 2.7 Maintenance Releases](#) section below.

For projects wishing to migrate from Python 2 to Python 3, or for library and framework developers wishing to support users on both Python 2 and Python 3, there are a variety of tools and guides available to help decide on a suitable approach and manage some of the technical details involved. The recommended starting point is the [Porting Python 2 Code to Python 3](#) HOWTO guide.

## Changes to the Handling of Deprecation Warnings

For Python 2.7, a policy decision was made to silence warnings only of interest to developers by default. [DeprecationWarning](#) and its descendants are now ignored unless otherwise requested, preventing users from seeing warnings triggered by an application. This change was also made in the branch that became Python 3.2. (Discussed on stdlib-sig and carried out in [bpo-7319](#) [<https://bugs.python.org/issue/?@action=redirect&bpo=7319>].)

In previous releases, [DeprecationWarning](#) messages were enabled by default, providing Python developers with a clear indication of where their code may break in a future major version of Python.

However, there are increasingly many users of Python-based applications who are not directly involved in the development of those applications. [DeprecationWarning](#) messages are irrelevant to such users, making them worry about an application that's actually working correctly and burdening application developers with responding to these concerns.

You can re-enable display of [DeprecationWarning](#) messages by running Python with the [-Wdefault](#) (short form: [-Wd](#)) switch, or

by setting the `PYTHONWARNINGS` environment variable to "default" (or "d") before running Python. Python code can also re-enable them by calling `warnings.simplefilter('default')`.

The `unittest` module also automatically reenables deprecation warnings when running tests.

## Python 3.1 Features

Much as Python 2.6 incorporated features from Python 3.0, version 2.7 incorporates some of the new features in Python 3.1. The 2.x series continues to provide tools for migrating to the 3.x series.

A partial list of 3.1 features that were backported to 2.7:

- The syntax for set literals (`{1, 2, 3}` is a mutable set).
- Dictionary and set comprehensions (`{i: i*2 for i in range(3)}`).
- Multiple context managers in a single `with` statement.
- A new version of the `io` library, rewritten in C for performance.
- The ordered-dictionary type described in [PEP 372: Adding an Ordered Dictionary to collections](#).
- The new `_, _` format specifier described in [PEP 378: Format Specifier for Thousands Separator](#).
- The `memoryview` object.
- A small subset of the `importlib` module, [described below](#).
- The `repr()` of a float `x` is shorter in many cases: it's now based on the shortest decimal string that's guaranteed to round back to `x`. As in previous versions of Python, it's guaranteed that `float(repr(x))` recovers `x`.
- Float-to-string and string-to-float conversions are correctly rounded. The `round()` function is also now correctly rounded.
- The `PyCapsule` type, used to provide a C API for extension modules.
- The `PyLong_AsLongAndOverflow()` C API function.

Other new Python3-mode warnings include:

- `operator.isCallable()` and `operator.sequenceIncludes()`, which are not supported in 3.x, now trigger warnings.
- The `-3` switch now automatically enables the `-Qwarn` switch that causes warnings about using classic division with integers and long integers.

## PEP 372: Adding an Ordered Dictionary to collections

Regular Python dictionaries iterate over key/value pairs in arbitrary order. Over the years, a number of authors have written alternative implementations that remember the order that the keys were originally inserted. Based on the experiences from those implementations, 2.7 introduces a new `OrderedDict` class in the `collections` module.

The `OrderedDict` API provides the same interface as regular dictionaries but iterates over keys and values in a guaranteed order depending on when a key was first inserted:

```
>>> from collections import OrderedDict
>>> d = OrderedDict([('first', 1),
...                  ('second', 2),
...                  ('third', 3)])
>>> d.items()
[('first', 1), ('second', 2), ('third', 3)]
```

If a new entry overwrites an existing entry, the original insertion position is left unchanged:

```
>>> d['second'] = 4
>>> d.items()
[('first', 1), ('second', 4), ('third', 3)]
```

Deleting an entry and reinserting it will move it to the end:

```
>>> del d['second']
>>> d['second'] = 5
```

```
>>> d.items()
[('first', 1), ('third', 3), ('second', 5)]
```

The `popitem()` method has an optional *last* argument that defaults to `True`. If *last* is true, the most recently added key is returned and removed; if it's false, the oldest key is selected:

```
>>> od = OrderedDict([(x,0) for x in range(20)])
>>> od.popitem()
(19, 0)
>>> od.popitem()
(18, 0)
>>> od.popitem(last=False)
(0, 0)
>>> od.popitem(last=False)
(1, 0)
```

Comparing two ordered dictionaries checks both the keys and values, and requires that the insertion order was the same:

```
>>> od1 = OrderedDict([('first', 1),
...                     ('second', 2),
...                     ('third', 3)])
>>> od2 = OrderedDict([('third', 3),
...                     ('first', 1),
...                     ('second', 2)])
>>> od1 == od2
False
>>> # Move 'third' key to the end
>>> del od2['third']; od2['third'] = 3
>>> od1 == od2
True
```

Comparing an `OrderedDict` with a regular dictionary ignores the insertion order and just compares the keys and values.

How does the `OrderedDict` work? It maintains a doubly linked list of keys, appending new keys to the list as they're inserted. A secondary dictionary maps keys to their corresponding list node, so deletion doesn't have to traverse the entire linked list and therefore

remains  $O(1)$ .

The standard library now supports use of ordered dictionaries in several modules.

- The **ConfigParser** module uses them by default, meaning that configuration files can now be read, modified, and then written back in their original order.
- The `_asdict()` method for `collections.namedtuple()` now returns an ordered dictionary with the values appearing in the same order as the underlying tuple indices.
- The `json` module's **JSONDecoder** class constructor was extended with an `object_pairs_hook` parameter to allow **OrderedDict** instances to be built by the decoder. Support was also added for third-party tools like **PyYAML** [<https://pyyaml.org/>].

**PEP 372** [<https://peps.python.org/pep-0372/>] - Adding an ordered dictionary to collections

PEP written by Armin Ronacher and Raymond Hettinger; implemented by Raymond Hettinger.

## PEP 378: Format Specifier for Thousands Separator

To make program output more readable, it can be useful to add separators to large numbers, rendering them as 18,446,744,073,709,551,616 instead of 18446744073709551616.

The fully general solution for doing this is the `locale` module, which can use different separators (“,” in North America, “.” in Europe) and different grouping sizes, but `locale` is complicated to use and unsuitable for multi-threaded applications where different threads are producing output for different locales.

Therefore, a simple comma-grouping mechanism has been added to

the mini-language used by the `str.format()` method. When formatting a floating-point number, simply include a comma between the width and the precision:

```
>>> '{:20,.2f}'.format(18446744073709551616.0)
'18,446,744,073,709,551,616.00'
```

When formatting an integer, include the comma after the width:

```
>>> '{:20,d}'.format(18446744073709551616)
'18,446,744,073,709,551,616'
```

This mechanism is not adaptable at all; commas are always used as the separator and the grouping is always into three-digit groups. The comma-formatting mechanism isn't as general as the `locale` module, but it's easier to use.

See also

**PEP 378** [<https://peps.python.org/pep-0378/>] - Format Specifier for Thousands Separator

PEP written by Raymond Hettinger; implemented by Eric Smith.

## PEP 389: The `argparse` Module for Parsing Command Lines

The `argparse` module for parsing command-line arguments was added as a more powerful replacement for the `optparse` module.

This means Python now supports three different modules for parsing command-line arguments: `getopt`, `optparse`, and `argparse`. The `getopt` module closely resembles the C library's `getopt()` function, so it remains useful if you're writing a Python prototype that will eventually be rewritten in C. `optparse` becomes redundant, but there are no plans to remove it because there are many scripts still using it, and there's no automated way to update these scripts. (Making the `argparse` API consistent with `optparse`'s interface was discussed but rejected as too messy and

difficult.)

In short, if you're writing a new script and don't need to worry about compatibility with earlier versions of Python, use **argparse** instead of **optparse**.

Here's an example:

```
import argparse
```

```
parser = argparse.ArgumentParser(description='Command-line
```

```
# Add optional switches
```

```
parser.add_argument('-v', action='store_true', dest='is_verbose',
                    help='produce verbose output')
```

```
parser.add_argument('-o', action='store', dest='output',
                    metavar='FILE',
                    help='direct output to FILE instead of stdout')
```

```
parser.add_argument('-C', action='store', type=int, dest='count',
                    metavar='NUM', default=0,
                    help='display NUM lines of added context')
```

```
# Allow any number of additional arguments.
```

```
parser.add_argument(nargs='*', action='store', dest='input_files',
                    help='input filenames (default is stdin)')
```

```
args = parser.parse_args()
```

```
print args.__dict__
```

Unless you override it, **-h** and **--help** switches are automatically added, and produce neatly formatted output:

```
-> ./python.exe argparse-example.py --help
```

```
usage: argparse-example.py [-h] [-v] [-o FILE] [-C NUM]
```

Command-line example.

positional arguments:

input\_files input filenames (default is stdin)

optional arguments:

```
-h, --help  show this help message and exit
-v          produce verbose output
-o FILE     direct output to FILE instead of stdout
-C NUM      display NUM lines of added context
```

As with [optparse](#), the command-line switches and arguments are returned as an object with attributes named by the *dest* parameters:

```
-> ./python.exe argparse-example.py -v
```

```
{'output': None,
 'is_verbose': True,
 'context': 0,
 'inputs': []}
```

```
-> ./python.exe argparse-example.py -v -o /tmp/output -C
```

```
{'output': '/tmp/output',
 'is_verbose': True,
 'context': 4,
 'inputs': ['file1', 'file2']}
```

[argparse](#) has much fancier validation than [optparse](#); you can specify an exact number of arguments as an integer, 0 or more arguments by passing `'*'`, 1 or more by passing `'+'`, or an optional argument with `'?'`. A top-level parser can contain sub-parsers to define subcommands that have different sets of switches, as in `svn commit`, `svn checkout`, etc. You can specify an argument's type as [FileType](#), which will automatically open files for you and understands that `'-'` means standard input or output.

## Command Line Parsing Module

PEP written and implemented by Steven Bethard.

# PEP 391: Dictionary-Based Configuration For Logging

The `logging` module is very flexible; applications can define a tree of logging subsystems, and each logger in this tree can filter out certain messages, format them differently, and direct messages to a varying number of handlers.

All this flexibility can require a lot of configuration. You can write Python statements to create objects and set their properties, but a complex set-up requires verbose but boring code. `logging` also supports a `fileConfig()` function that parses a file, but the file format doesn't support configuring filters, and it's messier to generate programmatically.

Python 2.7 adds a `dictConfig()` function that uses a dictionary to configure logging. There are many ways to produce a dictionary from different sources: construct one with code; parse a file containing JSON; or use a YAML parsing library if one is installed. For more information see [Configuration functions](#).

The following example configures two loggers, the root logger and a logger named “network”. Messages sent to the root logger will be sent to the system log using the syslog protocol, and messages to the “network” logger will be written to a `network.log` file that will be rotated once the log reaches 1MB.

```
import logging
import logging.config

configdict = {
    'version': 1,          # Configuration schema in use; must be
    'formatters': {
        'standard': {
            'format': ('%(asctime)s %(name)-15s '
                       '%(levelname)-8s %(message)s') },
    },
```

```

'handlers': {'netlog': {'backupCount': 10,
                        'class': 'logging.handlers.RotatingFileHandler',
                        'filename': '/logs/network.log',
                        'formatter': 'standard',
                        'level': 'INFO',
                        'maxBytes': 1000000},
             'syslog': {'class': 'logging.handlers.SysLogHandler',
                        'formatter': 'standard',
                        'level': 'ERROR'}}},

# Specify all the subordinate loggers
'loggers': {
    'network': {
        'handlers': ['netlog']
    },
}

# Specify properties of the root logger
'root': {
    'handlers': ['syslog']
},
}

# Set up configuration
logging.config.dictConfig(configdict)

# As an example, log two error messages
logger = logging.getLogger('/')
logger.error('Database not found')

netlogger = logging.getLogger('network')
netlogger.error('Connection failed')

```

Three smaller enhancements to the **logging** module, all implemented by Vinay Sajip, are:

- The **SysLogHandler** class now supports syslogging over TCP. The constructor has a *socktype* parameter giving the type of socket to use, either **socket.SOCK\_DGRAM** for UDP or

`socket.SOCK_STREAM` for TCP. The default protocol remains UDP.

- **Logger** instances gained a `getChild()` method that retrieves a descendant logger using a relative path. For example, once you retrieve a logger by doing `log = getLogger('app')`, calling `log.getChild('network.listen')` is equivalent to `getLogger('app.network.listen')`.
- The **LoggerAdapter** class gained an `isEnabledFor()` method that takes a *level* and returns whether the underlying logger would process a message of that level of importance.

See also

**PEP 391** [<https://peps.python.org/pep-0391/>] - Dictionary-Based Configuration For Logging

PEP written and implemented by Vinay Sajip.

## PEP 3106: Dictionary Views

The dictionary methods `keys()`, `values()`, and `items()` are different in Python 3.x. They return an object called a *view* instead of a fully materialized list.

It's not possible to change the return values of `keys()`, `values()`, and `items()` in Python 2.7 because too much code would break. Instead the 3.x versions were added under the new names `viewkeys()`, `viewvalues()`, and `viewitems()`.

```
>>> d = dict((i*10, chr(65+i)) for i in range(26))
>>> d
{0: 'A', 130: 'N', 10: 'B', 140: 'O', 20: ..., 250: 'Z'}
>>> d.viewkeys()
dict_keys([0, 130, 10, 140, 20, 150, 30, ..., 250])
```

Views can be iterated over, but the key and item views also behave like sets. The `&` operator performs intersection, and `|` performs a union:

```
>>> d1 = dict((i*10, chr(65+i)) for i in range(26))
>>> d2 = dict((i**.5, i) for i in range(1000))
>>> d1.viewkeys() & d2.viewkeys()
set([0.0, 10.0, 20.0, 30.0])
>>> d1.viewkeys() | range(0, 30)
set([0, 1, 130, 3, 4, 5, 6, ..., 120, 250])
```

The view keeps track of the dictionary and its contents change as the dictionary is modified:

```
>>> vk = d.viewkeys()
>>> vk
dict_keys([0, 130, 10, ..., 250])
>>> d[260] = '&'
>>> vk
dict_keys([0, 130, 260, 10, ..., 250])
```

However, note that you can't add or remove keys while you're iterating over the view:

```
>>> for k in vk:
...     d[k*2] = k
...
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
RuntimeError: dictionary changed size during iteration
```

You can use the view methods in Python 2.x code, and the 2to3 converter will change them to the standard `keys()`, `values()`, and `items()` methods.

**See also**

**PEP 3106** [<https://peps.python.org/pep-3106/>] - Revamping `dict.keys()`, `.values()` and `.items()`

PEP written by Guido van Rossum. Backported to 2.7 by Alexandre Vassalotti; [bpo-1967](https://bugs.python.org/issue?@action=redirect&bpo=1967) [<https://bugs.python.org/issue?@action=redirect&bpo=1967>].

# PEP 3137: The memoryview Object

The `memoryview` object provides a view of another object's memory content that matches the `bytes` type's interface.

```
>>> import string
>>> m = memoryview(string.letters)
>>> m
<memory at 0x37f850>
>>> len(m)                                # Returns length of underlying object
52
>>> m[0], m[25], m[26]                   # Indexing returns one byte
('a', 'z', 'A')
>>> m2 = m[0:26]                          # Slicing returns another memoryview
>>> m2
<memory at 0x37f080>
```

The content of the view can be converted to a string of bytes or a list of integers:

```
>>> m2.tobytes()
'abcdefghijklmnopqrstuvwxyz'
>>> m2.tolist()
[97, 98, 99, 100, 101, 102, 103, ... 121, 122]
>>>
```

**memoryview** objects allow modifying the underlying object if it's a mutable object.

```
>>> m2[0] = 75
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
TypeError: cannot modify read-only memory
>>> b = bytearray(string.ascii_letters) # Creating a mutable
>>> b
bytearray(b'abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ')
>>> mb = memoryview(b)
>>> mb[0] = '*' # Assign to view, changing the b
>>> b[0:5] # The bytearray has been changed
```

```
bytearray(b'*bcde')
>>>
```

### PEP 3137 [<https://peps.python.org/pep-3137/>] - Immutable Bytes and Mutable Buffer

PEP written by Guido van Rossum. Implemented by Travis Oliphant, Antoine Pitrou and others. Backported to 2.7 by Antoine Pitrou; [bpo-2396](https://bugs.python.org/issue?@action=redirect&bpo=2396) [<https://bugs.python.org/issue?@action=redirect&bpo=2396>].

## Other Language Changes

Some smaller changes made to the core Python language are:

- The syntax for set literals has been backported from Python 3.x. Curly brackets are used to surround the contents of the resulting mutable set; set literals are distinguished from dictionaries by not containing colons and values. `{}` continues to represent an empty dictionary; use `set()` for an empty set.

```
>>> {1, 2, 3, 4, 5}
set([1, 2, 3, 4, 5])
>>> set() # empty set
set([])
>>> {}    # empty dict
{}
```

Backported by Alexandre Vassalotti; [bpo-2335](https://bugs.python.org/issue?@action=redirect&bpo=2335) [<https://bugs.python.org/issue?@action=redirect&bpo=2335>].

- Dictionary and set comprehensions are another feature backported from 3.x, generalizing list/generator comprehensions to use the literal syntax for sets and dictionaries.

```
>>> {x: x*x for x in range(6)}
```

```
{0: 0, 1: 1, 2: 4, 3: 9, 4: 16, 5: 25}
>>> {'a'*x for x in range(6)}
set(['', 'a', 'aa', 'aaa', 'aaaa', 'aaaaa'])
```

Backported by Alexandre Vassalotti; [bpo-2333](https://bugs.python.org/issue/?@action=redirect&bpo=2333) [https://bugs.python.org/issue/?@action=redirect&bpo=2333].

- The **with** statement can now use multiple context managers in one statement. Context managers are processed from left to right and each one is treated as beginning a new **with** statement. This means that:

```
with A() as a, B() as b:
    ... suite of statements ...
```

is equivalent to:

```
with A() as a:
    with B() as b:
        ... suite of statements ...
```

The **contextlib.nested()** function provides a very similar function, so it's no longer necessary and has been deprecated.

(Proposed in <https://codereview.appspot.com/53094>; implemented by Georg Brandl.)

- Conversions between floating-point numbers and strings are now correctly rounded on most platforms. These conversions occur in many different places: **str()** on floats and complex numbers; the **float** and **complex** constructors; numeric formatting; serializing and deserializing floats and complex numbers using the **marshal**, **pickle** and **json** modules; parsing of float and imaginary literals in Python code; and **Decimal**-to-float conversion.

Related to this, the **repr()** of a floating-point number *x* now returns a result based on the shortest decimal string that's guaranteed to round back to *x* under correct rounding (with round-half-to-even rounding mode). Previously it gave a

string based on rounding x to 17 decimal digits.

The rounding library responsible for this improvement works on Windows and on Unix platforms using the gcc, icc, or suncc compilers. There may be a small number of platforms where correct operation of this code cannot be guaranteed, so the code is not used on such systems. You can find out which code is being used by checking `sys.float_repr_style`, which will be `short` if the new code is in use and `legacy` if it isn't.

Implemented by Eric Smith and Mark Dickinson, using David Gay's `dtoa.c` library; [bpo-7117](https://bugs.python.org/issue?@action=redirect&bpo=7117) [https://bugs.python.org/issue?@action=redirect&bpo=7117].

- Conversions from long integers and regular integers to floating point now round differently, returning the floating-point number closest to the number. This doesn't matter for small integers that can be converted exactly, but for large numbers that will unavoidably lose precision, Python 2.7 now approximates more closely. For example, Python 2.6 computed the following:

```
>>> n = 295147905179352891391
>>> float(n)
2.9514790517935283e+20
>>> n - long(float(n))
65535L
```

Python 2.7's floating-point result is larger, but much closer to the true value:

```
>>> n = 295147905179352891391
>>> float(n)
2.9514790517935289e+20
>>> n - long(float(n))
-1L
```

(Implemented by Mark Dickinson; [bpo-3166](https://bugs.python.org/issue?@action=redirect&bpo=3166) [https://bugs.python.org/issue?@action=redirect&bpo=3166].)

Integer division is also more accurate in its rounding behaviours. (Also implemented by Mark Dickinson; [bpo-1811](https://bugs.python.org/issue?@action=redirect&bpo=1811) [<https://bugs.python.org/issue?@action=redirect&bpo=1811>].)

- Implicit coercion for complex numbers has been removed; the interpreter will no longer ever attempt to call a `__coerce__()` method on complex objects. (Removed by Meador Inge and Mark Dickinson; [bpo-5211](https://bugs.python.org/issue?@action=redirect&bpo=5211) [<https://bugs.python.org/issue?@action=redirect&bpo=5211>].)
- The `str.format()` method now supports automatic numbering of the replacement fields. This makes using `str.format()` more closely resemble using `%s` formatting:

```
>>> '{}: {}: {}'.format(2009, 04, 'Sunday')
'2009:4:Sunday'
>>> '{}: {}: {day}'.format(2009, 4, day='Sunday')
'2009:4:Sunday'
```

The auto-numbering takes the fields from left to right, so the first `{...}` specifier will use the first argument to `str.format()`, the next specifier will use the next argument, and so on. You can't mix auto-numbering and explicit numbering – either number all of your specifier fields or none of them – but you can mix auto-numbering and named fields, as in the second example above. (Contributed by Eric Smith; [bpo-5237](https://bugs.python.org/issue?@action=redirect&bpo=5237) [<https://bugs.python.org/issue?@action=redirect&bpo=5237>].)

Complex numbers now correctly support usage with `format()`, and default to being right-aligned. Specifying a precision or comma-separation applies to both the real and imaginary parts of the number, but a specified field width and alignment is applied to the whole of the resulting `1.5+3j` output. (Contributed by Eric Smith; [bpo-1588](https://bugs.python.org/issue?@action=redirect&bpo=1588) [<https://bugs.python.org/issue?@action=redirect&bpo=1588>] and [bpo-7988](https://bugs.python.org/issue?@action=redirect&bpo=7988) [<https://bugs.python.org/issue?@action=redirect&bpo=7988>].)

The 'F' format code now always formats its output using uppercase characters, so it will now produce 'INF' and 'NaN'. (Contributed by Eric Smith; [bpo-3382](https://bugs.python.org/) [<https://bugs.python.org/>]

issue?@action=redirect&bpo=3382].)

A low-level change: the `object.__format__()` method now triggers a `PendingDeprecationWarning` if it's passed a format string, because the `__format__()` method for `object` converts the object to a string representation and formats that. Previously the method silently applied the format string to the string representation, but that could hide mistakes in Python code. If you're supplying formatting information such as an alignment or precision, presumably you're expecting the formatting to be applied in some object-specific way. (Fixed by Eric Smith; [bpo-7994](https://bugs.python.org/issue?@action=redirect&bpo=7994) [https://bugs.python.org/issue?@action=redirect&bpo=7994].)

- The `int()` and `long()` types gained a `bit_length` method that returns the number of bits necessary to represent its argument in binary:

```
>>> n = 37
>>> bin(n)
'0b100101'
>>> n.bit_length()
6
>>> n = 2**123-1
>>> n.bit_length()
123
>>> (n+1).bit_length()
124
```

(Contributed by Fredrik Johansson and Victor Stinner;  
[bpo-3439](https://bugs.python.org/issue?@action=redirect&bpo=3439) [https://bugs.python.org/issue?@action=redirect&bpo=3439].)

- The `import` statement will no longer try an absolute import if a relative import (e.g. `from .os import sep`) fails. This fixes a bug, but could possibly break certain `import` statements that were only working by accident. (Fixed by Meador Inge; [bpo-7902](https://bugs.python.org/issue?@action=redirect&bpo=7902) [https://bugs.python.org/issue?@action=redirect&bpo=7902].)
- It's now possible for a subclass of the built-in `unicode` type

to override the `__unicode__()` method. (Implemented by Victor Stinner; [bpo-1583863](https://bugs.python.org/issue?@action=redirect&bpo=1583863) [https://bugs.python.org/issue?@action=redirect&bpo=1583863].)

- The `bytearray` type's `translate()` method now accepts `None` as its first argument. (Fixed by Georg Brandl; [bpo-4759](https://bugs.python.org/issue?@action=redirect&bpo=4759) [https://bugs.python.org/issue?@action=redirect&bpo=4759].)
- When using `@classmethod` and `@staticmethod` to wrap methods as class or static methods, the wrapper object now exposes the wrapped function as their `__func__` attribute. (Contributed by Amaury Forgeot d'Arc, after a suggestion by George Sakkis; [bpo-5982](https://bugs.python.org/issue?@action=redirect&bpo=5982) [https://bugs.python.org/issue?@action=redirect&bpo=5982].)
- When a restricted set of attributes were set using `__slots__`, deleting an unset attribute would not raise `AttributeError` as you would expect. Fixed by Benjamin Peterson; [bpo-7604](https://bugs.python.org/issue?@action=redirect&bpo=7604) [https://bugs.python.org/issue?@action=redirect&bpo=7604].)
- Two new encodings are now supported: “cp720”, used primarily for Arabic text; and “cp858”, a variant of CP 850 that adds the euro symbol. (CP720 contributed by Alexander Belchenko and Amaury Forgeot d'Arc in [bpo-1616979](https://bugs.python.org/issue?@action=redirect&bpo=1616979) [https://bugs.python.org/issue?@action=redirect&bpo=1616979]; CP858 contributed by Tim Hatch in [bpo-8016](https://bugs.python.org/issue?@action=redirect&bpo=8016) [https://bugs.python.org/issue?@action=redirect&bpo=8016].)
- The `file` object will now set the `filename` attribute on the `IOError` exception when trying to open a directory on POSIX platforms (noted by Jan Kaliszewski; [bpo-4764](https://bugs.python.org/issue?@action=redirect&bpo=4764) [https://bugs.python.org/issue?@action=redirect&bpo=4764]), and now explicitly checks for and forbids writing to read-only file objects instead of trusting the C library to catch and report the error (fixed by Stefan Krah; [bpo-5677](https://bugs.python.org/issue?@action=redirect&bpo=5677) [https://bugs.python.org/issue?@action=redirect&bpo=5677]).
- The Python tokenizer now translates line endings itself, so the `compile()` built-in function now accepts code using any line-ending convention. Additionally, it no longer requires

that the code end in a newline.

- Extra parentheses in function definitions are illegal in Python 3.x, meaning that you get a syntax error from `def f(x): pass`. In Python3-warning mode, Python 2.7 will now warn about this odd usage. (Noted by James Lingard; [bpo-7362](https://bugs.python.org/issue?@action=redirect&bpo=7362) [<https://bugs.python.org/issue?@action=redirect&bpo=7362>].)
- It's now possible to create weak references to old-style class objects. New-style classes were always weak-referenceable. (Fixed by Antoine Pitrou; [bpo-8268](https://bugs.python.org/issue?@action=redirect&bpo=8268) [<https://bugs.python.org/issue?@action=redirect&bpo=8268>].)
- When a module object is garbage-collected, the module's dictionary is now only cleared if no one else is holding a reference to the dictionary ([bpo-7140](https://bugs.python.org/issue?@action=redirect&bpo=7140) [<https://bugs.python.org/issue?@action=redirect&bpo=7140>]).

## Interpreter Changes

A new environment variable, [PYTHONWARNINGS](#), allows controlling warnings. It should be set to a string containing warning settings, equivalent to those used with the `-W` switch, separated by commas. (Contributed by Brian Curtin; [bpo-7301](https://bugs.python.org/issue?@action=redirect&bpo=7301) [<https://bugs.python.org/issue?@action=redirect&bpo=7301>].)

For example, the following setting will print warnings every time they occur, but turn warnings from the `Cookie` module into an error. (The exact syntax for setting an environment variable varies across operating systems and shells.)

```
export PYTHONWARNINGS=all,error:::Cookie:0
```

## Optimizations

Several performance enhancements have been added:

- A new opcode was added to perform the initial setup for `with` statements, looking up the `__enter__()` and `__exit__()` methods. (Contributed by Benjamin Peterson.)

- The garbage collector now performs better for one common usage pattern: when many objects are being allocated without deallocating any of them. This would previously take quadratic time for garbage collection, but now the number of full garbage collections is reduced as the number of objects on the heap grows. The new logic only performs a full garbage collection pass when the middle generation has been collected 10 times and when the number of survivor objects from the middle generation exceeds 10% of the number of objects in the oldest generation. (Suggested by Martin von Löwis and implemented by Antoine Pitrou; [bpo-4074](https://bugs.python.org/issue/?@action=redirect&bpo=4074) [https://bugs.python.org/issue/?@action=redirect&bpo=4074].)
- The garbage collector tries to avoid tracking simple containers which can't be part of a cycle. In Python 2.7, this is now true for tuples and dicts containing atomic types (such as ints, strings, etc.). Transitively, a dict containing tuples of atomic types won't be tracked either. This helps reduce the cost of each garbage collection by decreasing the number of objects to be considered and traversed by the collector. (Contributed by Antoine Pitrou; [bpo-4688](https://bugs.python.org/issue/?@action=redirect&bpo=4688) [https://bugs.python.org/issue/?@action=redirect&bpo=4688].)
- Long integers are now stored internally either in base  $2^{15}$  or in base  $2^{30}$ , the base being determined at build time. Previously, they were always stored in base  $2^{15}$ . Using base  $2^{30}$  gives significant performance improvements on 64-bit machines, but benchmark results on 32-bit machines have been mixed. Therefore, the default is to use base  $2^{30}$  on 64-bit machines and base  $2^{15}$  on 32-bit machines; on Unix, there's a new configure option **--enable-big-digits** that can be used to override this default.

Apart from the performance improvements this change should be invisible to end users, with one exception: for testing and debugging purposes there's a new structseq **sys.long\_info** that provides information about the internal format, giving the number of bits per digit and the size in bytes of the C type used to store each digit:

```
>>> import sys
```

```
>>> sys.long_info
sys.long_info(bits_per_digit=30, sizeof_digit=4)
```

(Contributed by Mark Dickinson; [bpo-4258](https://bugs.python.org/issue?@action=redirect&bpo=4258) [https://bugs.python.org/issue?@action=redirect&bpo=4258].)

Another set of changes made long objects a few bytes smaller: 2 bytes smaller on 32-bit systems and 6 bytes on 64-bit.

(Contributed by Mark Dickinson; [bpo-5260](https://bugs.python.org/issue?@action=redirect&bpo=5260) [https://bugs.python.org/issue?@action=redirect&bpo=5260].)

- The division algorithm for long integers has been made faster by tightening the inner loop, doing shifts instead of multiplications, and fixing an unnecessary extra iteration. Various benchmarks show speedups of between 50% and 150% for long integer divisions and modulo operations. (Contributed by Mark Dickinson; [bpo-5512](https://bugs.python.org/issue?@action=redirect&bpo=5512) [https://bugs.python.org/issue?@action=redirect&bpo=5512].) Bitwise operations are also significantly faster (initial patch by Gregory Smith; [bpo-1087418](https://bugs.python.org/issue?@action=redirect&bpo=1087418) [https://bugs.python.org/issue?@action=redirect&bpo=1087418]).
- The implementation of `%` checks for the left-side operand being a Python string and special-cases it; this results in a 1–3% performance increase for applications that frequently use `%` with strings, such as templating libraries. (Implemented by Collin Winter; [bpo-5176](https://bugs.python.org/issue?@action=redirect&bpo=5176) [https://bugs.python.org/issue?@action=redirect&bpo=5176].)
- List comprehensions with an `if` condition are compiled into faster bytecode. (Patch by Antoine Pitrou, back-ported to 2.7 by Jeffrey Yasskin; [bpo-4715](https://bugs.python.org/issue?@action=redirect&bpo=4715) [https://bugs.python.org/issue?@action=redirect&bpo=4715].)
- Converting an integer or long integer to a decimal string was made faster by special-casing base 10 instead of using a generalized conversion function that supports arbitrary bases. (Patch by Gawain Bolton; [bpo-6713](https://bugs.python.org/issue?@action=redirect&bpo=6713) [https://bugs.python.org/issue?@action=redirect&bpo=6713].)
- The `split()`, `replace()`, `rindex()`, `rpartition()`,

and `rsplit()` methods of string-like types (strings, Unicode strings, and `bytearray` objects) now use a fast reverse-search algorithm instead of a character-by-character scan.

This is sometimes faster by a factor of 10. (Added by Florent Xicluna; [bpo-7462](https://bugs.python.org/issue?@action=redirect&bpo=7462) [https://bugs.python.org/issue?@action=redirect&bpo=7462] and [bpo-7622](https://bugs.python.org/issue?@action=redirect&bpo=7622) [https://bugs.python.org/issue?@action=redirect&bpo=7622].)

@action=redirect&bpo=7462] and [bpo-7622](https://bugs.python.org/issue?@action=redirect&bpo=7622) [https://bugs.python.org/issue?@action=redirect&bpo=7622].)

- The `pickle` and `cPickle` modules now automatically intern the strings used for attribute names, reducing memory usage of the objects resulting from unpickling. (Contributed by Jake McGuire; [bpo-5084](https://bugs.python.org/issue?@action=redirect&bpo=5084) [https://bugs.python.org/issue?@action=redirect&bpo=5084].)
- The `cPickle` module now special-cases dictionaries, nearly halving the time required to pickle them. (Contributed by Collin Winter; [bpo-5670](https://bugs.python.org/issue?@action=redirect&bpo=5670) [https://bugs.python.org/issue?@action=redirect&bpo=5670].)

## New and Improved Modules

As in every release, Python's standard library received a number of enhancements and bug fixes. Here's a partial list of the most notable changes, sorted alphabetically by module name. Consult the `Misc/NEWS` file in the source tree for a more complete list of changes, or look through the Subversion logs for all the details.

- The `bdb` module's base debugging class `Bdb` gained a feature for skipping modules. The constructor now takes an iterable containing glob-style patterns such as `django.*`; the debugger will not step into stack frames from a module that matches one of these patterns. (Contributed by Maru Newby after a suggestion by Senthil Kumaran; [bpo-5142](https://bugs.python.org/issue?@action=redirect&bpo=5142) [https://bugs.python.org/issue?@action=redirect&bpo=5142].)
- The `binascii` module now supports the buffer API, so it can be used with `memoryview` instances and other similar buffer objects. (Backported from 3.x by Florent Xicluna; [bpo-7703](https://bugs.python.org/issue?@action=redirect&bpo=7703) [https://bugs.python.org/issue?@action=redirect&bpo=7703].)

- Updated module: the **bsddb** module has been updated from 4.7.2devel9 to version 4.8.4 of [the pybsddb package](https://www.jcea.es/programacion/pybsddb.htm) [https://www.jcea.es/programacion/pybsddb.htm]. The new version features better Python 3.x compatibility, various bug fixes, and adds several new BerkeleyDB flags and methods. (Updated by Jesús Cea Avi3n; [bpo-8156](https://bugs.python.org/issue?@action=redirect&bpo=8156) [https://bugs.python.org/issue?@action=redirect&bpo=8156]. The pybsddb changelog can be read at <https://hg.jcea.es/pybsddb/file/tip/ChangeLog>.)
- The **bz2** module's **BZ2File** now supports the context management protocol, so you can write with `bz2.BZ2File(...)` as `f:.` (Contributed by Hagen F3rstenau; [bpo-3860](https://bugs.python.org/issue?@action=redirect&bpo=3860) [https://bugs.python.org/issue?@action=redirect&bpo=3860].)
- New class: the **Counter** class in the **collections** module is useful for tallying data. **Counter** instances behave mostly like dictionaries but return zero for missing keys instead of raising a **KeyError**:

```
>>> from collections import Counter
>>> c = Counter()
>>> for letter in 'here is a sample of english text
...     c[letter] += 1
...
>>> c
Counter({' ': 6, 'e': 5, 's': 3, 'a': 2, 'i': 2, 'h': 1, 'l': 2, 't': 2, 'g': 1, 'f': 1, 'm': 1, 'o': 1, 'n': 1, 'p': 1, 'r': 1, 'x': 1})
>>> c['e']
5
>>> c['z']
0
```

There are three additional **Counter** methods. **most\_common()** returns the N most common elements and their counts. **elements()** returns an iterator over the contained elements, repeating each element as many times as its count. **subtract()** takes an iterable and subtracts one for each element instead of adding; if the argument is a

dictionary or another **Counter**, the counts are subtracted.

```
>>> c.most_common(5)
[(' ', 6), ('e', 5), ('s', 3), ('a', 2), ('i', 2)]
>>> c.elements() ->
'a', 'a', ' ', ' ', ' ', ' ', ' ', ' ', ' ',
'e', 'e', 'e', 'e', 'e', 'g', 'f', 'i', 'i',
'h', 'h', 'm', 'l', 'l', 'o', 'n', 'p', 's',
's', 's', 'r', 't', 't', 'x'
>>> c['e']
5
>>> c.subtract('very heavy on the letter e')
>>> c['e']      # Count is now lower
-1
```

Contributed by Raymond Hettinger; [bpo-1696199](https://bugs.python.org/issue?@action=redirect&bpo=1696199) [https://bugs.python.org/issue?@action=redirect&bpo=1696199].

New class: **OrderedDict** is described in the earlier section [PEP 372: Adding an Ordered Dictionary to collections](#).

New method: The **deque** data type now has a **count()** method that returns the number of contained elements equal to the supplied argument *x*, and a **reverse()** method that reverses the elements of the deque in-place. **deque** also exposes its maximum length as the read-only **maxlen** attribute. (Both features added by Raymond Hettinger.)

The **namedtuple** class now has an optional *rename* parameter. If *rename* is true, field names that are invalid because they've been repeated or aren't legal Python identifiers will be renamed to legal names that are derived from the field's position within the list of fields:

```
>>> from collections import namedtuple
>>> T = namedtuple('T', ['field1', '$illegal', 'for'])
>>> T._fields
('field1', '_1', '_2', 'field2')
```

(Added by Raymond Hettinger; [bpo-1818](https://bugs.python.org/issue?@action=redirect&bpo=1818) [https://bugs.python.org/issue?@action=redirect&bpo=1818].)

[bugs.python.org/issue?@action=redirect&bpo=1818](https://bugs.python.org/issue?@action=redirect&bpo=1818)].)

Finally, the **Mapping** abstract base class now returns **NotImplemented** if a mapping is compared to another type that isn't a **Mapping**. (Fixed by Daniel Stutzbach; [bpo-8729](https://bugs.python.org/issue?@action=redirect&bpo=8729) [<https://bugs.python.org/issue?@action=redirect&bpo=8729>].)

- Constructors for the parsing classes in the **ConfigParser** module now take an *allow\_no\_value* parameter, defaulting to false; if true, options without values will be allowed. For example:

```
>>> import ConfigParser, StringIO
>>> sample_config = """
... [mysqld]
... user = mysql
... pid-file = /var/run/mysqld/mysqld.pid
... skip-bdb
... """
>>> config = ConfigParser.RawConfigParser(allow_no_value=True)
>>> config.readfp(StringIO.StringIO(sample_config))
>>> config.get('mysqld', 'user')
'mysql'
>>> print config.get('mysqld', 'skip-bdb')
None
>>> print config.get('mysqld', 'unknown')
Traceback (most recent call last):
...
NoOptionError: No option 'unknown' in section: 'mysqld'
```

(Contributed by Mats Kindahl; [bpo-7005](https://bugs.python.org/issue?@action=redirect&bpo=7005) [<https://bugs.python.org/issue?@action=redirect&bpo=7005>].)

- Deprecated function: **contextlib.nested()**, which allows handling more than one context manager with a single **with** statement, has been deprecated, because the **with** statement now supports multiple context managers.
- The **cookiecutter** module now ignores cookies that have an invalid version field, one that doesn't contain an integer

value. (Fixed by John J. Lee; [bpo-3924](https://bugs.python.org/issue?@action=redirect&bpo=3924) [https://bugs.python.org/issue?@action=redirect&bpo=3924].)

- The `copy` module's `deepcopy()` function will now correctly copy bound instance methods. (Implemented by Robert Collins; [bpo-1515](https://bugs.python.org/issue?@action=redirect&bpo=1515) [https://bugs.python.org/issue?@action=redirect&bpo=1515].)
- The `ctypes` module now always converts `None` to a C `NULL` pointer for arguments declared as pointers. (Changed by Thomas Heller; [bpo-4606](https://bugs.python.org/issue?@action=redirect&bpo=4606) [https://bugs.python.org/issue?@action=redirect&bpo=4606].) The underlying `libffi` library [https://sourceware.org/libffi/] has been updated to version 3.0.9, containing various fixes for different platforms. (Updated by Matthias Klose; [bpo-8142](https://bugs.python.org/issue?@action=redirect&bpo=8142) [https://bugs.python.org/issue?@action=redirect&bpo=8142].)
- New method: the `datetime` module's `timedelta` class gained a `total_seconds()` method that returns the number of seconds in the duration. (Contributed by Brian Quinlan; [bpo-5788](https://bugs.python.org/issue?@action=redirect&bpo=5788) [https://bugs.python.org/issue?@action=redirect&bpo=5788].)
- New method: the `Decimal` class gained a `from_float()` class method that performs an exact conversion of a floating-point number to a `Decimal`. This exact conversion strives for the closest decimal approximation to the floating-point representation's value; the resulting decimal value will therefore still include the inaccuracy, if any. For example, `Decimal.from_float(0.1)` returns `Decimal('0.1000000000000000055511151231257827021181')` (Implemented by Raymond Hettinger; [bpo-4796](https://bugs.python.org/issue?@action=redirect&bpo=4796) [https://bugs.python.org/issue?@action=redirect&bpo=4796].)

Comparing instances of `Decimal` with floating-point numbers now produces sensible results based on the numeric values of the operands. Previously such comparisons would fall back to Python's default rules for comparing objects, which produced arbitrary results based on their type. Note that you still cannot combine `Decimal` and floating-point in other operations such as addition, since you should be

explicitly choosing how to convert between float and **Decimal**. (Fixed by Mark Dickinson; [bpo-2531](https://bugs.python.org/issue?@action=redirect&bpo=2531) [https://bugs.python.org/issue?@action=redirect&bpo=2531].)

The constructor for **Decimal** now accepts floating-point numbers (added by Raymond Hettinger; [bpo-8257](https://bugs.python.org/issue?@action=redirect&bpo=8257) [https://bugs.python.org/issue?@action=redirect&bpo=8257]) and non-European Unicode characters such as Arabic-Indic digits (contributed by Mark Dickinson; [bpo-6595](https://bugs.python.org/issue?@action=redirect&bpo=6595) [https://bugs.python.org/issue?@action=redirect&bpo=6595]).

Most of the methods of the **Context** class now accept integers as well as **Decimal** instances; the only exceptions are the **canonical()** and **is\_canonical()** methods. (Patch by Juan José Conti; [bpo-7633](https://bugs.python.org/issue?@action=redirect&bpo=7633) [https://bugs.python.org/issue?@action=redirect&bpo=7633].)

When using **Decimal** instances with a string's **format()** method, the default alignment was previously left-alignment. This has been changed to right-alignment, which is more sensible for numeric types. (Changed by Mark Dickinson; [bpo-6857](https://bugs.python.org/issue?@action=redirect&bpo=6857) [https://bugs.python.org/issue?@action=redirect&bpo=6857].)

Comparisons involving a signaling NaN value (or **sNaN**) now signal **InvalidOperation** instead of silently returning a true or false value depending on the comparison operator. Quiet NaN values (or **NaN**) are now hashable. (Fixed by Mark Dickinson; [bpo-7279](https://bugs.python.org/issue?@action=redirect&bpo=7279) [https://bugs.python.org/issue?@action=redirect&bpo=7279].)

- The **difflib** module now produces output that is more compatible with modern **diff/patch** tools through one small change, using a tab character instead of spaces as a separator in the header giving the filename. (Fixed by Anatoly Techtonik; [bpo-7585](https://bugs.python.org/issue?@action=redirect&bpo=7585) [https://bugs.python.org/issue?@action=redirect&bpo=7585].)
- The Distutils **sdist** command now always regenerates the **MANIFEST** file, since even if the **MANIFEST.in** or **setup.py** files haven't been modified, the user might have

created some new files that should be included. (Fixed by Tarek Ziadé; [bpo-8688](https://bugs.python.org/issue?@action=redirect&bpo=8688) [https://bugs.python.org/issue?@action=redirect&bpo=8688].)

- The `doctest` module's `IGNORE_EXCEPTION_DETAIL` flag will now ignore the name of the module containing the exception being tested. (Patch by Lennart Regebro; [bpo-7490](https://bugs.python.org/issue?@action=redirect&bpo=7490) [https://bugs.python.org/issue?@action=redirect&bpo=7490].)
- The `email` module's `Message` class will now accept a Unicode-valued payload, automatically converting the payload to the encoding specified by `output_charset`. (Added by R. David Murray; [bpo-1368247](https://bugs.python.org/issue?@action=redirect&bpo=1368247) [https://bugs.python.org/issue?@action=redirect&bpo=1368247].)
- The `Fraction` class now accepts a single float or `Decimal` instance, or two rational numbers, as arguments to its constructor. (Implemented by Mark Dickinson; rationals added in [bpo-5812](https://bugs.python.org/issue?@action=redirect&bpo=5812) [https://bugs.python.org/issue?@action=redirect&bpo=5812], and float/decimal in [bpo-8294](https://bugs.python.org/issue?@action=redirect&bpo=8294) [https://bugs.python.org/issue?@action=redirect&bpo=8294].)

Ordering comparisons (`<`, `<=`, `>`, `>=`) between fractions and complex numbers now raise a `TypeError`. This fixes an oversight, making the `Fraction` match the other numeric types.

- New class: `FTP_TLS` in the `ftplib` module provides secure FTP connections using TLS encapsulation of authentication as well as subsequent control and data transfers. (Contributed by Giampaolo Rodola; [bpo-2054](https://bugs.python.org/issue?@action=redirect&bpo=2054) [https://bugs.python.org/issue?@action=redirect&bpo=2054].)

The `storbinary()` method for binary uploads can now restart uploads thanks to an added `rest` parameter (patch by Pablo Mouzo; [bpo-6845](https://bugs.python.org/issue?@action=redirect&bpo=6845) [https://bugs.python.org/issue?@action=redirect&bpo=6845].)

- New class decorator: `total_ordering()` in the `functools` module takes a class that defines an `__eq__()` method and one of `__lt__()`, `__le__()`, `__gt__()`, or

`__ge__()`, and generates the missing comparison methods. Since the `__cmp__()` method is being deprecated in Python 3.x, this decorator makes it easier to define ordered classes. (Added by Raymond Hettinger; [bpo-5479](https://bugs.python.org/issue?@action=redirect&bpo=5479) [https://bugs.python.org/issue?@action=redirect&bpo=5479].)

New function: `cmp_to_key()` will take an old-style comparison function that expects two arguments and return a new callable that can be used as the `key` parameter to functions such as `sorted()`, `min()` and `max()`, etc. The primary intended use is to help with making code compatible with Python 3.x. (Added by Raymond Hettinger.)

- New function: the `gc` module's `is_tracked()` returns true if a given instance is tracked by the garbage collector, false otherwise. (Contributed by Antoine Pitrou; [bpo-4688](https://bugs.python.org/issue?@action=redirect&bpo=4688) [https://bugs.python.org/issue?@action=redirect&bpo=4688].)
- The `gzip` module's `GzipFile` now supports the context management protocol, so you can write with `gzip.GzipFile(...)` as `f:` (contributed by Hagen Fürstenau; [bpo-3860](https://bugs.python.org/issue?@action=redirect&bpo=3860) [https://bugs.python.org/issue?@action=redirect&bpo=3860]), and it now implements the `io.BufferedIOBase` ABC, so you can wrap it with `io.BufferedReader` for faster processing (contributed by Nir Aides; [bpo-7471](https://bugs.python.org/issue?@action=redirect&bpo=7471) [https://bugs.python.org/issue?@action=redirect&bpo=7471]). It's also now possible to override the modification time recorded in a gzipped file by providing an optional timestamp to the constructor. (Contributed by Jacques Frechet; [bpo-4272](https://bugs.python.org/issue?@action=redirect&bpo=4272) [https://bugs.python.org/issue?@action=redirect&bpo=4272].)

Files in `gzip` format can be padded with trailing zero bytes; the `gzip` module will now consume these trailing bytes. (Fixed by Tadek Pietraszek and Brian Curtin; [bpo-2846](https://bugs.python.org/issue?@action=redirect&bpo=2846) [https://bugs.python.org/issue?@action=redirect&bpo=2846].)

- New attribute: the `hashlib` module now has an `algorithms` attribute containing a tuple naming the supported algorithms. In Python 2.7, `hashlib.algorithms` contains `('md5', 'sha1',`

```
'sha224', 'sha256', 'sha384', 'sha512').
```

(Contributed by Carl Chenet; [bpo-7418](https://bugs.python.org/issue?@action=redirect&bpo=7418) [https://bugs.python.org/issue?@action=redirect&bpo=7418].)

- The default **HTTPResponse** class used by the **httplib** module now supports buffering, resulting in much faster reading of HTTP responses. (Contributed by Kristján Valur Jónsson; [bpo-4879](https://bugs.python.org/issue?@action=redirect&bpo=4879) [https://bugs.python.org/issue?@action=redirect&bpo=4879].)

The **HTTPConnection** and **HTTPSConnection** classes now support a *source\_address* parameter, a (host, port) 2-tuple giving the source address that will be used for the connection. (Contributed by Eldon Ziegler; [bpo-3972](https://bugs.python.org/issue?@action=redirect&bpo=3972) [https://bugs.python.org/issue?@action=redirect&bpo=3972].)

- The **ihooks** module now supports relative imports. Note that **ihooks** is an older module for customizing imports, superseded by the **importlib** module added in Python 2.0. (Relative import support added by Neil Schemenauer.)
- The **imaplib** module now supports IPv6 addresses. (Contributed by Derek Morr; [bpo-1655](https://bugs.python.org/issue?@action=redirect&bpo=1655) [https://bugs.python.org/issue?@action=redirect&bpo=1655].)
- New function: the **inspect** module's **getcallargs()** takes a callable and its positional and keyword arguments, and figures out which of the callable's parameters will receive each argument, returning a dictionary mapping argument names to their values. For example:

```
>>> from inspect import getcallargs
>>> def f(a, b=1, *pos, **named):
...     pass
>>> getcallargs(f, 1, 2, 3)
{'a': 1, 'b': 2, 'pos': (3,), 'named': {}}
>>> getcallargs(f, a=2, x=4)
{'a': 2, 'b': 1, 'pos': (), 'named': {'x': 4}}
>>> getcallargs(f)
Traceback (most recent call last):
...
```

`TypeError: f() takes at least 1 argument (0 given)`

Contributed by George Sakkis; [bpo-3135](https://bugs.python.org/issue?@action=redirect&bpo=3135) [https://bugs.python.org/issue?@action=redirect&bpo=3135].

- Updated module: The `io` library has been upgraded to the version shipped with Python 3.1. For 3.1, the I/O library was entirely rewritten in C and is 2 to 20 times faster depending on the task being performed. The original Python version was renamed to the `_pyio` module.

One minor resulting change: the `io.TextIOBase` class now has an `errors` attribute giving the error setting used for encoding and decoding errors (one of `'strict'`, `'replace'`, `'ignore'`).

The `io.FileIO` class now raises an `OSError` when passed an invalid file descriptor. (Implemented by Benjamin Peterson; [bpo-4991](https://bugs.python.org/issue?@action=redirect&bpo=4991) [https://bugs.python.org/issue?@action=redirect&bpo=4991].) The `truncate()` method now preserves the file position; previously it would change the file position to the end of the new file. (Fixed by Pascal Chambon; [bpo-6939](https://bugs.python.org/issue?@action=redirect&bpo=6939) [https://bugs.python.org/issue?@action=redirect&bpo=6939].)

- New function: `itertools.compress(data, selectors)` takes two iterators. Elements of *data* are returned if the corresponding value in *selectors* is true:

```
itertools.compress('ABCDEF', [1,0,1,0,1,1]) =>
    A, C, E, F
```

New function:

`itertools.combinations_with_replacement(iter, r)` returns all the possible *r*-length combinations of elements from the iterable *iter*. Unlike `combinations()`, individual elements can be repeated in the generated combinations:

```
itertools.combinations_with_replacement('abc', 2) =
    ('a', 'a'), ('a', 'b'), ('a', 'c'),
    ('b', 'b'), ('b', 'c'), ('c', 'c')
```

Note that elements are treated as unique depending on their position in the input, not their actual values.

The `itertools.count()` function now has a *step* argument that allows incrementing by values other than 1. `count()` also now allows keyword arguments, and using non-integer values such as floats or `Decimal` instances. (Implemented by Raymond Hettinger; [bpo-5032](https://bugs.python.org/issue?@action=redirect&bpo=5032) [https://bugs.python.org/issue?@action=redirect&bpo=5032].)

`itertools.combinations()` and `itertools.product()` previously raised `ValueError` for values of *r* larger than the input iterable. This was deemed a specification error, so they now return an empty iterator. (Fixed by Raymond Hettinger; [bpo-4816](https://bugs.python.org/issue?@action=redirect&bpo=4816) [https://bugs.python.org/issue?@action=redirect&bpo=4816].)

- Updated module: The `json` module was upgraded to version 2.0.9 of the `simplejson` package, which includes a C extension that makes encoding and decoding faster. (Contributed by Bob Ippolito; [bpo-4136](https://bugs.python.org/issue?@action=redirect&bpo=4136) [https://bugs.python.org/issue?@action=redirect&bpo=4136].)

To support the new `collections.OrderedDict` type, `json.load()` now has an optional *object\_pairs\_hook* parameter that will be called with any object literal that decodes to a list of pairs. (Contributed by Raymond Hettinger; [bpo-5381](https://bugs.python.org/issue?@action=redirect&bpo=5381) [https://bugs.python.org/issue?@action=redirect&bpo=5381].)

- The `mailbox` module's `Maildir` class now records the timestamp on the directories it reads, and only re-reads them if the modification time has subsequently changed. This improves performance by avoiding unneeded directory scans. (Fixed by A.M. Kuchling and Antoine Pitrou; [bpo-1607951](https://bugs.python.org/issue?@action=redirect&bpo=1607951) [https://bugs.python.org/issue?@action=redirect&bpo=1607951], [bpo-6896](https://bugs.python.org/issue?@action=redirect&bpo=6896) [https://bugs.python.org/issue?@action=redirect&bpo=6896].)
- New functions: the `math` module gained `erf()` and `erfc()` for the error function and the complementary error

function, `expm1()` which computes  $e^x - 1$  with more precision than using `exp()` and subtracting 1, `gamma()` for the Gamma function, and `lgamma()` for the natural log of the Gamma function. (Contributed by Mark Dickinson and nirinA raseliarison; [bpo-3366](https://bugs.python.org/issue?@action=redirect&bpo=3366) [https://bugs.python.org/issue?@action=redirect&bpo=3366].)

- The `multiprocessing` module's `Manager*` classes can now be passed a callable that will be called whenever a subprocess is started, along with a set of arguments that will be passed to the callable. (Contributed by lekma; [bpo-5585](https://bugs.python.org/issue?@action=redirect&bpo=5585) [https://bugs.python.org/issue?@action=redirect&bpo=5585].)

The `Pool` class, which controls a pool of worker processes, now has an optional `maxtasksperchild` parameter. Worker processes will perform the specified number of tasks and then exit, causing the `Pool` to start a new worker. This is useful if tasks may leak memory or other resources, or if some tasks will cause the worker to become very large. (Contributed by Charles Cazabon; [bpo-6963](https://bugs.python.org/issue?@action=redirect&bpo=6963) [https://bugs.python.org/issue?@action=redirect&bpo=6963].)

- The `nntplib` module now supports IPv6 addresses. (Contributed by Derek Morr; [bpo-1664](https://bugs.python.org/issue?@action=redirect&bpo=1664) [https://bugs.python.org/issue?@action=redirect&bpo=1664].)
- New functions: the `os` module wraps the following POSIX system calls: `getresgid()` and `getresuid()`, which return the real, effective, and saved GIDs and UIDs; `setresgid()` and `setresuid()`, which set real, effective, and saved GIDs and UIDs to new values; `initgroups()`, which initialize the group access list for the current process. (GID/UID functions contributed by Travis H.; [bpo-6508](https://bugs.python.org/issue?@action=redirect&bpo=6508) [https://bugs.python.org/issue?@action=redirect&bpo=6508]. Support for `initgroups` added by Jean-Paul Calderone; [bpo-7333](https://bugs.python.org/issue?@action=redirect&bpo=7333) [https://bugs.python.org/issue?@action=redirect&bpo=7333].)

The `os.fork()` function now re-initializes the import lock in the child process; this fixes problems on Solaris when `fork()` is called from a thread. (Fixed by Zsolt Cserna; [bpo-7242](https://bugs.python.org/issue?@action=redirect&bpo=7242) [https://bugs.python.org/issue?@action=redirect&bpo=7242].)

@action=redirect&bpo=7242].)

- In the `os.path` module, the `normpath()` and `abspath()` functions now preserve Unicode; if their input path is a Unicode string, the return value is also a Unicode string. (`normpath()` fixed by Matt Giuca in [bpo-5827](https://bugs.python.org/issue?@action=redirect&bpo=5827) [https://bugs.python.org/issue?@action=redirect&bpo=5827]; `abspath()` fixed by Ezio Melotti in [bpo-3426](https://bugs.python.org/issue?@action=redirect&bpo=3426) [https://bugs.python.org/issue?@action=redirect&bpo=3426].)
- The `pydoc` module now has help for the various symbols that Python uses. You can now do `help('<<')` or `help('@')`, for example. (Contributed by David Laban; [bpo-4739](https://bugs.python.org/issue?@action=redirect&bpo=4739) [https://bugs.python.org/issue?@action=redirect&bpo=4739].)
- The `re` module's `split()`, `sub()`, and `subn()` now accept an optional *flags* argument, for consistency with the other functions in the module. (Added by Gregory P. Smith.)
- New function: `run_path()` in the `runpy` module will execute the code at a provided *path* argument. *path* can be the path of a Python source file (`example.py`), a compiled bytecode file (`example.pyc`), a directory (`./package/`), or a zip archive (`example.zip`). If a directory or zip path is provided, it will be added to the front of `sys.path` and the module `__main__` will be imported. It's expected that the directory or zip contains a `__main__.py`; if it doesn't, some other `__main__.py` might be imported from a location later in `sys.path`. This makes more of the machinery of `runpy` available to scripts that want to mimic the way Python's command line processes an explicit path name. (Added by Nick Coghlan; [bpo-6816](https://bugs.python.org/issue?@action=redirect&bpo=6816) [https://bugs.python.org/issue?@action=redirect&bpo=6816].)
- New function: in the `shutil` module, `make_archive()` takes a filename, archive type (zip or tar-format), and a directory path, and creates an archive containing the directory's contents. (Added by Tarek Ziadé.)

`shutil`'s `copyfile()` and `copytree()` functions now

raise a **SpecialFileError** exception when asked to copy a named pipe. Previously the code would treat named pipes like a regular file by opening them for reading, and this would block indefinitely. (Fixed by Antoine Pitrou; [bpo-3002](https://bugs.python.org/issue?@action=redirect&bpo=3002) [<https://bugs.python.org/issue?@action=redirect&bpo=3002>].)

- The **signal** module no longer re-installs the signal handler unless this is truly necessary, which fixes a bug that could make it impossible to catch the **EINTR** signal robustly. (Fixed by Charles-Francois Natali; [bpo-8354](https://bugs.python.org/issue?@action=redirect&bpo=8354) [<https://bugs.python.org/issue?@action=redirect&bpo=8354>].)
- New functions: in the **site** module, three new functions return various site- and user-specific paths. **getsitpackages()** returns a list containing all global site-packages directories, **getusersitpackages()** returns the path of the user's site-packages directory, and **getuserbase()** returns the value of the **USER\_BASE** environment variable, giving the path to a directory that can be used to store data. (Contributed by Tarek Ziadé; [bpo-6693](https://bugs.python.org/issue?@action=redirect&bpo=6693) [<https://bugs.python.org/issue?@action=redirect&bpo=6693>].)

The **site** module now reports exceptions occurring when the **sitecustomize** module is imported, and will no longer catch and swallow the **KeyboardInterrupt** exception. (Fixed by Victor Stinner; [bpo-3137](https://bugs.python.org/issue?@action=redirect&bpo=3137) [<https://bugs.python.org/issue?@action=redirect&bpo=3137>].)

- The **create\_connection()** function gained a *source\_address* parameter, a (host, port) 2-tuple giving the source address that will be used for the connection. (Contributed by Eldon Ziegler; [bpo-3972](https://bugs.python.org/issue?@action=redirect&bpo=3972) [<https://bugs.python.org/issue?@action=redirect&bpo=3972>].)

The **recv\_into()** and **recvfrom\_into()** methods will now write into objects that support the buffer API, most usefully the **bytearray** and **memoryview** objects. (Implemented by Antoine Pitrou; [bpo-8104](https://bugs.python.org/issue?@action=redirect&bpo=8104) [<https://bugs.python.org/issue?@action=redirect&bpo=8104>].)

- The **SocketServer** module's **TCPServer** class now

supports socket timeouts and disabling the Nagle algorithm. The `disable_nagle_algorithm` class attribute defaults to `False`; if overridden to be `True`, new request connections will have the `TCP_NODELAY` option set to prevent buffering many small sends into a single TCP packet. The `timeout` class attribute can hold a timeout in seconds that will be applied to the request socket; if no request is received within that time, `handle_timeout()` will be called and `handle_request()` will return. (Contributed by Kristján Valur Jónsson; [bpo-6192](https://bugs.python.org/issue?@action=redirect&bpo=6192) [https://bugs.python.org/issue?@action=redirect&bpo=6192] and [bpo-6267](https://bugs.python.org/issue?@action=redirect&bpo=6267) [https://bugs.python.org/issue?@action=redirect&bpo=6267]).

- Updated module: the `sqlite3` module has been updated to version 2.6.0 of the [pysqlite package](https://github.com/ghaering/pysqlite) [https://github.com/ghaering/pysqlite]. Version 2.6.0 includes a number of bugfixes, and adds the ability to load SQLite extensions from shared libraries. Call the `enable_load_extension(True)` method to enable extensions, and then call `load_extension()` to load a particular shared library. (Updated by Gerhard Häring.)
- The `ssl` module's `SSLSocket` objects now support the buffer API, which fixed a test suite failure (fix by Antoine Pitrou; [bpo-7133](https://bugs.python.org/issue?@action=redirect&bpo=7133) [https://bugs.python.org/issue?@action=redirect&bpo=7133]) and automatically set OpenSSL's `SSL_MODE_AUTO_RETRY`, which will prevent an error code being returned from `recv()` operations that trigger an SSL renegotiation (fix by Antoine Pitrou; [bpo-8222](https://bugs.python.org/issue?@action=redirect&bpo=8222) [https://bugs.python.org/issue?@action=redirect&bpo=8222]).

The `ssl.wrap_socket()` constructor function now takes a `ciphers` argument that's a string listing the encryption algorithms to be allowed; the format of the string is described in the [OpenSSL documentation](https://www.openssl.org/docs/man1.0.2/man1/ciphers.html) [https://www.openssl.org/docs/man1.0.2/man1/ciphers.html]. (Added by Antoine Pitrou; [bpo-8322](https://bugs.python.org/issue?@action=redirect&bpo=8322) [https://bugs.python.org/issue?@action=redirect&bpo=8322]).

Another change makes the extension load all of OpenSSL's ciphers and digest algorithms so that they're all available.

Some SSL certificates couldn't be verified, reporting an "unknown algorithm" error. (Reported by Beda Kosata, and fixed by Antoine Pitrou; [bpo-8484](https://bugs.python.org/issue?@action=redirect&bpo=8484) [https://bugs.python.org/issue?@action=redirect&bpo=8484].)

The version of OpenSSL being used is now available as the module attributes `ssl.OPENSSL_VERSION` (a string), `ssl.OPENSSL_VERSION_INFO` (a 5-tuple), and `ssl.OPENSSL_VERSION_NUMBER` (an integer). (Added by Antoine Pitrou; [bpo-8321](https://bugs.python.org/issue?@action=redirect&bpo=8321) [https://bugs.python.org/issue?@action=redirect&bpo=8321].)

- The `struct` module will no longer silently ignore overflow errors when a value is too large for a particular integer format code (one of `bBhHiIlLqQ`); it now always raises a `struct.error` exception. (Changed by Mark Dickinson; [bpo-1523](https://bugs.python.org/issue?@action=redirect&bpo=1523) [https://bugs.python.org/issue?@action=redirect&bpo=1523].) The `pack()` function will also attempt to use `__index__()` to convert and pack non-integers before trying the `__int__()` method or reporting an error. (Changed by Mark Dickinson; [bpo-8300](https://bugs.python.org/issue?@action=redirect&bpo=8300) [https://bugs.python.org/issue?@action=redirect&bpo=8300].)
- New function: the `subprocess` module's `check_output()` runs a command with a specified set of arguments and returns the command's output as a string when the command runs without error, or raises a `CalledProcessError` exception otherwise.

```
>>> subprocess.check_output(['df', '-h', '.'])
Filesystem      Size   Used  Avail Capacity  Mounted on
/dev/disk0s2    52G    49G   3.0G     94%      /\n'

>>> subprocess.check_output(['df', '-h', '/bogus'])
...
subprocess.CalledProcessError: Command '['df', '-h'
```

(Contributed by Gregory P. Smith.)

The `subprocess` module will now retry its internal system calls on receiving an `EINTR` signal. (Reported by several

people; final patch by Gregory P. Smith in [bpo-1068268](#)

[<https://bugs.python.org/issue?@action=redirect&bpo=1068268>].)

- New function: `is_declared_global()` in the `symtable` module returns true for variables that are explicitly declared to be global, false for ones that are implicitly global. (Contributed by Jeremy Hylton.)
- The `syslog` module will now use the value of `sys.argv[0]` as the identifier instead of the previous default value of `'python'`. (Changed by Sean Reifschneider; [bpo-8451](#) [<https://bugs.python.org/issue?@action=redirect&bpo=8451>].)
- The `sys.version_info` value is now a named tuple, with attributes named **major**, **minor**, **micro**, **releaselevel**, and **serial**. (Contributed by Ross Light; [bpo-4285](#) [<https://bugs.python.org/issue?@action=redirect&bpo=4285>].)

`sys.getwindowsversion()` also returns a named tuple, with attributes named **major**, **minor**, **build**, **platform**, **service\_pack**, **service\_pack\_major**, **service\_pack\_minor**, **suite\_mask**, and **product\_type**. (Contributed by Brian Curtin; [bpo-7766](#) [<https://bugs.python.org/issue?@action=redirect&bpo=7766>].)

- The `tarfile` module's default error handling has changed, to no longer suppress fatal errors. The default error level was previously 0, which meant that errors would only result in a message being written to the debug log, but because the debug log is not activated by default, these errors go unnoticed. The default error level is now 1, which raises an exception if there's an error. (Changed by Lars Gustäbel; [bpo-7357](#) [<https://bugs.python.org/issue?@action=redirect&bpo=7357>].)

`tarfile` now supports filtering the `TarInfo` objects being added to a tar file. When you call `add()`, you may supply an optional *filter* argument that's a callable. The *filter* callable will be passed the `TarInfo` for every file being added, and can modify and return it. If the callable returns `None`, the file

will be excluded from the resulting archive. This is more powerful than the existing *exclude* argument, which has therefore been deprecated. (Added by Lars Gustäbel; [bpo-6856](https://bugs.python.org/issue?@action=redirect&bpo=6856) [https://bugs.python.org/issue?@action=redirect&bpo=6856].) The **TarFile** class also now supports the context management protocol. (Added by Lars Gustäbel; [bpo-7232](https://bugs.python.org/issue?@action=redirect&bpo=7232) [https://bugs.python.org/issue?@action=redirect&bpo=7232].)

- The **wait()** method of the **threading.Event** class now returns the internal flag on exit. This means the method will usually return true because **wait()** is supposed to block until the internal flag becomes true. The return value will only be false if a timeout was provided and the operation timed out. (Contributed by Tim Leshner; [bpo-1674032](https://bugs.python.org/issue?@action=redirect&bpo=1674032) [https://bugs.python.org/issue?@action=redirect&bpo=1674032].)
- The Unicode database provided by the **unicodedata** module is now used internally to determine which characters are numeric, whitespace, or represent line breaks. The database also includes information from the `UniHan.txt` data file (patch by Anders Chrigström and Amaury Forgeot d'Arc; [bpo-1571184](https://bugs.python.org/issue?@action=redirect&bpo=1571184) [https://bugs.python.org/issue?@action=redirect&bpo=1571184]) and has been updated to version 5.2.0 (updated by Florent Xicluna; [bpo-8024](https://bugs.python.org/issue?@action=redirect&bpo=8024) [https://bugs.python.org/issue?@action=redirect&bpo=8024]).
- The **urlparse** module's **urlsplit()** now handles unknown URL schemes in a fashion compliant with [RFC 3986](https://datatracker.ietf.org/doc/html/rfc3986.html) [https://datatracker.ietf.org/doc/html/rfc3986.html]: if the URL is of the form "`<something>://...`", the text before the `://` is treated as the scheme, even if it's a made-up scheme that the module doesn't know about. This change may break code that worked around the old behaviour. For example, Python 2.6.4 or 2.5 will return the following:

```
>>> import urlparse
>>> urlparse.urlsplit('invented://host/filename?query')
('invented', '', '//host/filename?query', '', '')
```

Python 2.7 (and Python 2.6.5) will return:

```
>>> import urlparse
>>> urlparse.urlsplit('invented://host/filename?query')
('invented', 'host', '/filename?query', '', '')
```

(Python 2.7 actually produces slightly different output, since it returns a named tuple instead of a standard tuple.)

The **urlparse** module also supports IPv6 literal addresses as defined by [RFC 2732](https://datatracker.ietf.org/doc/html/rfc2732.html) [https://datatracker.ietf.org/doc/html/rfc2732.html] (contributed by Senthil Kumaran; [bpo-2987](https://bugs.python.org/issue?@action=redirect&bpo=2987) [https://bugs.python.org/issue?@action=redirect&bpo=2987]).

```
>>> urlparse.urlparse('http://[1080::8:800:200C:417]')
ParseResult(scheme='http', netloc='[1080::8:800:200C:417]', path='/foo', params='', query='', fragm=)
```

- New class: the **WeakSet** class in the **weakref** module is a set that only holds weak references to its elements; elements will be removed once there are no references pointing to them. (Originally implemented in Python 3.x by Raymond Hettinger, and backported to 2.7 by Michael Foord.)
- The ElementTree library, **xml.etree**, no longer escapes ampersands and angle brackets when outputting an XML processing instruction (which looks like `<?xml-stylesheet href="#style1"??>`) or comment (which looks like `<!-- comment -->`). (Patch by Neil Muller; [bpo-2746](https://bugs.python.org/issue?@action=redirect&bpo=2746) [https://bugs.python.org/issue?@action=redirect&bpo=2746].)
- The XML-RPC client and server, provided by the **xmlrpclib** and **SimpleXMLRPCServer** modules, have improved performance by supporting HTTP/1.1 keep-alive and by optionally using gzip encoding to compress the XML being exchanged. The gzip compression is controlled by the **encode\_threshold** attribute of **SimpleXMLRPCRequestHandler**, which contains a size in bytes; responses larger than this will be compressed. (Contributed by Kristján Valur Jónsson; [bpo-6267](https://bugs.python.org/issue?@action=redirect&bpo=6267) [https://bugs.python.org/issue?@action=redirect&bpo=6267].)

- The **zipfile** module's **ZipFile** now supports the context management protocol, so you can write with `zipfile.ZipFile(...)` as `f:`. (Contributed by Brian Curtin; [bpo-5511](https://bugs.python.org/issue?@action=redirect&bpo=5511) [<https://bugs.python.org/issue?@action=redirect&bpo=5511>].)

**zipfile** now also supports archiving empty directories and extracts them correctly. (Fixed by Kuba Wieczorek; [bpo-4710](https://bugs.python.org/issue?@action=redirect&bpo=4710) [<https://bugs.python.org/issue?@action=redirect&bpo=4710>].) Reading files out of an archive is faster, and interleaving **read()** and **readline()** now works correctly. (Contributed by Nir Aides; [bpo-7610](https://bugs.python.org/issue?@action=redirect&bpo=7610) [<https://bugs.python.org/issue?@action=redirect&bpo=7610>].)

The **is\_zipfile()** function now accepts a file object, in addition to the path names accepted in earlier versions. (Contributed by Gabriel Genellina; [bpo-4756](https://bugs.python.org/issue?@action=redirect&bpo=4756) [<https://bugs.python.org/issue?@action=redirect&bpo=4756>].)

The **writestr()** method now has an optional *compress\_type* parameter that lets you override the default compression method specified in the **ZipFile** constructor. (Contributed by Ronald Oussoren; [bpo-6003](https://bugs.python.org/issue?@action=redirect&bpo=6003) [<https://bugs.python.org/issue?@action=redirect&bpo=6003>].)

## New module: **importlib**

Python 3.1 includes the **importlib** package, a re-implementation of the logic underlying Python's **import** statement. **importlib** is useful for implementors of Python interpreters and to users who wish to write new importers that can participate in the import process. Python 2.7 doesn't contain the complete **importlib** package, but instead has a tiny subset that contains a single function, **import\_module()**.

`import_module(name, package=None)` imports a module. *name* is a string containing the module or package's name. It's possible to do relative imports by providing a string that begins with a `.` character, such as `..utils.errors`. For relative imports, the *package* argument must be provided and is the name of the package that will be used as the anchor for the relative import.

`import_module()` both inserts the imported module into `sys.modules` and returns the module object.

Here are some examples:

```
>>> from importlib import import_module
>>> anydbm = import_module('anydbm') # Standard absolute
>>> anydbm
<module 'anydbm' from '/p/python/Lib/anydbm.py'>
>>> # Relative import
>>> file_util = import_module('../file_util', 'distutils.')
>>> file_util
<module 'distutils.file_util' from '/python/Lib/distutil
```

`importlib` was implemented by Brett Cannon and introduced in Python 3.1.

## New module: `sysconfig`

The `sysconfig` module has been pulled out of the Distutils package, becoming a new top-level module in its own right. `sysconfig` provides functions for getting information about Python's build process: compiler switches, installation paths, the platform name, and whether Python is running from its source directory.

Some of the functions in the module are:

- `get_config_var()` returns variables from Python's Makefile and the `pyconfig.h` file.
- `get_config_vars()` returns a dictionary containing all of the configuration variables.
- `get_path()` returns the configured path for a particular type of module: the standard library, site-specific modules, platform-specific modules, etc.
- `is_python_build()` returns true if you're running a binary from a Python source tree, and false otherwise.

Consult the `sysconfig` documentation for more details and for a complete list of functions.

The Distutils package and **sysconfig** are now maintained by Tarek Ziadé, who has also started a Distutils2 package (source repository at <https://hg.python.org/distutils2/>) for developing a next-generation version of Distutils.

## ttk: Themed Widgets for Tk

Tcl/Tk 8.5 includes a set of themed widgets that re-implement basic Tk widgets but have a more customizable appearance and can therefore more closely resemble the native platform's widgets. This widget set was originally called Tile, but was renamed to Ttk (for “themed Tk”) on being added to Tcl/Tk release 8.5.

To learn more, read the **ttk** module documentation. You may also wish to read the Tcl/Tk manual page describing the Ttk theme engine, available at [https://www.tcl.tk/man/tcl8.5/TkCmd/ttk\\_intro.htm](https://www.tcl.tk/man/tcl8.5/TkCmd/ttk_intro.htm). Some screenshots of the Python/Ttk code in use are at <https://code.google.com/archive/p/python-ttk/wikis/Screenshots.wiki>.

The **ttk** module was written by Guilherme Polo and added in [bpo-2983](https://bugs.python.org/issue?@action=redirect&bpo=2983) [https://bugs.python.org/issue?@action=redirect&bpo=2983]. An alternate version called `Tile.py`, written by Martin Franklin and maintained by Kevin Walzer, was proposed for inclusion in [bpo-2618](https://bugs.python.org/issue?@action=redirect&bpo=2618) [https://bugs.python.org/issue?@action=redirect&bpo=2618], but the authors argued that Guilherme Polo's work was more comprehensive.

## Updated module: unittest

The **unittest** module was greatly enhanced; many new features were added. Most of these features were implemented by Michael Foord, unless otherwise noted. The enhanced version of the module is downloadable separately for use with Python versions 2.4 to 2.6, packaged as the **unittest2** package, from <https://pypi.org/project/unittest2>.

When used from the command line, the module can automatically discover tests. It's not as fancy as **py.test** [https://pytest.org] or **nose** [https://nose.readthedocs.io/], but provides a simple way to run tests

kept within a set of package directories. For example, the following command will search the `test/` subdirectory for any importable test files named `test*.py`:

```
python -m unittest discover -s test
```

Consult the [unittest](#) module documentation for more details. (Developed in [bpo-6001](#) [<https://bugs.python.org/issue?@action=redirect&bpo=6001>].)

The [main\(\)](#) function supports some other new options:

- **-b** or **--buffer** will buffer the standard output and standard error streams during each test. If the test passes, any resulting output will be discarded; on failure, the buffered output will be displayed.
- **-c** or **--catch** will cause the control-C interrupt to be handled more gracefully. Instead of interrupting the test process immediately, the currently running test will be completed and then the partial results up to the interruption will be reported. If you're impatient, a second press of control-C will cause an immediate interruption.

This control-C handler tries to avoid causing problems when the code being tested or the tests being run have defined a signal handler of their own, by noticing that a signal handler was already set and calling it. If this doesn't work for you, there's a [removeHandler\(\)](#) decorator that can be used to mark tests that should have the control-C handling disabled.

- **-f** or **--failfast** makes test execution stop immediately when a test fails instead of continuing to execute further tests. (Suggested by Cliff Dyer and implemented by Michael Foord; [bpo-8074](#) [<https://bugs.python.org/issue?@action=redirect&bpo=8074>].)

The progress messages now show 'x' for expected failures and 'u' for unexpected successes when run in verbose mode. (Contributed by Benjamin Peterson.)

Test cases can raise the `SkipTest` exception to skip a test ([bpo-1034053](https://bugs.python.org/issue?@action=redirect&bpo=1034053) [https://bugs.python.org/issue?@action=redirect&bpo=1034053]).

The error messages for `assertEqual()`, `assertTrue()`, and `assertFalse()` failures now provide more information. If you set the `longMessage` attribute of your `TestCase` classes to true, both the standard error message and any additional message you provide will be printed for failures. (Added by Michael Foord; [bpo-5663](https://bugs.python.org/issue?@action=redirect&bpo=5663) [https://bugs.python.org/issue?@action=redirect&bpo=5663].)

The `assertRaises()` method now returns a context handler when called without providing a callable object to run. For example, you can write this:

```
with self.assertRaises(KeyError):  
    {}['foo']
```

(Implemented by Antoine Pitrou; [bpo-4444](https://bugs.python.org/issue?@action=redirect&bpo=4444) [https://bugs.python.org/issue?@action=redirect&bpo=4444].)

Module- and class-level setup and teardown fixtures are now supported. Modules can contain `setUpModule()` and `tearDownModule()` functions. Classes can have `setUpClass()` and `tearDownClass()` methods that must be defined as class methods (using `@classmethod` or equivalent). These functions and methods are invoked when the test runner switches to a test case in a different module or class.

The methods `addCleanup()` and `doCleanups()` were added. `addCleanup()` lets you add cleanup functions that will be called unconditionally (after `setUp()` if `setUp()` fails, otherwise after `tearDown()`). This allows for much simpler resource allocation and deallocation during tests ([bpo-5679](https://bugs.python.org/issue?@action=redirect&bpo=5679) [https://bugs.python.org/issue?@action=redirect&bpo=5679]).

A number of new methods were added that provide more specialized tests. Many of these methods were written by Google engineers for use in their test suites; Gregory P. Smith, Michael Foord, and GvR worked on merging them into Python's version of `unittest`.

- `assertIsNone()` and `assertIsNotNone()` take one expression and verify that the result is or is not `None`.
- `assertIs()` and `assertIsNot()` take two values and check whether the two values evaluate to the same object or not. (Added by Michael Foord; [bpo-2578](https://bugs.python.org/issue?@action=redirect&bpo=2578) [https://bugs.python.org/issue?@action=redirect&bpo=2578].)
- `assertIsInstance()` and `assertNotIsInstance()` check whether the resulting object is an instance of a particular class, or of one of a tuple of classes. (Added by Georg Brandl; [bpo-7031](https://bugs.python.org/issue?@action=redirect&bpo=7031) [https://bugs.python.org/issue?@action=redirect&bpo=7031].)
- `assertGreater()`, `assertGreaterEqual()`, `assertLess()`, and `assertLessEqual()` compare two quantities.
- `assertMultiLineEqual()` compares two strings, and if they're not equal, displays a helpful comparison that highlights the differences in the two strings. This comparison is now used by default when Unicode strings are compared with `assertEqual()`.
- `assertRegexpMatches()` and `assertNotRegexpMatches()` checks whether the first argument is a string matching or not matching the regular expression provided as the second argument ([bpo-8038](https://bugs.python.org/issue?@action=redirect&bpo=8038) [https://bugs.python.org/issue?@action=redirect&bpo=8038]).
- `assertRaisesRegexp()` checks whether a particular exception is raised, and then also checks that the string representation of the exception matches the provided regular expression.
- `assertIn()` and `assertNotIn()` tests whether *first* is or is not in *second*.
- `assertItemsEqual()` tests whether two provided sequences contain the same elements.
- `assertSetEqual()` compares whether two sets are equal, and only reports the differences between the sets in case of error.
- Similarly, `assertListEqual()` and `assertTupleEqual()` compare the specified types and explain any differences without necessarily printing their full values; these methods are now used by default when comparing lists and tuples using `assertEqual()`. More

generally, `assertSequenceEqual()` compares two sequences and can optionally check whether both sequences are of a particular type.

- `assertDictEqual()` compares two dictionaries and reports the differences; it's now used by default when you compare two dictionaries using `assertEqual()`.  
`assertDictContainsSubset()` checks whether all of the key/value pairs in *first* are found in *second*.
- `assertAlmostEqual()` and `assertNotAlmostEqual()` test whether *first* and *second* are approximately equal. This method can either round their difference to an optionally specified number of *places* (the default is 7) and compare it to zero, or require the difference to be smaller than a supplied *delta* value.
- `loadTestsFromName()` properly honors the `suiteClass` attribute of the `TestLoader`. (Fixed by Mark Roddy; [bpo-6866](https://bugs.python.org/issue?@action=redirect&bpo=6866) [https://bugs.python.org/issue?@action=redirect&bpo=6866].)
- A new hook lets you extend the `assertEqual()` method to handle new data types. The `addTypeEqualityFunc()` method takes a type object and a function. The function will be used when both of the objects being compared are of the specified type. This function should compare the two objects and raise an exception if they don't match; it's a good idea for the function to provide additional information about why the two objects aren't matching, much as the new sequence comparison methods do.

`unittest.main()` now takes an optional `exit` argument. If false, `main()` doesn't call `sys.exit()`, allowing `main()` to be used from the interactive interpreter. (Contributed by J. Pablo Fernández; [bpo-3379](https://bugs.python.org/issue?@action=redirect&bpo=3379) [https://bugs.python.org/issue?@action=redirect&bpo=3379].)

`TestResult` has new `startTestRun()` and `stopTestRun()` methods that are called immediately before and after a test run. (Contributed by Robert Collins; [bpo-5728](https://bugs.python.org/issue?@action=redirect&bpo=5728) [https://bugs.python.org/issue?@action=redirect&bpo=5728].)

With all these changes, the `unittest.py` was becoming

awkwardly large, so the module was turned into a package and the code split into several files (by Benjamin Peterson). This doesn't affect how the module is imported or used.

Describes the new features, how to use them, and the rationale for various design decisions. (By Michael Foord.)

## Updated module: ElementTree 1.3

The version of the ElementTree library included with Python was updated to version 1.3. Some of the new features are:

- The various parsing functions now take a *parser* keyword argument giving an `XMLParser` instance that will be used. This makes it possible to override the file's internal encoding:

```
p = ET.XMLParser(encoding='utf-8')
t = ET.XML("""<root/>""", parser=p)
```

Errors in parsing XML now raise a `ParseError` exception, whose instances have a `position` attribute containing a (*line*, *column*) tuple giving the location of the problem.

- ElementTree's code for converting trees to a string has been significantly reworked, making it roughly twice as fast in many cases. The `ElementTree.write()` and `Element.write()` methods now have a *method* parameter that can be "xml" (the default), "html", or "text". HTML mode will output empty elements as `<empty></empty>` instead of `<empty/>`, and text mode will skip over elements and only output the text chunks. If you set the `tag` attribute of an element to `None` but leave its children in place, the element will be omitted when the tree is written out, so you don't need to do more extensive rearrangement to remove a single element.

Namespace handling has also been improved. All `xmlns:<whatever>` declarations are now output on the root element, not scattered throughout the resulting XML. You can set the default namespace for a tree by setting the **default\_namespace** attribute and can register new prefixes with **register\_namespace()**. In XML mode, you can use the true/false *xml\_declaration* parameter to suppress the XML declaration.

- New **Element** method: **extend()** appends the items from a sequence to the element's children. Elements themselves behave like sequences, so it's easy to move children from one element to another:

```
from xml.etree import ElementTree as ET

t = ET.XML("""<list>
    <item>1</item> <item>2</item>  <item>3</item>
</list>""")
new = ET.XML('<root/>')
new.extend(t)

# Outputs <root><item>1</item>...</root>
print ET.tostring(new)
```

- New **Element** method: **iter()** yields the children of the element as a generator. It's also possible to write `for child in elem:` to loop over an element's children. The existing method **getiterator()** is now deprecated, as is **getchildren()** which constructs and returns a list of children.
- New **Element** method: **itertext()** yields all chunks of text that are descendants of the element. For example:

```
t = ET.XML("""<list>
    <item>1</item> <item>2</item>  <item>3</item>
</list>""")

# Outputs ['\n ', '1', ' ', '2', ' ', '3', '\n']
```

```
print list(t.itertext())
```

- **Deprecated:** using an element as a Boolean (i.e., `if elem:`) would return true if the element had any children, or false if there were no children. This behaviour is confusing – `None` is false, but so is a childless element? – so it will now trigger a **FutureWarning**. In your code, you should be explicit: write `len(elem) != 0` if you're interested in the number of children, or `elem is not None`.

Fredrik Lundh develops ElementTree and produced the 1.3 version; you can read his article describing 1.3 at <https://web.archive.org/web/20200703234532/http://effbot.org/zone/elementtree-13-intro.htm>. Florent Xicluna updated the version included with Python, after discussions on python-dev and in [bpo-6472](https://bugs.python.org/issue?@action=redirect&bpo=6472) [https://bugs.python.org/issue?@action=redirect&bpo=6472].)

## Build and C API Changes

Changes to Python's build process and to the C API include:

- The latest release of the GNU Debugger, GDB 7, can be [scripted using Python](https://web.archive.org/web/20110715084810/http://sourceware.org/gdb/current/onlinedocs/gdb/Python.html) [https://web.archive.org/web/20110715084810/http://sourceware.org/gdb/current/onlinedocs/gdb/Python.html]. When you begin debugging an executable program P, GDB will look for a file named `P-gdb.py` and automatically read it. Dave Malcolm contributed a `python-gdb.py` that adds a number of commands useful when debugging Python itself. For example, `py-up` and `py-down` go up or down one Python stack frame, which usually corresponds to several C stack frames. `py-print` prints the value of a Python variable, and `py-bt` prints the Python stack trace. (Added as a result of [bpo-8032](https://bugs.python.org/issue?@action=redirect&bpo=8032) [https://bugs.python.org/issue?@action=redirect&bpo=8032].)
- If you use the `.gdbinit` file provided with Python, the “pyo” macro in the 2.7 version now works correctly when the thread being debugged doesn't hold the GIL; the macro now acquires it before printing. (Contributed by Victor Stinner; [bpo-3632](https://bugs.python.org/issue?@action=redirect&bpo=3632) [https://bugs.python.org/issue?@action=redirect&bpo=3632].)

@action=redirect&bpo=3632].)

- **Py\_AddPendingCall()** is now thread-safe, letting any worker thread submit notifications to the main Python thread. This is particularly useful for asynchronous IO operations. (Contributed by Kristján Valur Jónsson; [bpo-4293](https://bugs.python.org/issue?@action=redirect&bpo=4293) [https://bugs.python.org/issue?@action=redirect&bpo=4293].)
- New function: **PyCode\_NewEmpty()** creates an empty code object; only the filename, function name, and first line number are required. This is useful for extension modules that are attempting to construct a more useful traceback stack. Previously such extensions needed to call **PyCode\_New()**, which had many more arguments. (Added by Jeffrey Yasskin.)
- New function: **PyErr\_NewExceptionWithDoc()** creates a new exception class, just as the existing **PyErr\_NewException()** does, but takes an extra `char *` argument containing the docstring for the new exception class. (Added by 'lekma' on the Python bug tracker; [bpo-7033](https://bugs.python.org/issue?@action=redirect&bpo=7033) [https://bugs.python.org/issue?@action=redirect&bpo=7033].)
- New function: **PyFrame\_GetLineNumber()** takes a frame object and returns the line number that the frame is currently executing. Previously code would need to get the index of the bytecode instruction currently executing, and then look up the line number corresponding to that address. (Added by Jeffrey Yasskin.)
- New functions: **PyLong\_AsLongAndOverflow()** and **PyLong\_AsLongLongAndOverflow()** approximates a Python long integer as a C long or long long. If the number is too large to fit into the output type, an *overflow* flag is set and returned to the caller. (Contributed by Case Van Horsen; [bpo-7528](https://bugs.python.org/issue?@action=redirect&bpo=7528) [https://bugs.python.org/issue?@action=redirect&bpo=7528] and [bpo-7767](https://bugs.python.org/issue?@action=redirect&bpo=7767) [https://bugs.python.org/issue?@action=redirect&bpo=7767].)
- New function: stemming from the rewrite of string-to-float conversion, a new **PyOS\_string\_to\_double()** function

was added. The old `PyOS_ascii_strtod()` and `PyOS_ascii_atof()` functions are now deprecated.

- New function: `PySys_SetArgvEx()` sets the value of `sys.argv` and can optionally update `sys.path` to include the directory containing the script named by `sys.argv[0]` depending on the value of an *updatepath* parameter.

This function was added to close a security hole for applications that embed Python. The old function, `PySys_SetArgv()`, would always update `sys.path`, and sometimes it would add the current directory. This meant that, if you ran an application embedding Python in a directory controlled by someone else, attackers could put a Trojan-horse module in the directory (say, a file named `os.py`) that your application would then import and run.

If you maintain a C/C++ application that embeds Python, check whether you're calling `PySys_SetArgv()` and carefully consider whether the application should be using `PySys_SetArgvEx()` with *updatepath* set to false.

Security issue reported as [CVE-2008-5983](https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-5983) [https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-5983]; discussed in [bpo-5753](https://bugs.python.org/issue?@action=redirect&bpo=5753) [https://bugs.python.org/issue?@action=redirect&bpo=5753], and fixed by Antoine Pitrou.

- New macros: the Python header files now define the following macros: `Py_ISALNUM`, `Py_ISALPHA`, `Py_ISDIGIT`, `Py_ISLOWER`, `Py_ISSPACE`, `Py_ISUPPER`, `Py_ISXDIGIT`, `Py_TOLOWER`, and `Py_TOUPPER`. All of these functions are analogous to the C standard macros for classifying characters, but ignore the current locale setting, because in several places Python needs to analyze characters in a locale-independent way. (Added by Eric Smith; [bpo-5793](https://bugs.python.org/issue?@action=redirect&bpo=5793) [https://bugs.python.org/issue?@action=redirect&bpo=5793].)
- Removed function: `PyEval_CallObject` is now only available as a macro. A function version was being kept around to preserve ABI linking compatibility, but that was in 1997; it can certainly be deleted by now. (Removed by

Antoine Pitrou; [bpo-8276](https://bugs.python.org/issue?@action=redirect&bpo=8276) [https://bugs.python.org/issue?@action=redirect&bpo=8276].)

- New format codes: the `PyFormat_FromString()`, `PyFormat_FromStringV()`, and `PyErr_Format()` functions now accept `%lld` and `%llu` format codes for displaying C's long long types. (Contributed by Mark Dickinson; [bpo-7228](https://bugs.python.org/issue?@action=redirect&bpo=7228) [https://bugs.python.org/issue?@action=redirect&bpo=7228].)
- The complicated interaction between threads and process forking has been changed. Previously, the child process created by `os.fork()` might fail because the child is created with only a single thread running, the thread performing the `os.fork()`. If other threads were holding a lock, such as Python's import lock, when the fork was performed, the lock would still be marked as "held" in the new process. But in the child process nothing would ever release the lock, since the other threads weren't replicated, and the child process would no longer be able to perform imports.

Python 2.7 acquires the import lock before performing an `os.fork()`, and will also clean up any locks created using the `threading` module. C extension modules that have internal locks, or that call `fork()` themselves, will not benefit from this clean-up.

(Fixed by Thomas Wouters; [bpo-1590864](https://bugs.python.org/issue?@action=redirect&bpo=1590864) [https://bugs.python.org/issue?@action=redirect&bpo=1590864].)

- The `Py_Finalize()` function now calls the internal `threading._shutdown()` function; this prevents some exceptions from being raised when an interpreter shuts down. (Patch by Adam Olsen; [bpo-1722344](https://bugs.python.org/issue?@action=redirect&bpo=1722344) [https://bugs.python.org/issue?@action=redirect&bpo=1722344].)
- When using the `PyMemberDef` structure to define attributes of a type, Python will no longer let you try to delete or set a `T_STRING_INPLACE` attribute.

- Global symbols defined by the **ctypes** module are now prefixed with `Py`, or with `_ctypes`. (Implemented by Thomas Heller; [bpo-3102](https://bugs.python.org/issue?@action=redirect&bpo=3102) [https://bugs.python.org/issue?@action=redirect&bpo=3102].)
  - New configure option: the **--with-system-expat** switch allows building the **pyexpat** module to use the system Expat library. (Contributed by Arfrever Frehtes Taifersar Arahesis; [bpo-7609](https://bugs.python.org/issue?@action=redirect&bpo=7609) [https://bugs.python.org/issue?@action=redirect&bpo=7609].)
  - New configure option: the **--with-valgrind** option will now disable the pymalloc allocator, which is difficult for the Valgrind memory-error detector to analyze correctly. Valgrind will therefore be better at detecting memory leaks and overruns. (Contributed by James Henstridge; [bpo-2422](https://bugs.python.org/issue?@action=redirect&bpo=2422) [https://bugs.python.org/issue?@action=redirect&bpo=2422].)
  - New configure option: you can now supply an empty string to **--with-dbmliborder=** in order to disable all of the various DBM modules. (Added by Arfrever Frehtes Taifersar Arahesis; [bpo-6491](https://bugs.python.org/issue?@action=redirect&bpo=6491) [https://bugs.python.org/issue?@action=redirect&bpo=6491].)
  - The **configure** script now checks for floating-point rounding bugs on certain 32-bit Intel chips and defines a **X87\_DOUBLE\_ROUNDING** preprocessor definition. No code currently uses this definition, but it's available if anyone wishes to use it. (Added by Mark Dickinson; [bpo-2937](https://bugs.python.org/issue?@action=redirect&bpo=2937) [https://bugs.python.org/issue?@action=redirect&bpo=2937].)
- configure** also now sets a **LDCXXSHARED** Makefile variable for supporting C++ linking. (Contributed by Arfrever Frehtes Taifersar Arahesis; [bpo-1222585](https://bugs.python.org/issue?@action=redirect&bpo=1222585) [https://bugs.python.org/issue?@action=redirect&bpo=1222585].)
- The build process now creates the necessary files for pkg-config support. (Contributed by Clinton Roy; [bpo-3585](https://bugs.python.org/issue?@action=redirect&bpo=3585) [https://bugs.python.org/issue?@action=redirect&bpo=3585].)
  - The build process now supports Subversion 1.7. (Contributed

by Arfrever Frehtes Taifersar Arahesis; [bpo-6094](https://bugs.python.org/issue?@action=redirect&bpo=6094) [https://bugs.python.org/issue?@action=redirect&bpo=6094].)

## Capsules

Python 3.1 adds a new C datatype, **PyCapsule**, for providing a C API to an extension module. A capsule is essentially the holder of a C `void *` pointer, and is made available as a module attribute; for example, the **socket** module's API is exposed as `socket.CAPI`, and **unicodedata** exposes `ucnhash_CAPI`. Other extensions can import the module, access its dictionary to get the capsule object, and then get the `void *` pointer, which will usually point to an array of pointers to the module's various API functions.

There is an existing data type already used for this, **PyObject**, but it doesn't provide type safety. Evil code written in pure Python could cause a segmentation fault by taking a **PyObject** from module A and somehow substituting it for the **PyObject** in module B. Capsules know their own name, and getting the pointer requires providing the name:

```
void *vtable;

if (!PyCapsule_IsValid(capsule, "mymodule.CAPI") {
    PyErr_SetString(PyExc_ValueError, "argument type
    return NULL;
}

vtable = PyCapsule_GetPointer(capsule, "mymodule.CAPI");
```

You are assured that `vtable` points to whatever you're expecting. If a different capsule was passed in, **PyCapsule\_IsValid()** would detect the mismatched name and return false. Refer to [Providing a C API for an Extension Module](#) for more information on using these objects.

Python 2.7 now uses capsules internally to provide various extension-module APIs, but the **PyObject\_AsVoidPtr()** was modified to handle capsules, preserving compile-time compatibility with the **CObject** interface. Use of **PyObject\_AsVoidPtr()**

will signal a `PendingDeprecationWarning`, which is silent by default.

Implemented in Python 3.1 and backported to 2.7 by Larry Hastings; discussed in [bpo-5630](https://bugs.python.org/issue?@action=redirect&bpo=5630) [https://bugs.python.org/issue?@action=redirect&bpo=5630].

## Port-Specific Changes: Windows

- The `msvcrt` module now contains some constants from the `crtassem.h` header file: `CRT_ASSEMBLY_VERSION`, `VC_ASSEMBLY_PUBLICKEYTOKEN`, and `LIBRARIES_ASSEMBLY_NAME_PREFIX`. (Contributed by David Cournapeau; [bpo-4365](https://bugs.python.org/issue?@action=redirect&bpo=4365) [https://bugs.python.org/issue?@action=redirect&bpo=4365].)
- The `_winreg` module for accessing the registry now implements the `CreateKeyEx()` and `DeleteKeyEx()` functions, extended versions of previously supported functions that take several extra arguments. The `DisableReflectionKey()`, `EnableReflectionKey()`, and `QueryReflectionKey()` were also tested and documented. (Implemented by Brian Curtin: [bpo-7347](https://bugs.python.org/issue?@action=redirect&bpo=7347) [https://bugs.python.org/issue?@action=redirect&bpo=7347].)
- The new `_beginthreadex()` API is used to start threads, and the native thread-local storage functions are now used. (Contributed by Kristján Valur Jónsson; [bpo-3582](https://bugs.python.org/issue?@action=redirect&bpo=3582) [https://bugs.python.org/issue?@action=redirect&bpo=3582].)
- The `os.kill()` function now works on Windows. The signal value can be the constants `CTRL_C_EVENT`, `CTRL_BREAK_EVENT`, or any integer. The first two constants will send Control-C and Control-Break keystroke events to subprocesses; any other value will use the `TerminateProcess()` API. (Contributed by Miki Tebeka; [bpo-122012](https://bugs.python.org/issue?@action=redirect&bpo=122012) [https://bugs.python.org/issue?@action=redirect&bpo=122012].)
- The `os.listdir()` function now correctly fails for an empty path. (Fixed by Hirokazu Yamamoto; [bpo-5913](https://bugs.python.org/issue?@action=redirect&bpo=5913) [https://bugs.python.org/issue?@action=redirect&bpo=5913].)
- The `mimelib` module will now read the MIME database from the Windows registry when initializing. (Patch by

Gabriel Genellina; [bpo-4969](https://bugs.python.org/issue?@action=redirect&bpo=4969) [https://bugs.python.org/issue?@action=redirect&bpo=4969].)

## Port-Specific Changes: Mac OS X

- The path `/Library/Python/2.7/site-packages` is now appended to `sys.path`, in order to share added packages between the system installation and a user-installed copy of the same version. (Changed by Ronald Oussoren; [bpo-4865](https://bugs.python.org/issue?@action=redirect&bpo=4865) [https://bugs.python.org/issue?@action=redirect&bpo=4865].)

*Changed in version 2.7.13:* As of 2.7.13, this change was removed. `/Library/Python/2.7/site-packages`, the site-packages directory used by the Apple-supplied system Python 2.7 is no longer appended to `sys.path` for user-installed Pythons such as from the python.org installers. As of macOS 10.12, Apple changed how the system site-packages directory is configured, which could cause installation of pip components, like `setuptools`, to fail. Packages installed for the system Python will no longer be shared with user-installed Pythons. ([bpo-28440](https://bugs.python.org/issue?@action=redirect&bpo=28440) [https://bugs.python.org/issue?@action=redirect&bpo=28440])

## Port-Specific Changes: FreeBSD

- FreeBSD 7.1's `SO_SETFIB` constant, used with `getsockopt()`/`setsockopt()` to select an alternate routing table, is now available in the `socket` module. (Added by Kyle VanderBeek; [bpo-8235](https://bugs.python.org/issue?@action=redirect&bpo=8235) [https://bugs.python.org/issue?@action=redirect&bpo=8235].)

## Other Changes and Fixes

- Two benchmark scripts, `iobench` and `ccbench`, were added to the `Tools` directory. `iobench` measures the speed

of the built-in file I/O objects returned by `open()` while performing various operations, and `ccbench` is a concurrency benchmark that tries to measure computing throughput, thread switching latency, and IO processing bandwidth when performing several tasks using a varying number of threads.

- The `Tools/i18n/msgfmt.py` script now understands plural forms in `.po` files. (Fixed by Martin von Löwis; [bpo-5464](https://bugs.python.org/issue?@action=redirect&bpo=5464) [https://bugs.python.org/issue?@action=redirect&bpo=5464].)
- When importing a module from a `.pyc` or `.pyo` file with an existing `.py` counterpart, the `co_filename` attributes of the resulting code objects are overwritten when the original filename is obsolete. This can happen if the file has been renamed, moved, or is accessed through different paths. (Patch by Ziga Seilnacht and Jean-Paul Calderone; [bpo-1180193](https://bugs.python.org/issue?@action=redirect&bpo=1180193) [https://bugs.python.org/issue?@action=redirect&bpo=1180193].)
- The `regtest.py` script now takes a `--randseed=` switch that takes an integer that will be used as the random seed for the `-r` option that executes tests in random order. The `-r` option also reports the seed that was used (Added by Collin Winter.)
- Another `regtest.py` switch is `-j`, which takes an integer specifying how many tests run in parallel. This allows reducing the total runtime on multi-core machines. This option is compatible with several other options, including the `-R` switch which is known to produce long runtimes. (Added by Antoine Pitrou, [bpo-6152](https://bugs.python.org/issue?@action=redirect&bpo=6152) [https://bugs.python.org/issue?@action=redirect&bpo=6152].) This can also be used with a new `-F` switch that runs selected tests in a loop until they fail. (Added by Antoine Pitrou; [bpo-7312](https://bugs.python.org/issue?@action=redirect&bpo=7312) [https://bugs.python.org/issue?@action=redirect&bpo=7312].)
- When executed as a script, the `py_compile.py` module now accepts `'-'` as an argument, which will read standard input for the list of filenames to be compiled. (Contributed by Piotr Ożarowski; [bpo-8233](https://bugs.python.org/issue?@action=redirect&bpo=8233) [https://bugs.python.org/issue?@action=redirect&bpo=8233].)

# Porting to Python 2.7

This section lists previously described changes and other bugfixes that may require changes to your code:

- The `range()` function processes its arguments more consistently; it will now call `__int__()` on non-float, non-integer arguments that are supplied to it. (Fixed by Alexander Belopolsky; [bpo-1533](https://bugs.python.org/issue?@action=redirect&bpo=1533) [https://bugs.python.org/issue?@action=redirect&bpo=1533].)
- The string `format()` method changed the default precision used for floating-point and complex numbers from 6 decimal places to 12, which matches the precision used by `str()`. (Changed by Eric Smith; [bpo-5920](https://bugs.python.org/issue?@action=redirect&bpo=5920) [https://bugs.python.org/issue?@action=redirect&bpo=5920].)
- Because of an optimization for the `with` statement, the special methods `__enter__()` and `__exit__()` must belong to the object's type, and cannot be directly attached to the object's instance. This affects new-style classes (derived from `object`) and C extension types. ([bpo-6101](https://bugs.python.org/issue?@action=redirect&bpo=6101) [https://bugs.python.org/issue?@action=redirect&bpo=6101].)
- Due to a bug in Python 2.6, the `exc_value` parameter to `__exit__()` methods was often the string representation of the exception, not an instance. This was fixed in 2.7, so `exc_value` will be an instance as expected. (Fixed by Florent Xicluna; [bpo-7853](https://bugs.python.org/issue?@action=redirect&bpo=7853) [https://bugs.python.org/issue?@action=redirect&bpo=7853].)
- When a restricted set of attributes were set using `__slots__`, deleting an unset attribute would not raise `AttributeError` as you would expect. Fixed by Benjamin Peterson; [bpo-7604](https://bugs.python.org/issue?@action=redirect&bpo=7604) [https://bugs.python.org/issue?@action=redirect&bpo=7604].)

In the standard library:

- Operations with `datetime` instances that resulted in a year falling outside the supported range didn't always raise `OverflowError`. Such errors are now checked more carefully and will now raise the exception. (Reported by Mark Leander, patch by Anand B. Pillai and Alexander Belopolsky;

[bpo-7150](https://bugs.python.org/issue?@action=redirect&bpo=7150) [https://bugs.python.org/issue?@action=redirect&bpo=7150].)

- When using **Decimal** instances with a string's **format()** method, the default alignment was previously left-alignment. This has been changed to right-alignment, which might change the output of your programs. (Changed by Mark Dickinson; [bpo-6857](https://bugs.python.org/issue?@action=redirect&bpo=6857) [https://bugs.python.org/issue?@action=redirect&bpo=6857].)

Comparisons involving a signaling NaN value (or **sNaN**) now signal **InvalidOperation** instead of silently returning a true or false value depending on the comparison operator. Quiet NaN values (or **NaN**) are now hashable. (Fixed by Mark Dickinson; [bpo-7279](https://bugs.python.org/issue?@action=redirect&bpo=7279) [https://bugs.python.org/issue?@action=redirect&bpo=7279].)

- The ElementTree library, **xml.etree**, no longer escapes ampersands and angle brackets when outputting an XML processing instruction (which looks like `<?xml-stylesheet href="#style1"?>`) or comment (which looks like `<!-- comment -->`). (Patch by Neil Muller; [bpo-2746](https://bugs.python.org/issue?@action=redirect&bpo=2746) [https://bugs.python.org/issue?@action=redirect&bpo=2746].)
- The **readline()** method of **StringIO** objects now does nothing when a negative length is requested, as other file-like objects do. ([bpo-7348](https://bugs.python.org/issue?@action=redirect&bpo=7348) [https://bugs.python.org/issue?@action=redirect&bpo=7348]).
- The **syslog** module will now use the value of `sys.argv[0]` as the identifier instead of the previous default value of `'python'`. (Changed by Sean Reifschneider; [bpo-8451](https://bugs.python.org/issue?@action=redirect&bpo=8451) [https://bugs.python.org/issue?@action=redirect&bpo=8451].)
- The **tarfile** module's default error handling has changed, to no longer suppress fatal errors. The default error level was previously 0, which meant that errors would only result in a message being written to the debug log, but because the debug log is not activated by default, these errors go

unnoticed. The default error level is now 1, which raises an exception if there's an error. (Changed by Lars Gustäbel; [bpo-7357](https://bugs.python.org/issue?@action=redirect&bpo=7357) [https://bugs.python.org/issue?@action=redirect&bpo=7357].)

- The **urlparse** module's **urlsplit()** now handles unknown URL schemes in a fashion compliant with [RFC 3986](https://datatracker.ietf.org/doc/html/rfc3986) [https://datatracker.ietf.org/doc/html/rfc3986.html]: if the URL is of the form "`<something>://...`", the text before the `://` is treated as the scheme, even if it's a made-up scheme that the module doesn't know about. This change may break code that worked around the old behaviour. For example, Python 2.6.4 or 2.5 will return the following:

```
>>> import urlparse
>>> urlparse.urlsplit('invented://host/filename?query')
('invented', '', '//host/filename?query', '', '')
```

Python 2.7 (and Python 2.6.5) will return:

```
>>> import urlparse
>>> urlparse.urlsplit('invented://host/filename?query')
('invented', 'host', '/filename?query', '', '')
```

(Python 2.7 actually produces slightly different output, since it returns a named tuple instead of a standard tuple.)

For C extensions:

- C extensions that use integer format codes with the `PyArg_Parse*` family of functions will now raise a **TypeError** exception instead of triggering a **DeprecationWarning** ([bpo-5080](https://bugs.python.org/issue?@action=redirect&bpo=5080) [https://bugs.python.org/issue?@action=redirect&bpo=5080]).
- Use the new **PyOS\_string\_to\_double()** function instead of the old **PyOS\_ascii\_strtod()** and **PyOS\_ascii\_atof()** functions, which are now deprecated.

For applications that embed Python:

- The **PySys\_SetArgvEx()** function was added, letting

applications close a security hole when the existing `PySys_SetArgv()` function was used. Check whether you're calling `PySys_SetArgv()` and carefully consider whether the application should be using `PySys_SetArgvEx()` with `updatepath` set to `false`.

## New Features Added to Python 2.7 Maintenance Releases

New features may be added to Python 2.7 maintenance releases when the situation genuinely calls for it. Any such additions must go through the Python Enhancement Proposal process, and make a compelling case for why they can't be adequately addressed by either adding the new feature solely to Python 3, or else by publishing it on the Python Package Index.

In addition to the specific proposals listed below, there is a general exemption allowing new `-3` warnings to be added in any Python 2.7 maintenance release.

### Two new environment variables for debug mode

In debug mode, the `[xxx refs]` statistic is not written by default, the `PYTHONSHOWREFCOUNT` environment variable now must also be set. (Contributed by Victor Stinner; [bpo-31733](https://bugs.python.org/issue?@action=redirect&bpo=31733) [https://bugs.python.org/issue?@action=redirect&bpo=31733].)

When Python is compiled with `COUNT_ALLOC` defined, allocation counts are no longer dumped by default anymore: the `PYTHONSHOWALLOCCOUNT` environment variable must now also be set. Moreover, allocation counts are now dumped into `stderr`, rather than `stdout`. (Contributed by Victor Stinner; [bpo-31692](https://bugs.python.org/issue?@action=redirect&bpo=31692) [https://bugs.python.org/issue?@action=redirect&bpo=31692].)

*New in version 2.7.15.*

### PEP 434: IDLE Enhancement Exception for All Branches

**PEP 434** [<https://peps.python.org/pep-0434/>] describes a general exemption for changes made to the IDLE development environment shipped along with Python. This exemption makes it possible for the IDLE developers to provide a more consistent user experience across all supported versions of Python 2 and 3.

For details of any IDLE changes, refer to the NEWS file for the specific release.

## **PEP 466: Network Security Enhancements for Python 2.7**

**PEP 466** [<https://peps.python.org/pep-0466/>] describes a number of network security enhancement proposals that have been approved for inclusion in Python 2.7 maintenance releases, with the first of those changes appearing in the Python 2.7.7 release.

**PEP 466** [<https://peps.python.org/pep-0466/>] related features added in Python 2.7.7:

- **`hmac.compare_digest()`** was backported from Python 3 to make a timing attack resistant comparison operation available to Python 2 applications. (Contributed by Alex Gaynor; [bpo-21306](https://bugs.python.org/issue?@action=redirect&bpo=21306) [<https://bugs.python.org/issue?@action=redirect&bpo=21306>].)
- OpenSSL 1.0.1g was upgraded in the official Windows installers published on python.org. (Contributed by Zachary Ware; [bpo-21462](https://bugs.python.org/issue?@action=redirect&bpo=21462) [<https://bugs.python.org/issue?@action=redirect&bpo=21462>].)

**PEP 466** [<https://peps.python.org/pep-0466/>] related features added in Python 2.7.8:

- **`hashlib.pbkdf2_hmac()`** was backported from Python 3 to make a hashing algorithm suitable for secure password storage broadly available to Python 2 applications. (Contributed by Alex Gaynor; [bpo-21304](https://bugs.python.org/issue?@action=redirect&bpo=21304) [<https://bugs.python.org/issue?@action=redirect&bpo=21304>].)
- OpenSSL 1.0.1h was upgraded for the official Windows installers published on python.org. (contributed by Zachary

Ware in [bpo-21671](https://bugs.python.org/issue?@action=redirect&bpo=21671) [<https://bugs.python.org/issue?@action=redirect&bpo=21671>] for CVE-2014-0224)

**PEP 466** [<https://peps.python.org/pep-0466/>] related features added in Python 2.7.9:

- Most of Python 3.4's **ssl** module was backported. This means **ssl** now supports Server Name Indication, TLS1.x settings, access to the platform certificate store, the **SSLContext** class, and other features. (Contributed by Alex Gaynor and David Reid; [bpo-21308](https://bugs.python.org/issue?@action=redirect&bpo=21308) [<https://bugs.python.org/issue?@action=redirect&bpo=21308>].)

Refer to the “Version added: 2.7.9” notes in the module documentation for specific details.

- **os.urandom()** was changed to cache a file descriptor to `/dev/urandom` instead of reopening `/dev/urandom` on every call. (Contributed by Alex Gaynor; [bpo-21305](https://bugs.python.org/issue?@action=redirect&bpo=21305) [<https://bugs.python.org/issue?@action=redirect&bpo=21305>].)
- **hashlib.algorithms\_guaranteed** and **hashlib.algorithms\_available** were backported from Python 3 to make it easier for Python 2 applications to select the strongest available hash algorithm. (Contributed by Alex Gaynor in [bpo-21307](https://bugs.python.org/issue?@action=redirect&bpo=21307) [<https://bugs.python.org/issue?@action=redirect&bpo=21307>])

## PEP 477: Backport ensurepip (PEP 453) to Python 2.7

**PEP 477** [<https://peps.python.org/pep-0477/>] approves the inclusion of the **PEP 453** [<https://peps.python.org/pep-0453/>] **ensurepip** module and the improved documentation that was enabled by it in the Python 2.7 maintenance releases, appearing first in the Python 2.7.9 release.

### Bootstrapping pip By Default

The new **ensurepip** module (defined in **PEP 453** [<https://peps.python.org/pep-0453/>]) provides a standard cross-platform

mechanism to bootstrap the pip installer into Python installations. The version of `pip` included with Python 2.7.9 is `pip 1.5.6`, and future 2.7.x maintenance releases will update the bundled version to the latest version of `pip` that is available at the time of creating the release candidate.

By default, the commands `pip`, `pipX` and `pipX.Y` will be installed on all platforms (where X.Y stands for the version of the Python installation), along with the `pip` Python package and its dependencies.

For CPython [source builds on POSIX systems](#), the `make install` and `make altinstall` commands do not bootstrap `pip` by default. This behaviour can be controlled through configure options, and overridden through Makefile options.

On Windows and Mac OS X, the CPython installers now default to installing `pip` along with CPython itself (users may opt out of installing it during the installation process). Window users will need to opt in to the automatic `PATH` modifications to have `pip` available from the command line by default, otherwise it can still be accessed through the Python launcher for Windows as `py -m pip`.

As [discussed in the PEP](#) [<https://peps.python.org/pep-0477/#disabling-ensurepip-by-downstream-distributors>], platform packagers may choose not to install these commands by default, as long as, when invoked, they provide clear and simple directions on how to install them on that platform (usually using the system package manager).

## Documentation Changes

As part of this change, the [Installing Python Modules](#) and [Distributing Python Modules](#) sections of the documentation have been completely redesigned as short getting started and FAQ documents. Most packaging documentation has now been moved out to the Python Packaging Authority maintained [Python Packaging User Guide](#) [<https://packaging.python.org/>] and the documentation of the individual projects.

However, as this migration is currently still incomplete, the legacy

versions of those guides remaining available as [Installing Python Modules \(Legacy version\)](#) and [Distributing Python Modules \(Legacy version\)](#).

## See also

### [PEP 453](https://peps.python.org/pep-0453/) [https://peps.python.org/pep-0453/] – Explicit bootstrapping of pip in Python installations

PEP written by Donald Stufft and Nick Coghlan, implemented by Donald Stufft, Nick Coghlan, Martin von Löwis and Ned Deily.

## PEP 476: Enabling certificate verification by default for stdlib http clients

[PEP 476](https://peps.python.org/pep-0476/) [https://peps.python.org/pep-0476/] updated `httplib` and modules which use it, such as `urllib2` and `xmlrpclib`, to now verify that the server presents a certificate which is signed by a Certificate Authority in the platform trust store and whose hostname matches the hostname being requested by default, significantly improving security for many applications. This change was made in the Python 2.7.9 release.

For applications which require the old previous behavior, they can pass an alternate context:

```
import urllib2
import ssl
```

```
# This disables all verification
context = ssl._create_unverified_context()
```

```
# This allows using a specific certificate for the host,
# to be in the trust store
context = ssl.create_default_context(cafile="/path/to/fo
```

```
urllib2.urlopen("https://invalid-cert", context=context)
```

## PEP 493: HTTPS verification migration tools for

## Python 2.7

**PEP 493** [<https://peps.python.org/pep-0493/>] provides additional migration tools to support a more incremental infrastructure upgrade process for environments containing applications and services relying on the historically permissive processing of server certificates when establishing client HTTPS connections. These additions were made in the Python 2.7.12 release.

These tools are intended for use in cases where affected applications and services can't be modified to explicitly pass a more permissive SSL context when establishing the connection.

For applications and services which can't be modified at all, the new `PYTHONHTTPSVERIFY` environment variable may be set to `0` to revert an entire Python process back to the default permissive behaviour of Python 2.7.8 and earlier.

For cases where the connection establishment code can't be modified, but the overall application can be, the new `ssl._https_verify_certificates()` function can be used to adjust the default behaviour at runtime.

### New `make regen-all` build target

To simplify cross-compilation, and to ensure that CPython can reliably be compiled without requiring an existing version of Python to already be available, the autotools-based build system no longer attempts to implicitly recompile generated files based on file modification times.

Instead, a new `make regen-all` command has been added to force regeneration of these files when desired (e.g. after an initial version of Python has already been built based on the pregenerated versions).

More selective regeneration targets are also defined - see [Makefile.pre.in](https://github.com/python/cpython/tree/3.11/Makefile.pre.in) [<https://github.com/python/cpython/tree/3.11/Makefile.pre.in>] for details.

(Contributed by Victor Stinner in [bpo-23404](https://bugs.python.org/) [<https://bugs.python.org/>])

issue?@action=redirect&bpo=23404].)

*New in version 2.7.14.*

## **Removal of `make touch build` target**

The `make touch build` target previously used to request implicit regeneration of generated files by updating their modification times has been removed.

It has been replaced by the new `make regen-all` target.

(Contributed by Victor Stinner in [bpo-23404](https://bugs.python.org/issue?@action=redirect&bpo=23404) [https://bugs.python.org/issue?@action=redirect&bpo=23404].)

*Changed in version 2.7.14.*

# What's New in Python 2.6

## Author

A.M. Kuchling (amk at amk.ca)

This article explains the new features in Python 2.6, released on October 1, 2008. The release schedule is described in [PEP 361](https://peps.python.org/pep-0361/) [https://peps.python.org/pep-0361/].

The major theme of Python 2.6 is preparing the migration path to Python 3.0, a major redesign of the language. Whenever possible, Python 2.6 incorporates new features and syntax from 3.0 while remaining compatible with existing code by not removing older features or syntax. When it's not possible to do that, Python 2.6 tries to do what it can, adding compatibility functions in a **future\_builtins** module and a `-3` switch to warn about usages that will become unsupported in 3.0.

Some significant new packages have been added to the standard library, such as the [multiprocessing](#) and [json](#) modules, but there aren't many new features that aren't related to Python 3.0 in some way.

Python 2.6 also sees a number of improvements and bugfixes throughout the source. A search through the change logs finds there were 259 patches applied and 612 bugs fixed between Python 2.5 and 2.6. Both figures are likely to be underestimates.

This article doesn't attempt to provide a complete specification of the new features, but instead provides a convenient overview. For full details, you should refer to the documentation for Python 2.6. If you want to understand the rationale for the design and implementation, refer to the PEP for a particular new feature. Whenever possible, "What's New in Python" links to the bug/patch item for each change.

# Python 3.0

The development cycle for Python versions 2.6 and 3.0 was synchronized, with the alpha and beta releases for both versions being made on the same days. The development of 3.0 has influenced many features in 2.6.

Python 3.0 is a far-ranging redesign of Python that breaks compatibility with the 2.x series. This means that existing Python code will need some conversion in order to run on Python 3.0. However, not all the changes in 3.0 necessarily break compatibility. In cases where new features won't cause existing code to break, they've been backported to 2.6 and are described in this document in the appropriate place. Some of the 3.0-derived features are:

- A `__complex__()` method for converting objects to a complex number.
- Alternate syntax for catching exceptions: `except TypeError as exc`.
- The addition of `functools.reduce()` as a synonym for the built-in `reduce()` function.

Python 3.0 adds several new built-in functions and changes the semantics of some existing builtins. Functions that are new in 3.0 such as `bin()` have simply been added to Python 2.6, but existing builtins haven't been changed; instead, the `future_builtins` module has versions with the new 3.0 semantics. Code written to be compatible with 3.0 can do `from future_builtins import hex, map` as necessary.

A new command-line switch, `-3`, enables warnings about features that will be removed in Python 3.0. You can run code with this switch to see how much work will be necessary to port code to 3.0. The value of this switch is available to Python code as the boolean variable `sys.py3kwarning`, and to C extension code as `Py_Py3kWarningFlag`.

## Changes to the Development Process

While 2.6 was being developed, the Python development process underwent two significant changes: we switched from SourceForge's issue tracker to a customized Roundup installation, and the documentation was converted from LaTeX to reStructuredText.

### New Issue Tracker: Roundup

For a long time, the Python developers had been growing increasingly annoyed by SourceForge's bug tracker. SourceForge's hosted solution doesn't permit much customization; for example, it wasn't possible to customize the life cycle of issues.

The infrastructure committee of the Python Software Foundation therefore posted a call for issue trackers, asking volunteers to set up different products and import some of the bugs and patches from SourceForge. Four different trackers were examined: **Jira** [<https://www.atlassian.com/software/jira/>], **Launchpad** [<https://launchpad.net/>], **Roundup** [<https://roundup.sourceforge.io/>], and **Trac** [<https://trac.edgewall.org/>]. The committee eventually settled on Jira and Roundup as the two candidates. Jira is a commercial product that offers no-cost hosted instances to free-software projects; Roundup is an open-source project that requires volunteers to administer it and a server to host it.

After posting a call for volunteers, a new Roundup installation was set up at <https://bugs.python.org>. One installation of Roundup can host multiple trackers, and this server now also hosts issue trackers for Jython and for the Python web site. It will surely find other uses in the future. Where possible, this edition of "What's New in Python" links to the bug/patch item for each change.

Hosting of the Python bug tracker is kindly provided by [Upfront Systems](https://upfrontsoftware.co.za) [https://upfrontsoftware.co.za] of Stellenbosch, South Africa. Martin von Löwis put a lot of effort into importing existing bugs and patches from SourceForge; his scripts for this import operation are at <https://svn.python.org/view/tracker/importer/> and may be useful to other projects wishing to move from SourceForge to Roundup.

## **New Documentation Format: reStructuredText Using Sphinx**

The Python documentation was written using LaTeX since the project started around 1989. In the 1980s and early 1990s, most documentation was printed out for later study, not viewed online. LaTeX was widely used because it provided attractive printed output while remaining straightforward to write once the basic rules of the markup were learned.

Today LaTeX is still used for writing publications destined for printing, but the landscape for programming tools has shifted. We no longer print out reams of documentation; instead, we browse through it online and HTML has become the most important format to support. Unfortunately, converting LaTeX to HTML is fairly complicated and Fred L. Drake Jr., the long-time Python documentation editor, spent a lot of time maintaining the conversion process. Occasionally people would suggest converting

the documentation into SGML and later XML, but performing a good conversion is a major task and no one ever committed the time required to finish the job.

During the 2.6 development cycle, Georg Brandl put a lot of effort into building a new toolchain for processing the documentation. The resulting package is called Sphinx, and is available from <https://www.sphinx-doc.org/>.

Sphinx concentrates on HTML output, producing attractively styled and modern HTML; printed output is still supported through conversion to LaTeX. The input format is reStructuredText, a markup syntax supporting custom extensions and directives that is commonly used in the Python community.

Sphinx is a standalone package that can be used for writing, and almost two dozen other projects ([listed on the Sphinx web site](https://www.sphinx-doc.org/en/master/examples.html) [https://www.sphinx-doc.org/en/master/examples.html]) have adopted Sphinx as their documentation tool.

## PEP 343: The ‘with’ statement

The previous version, Python 2.5, added the ‘**with**’ statement as an optional feature, to be enabled by a `from __future__ import with_statement` directive. In 2.6 the statement no longer needs to be specially enabled; this means that **with** is now always a keyword. The rest of this section is a copy of the corresponding section from the “What’s New in Python 2.5” document; if you’re

familiar with the ‘**with**’ statement from Python 2.5, you can skip this section.

The ‘**with**’ statement clarifies code that previously would use `try...finally` blocks to ensure that clean-up code is executed. In this section, I’ll discuss the statement as it will commonly be used. In the next section, I’ll examine the implementation details and show how to write objects for use with this statement.

The ‘**with**’ statement is a control-flow structure whose basic structure is:

```
with expression [as variable]:  
    with-block
```

The expression is evaluated, and it should result in an object that supports the context management protocol (that is, has `__enter__()` and `__exit__()` methods).

The object’s `__enter__()` is called before *with-block* is executed and therefore can run set-up code. It also may return a value that is bound to the name *variable*, if given. (Note carefully that *variable* is *not* assigned the result of *expression*.)

After execution of the *with-block* is finished, the object’s `__exit__()` method is called, even if the block raised an exception, and can therefore run clean-up code.

Some standard Python objects now support the context management protocol and can be used with the ‘**with**’ statement. File objects are one example:

```
with open('/etc/passwd', 'r') as f:  
    for line in f:  
        print line  
        ... more processing code ...
```

After this statement has executed, the file object in *f* will have been automatically closed, even if the **for** loop raised an exception part-way through the block.

## Note

In this case, *f* is the same object created by `open()`, because `file.__enter__()` returns *self*.

The `threading` module's locks and condition variables also support the `'with'` statement:

```
lock = threading.Lock()
with lock:
    # Critical section of code
    ...
```

The lock is acquired before the block is executed and always released once the block is complete.

The `localcontext()` function in the `decimal` module makes it easy to save and restore the current decimal context, which encapsulates the desired precision and rounding characteristics for computations:

```
from decimal import Decimal, Context, localcontext

# Displays with default precision of 28 digits
v = Decimal('578')
print v.sqrt()

with localcontext(Context(prec=16)):
    # All code in this block uses a precision of 16 digits
    # The original context is restored on exiting the block
    print v.sqrt()
```

## Writing Context Managers

Under the hood, the `'with'` statement is fairly complicated. Most people will only use `'with'` in company with existing objects and don't need to know these details, so you can skip the rest of this section if you like. Authors of new objects will need to understand the details of the underlying implementation and should keep reading.

A high-level explanation of the context management protocol is:

- The expression is evaluated and should result in an object called a “context manager”. The context manager must have `__enter__()` and `__exit__()` methods.
- The context manager’s `__enter__()` method is called. The value returned is assigned to `VAR`. If no `as VAR` clause is present, the value is simply discarded.
- The code in *BLOCK* is executed.
- If *BLOCK* raises an exception, the context manager’s `__exit__()` method is called with three arguments, the exception details (`type`, `value`, `traceback`, the same values returned by `sys.exc_info()`, which can also be `None` if no exception occurred). The method’s return value controls whether an exception is re-raised: any false value re-raises the exception, and `True` will result in suppressing it. You’ll only rarely want to suppress the exception, because if you do the author of the code containing the ‘`with`’ statement will never realize anything went wrong.
- If *BLOCK* didn’t raise an exception, the `__exit__()` method is still called, but `type`, `value`, and `traceback` are all `None`.

Let’s think through an example. I won’t present detailed code but will only sketch the methods necessary for a database that supports transactions.

(For people unfamiliar with database terminology: a set of changes to the database are grouped into a transaction. Transactions can be either committed, meaning that all the changes are written into the database, or rolled back, meaning that the changes are all discarded and the database is unchanged. See any database textbook for more information.)

Let’s assume there’s an object representing a database connection. Our goal will be to let the user write code like this:

```
db_connection = DatabaseConnection()
with db_connection as cursor:
    cursor.execute('insert into ...')
    cursor.execute('delete from ...')
    # ... more operations ...
```

The transaction should be committed if the code in the block runs flawlessly or rolled back if there's an exception. Here's the basic interface for **DatabaseConnection** that I'll assume:

```
class DatabaseConnection:
    # Database interface
    def cursor(self):
        "Returns a cursor object and starts a new transaction"
    def commit(self):
        "Commits current transaction"
    def rollback(self):
        "Rolls back current transaction"
```

The **\_\_enter\_\_()** method is pretty easy, having only to start a new transaction. For this application the resulting cursor object would be a useful result, so the method will return it. The user can then add `as cursor` to their **'with'** statement to bind the cursor to a variable name.

```
class DatabaseConnection:
    ...
    def __enter__(self):
        # Code to start a new transaction
        cursor = self.cursor()
        return cursor
```

The **\_\_exit\_\_()** method is the most complicated because it's where most of the work has to be done. The method has to check if an exception occurred. If there was no exception, the transaction is committed. The transaction is rolled back if there was an exception.

In the code below, execution will just fall off the end of the function, returning the default value of `None`. `None` is false, so the exception will be re-raised automatically. If you wished, you could be more explicit and add a **return** statement at the marked location.

```
class DatabaseConnection:
    ...
    def __exit__(self, type, value, tb):
```

```
if tb is None:
    # No exception, so commit
    self.commit()
else:
    # Exception occurred, so rollback.
    self.rollback()
    # return False
```

## The contextlib module

The **contextlib** module provides some functions and a decorator that are useful when writing objects for use with the ‘**with**’ statement.

The decorator is called **contextmanager()**, and lets you write a single generator function instead of defining a new class. The generator should yield exactly one value. The code up to the **yield** will be executed as the **\_\_enter\_\_()** method, and the value yielded will be the method’s return value that will get bound to the variable in the ‘**with**’ statement’s **as** clause, if any. The code after the **yield** will be executed in the **\_\_exit\_\_()** method. Any exception raised in the block will be raised by the **yield** statement.

Using this decorator, our database example from the previous section could be written as:

```
from contextlib import contextmanager

@contextmanager
def db_transaction(connection):
    cursor = connection.cursor()
    try:
        yield cursor
    except:
        connection.rollback()
        raise
    else:
        connection.commit()
```

```
db = DatabaseConnection()
with db_transaction(db) as cursor:
    ...
```

The `contextlib` module also has a `nested(mgr1, mgr2, ...)` function that combines a number of context managers so you don't need to write nested `'with'` statements. In this example, the single `'with'` statement both starts a database transaction and acquires a thread lock:

```
lock = threading.Lock()
with nested (db_transaction(db), lock) as (cursor, locke
    ...
```

Finally, the `closing()` function returns its argument so that it can be bound to a variable, and calls the argument's `.close()` method at the end of the block.

```
import urllib, sys
from contextlib import closing

with closing(urllib.urlopen('http://www.yahoo.com')) as
    for line in f:
        sys.stdout.write(line)
```

## PEP 366: Explicit Relative Imports From a Main Module

Python's `-m` switch allows running a module as a script. When you ran a module that was located inside a package, relative imports didn't work correctly.

The fix for Python 2.6 adds a `__package__` attribute to modules. When this attribute is present, relative imports will be relative to the value of this attribute instead of the `__name__` attribute.

PEP 302-style importers can then set `__package__` as necessary. The `runpy` module that implements the `-m` switch now does this, so relative imports will now work correctly in scripts running from inside a package.

## PEP 370: Per-user `site-packages` Directory

When you run Python, the module search path `sys.path` usually includes a directory whose path ends in `"site-packages"`. This directory is intended to hold locally installed packages available to all users using a machine or a particular site installation.

Python 2.6 introduces a convention for user-specific site directories. The directory varies depending on the platform:

- Unix and Mac OS X: `~/.local/`
- Windows: `%APPDATA%/Python`

Within this directory, there will be version-specific subdirectories, such as `lib/python2.6/site-packages` on Unix/Mac OS and `Python26/site-packages` on Windows.

If you don't like the default directory, it can be overridden by an environment variable. `PYTHONUSERBASE` sets the root directory used for all Python versions supporting this feature. On Windows, the directory for application-specific data can be changed by setting the `APPDATA` environment variable. You can also modify the `site.py` file for your Python installation.

The feature can be disabled entirely by running Python with the `-s` option or setting the `PYTHONNOUSERSITE` environment variable.

PEP written and implemented by Christian Heimes.

## PEP 371: The multiprocessing Package

The new **multiprocessing** package lets Python programs create new processes that will perform a computation and return a result to the parent. The parent and child processes can communicate using queues and pipes, synchronize their operations using locks and semaphores, and can share simple arrays of data.

The **multiprocessing** module started out as an exact emulation of the **threading** module using processes instead of threads. That goal was discarded along the path to Python 2.6, but the general approach of the module is still similar. The fundamental class is the **Process**, which is passed a callable object and a collection of arguments. The **start()** method sets the callable running in a subprocess, after which you can call the **is\_alive()** method to check whether the subprocess is still running and the **join()** method to wait for the process to exit.

Here's a simple example where the subprocess will calculate a factorial. The function doing the calculation is written strangely so that it takes significantly longer when the input argument is a multiple of 4.

```
import time
from multiprocessing import Process, Queue

def factorial(queue, N):
    "Compute a factorial."
    # If N is a multiple of 4, this function will take more time
    if (N % 4) == 0:
        time.sleep(.05 * N/4)
```

```

# Calculate the result
fact = 1L
for i in range(1, N+1):
    fact = fact * i

# Put the result on the queue
queue.put(fact)

if __name__ == '__main__':
    queue = Queue()

    N = 5

    p = Process(target=factorial, args=(queue, N))
    p.start()
    p.join()

    result = queue.get()
    print 'Factorial', N, '=', result

```

A **Queue** is used to communicate the result of the factorial. The **Queue** object is stored in a global variable. The child process will use the value of the variable when the child was created; because it's a **Queue**, parent and child can use the object to communicate. (If the parent were to change the value of the global variable, the child's value would be unaffected, and vice versa.)

Two other classes, **Pool** and **Manager**, provide higher-level interfaces. **Pool** will create a fixed number of worker processes, and requests can then be distributed to the workers by calling **apply()** or **apply\_async()** to add a single request, and **map()** or **map\_async()** to add a number of requests. The following code uses a **Pool** to spread requests across 5 worker processes and retrieve a list of results:

```

from multiprocessing import Pool

def factorial(N, dictionary):
    "Compute a factorial."

```

```

...
p = Pool(5)
result = p.map(factorial, range(1, 1000, 10))
for v in result:
    print v

```

This produces the following output:

```

1
39916800
51090942171709440000
82228386541779228177255628800000000
334525266131638071081700620534407516651520000000000
...

```

The other high-level interface, the **Manager** class, creates a separate server process that can hold master copies of Python data structures. Other processes can then access and modify these data structures using proxy objects. The following example creates a shared dictionary by calling the `dict()` method; the worker processes then insert values into the dictionary. (Locking is not done for you automatically, which doesn't matter in this example. **Manager**'s methods also include `Lock()`, `RLock()`, and `Semaphore()` to create shared locks.)

```

import time
from multiprocessing import Pool, Manager

def factorial(N, dictionary):
    "Compute a factorial."
    # Calculate the result
    fact = 1L
    for i in range(1, N+1):
        fact = fact * i

    # Store result in dictionary
    dictionary[N] = fact

if __name__ == '__main__':
    p = Pool(5)

```

```

mgr = Manager()
d = mgr.dict()           # Create shared dictionary

# Run tasks using the pool
for N in range(1, 1000, 10):
    p.apply_async(factorial, (N, d))

# Mark pool as closed -- no more tasks can be added.
p.close()

# Wait for tasks to exit
p.join()

# Output results
for k, v in sorted(d.items()):
    print k, v

```

This will produce the output:

```

1 1
11 39916800
21 51090942171709440000
31 8222838654177922817725562880000000
41 33452526613163807108170062053440751665152000000000
51 15511187532873822802242430164693032110632597200169861

```

implemented by Richard Oudkerk and Jesse Noller.

## PEP 3101: Advanced String Formatting

In Python 3.0, the `%` operator is supplemented by a more powerful

string formatting method, `format()`. Support for the `str.format()` method has been backported to Python 2.6.

In 2.6, both 8-bit and Unicode strings have a `.format()` method that treats the string as a template and takes the arguments to be formatted. The formatting template uses curly brackets (`{`, `}`) as special characters:

```
>>> # Substitute positional argument 0 into the string.
>>> "User ID: {0}".format("root")
'User ID: root'
>>> # Use the named keyword arguments
>>> "User ID: {uid}   Last seen: {last_login}".format(
...     uid="root",
...     last_login = "5 Mar 2008 07:20")
'User ID: root   Last seen: 5 Mar 2008 07:20'
```

Curly brackets can be escaped by doubling them:

```
>>> "Empty dict: {}".format()
'Empty dict: {}'
```

Field names can be integers indicating positional arguments, such as `{0}`, `{1}`, etc. or names of keyword arguments. You can also supply compound field names that read attributes or access dictionary keys:

```
>>> import sys
>>> print 'Platform: {0.platform}\nPython version: {0.version}'
Platform: darwin
Python version: 2.6a1+ (trunk:61261M, Mar  5 2008, 20:29:00)
[GCC 4.0.1 (Apple Computer, Inc. build 5367)]'

>>> import mimetypes
>>> 'Content-type: {0[.mp4]}'.format(mimetypes.types_map)
'Content-type: video/mp4'
```

Note that when using dictionary-style notation such as `[.mp4]`, you don't need to put any quotation marks around the string; it will look up the value using `.mp4` as the key. Strings beginning with a

number will be converted to an integer. You can't write more complicated expressions inside a format string.

So far we've shown how to specify which field to substitute into the resulting string. The precise formatting used is also controllable by adding a colon followed by a format specifier. For example:

```
>>> # Field 0: left justify, pad to 15 characters
>>> # Field 1: right justify, pad to 6 characters
>>> fmt = '{0:15} ${1:>6}'
>>> fmt.format('Registration', 35)
'Registration      $      35'
>>> fmt.format('Tutorial', 50)
'Tutorial          $      50'
>>> fmt.format('Banquet', 125)
'Banquet           $     125'
```

Format specifiers can reference other fields through nesting:

```
>>> fmt = '{0:{1}}'
>>> width = 15
>>> fmt.format('Invoice #1234', width)
'Invoice #1234   '
>>> width = 35
>>> fmt.format('Invoice #1234', width)
'Invoice #1234                                   '
>>>
```

The alignment of a field within the desired width can be specified:

Effect
Left-align (default)
Right-align
Center
(For numeric types only) Pad after the sign.

Format specifiers can also include a presentation type, which controls how the value is formatted. For example, floating-point numbers can be formatted as a general number or in exponential notation:

```
>>> '{0:g}'.format(3.75)
```

```
'3.75'  
>>> '{0:e}'.format(3.75)  
'3.750000e+00'
```

A variety of presentation types are available. Consult the 2.6 documentation for a [complete list](#); here's a sample:

**Binary.** Outputs the number in base 2.

---

**Character.** Converts the integer to the corresponding Unicode character before printing.

---

**Decimal Integer.** Outputs the number in base 10.

---

**Octal format.** Outputs the number in base 8.

---

**Hex format.** Outputs the number in base 16, using lower-case letters for the digits above 9.

---

**Exponent notation.** Prints the number in scientific notation using the letter 'e' to indicate the exponent.

---

**General format.** This prints the number as a fixed-point number, unless the number is too large, in which case it switches to 'e' exponent notation.

---

**Number.** This is the same as 'g' (for floats) or 'd' (for integers), except that it uses the current locale setting to insert the appropriate number separator characters.

---

**Percentage.** Multiplies the number by 100 and displays in fixed ('f') format, followed by a percent sign.

---

Classes and types can define a `__format__()` method to control how they're formatted. It receives a single argument, the format specifier:

```
def __format__(self, format_spec):  
    if isinstance(format_spec, unicode):  
        return unicode(str(self))  
    else:  
        return str(self)
```

There's also a `format()` builtin that will format a single value. It calls the type's `__format__()` method with the provided specifier:

```
>>> format(75.6564, '.2f')  
'75.66'
```

PEP written by Talin. Implemented by Eric Smith.

## PEP 3105: `print` As a Function

The `print` statement becomes the `print()` function in Python 3.0. Making `print()` a function makes it possible to replace the function by doing `def print(...)` or importing a new function from somewhere else.

Python 2.6 has a `__future__` import that removes `print` as language syntax, letting you use the functional form instead. For example:

```
>>> from __future__ import print_function
>>> print('# of entries', len(dictionary), file=sys.stde
```

The signature of the new function is:

```
def print(*args, sep=' ', end='\n', file=None)
```

The parameters are:

- *args*: positional arguments whose values will be printed out.
- *sep*: the separator, which will be printed between arguments.
- *end*: the ending text, which will be printed after all of the arguments have been output.
- *file*: the file object to which the output will be sent.

PEP written by Georg Brandl.

## PEP 3110: Exception-Handling Changes

One error that Python programmers occasionally make is writing the following code:

```
try:
    ...
except TypeError, ValueError:  # Wrong!
    ...
```

The author is probably trying to catch both `TypeError` and `ValueError` exceptions, but this code actually does something different: it will catch `TypeError` and bind the resulting exception object to the local name `"ValueError"`. The `ValueError` exception will not be caught at all. The correct code specifies a tuple of exceptions:

```
try:
    ...
except (TypeError, ValueError):
    ...
```

This error happens because the use of the comma here is ambiguous: does it indicate two different nodes in the parse tree, or a single node that's a tuple?

Python 3.0 makes this unambiguous by replacing the comma with the word `"as"`. To catch an exception and store the exception object in the variable `exc`, you must write:

```
try:
    ...
except TypeError as exc:
    ...
```

Python 3.0 will only support the use of `"as"`, and therefore

interprets the first example as catching two different exceptions. Python 2.6 supports both the comma and “as”, so existing code will continue to work. We therefore suggest using “as” when writing new Python code that will only be executed with 2.6.

**PEP 3110** [<https://peps.python.org/pep-3110/>] - Catching Exceptions in Python 3000

PEP written and implemented by Collin Winter.

## PEP 3112: Byte Literals

Python 3.0 adopts Unicode as the language’s fundamental string type and denotes 8-bit literals differently, either as `b'string'` or using a **bytes** constructor. For future compatibility, Python 2.6 adds **bytes** as a synonym for the **str** type, and it also supports the `b''` notation.

The 2.6 **str** differs from 3.0’s **bytes** type in various ways; most notably, the constructor is completely different. In 3.0, `bytes([65, 66, 67])` is 3 elements long, containing the bytes representing ABC; in 2.6, `bytes([65, 66, 67])` returns the 12-byte string representing the **str()** of the list.

The primary use of **bytes** in 2.6 will be to write tests of object type such as `isinstance(x, bytes)`. This will help the 2to3 converter, which can’t tell whether 2.x code intends strings to contain either characters or 8-bit bytes; you can now use either **bytes** or **str** to represent your intention exactly, and the resulting code will also be correct in Python 3.0.

There’s also a `__future__` import that causes all string literals to become Unicode strings. This means that `\u` escape sequences can be used to include Unicode characters:

```
from __future__ import unicode_literals
```

```
s = ('\u751f\u3080\u304e\u3000\u751f\u3054')
```

```
'\u3081\u3000\u751f\u305f\u307e\u3054')
```

```
print len(s) # 12 Unicode characters
```

At the C level, Python 3.0 will rename the existing 8-bit string type, called **PyStringObject** in Python 2.x, to **PyBytesObject**. Python 2.6 uses `#define` to support using the names **PyBytesObject()**, **PyBytes\_Check()**, **PyBytes\_FromStringAndSize()**, and all the other functions and macros used with strings.

Instances of the **bytes** type are immutable just as strings are. A new **bytearray** type stores a mutable sequence of bytes:

```
>>> bytearray([65, 66, 67])
bytearray(b'ABC')
>>> b = bytearray(u'\u21ef\u3244', 'utf-8')
>>> b
bytearray(b'\xe2\x87\xaf\xe3\x89\x84')
>>> b[0] = '\xe3'
>>> b
bytearray(b'\xe3\x87\xaf\xe3\x89\x84')
>>> unicode(str(b), 'utf-8')
u'\u31ef \u3244'
```

Byte arrays support most of the methods of string types, such as **startswith()/endswith()**, **find()/rfind()**, and some of the methods of lists, such as **append()**, **pop()**, and **reverse()**.

```
>>> b = bytearray('ABC')
>>> b.append('d')
>>> b.append(ord('e'))
>>> b
bytearray(b'ABCde')
```

There's also a corresponding C API, with **PyByteArray\_FromObject()**, **PyByteArray\_FromStringAndSize()**, and various other functions.

PEP written by Jason Orendorff; backported to 2.6 by Christian Heimes.

## PEP 3116: New I/O Library

Python's built-in file objects support a number of methods, but file-like objects don't necessarily support all of them. Objects that imitate files usually support `read()` and `write()`, but they may not support `readline()`, for example. Python 3.0 introduces a layered I/O library in the `io` module that separates buffering and text-handling features from the fundamental read and write operations.

There are three levels of abstract base classes provided by the `io` module:

- **RawIOBase** defines raw I/O operations: `read()`, `readinto()`, `write()`, `seek()`, `tell()`, `truncate()`, and `close()`. Most of the methods of this class will often map to a single system call. There are also `readable()`, `writable()`, and `seekable()` methods for determining what operations a given object will allow.

Python 3.0 has concrete implementations of this class for files and sockets, but Python 2.6 hasn't restructured its file and socket objects in this way.

- **BufferedIOBase** is an abstract base class that buffers data in memory to reduce the number of system calls used, making I/O processing more efficient. It supports all of the methods of **RawIOBase**, and adds a `raw` attribute holding the underlying raw object.

There are five concrete classes implementing this ABC. **BufferedWriter** and **BufferedReader** are for objects that support write-only or read-only usage that have a

**seek()** method for random access. **BufferedRandom** objects support read and write access upon the same underlying stream, and **BufferedRWPair** is for objects such as TTYs that have both read and write operations acting upon unconnected streams of data. The **BytesIO** class supports reading, writing, and seeking over an in-memory buffer.

- **TextIOBase**: Provides functions for reading and writing strings (remember, strings will be Unicode in Python 3.0), and supporting [universal newlines](#). **TextIOBase** defines the [readline\(\)](#) method and supports iteration upon objects.

There are two concrete implementations. **TextIOWrapper** wraps a buffered I/O object, supporting all of the methods for text I/O and adding a **buffer** attribute for access to the underlying object. **StringIO** simply buffers everything in memory without ever writing anything to disk.

(In Python 2.6, [io.StringIO](#) is implemented in pure Python, so it's pretty slow. You should therefore stick with the existing **StringIO** module or **cStringIO** for now. At some point Python 3.0's [io](#) module will be rewritten into C for speed, and perhaps the C implementation will be backported to the 2.x releases.)

In Python 2.6, the underlying implementations haven't been restructured to build on top of the [io](#) module's classes. The module is being provided to make it easier to write code that's forward-compatible with 3.0, and to save developers the effort of writing their own implementations of buffering and text I/O.

# PEP 3118: Revised Buffer Protocol

The buffer protocol is a C-level API that lets Python types exchange pointers into their internal representations. A memory-mapped file can be viewed as a buffer of characters, for example, and this lets another module such as `re` treat memory-mapped files as a string of characters to be searched.

The primary users of the buffer protocol are numeric-processing packages such as NumPy, which expose the internal representation of arrays so that callers can write data directly into an array instead of going through a slower API. This PEP updates the buffer protocol in light of experience from NumPy development, adding a number of new features such as indicating the shape of an array or locking a memory region.

The most important new C API function is `PyObject_GetBuffer(PyObject *obj, Py_buffer *view, int flags)`, which takes an object and a set of flags, and fills in the `Py_buffer` structure with information about the object's memory representation. Objects can use this operation to lock memory in place while an external caller could be modifying the contents, so there's a corresponding `PyBuffer_Release(Py_buffer *view)` to indicate that the external caller is done.

The *flags* argument to `PyObject_GetBuffer()` specifies constraints upon the memory returned. Some examples are:

- **PyBUF\_WRITABLE** indicates that the memory must be writable.
- **PyBUF\_LOCK** requests a read-only or exclusive lock on the memory.
- **PyBUF\_C\_CONTIGUOUS** and **PyBUF\_F\_CONTIGUOUS** requests a C-contiguous (last dimension varies the fastest) or Fortran-contiguous (first dimension varies the fastest) array layout.

Two new argument codes for `PyArg_ParseTuple()`, `s*` and

`z*`, return locked buffer objects for a parameter.

## PEP 3119: Abstract Base Classes

Some object-oriented languages such as Java support interfaces, declaring that a class has a given set of methods or supports a given access protocol. Abstract Base Classes (or ABCs) are an equivalent feature for Python. The ABC support consists of an `abc` module containing a metaclass called `ABCMeta`, special handling of this metaclass by the `isinstance()` and `issubclass()` builtins, and a collection of basic ABCs that the Python developers think will be widely useful. Future versions of Python will probably add more ABCs.

Let's say you have a particular class and wish to know whether it supports dictionary-style access. The phrase "dictionary-style" is vague, however. It probably means that accessing items with `obj[1]` works. Does it imply that setting items with `obj[2] = value` works? Or that the object will have `keys()`, `values()`, and `items()` methods? What about the iterative variants such as `iterkeys()`? `copy()` and `update()`? Iterating over the object with `iter()`?

The Python 2.6 `collections` module includes a number of different ABCs that represent these distinctions. `Iterable` indicates that a class defines `__iter__()`, and `Container` means the class defines a `__contains__()` method and therefore supports `x in y` expressions. The basic dictionary interface of getting items, setting items, and `keys()`, `values()`, and `items()`, is defined by the `MutableMapping` ABC.

You can derive your own classes from a particular ABC to indicate

they support that ABC's interface:

```
import collections

class Storage(collections.MutableMapping):
    ...
```

Alternatively, you could write the class without deriving from the desired ABC and instead register the class by calling the ABC's **register()** method:

```
import collections

class Storage:
    ...

collections.MutableMapping.register(Storage)
```

For classes that you write, deriving from the ABC is probably clearer. The **register()** method is useful when you've written a new ABC that can describe an existing type or class, or if you want to declare that some third-party class implements an ABC. For example, if you defined a **PrintableType** ABC, it's legal to do:

```
# Register Python's types
PrintableType.register(int)
PrintableType.register(float)
PrintableType.register(str)
```

Classes should obey the semantics specified by an ABC, but Python can't check this; it's up to the class author to understand the ABC's requirements and to implement the code accordingly.

To check whether an object supports a particular interface, you can now write:

```
def func(d):
    if not isinstance(d, collections.MutableMapping):
        raise ValueError("Mapping object expected, not %s"
```

Don't feel that you must now begin writing lots of checks as in the

above example. Python has a strong tradition of duck-typing, where explicit type-checking is never done and code simply calls methods on an object, trusting that those methods will be there and raising an exception if they aren't. Be judicious in checking for ABCs and only do it where it's absolutely necessary.

You can write your own ABCs by using `abc.ABCMeta` as the metaclass in a class definition:

```
from abc import ABCMeta, abstractmethod

class Drawable():
    __metaclass__ = ABCMeta

    @abstractmethod
    def draw(self, x, y, scale=1.0):
        pass

    def draw_doubled(self, x, y):
        self.draw(x, y, scale=2.0)

class Square(Drawable):
    def draw(self, x, y, scale):
        ...
```

In the **Drawable** ABC above, the **draw\_doubled()** method renders the object at twice its size and can be implemented in terms of other methods described in **Drawable**. Classes implementing this ABC therefore don't need to provide their own implementation of **draw\_doubled()**, though they can do so. An implementation of **draw()** is necessary, though; the ABC can't provide a useful generic implementation.

You can apply the `@abstractmethod` decorator to methods such as **draw()** that must be implemented; Python will then raise an exception for classes that don't define the method. Note that the exception is only raised when you actually try to create an instance of a subclass lacking the method:

```
>>> class Circle(Drawable):
...     pass
...
>>> c = Circle()
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
TypeError: Can't instantiate abstract class Circle with
>>>
```

Abstract data attributes can be declared using the `@abstractmethod` decorator:

```
from abc import abstractproperty
...

@abstractproperty
def readonly(self):
    return self._x
```

Subclasses must then define a `readonly()` property.

PEP written by Guido van Rossum and Talin. Implemented by Guido van Rossum. Backported to 2.6 by Benjamin Aranguren, with Alex Martelli.

## PEP 3127: Integer Literal Support and Syntax

Python 3.0 changes the syntax for octal (base-8) integer literals, prefixing them with “0o” or “OO” instead of a leading zero, and adds support for binary (base-2) integer literals, signalled by a “0b” or “OB” prefix.

Python 2.6 doesn’t drop support for a leading 0 signalling an octal

number, but it does add support for “0o” and “0b”:

```
>>> 0o21, 2*8 + 1
(17, 17)
>>> 0b101111
47
```

The `oct()` builtin still returns numbers prefixed with a leading zero, and a new `bin()` builtin returns the binary representation for a number:

```
>>> oct(42)
'052'
>>> future_builtins.oct(42)
'0o52'
>>> bin(173)
'0b10101101'
```

The `int()` and `long()` builtins will now accept the “0o” and “0b” prefixes when base-8 or base-2 are requested, or when the *base* argument is zero (signalling that the base used should be determined from the string):

```
>>> int('0o52', 0)
42
>>> int('1101', 2)
13
>>> int('0b1101', 2)
13
>>> int('0b1101', 0)
13
```

### **PEP 3127** [<https://peps.python.org/pep-3127/>] - Integer Literal Support and Syntax

PEP written by Patrick Maupin; backported to 2.6 by Eric Smith.

## PEP 3129: Class Decorators

Decorators have been extended from functions to classes. It's now legal to write:

```
@foo
@bar
class A:
    pass
```

This is equivalent to:

```
class A:
    pass
```

```
A = foo(bar(A))
```

PEP written by Collin Winter.

## PEP 3141: A Type Hierarchy for Numbers

Python 3.0 adds several abstract base classes for numeric types inspired by Scheme's numeric tower. These classes were backported to 2.6 as the **numbers** module.

The most general ABC is **Number**. It defines no operations at all, and only exists to allow checking if an object is a number by doing `isinstance(obj, Number)`.

**Complex** is a subclass of **Number**. Complex numbers can undergo the basic operations of addition, subtraction, multiplication, division, and exponentiation, and you can retrieve the real and imaginary parts and obtain a number's conjugate. Python's built-in complex type is an implementation of **Complex**.

**Real** further derives from **Complex**, and adds operations that only

work on real numbers: `floor()`, `trunc()`, rounding, taking the remainder mod N, floor division, and comparisons.

**Rational** numbers derive from **Real**, have **numerator** and **denominator** properties, and can be converted to floats. Python 2.6 adds a simple rational-number class, **Fraction**, in the `fractions` module. (It's called **Fraction** instead of **Rational** to avoid a name clash with `numbers.Rational`.)

**Integral** numbers derive from **Rational**, and can be shifted left and right with `<<` and `>>`, combined using bitwise operations such as `&` and `|`, and can be used as array indexes and slice boundaries.

In Python 3.0, the PEP slightly redefines the existing builtins `round()`, `math.floor()`, `math.ceil()`, and adds a new one, `math.trunc()`, that's been backported to Python 2.6. `math.trunc()` rounds toward zero, returning the closest **Integral** that's between the function's argument and zero.

See also

**PEP 3141** [<https://peps.python.org/pep-3141/>] - A Type Hierarchy for Numbers

PEP written by Jeffrey Yasskin.

**Scheme's numerical tower** [[https://www.gnu.org/software/guile/manual/html\\_node/Numerical-Tower.html#Numerical-Tower](https://www.gnu.org/software/guile/manual/html_node/Numerical-Tower.html#Numerical-Tower)], from the Guile manual.

**Scheme's number datatypes** [[https://conservatory.scheme.org/schemers/Documents/Standards/R5RS/HTML/r5rs-Z-H-9.html#%\\_sec\\_6.2](https://conservatory.scheme.org/schemers/Documents/Standards/R5RS/HTML/r5rs-Z-H-9.html#%_sec_6.2)] from the R5RS Scheme specification.

## The `fractions` Module

To fill out the hierarchy of numeric types, the `fractions` module provides a rational-number class. Rational numbers store their values as a numerator and denominator forming a fraction, and can exactly represent numbers such as  $2/3$  that floating-point numbers can only approximate.

The **Fraction** constructor takes two **Integral** values that will be the numerator and denominator of the resulting fraction.

```
>>> from fractions import Fraction
>>> a = Fraction(2, 3)
>>> b = Fraction(2, 5)
>>> float(a), float(b)
(0.6666666666666666, 0.40000000000000002)
>>> a+b
Fraction(16, 15)
>>> a/b
Fraction(5, 3)
```

For converting floating-point numbers to rationals, the float type now has an **as\_integer\_ratio()** method that returns the numerator and denominator for a fraction that evaluates to the same floating-point value:

```
>>> (2.5).as_integer_ratio()
(5, 2)
>>> (3.1415).as_integer_ratio()
(7074029114692207L, 2251799813685248L)
>>> (1./3).as_integer_ratio()
(6004799503160661L, 18014398509481984L)
```

Note that values that can only be approximated by floating-point numbers, such as  $1./3$ , are not simplified to the number being approximated; the fraction attempts to match the floating-point value **exactly**.

The **fractions** module is based upon an implementation by Sjoerd Mullender that was in Python's `Demo/classes/` directory for a long time. This implementation was significantly updated by Jeffrey Yasskin.

## Other Language Changes

Some smaller changes made to the core Python language are:

- Directories and zip archives containing a `__main__.py` file

can now be executed directly by passing their name to the interpreter. The directory or zip archive is automatically inserted as the first entry in `sys.path`. (Suggestion and initial patch by Andy Chu, subsequently revised by Phillip J. Eby and Nick Coghlan; [bpo-1739468](https://bugs.python.org/issue?@action=redirect&bpo=1739468) [https://bugs.python.org/issue?@action=redirect&bpo=1739468].)

- The `hasattr()` function was catching and ignoring all errors, under the assumption that they meant a `__getattr__()` method was failing somehow and the return value of `hasattr()` would therefore be `False`. This logic shouldn't be applied to `KeyboardInterrupt` and `SystemExit`, however; Python 2.6 will no longer discard such exceptions when `hasattr()` encounters them. (Fixed by Benjamin Peterson; [bpo-2196](https://bugs.python.org/issue?@action=redirect&bpo=2196) [https://bugs.python.org/issue?@action=redirect&bpo=2196].)
- When calling a function using the `**` syntax to provide keyword arguments, you are no longer required to use a Python dictionary; any mapping will now work:

```
>>> def f(**kw):
...     print sorted(kw)
...
>>> ud=UserDict.UserDict()
>>> ud['a'] = 1
>>> ud['b'] = 'string'
>>> f(**ud)
['a', 'b']
```

(Contributed by Alexander Belopolsky; [bpo-1686487](https://bugs.python.org/issue?@action=redirect&bpo=1686487) [https://bugs.python.org/issue?@action=redirect&bpo=1686487].)

It's also become legal to provide keyword arguments after a `*args` argument to a function call.

```
>>> def f(*args, **kw):
...     print args, kw
...
>>> f(1,2,3, *(4,5,6), keyword=13)
```

```
(1, 2, 3, 4, 5, 6) {'keyword': 13}
```

Previously this would have been a syntax error. (Contributed by Amaury Forgeot d'Arc; [bpo-3473](https://bugs.python.org/issue?@action=redirect&bpo=3473) [https://bugs.python.org/issue?@action=redirect&bpo=3473].)

- A new builtin, `next(iterator, [default])` returns the next item from the specified iterator. If the *default* argument is supplied, it will be returned if *iterator* has been exhausted; otherwise, the [StopIteration](https://bugs.python.org/issue?@action=redirect&bpo=2719) exception will be raised. (Backported in [bpo-2719](https://bugs.python.org/issue?@action=redirect&bpo=2719) [https://bugs.python.org/issue?@action=redirect&bpo=2719].)
- Tuples now have `index()` and `count()` methods matching the list type's `index()` and `count()` methods:

```
>>> t = (0,1,2,3,4,0,1,2)
>>> t.index(3)
3
>>> t.count(0)
2
```

(Contributed by Raymond Hettinger)

- The built-in types now have improved support for extended slicing syntax, accepting various combinations of (*start*, *stop*, *step*). Previously, the support was partial and certain corner cases wouldn't work. (Implemented by Thomas Wouters.)
- Properties now have three attributes, **getter**, **setter** and **deleter**, that are decorators providing useful shortcuts for adding a getter, setter or deleter function to an existing property. You would use them like this:

```
class C(object):
    @property
    def x(self):
        return self._x

    @x.setter
```

```

    def x(self, value):
        self._x = value

    @x.deleter
    def x(self):
        del self._x

class D(C):
    @C.x.getter
    def x(self):
        return self._x * 2

    @x.setter
    def x(self, value):
        self._x = value / 2

```

- Several methods of the built-in set types now accept multiple iterables: **intersection()**, **intersection\_update()**, **union()**, **update()**, **difference()** and **difference\_update()**.

```

>>> s=set('1234567890')
>>> s.intersection('abc123', 'cdf246') # Intersect
set(['2'])
>>> s.difference('246', '789')
set(['1', '0', '3', '5'])

```

(Contributed by Raymond Hettinger.)

- Many floating-point features were added. The **float()** function will now turn the string `nan` into an IEEE 754 Not A Number value, and `+inf` and `-inf` into positive or negative infinity. This works on any platform with IEEE 754 semantics. (Contributed by Christian Heimes; [bpo-1635](https://bugs.python.org/issue?@action=redirect&bpo=1635) [https://bugs.python.org/issue?@action=redirect&bpo=1635].)

Other functions in the **math** module, **isinf()** and **isnan()**, return true if their floating-point argument is infinite or Not A Number. ([bpo-1640](https://bugs.python.org/issue?@action=redirect&bpo=1640) [https://bugs.python.org/issue?@action=redirect&bpo=1640])

Conversion functions were added to convert floating-point numbers into hexadecimal strings ([bpo-3008](https://bugs.python.org/issue?@action=redirect&bpo=3008) [https://bugs.python.org/issue?@action=redirect&bpo=3008]). These functions convert floats to and from a string representation without introducing rounding errors from the conversion between decimal and binary. Floats have a `hex()` method that returns a string representation, and the `float.fromhex()` method converts a string back into a number:

```
>>> a = 3.75
>>> a.hex()
'0x1.e000000000000p+1'
>>> float.fromhex('0x1.e000000000000p+1')
3.75
>>> b=1./3
>>> b.hex()
'0x1.5555555555555p-2'
```

- A numerical nicety: when creating a complex number from two floats on systems that support signed zeros (-0 and +0), the `complex()` constructor will now preserve the sign of the zero. (Fixed by Mark T. Dickinson; [bpo-1507](https://bugs.python.org/issue?@action=redirect&bpo=1507) [https://bugs.python.org/issue?@action=redirect&bpo=1507].)
- Classes that inherit a `__hash__()` method from a parent class can set `__hash__ = None` to indicate that the class isn't hashable. This will make `hash(obj)` raise a `TypeError` and the class will not be indicated as implementing the `Hashable` ABC.

You should do this when you've defined a `__cmp__()` or `__eq__()` method that compares objects by their value rather than by identity. All objects have a default hash method that uses `id(obj)` as the hash value. There's no tidy way to remove the `__hash__()` method inherited from a parent class, so assigning `None` was implemented as an override. At the C level, extensions can set `tp_hash` to `PyObject_HashNotImplemented()`. (Fixed by Nick Coghlan and Amaury Forgeot d'Arc; [bpo-2235](https://bugs.python.org/issue?@action=redirect&bpo=2235) [https://bugs.python.org/issue?@action=redirect&bpo=2235].)

- The `GeneratorExit` exception now subclasses `BaseException` instead of `Exception`. This means that an exception handler that does `except Exception:` will not inadvertently catch `GeneratorExit`. (Contributed by Chad Austin; [bpo-1537](https://bugs.python.org/issue?@action=redirect&bpo=1537) [https://bugs.python.org/issue?@action=redirect&bpo=1537].)
- Generator objects now have a `gi_code` attribute that refers to the original code object backing the generator. (Contributed by Collin Winter; [bpo-1473257](https://bugs.python.org/issue?@action=redirect&bpo=1473257) [https://bugs.python.org/issue?@action=redirect&bpo=1473257].)
- The `compile()` built-in function now accepts keyword arguments as well as positional parameters. (Contributed by Thomas Wouters; [bpo-1444529](https://bugs.python.org/issue?@action=redirect&bpo=1444529) [https://bugs.python.org/issue?@action=redirect&bpo=1444529].)
- The `complex()` constructor now accepts strings containing parenthesized complex numbers, meaning that `complex(repr(cplx))` will now round-trip values. For example, `complex(' (3+4j) ')` now returns the value `(3 + 4j)`. ([bpo-1491866](https://bugs.python.org/issue?@action=redirect&bpo=1491866) [https://bugs.python.org/issue?@action=redirect&bpo=1491866])
- The string `translate()` method now accepts `None` as the translation table parameter, which is treated as the identity transformation. This makes it easier to carry out operations that only delete characters. (Contributed by Bengt Richter and implemented by Raymond Hettinger; [bpo-1193128](https://bugs.python.org/issue?@action=redirect&bpo=1193128) [https://bugs.python.org/issue?@action=redirect&bpo=1193128].)
- The built-in `dir()` function now checks for a `__dir__()` method on the objects it receives. This method must return a list of strings containing the names of valid attributes for the object, and lets the object control the value that `dir()` produces. Objects that have `__getattr__()` or `__getattribute__()` methods can use this to advertise pseudo-attributes they will honor. ([bpo-1591665](https://bugs.python.org/issue?@action=redirect&bpo=1591665) [https://bugs.python.org/issue?@action=redirect&bpo=1591665])
- Instance method objects have new attributes for the object

and function comprising the method; the new synonym for `im_self` is `__self__`, and `im_func` is also available as `__func__`. The old names are still supported in Python 2.6, but are gone in 3.0.

- An obscure change: when you use the `locals()` function inside a `class` statement, the resulting dictionary no longer returns free variables. (Free variables, in this case, are variables referenced in the `class` statement that aren't attributes of the class.)

## Optimizations

- The `warnings` module has been rewritten in C. This makes it possible to invoke warnings from the parser, and may also make the interpreter's startup faster. (Contributed by Neal Norwitz and Brett Cannon; [bpo-1631171](https://bugs.python.org/issue?@action=redirect&bpo=1631171) [https://bugs.python.org/issue?@action=redirect&bpo=1631171].)
- Type objects now have a cache of methods that can reduce the work required to find the correct method implementation for a particular class; once cached, the interpreter doesn't need to traverse base classes to figure out the right method to call. The cache is cleared if a base class or the class itself is modified, so the cache should remain correct even in the face of Python's dynamic nature. (Original optimization implemented by Armin Rigo, updated for Python 2.6 by Kevin Jacobs; [bpo-1700288](https://bugs.python.org/issue?@action=redirect&bpo=1700288) [https://bugs.python.org/issue?@action=redirect&bpo=1700288].)

By default, this change is only applied to types that are included with the Python core. Extension modules may not necessarily be compatible with this cache, so they must explicitly add `Py_TPFLAGS_HAVE_VERSION_TAG` to the module's `tp_flags` field to enable the method cache. (To be compatible with the method cache, the extension module's code must not directly access and modify the `tp_dict` member of any of the types it implements. Most modules don't do this, but it's impossible for the Python interpreter to determine that. See [bpo-1878](https://bugs.python.org/issue?@action=redirect&bpo=1878) [https://bugs.python.org/issue?@action=redirect&bpo=1878].)

@action=redirect&bpo=1878] for some discussion.)

- Function calls that use keyword arguments are significantly faster by doing a quick pointer comparison, usually saving the time of a full string comparison. (Contributed by Raymond Hettinger, after an initial implementation by Antoine Pitrou; [bpo-1819](https://bugs.python.org/issue?@action=redirect&bpo=1819) [https://bugs.python.org/issue?@action=redirect&bpo=1819].)
- All of the functions in the `struct` module have been rewritten in C, thanks to work at the Need For Speed sprint. (Contributed by Raymond Hettinger.)
- Some of the standard built-in types now set a bit in their type objects. This speeds up checking whether an object is a subclass of one of these types. (Contributed by Neal Norwitz.)
- Unicode strings now use faster code for detecting whitespace and line breaks; this speeds up the `split()` method by about 25% and `splitlines()` by 35%. (Contributed by Antoine Pitrou.) Memory usage is reduced by using pymalloc for the Unicode string's data.
- The `with` statement now stores the `__exit__()` method on the stack, producing a small speedup. (Implemented by Jeffrey Yasskin.)
- To reduce memory usage, the garbage collector will now clear internal free lists when garbage-collecting the highest generation of objects. This may return memory to the operating system sooner.

## Interpreter Changes

Two command-line options have been reserved for use by other Python implementations. The `-J` switch has been reserved for use by Jython for Jython-specific options, such as switches that are passed to the underlying JVM. `-X` has been reserved for options specific to a particular implementation of Python such as CPython, Jython, or IronPython. If either option is used with Python 2.6, the interpreter will report that the option isn't currently used.

Python can now be prevented from writing `.pyc` or `.pyo` files by supplying the `-B` switch to the Python interpreter, or by setting the `PYTHONDONTWRITEBYTECODE` environment variable before running the interpreter. This setting is available to Python programs as the `sys.dont_write_bytecode` variable, and Python code can change the value to modify the interpreter's behaviour. (Contributed by Neal Norwitz and Georg Brandl.)

The encoding used for standard input, output, and standard error can be specified by setting the `PYTHONIOENCODING` environment variable before running the interpreter. The value should be a string in the form `<encoding>` or `<encoding>:<errorhandler>`. The *encoding* part specifies the encoding's name, e.g. `utf-8` or `latin-1`; the optional *errorhandler* part specifies what to do with characters that can't be handled by the encoding, and should be one of "error", "ignore", or "replace". (Contributed by Martin von Löwis.)

## New and Improved Modules

As in every release, Python's standard library received a number of enhancements and bug fixes. Here's a partial list of the most notable changes, sorted alphabetically by module name. Consult the `Misc/NEWS` file in the source tree for a more complete list of changes, or look through the Subversion logs for all the details.

- The `asyncore` and `asynchat` modules are being actively maintained again, and a number of patches and bugfixes were applied. (Maintained by Josiah Carlson; see [bpo-1736190](https://bugs.python.org/issue?@action=redirect&bpo=1736190) [<https://bugs.python.org/issue?@action=redirect&bpo=1736190>] for one patch.)
- The `bsddb` module also has a new maintainer, Jesús Cea Avión, and the package is now available as a standalone package. The web page for the package is [www.jcea.es/programacion/pybsddb.htm](http://www.jcea.es/programacion/pybsddb.htm) [<https://www.jcea.es/programacion/pybsddb.htm>]. The plan is to remove the package from the standard library in Python 3.0, because its pace of releases is much more frequent than Python's.

The **bsddb.dbshelve** module now uses the highest pickling protocol available, instead of restricting itself to protocol 1. (Contributed by W. Barnes.)

- The **cgi** module will now read variables from the query string of an HTTP POST request. This makes it possible to use form actions with URLs that include query strings such as “/cgi-bin/add.py?category=1”. (Contributed by Alexandre Fiori and Nubis; [bpo-1817](https://bugs.python.org/issue?@action=redirect&bpo=1817) [https://bugs.python.org/issue?@action=redirect&bpo=1817].)

The **parse\_qs()** and **parse\_qs1()** functions have been relocated from the **cgi** module to the **urlparse** module. The versions still available in the **cgi** module will trigger **PendingDeprecationWarning** messages in 2.6 ([bpo-600362](https://bugs.python.org/issue?@action=redirect&bpo=600362) [https://bugs.python.org/issue?@action=redirect&bpo=600362]).

- The **cmath** module underwent extensive revision, contributed by Mark Dickinson and Christian Heimes. Five new functions were added:
  - **polar()** converts a complex number to polar form, returning the modulus and argument of the complex number.
  - **rect()** does the opposite, turning a modulus, argument pair back into the corresponding complex number.
  - **phase()** returns the argument (also called the angle) of a complex number.
  - **isnan()** returns True if either the real or imaginary part of its argument is a NaN.
  - **isinf()** returns True if either the real or imaginary part of its argument is infinite.

The revisions also improved the numerical soundness of the **cmath** module. For all functions, the real and imaginary parts of the results are accurate to within a few units of least precision (ulps) whenever possible. See [bpo-1381](https://bugs.python.org/issue?@action=redirect&bpo=1381) [https://bugs.python.org/issue?@action=redirect&bpo=1381] for the details. The branch cuts for **asinh()**, **atanh()**, and **atan()** have

also been corrected.

The tests for the module have been greatly expanded; nearly 2000 new test cases exercise the algebraic functions.

On IEEE 754 platforms, the `cmath` module now handles IEEE 754 special values and floating-point exceptions in a manner consistent with Annex 'G' of the C99 standard.

- A new data type in the `collections` module: **`namedtuple(typename, fieldnames)`** is a factory function that creates subclasses of the standard tuple whose fields are accessible by name as well as index. For example:

```
>>> var_type = collections.namedtuple('variable',
...                                   'id name type size')
>>> # Names are separated by spaces or commas.
>>> # 'id, name, type, size' would also work.
>>> var_type._fields
('id', 'name', 'type', 'size')

>>> var = var_type(1, 'frequency', 'int', 4)
>>> print var[0], var.id      # Equivalent
1 1
>>> print var[2], var.type    # Equivalent
int int
>>> var._asdict()
{'size': 4, 'type': 'int', 'id': 1, 'name': 'freque
>>> v2 = var._replace(name='amplitude')
>>> v2
variable(id=1, name='amplitude', type='int', size=4
```

Several places in the standard library that returned tuples have been modified to return **`namedtuple`** instances. For example, the **`Decimal.as_tuple()`** method now returns a named tuple with **`sign`**, **`digits`**, and **`exponent`** fields.

(Contributed by Raymond Hettinger.)

- Another change to the `collections` module is that the

**deque** type now supports an optional *maxlen* parameter; if supplied, the deque's size will be restricted to no more than *maxlen* items. Adding more items to a full deque causes old items to be discarded.

```
>>> from collections import deque
>>> dq=deque(maxlen=3)
>>> dq
deque([], maxlen=3)
>>> dq.append(1); dq.append(2); dq.append(3)
>>> dq
deque([1, 2, 3], maxlen=3)
>>> dq.append(4)
>>> dq
deque([2, 3, 4], maxlen=3)
```

(Contributed by Raymond Hettinger.)

- The **Cookie** module's **Morsel** objects now support an **httponly** attribute. In some browsers, cookies with this attribute set cannot be accessed or manipulated by JavaScript code. (Contributed by Arvin Schnell; [bpo-1638033](https://bugs.python.org/issue?@action=redirect&bpo=1638033) [<https://bugs.python.org/issue?@action=redirect&bpo=1638033>].)
- A new window method in the **curses** module, **chgat()**, changes the display attributes for a certain number of characters on a single line. (Contributed by Fabian Kreutz.)

```
# Boldface text starting at y=0,x=21
# and affecting the rest of the line.
stdscr.chgat(0, 21, curses.A_BOLD)
```

The **Textbox** class in the **curses.textpad** module now supports editing in insert mode as well as overwrite mode. Insert mode is enabled by supplying a true value for the *insert\_mode* parameter when creating the **Textbox** instance.

- The **datetime** module's **strftime()** methods now support a `%f` format code that expands to the number of microseconds in the object, zero-padded on the left to six places. (Contributed by Skip Montanaro; [bpo-1158](https://bpo-1158) [[https://](https://bpo-1158)

[bugs.python.org/issue?@action=redirect&bpo=1158](https://bugs.python.org/issue?@action=redirect&bpo=1158)].)

- The **decimal** module was updated to version 1.66 of [the General Decimal Specification](https://speleotrove.com/decimal/decarith.html) [https://speleotrove.com/decimal/decarith.html]. New features include some methods for some basic mathematical functions such as **exp()** and **log10()**:

```
>>> Decimal(1).exp()
Decimal("2.718281828459045235360287471")
>>> Decimal("2.7182818").ln()
Decimal("0.9999999895305022877376682436")
>>> Decimal(1000).log10()
Decimal("3")
```

The **as\_tuple()** method of **Decimal** objects now returns a named tuple with **sign**, **digits**, and **exponent** fields.

(Implemented by Facundo Batista and Mark Dickinson.  
Named tuple support added by Raymond Hettinger.)

- The **difflib** module's **SequenceMatcher** class now returns named tuples representing matches, with **a**, **b**, and **size** attributes. (Contributed by Raymond Hettinger.)
- An optional **timeout** parameter, specifying a timeout measured in seconds, was added to the **ftplib.FTP** class constructor as well as the **connect()** method. (Added by Facundo Batista.) Also, the **FTP** class's **storbinary()** and **storlines()** now take an optional **callback** parameter that will be called with each block of data after the data has been sent. (Contributed by Phil Schwartz; [bpo-1221598](https://bugs.python.org/issue?@action=redirect&bpo=1221598) [https://bugs.python.org/issue?@action=redirect&bpo=1221598].)
- The **reduce()** built-in function is also available in the **functools** module. In Python 3.0, the builtin has been dropped and **reduce()** is only available from **functools**; currently there are no plans to drop the builtin in the 2.x series. (Patched by Christian Heimes; [bpo-1739906](https://bugs.python.org/issue?@action=redirect&bpo=1739906) [https://bugs.python.org/issue?@action=redirect&bpo=1739906].)
- When possible, the **getpass** module will now use `/dev/`

`tty` to print a prompt message and read the password, falling back to standard error and standard input. If the password may be echoed to the terminal, a warning is printed before the prompt is displayed. (Contributed by Gregory P. Smith.)

- The `glob.glob()` function can now return Unicode filenames if a Unicode path was used and Unicode filenames are matched within the directory. ([bpo-1001604](https://bugs.python.org/issue?@action=redirect&bpo=1001604) [<https://bugs.python.org/issue?@action=redirect&bpo=1001604>])
- A new function in the `heapq` module, `merge(iter1, iter2, ...)`, takes any number of iterables returning data in sorted order, and returns a new generator that returns the contents of all the iterators, also in sorted order. For example:

```
>>> list(heapq.merge([1, 3, 5, 9], [2, 8, 16]))  
[1, 2, 3, 5, 8, 9, 16]
```

Another new function, `heappushpop(heap, item)`, pushes *item* onto *heap*, then pops off and returns the smallest item. This is more efficient than making a call to `heappush()` and then `heappop()`.

`heapq` is now implemented to only use less-than comparison, instead of the less-than-or-equal comparison it previously used. This makes `heapq`'s usage of a type match the `list.sort()` method. (Contributed by Raymond Hettinger.)

- An optional `timeout` parameter, specifying a timeout measured in seconds, was added to the `httplib.HTTPConnection` and `HTTPSConnection` class constructors. (Added by Facundo Batista.)
- Most of the `inspect` module's functions, such as `getmoduleinfo()` and `getargs()`, now return named tuples. In addition to behaving like tuples, the elements of the return value can also be accessed as attributes. (Contributed by Raymond Hettinger.)

Some new functions in the module include `isgenerator()`, `isgeneratorfunction()`, and `isabstract()`.

- The `itertools` module gained several new functions.

`izip_longest(iter1, iter2, ...[, fillvalue])` makes tuples from each of the elements; if some of the iterables are shorter than others, the missing values are set to *fillvalue*. For example:

```
>>> tuple(itertools.izip_longest([1,2,3], [1,2,3,4,5],
((1, 1), (2, 2), (3, 3), (None, 4), (None, 5))
```

`product(iter1, iter2, ..., [repeat=N])` returns the Cartesian product of the supplied iterables, a set of tuples containing every possible combination of the elements returned from each iterable.

```
>>> list(itertools.product([1,2,3], [4,5,6]))
[(1, 4), (1, 5), (1, 6),
 (2, 4), (2, 5), (2, 6),
 (3, 4), (3, 5), (3, 6)]
```

The optional *repeat* keyword argument is used for taking the product of an iterable or a set of iterables with themselves, repeated *N* times. With a single iterable argument, *N*-tuples are returned:

```
>>> list(itertools.product([1,2], repeat=3))
[(1, 1, 1), (1, 1, 2), (1, 2, 1), (1, 2, 2),
 (2, 1, 1), (2, 1, 2), (2, 2, 1), (2, 2, 2)]
```

With two iterables,  $2N$ -tuples are returned.

```
>>> list(itertools.product([1,2], [3,4], repeat=2))
[(1, 3, 1, 3), (1, 3, 1, 4), (1, 3, 2, 3), (1, 3, 2, 4),
 (1, 4, 1, 3), (1, 4, 1, 4), (1, 4, 2, 3), (1, 4, 2, 4),
 (2, 3, 1, 3), (2, 3, 1, 4), (2, 3, 2, 3), (2, 3, 2, 4),
 (2, 4, 1, 3), (2, 4, 1, 4), (2, 4, 2, 3), (2, 4, 2, 4)]
```

`combinations(iterable, r)` returns sub-sequences of length *r* from the elements of *iterable*.

```
>>> list(itertools.combinations('123', 2))
```

```
[('1', '2'), ('1', '3'), ('2', '3')]
>>> list(itertools.combinations('123', 3))
[('1', '2', '3')]
>>> list(itertools.combinations('1234', 3))
[('1', '2', '3'), ('1', '2', '4'),
 ('1', '3', '4'), ('2', '3', '4')]
```

`permutations(iter[, r])` returns all the permutations of length *r* of the iterable's elements. If *r* is not specified, it will default to the number of elements produced by the iterable.

```
>>> list(itertools.permutations([1,2,3,4], 2))
[(1, 2), (1, 3), (1, 4),
 (2, 1), (2, 3), (2, 4),
 (3, 1), (3, 2), (3, 4),
 (4, 1), (4, 2), (4, 3)]
```

`itertools.chain(*iterables)` is an existing function in [itertools](#) that gained a new constructor in Python 2.6. `itertools.chain.from_iterable(iterable)` takes a single iterable that should return other iterables. `chain()` will then return all the elements of the first iterable, then all the elements of the second, and so on.

```
>>> list(itertools.chain.from_iterable([[1,2,3], [4
[1, 2, 3, 4, 5, 6]]
```

(All contributed by Raymond Hettinger.)

- The [logging](#) module's **FileHandler** class and its subclasses **WatchedFileHandler**, **RotatingFileHandler**, and **TimedRotatingFileHandler** now have an optional *delay* parameter to their constructors. If *delay* is true, opening of the log file is deferred until the first `emit()` call is made. (Contributed by Vinay Sajip.)

**TimedRotatingFileHandler** also has a *utc* constructor parameter. If the argument is true, UTC time will be used in determining when midnight occurs and in generating

filenames; otherwise local time will be used.

- Several new functions were added to the **math** module:
  - **isinf()** and **isnan()** determine whether a given float is a (positive or negative) infinity or a NaN (Not a Number), respectively.
  - **copysign()** copies the sign bit of an IEEE 754 number, returning the absolute value of *x* combined with the sign bit of *y*. For example, `math.copysign(1, -0.0)` returns `-1.0`. (Contributed by Christian Heimes.)
  - **factorial()** computes the factorial of a number. (Contributed by Raymond Hettinger; [bpo-2138](https://bugs.python.org/issue?@action=redirect&bpo=2138) [https://bugs.python.org/issue?@action=redirect&bpo=2138].)
  - **fsum()** adds up the stream of numbers from an iterable, and is careful to avoid loss of precision through using partial sums. (Contributed by Jean Brouwers, Raymond Hettinger, and Mark Dickinson; [bpo-2819](https://bugs.python.org/issue?@action=redirect&bpo=2819) [https://bugs.python.org/issue?@action=redirect&bpo=2819].)
  - **acosh()**, **asinh()** and **atanh()** compute the inverse hyperbolic functions.
  - **log1p()** returns the natural logarithm of  $1 + x$  (base *e*).
  - **trunc()** rounds a number toward zero, returning the closest **Integral** that's between the function's argument and zero. Added as part of the backport of [PEP 3141's type hierarchy for numbers](#).
- The **math** module has been improved to give more consistent behaviour across platforms, especially with respect to handling of floating-point exceptions and IEEE 754 special values.

Whenever possible, the module follows the recommendations of the C99 standard about 754's special values. For example, `sqrt(-1.)` should now give a **ValueError** across almost all platforms, while `sqrt(float('NaN'))` should return a NaN on all IEEE 754 platforms. Where Annex 'F' of the C99 standard recommends signaling 'divide-by-zero' or 'invalid',

Python will raise **ValueError**. Where Annex ‘F’ of the C99 standard recommends signaling ‘overflow’, Python will raise **OverflowError**. (See [bpo-711019](https://bugs.python.org/issue?@action=redirect&bpo=711019) [https://bugs.python.org/issue?@action=redirect&bpo=711019] and [bpo-1640](https://bugs.python.org/issue?@action=redirect&bpo=1640) [https://bugs.python.org/issue?@action=redirect&bpo=1640].)

(Contributed by Christian Heimes and Mark Dickinson.)

- **mmap** objects now have a **rfind()** method that searches for a substring beginning at the end of the string and searching backwards. The **find()** method also gained an *end* parameter giving an index at which to stop searching. (Contributed by John Lenton.)

- The **operator** module gained a **methodcaller()** function that takes a name and an optional set of arguments, returning a callable that will call the named function on any arguments passed to it. For example:

```
>>> # Equivalent to lambda s: s.replace('old', 'new')
>>> replacer = operator.methodcaller('replace', 'ol
>>> replacer('old wine in old bottles')
'new wine in new bottles'
```

(Contributed by Georg Brandl, after a suggestion by Gregory Petrosyan.)

The **attrgetter()** function now accepts dotted names and performs the corresponding attribute lookups:

```
>>> inst_name = operator.attrgetter(
...     '__class__.__name__')
>>> inst_name('')
'str'
>>> inst_name(help)
'_Helper'
```

(Contributed by Georg Brandl, after a suggestion by Barry Warsaw.)

- The **os** module now wraps several new system calls.

`fchmod(fd, mode)` and `fchown(fd, uid, gid)` change the mode and ownership of an opened file, and `lchmod(path, mode)` changes the mode of a symlink. (Contributed by Georg Brandl and Christian Heimes.)

`chflags()` and `lchflags()` are wrappers for the corresponding system calls (where they're available), changing the flags set on a file. Constants for the flag values are defined in the `stat` module; some possible values include `UF_IMMUTABLE` to signal the file may not be changed and `UF_APPEND` to indicate that data can only be appended to the file. (Contributed by M. Levinson.)

`os.closerange(low, high)` efficiently closes all file descriptors from *low* to *high*, ignoring any errors and not including *high* itself. This function is now used by the `subprocess` module to make starting processes faster. (Contributed by Georg Brandl; [bpo-1663329](https://bugs.python.org/issue?@action=redirect&bpo=1663329) [<https://bugs.python.org/issue?@action=redirect&bpo=1663329>].)

- The `os.environ` object's `clear()` method will now unset the environment variables using `os.unsetenv()` in addition to clearing the object's keys. (Contributed by Martin Horcicka; [bpo-1181](https://bugs.python.org/issue?@action=redirect&bpo=1181) [<https://bugs.python.org/issue?@action=redirect&bpo=1181>].)
- The `os.walk()` function now has a `followlinks` parameter. If set to `True`, it will follow symlinks pointing to directories and visit the directory's contents. For backward compatibility, the parameter's default value is `false`. Note that the function can fall into an infinite recursion if there's a symlink that points to a parent directory. ([bpo-1273829](https://bugs.python.org/issue?@action=redirect&bpo=1273829) [<https://bugs.python.org/issue?@action=redirect&bpo=1273829>])
- In the `os.path` module, the `splitext()` function has been changed to not split on leading period characters. This produces better results when operating on Unix's dot-files. For example, `os.path.splitext('.ipython')` now returns `('.ipython', '')` instead of `('', '.ipython')`. ([bpo-1115886](https://bugs.python.org/issue?@action=redirect&bpo=1115886) [<https://bugs.python.org/issue?@action=redirect&bpo=1115886>])

A new function, `os.path.relpath(path, start='.',)`, returns a relative path from the `start` path, if it's supplied, or from the current working directory to the destination path. (Contributed by Richard Barran; [bpo-1339796](https://bugs.python.org/issue?@action=redirect&bpo=1339796) [https://bugs.python.org/issue?@action=redirect&bpo=1339796].)

On Windows, `os.path.expandvars()` will now expand environment variables given in the form “%var%”, and “~user” will be expanded into the user's home directory path. (Contributed by Josiah Carlson; [bpo-957650](https://bugs.python.org/issue?@action=redirect&bpo=957650) [https://bugs.python.org/issue?@action=redirect&bpo=957650].)

- The Python debugger provided by the `pdb` module gained a new command: “run” restarts the Python program being debugged and can optionally take new command-line arguments for the program. (Contributed by Rocky Bernstein; [bpo-1393667](https://bugs.python.org/issue?@action=redirect&bpo=1393667) [https://bugs.python.org/issue?@action=redirect&bpo=1393667].)
- The `pdb.post_mortem()` function, used to begin debugging a traceback, will now use the traceback returned by `sys.exc_info()` if no traceback is supplied. (Contributed by Facundo Batista; [bpo-1106316](https://bugs.python.org/issue?@action=redirect&bpo=1106316) [https://bugs.python.org/issue?@action=redirect&bpo=1106316].)
- The `pickletools` module now has an `optimize()` function that takes a string containing a pickle and removes some unused opcodes, returning a shorter pickle that contains the same data structure. (Contributed by Raymond Hettinger.)
- A `get_data()` function was added to the `pkgutil` module that returns the contents of resource files included with an installed Python package. For example:

```
>>> import pkgutil
>>> print pkgutil.get_data('test', 'exception_hiera
BaseException
+-- SystemExit
+-- KeyboardInterrupt
+-- GeneratorExit
```

```
+-+ Exception
    +-+ StopIteration
    +-+ StandardError
...

```

(Contributed by Paul Moore; [bpo-2439](https://bugs.python.org/issue?@action=redirect&bpo=2439) [https://bugs.python.org/issue?@action=redirect&bpo=2439].)

- The **pyexpat** module's **Parser** objects now allow setting their **buffer\_size** attribute to change the size of the buffer used to hold character data. (Contributed by Achim Gaedke; [bpo-1137](https://bugs.python.org/issue?@action=redirect&bpo=1137) [https://bugs.python.org/issue?@action=redirect&bpo=1137].)
- The **Queue** module now provides queue variants that retrieve entries in different orders. The **PriorityQueue** class stores queued items in a heap and retrieves them in priority order, and **LifoQueue** retrieves the most recently added entries first, meaning that it behaves like a stack. (Contributed by Raymond Hettinger.)
- The **random** module's **Random** objects can now be pickled on a 32-bit system and unpickled on a 64-bit system, and vice versa. Unfortunately, this change also means that Python 2.6's **Random** objects can't be unpickled correctly on earlier versions of Python. (Contributed by Shawn Ligocki; [bpo-1727780](https://bugs.python.org/issue?@action=redirect&bpo=1727780) [https://bugs.python.org/issue?@action=redirect&bpo=1727780].)

The new `triangular(low, high, mode)` function returns random numbers following a triangular distribution. The returned values are between *low* and *high*, not including *high* itself, and with *mode* as the most frequently occurring value in the distribution. (Contributed by Wladimir van der Laan and Raymond Hettinger; [bpo-1681432](https://bugs.python.org/issue?@action=redirect&bpo=1681432) [https://bugs.python.org/issue?@action=redirect&bpo=1681432].)

- Long regular expression searches carried out by the **re** module will check for signals being delivered, so time-consuming searches can now be interrupted. (Contributed by Josh Hoyt and Ralf Schmitt; [bpo-846388](https://bugs.python.org/) [https://bugs.python.org/

issue?@action=redirect&bpo=846388].)

The regular expression module is implemented by compiling bytecodes for a tiny regex-specific virtual machine. Untrusted code could create malicious strings of bytecode directly and cause crashes, so Python 2.6 includes a verifier for the regex bytecode. (Contributed by Guido van Rossum from work for Google App Engine; [bpo-3487](https://bugs.python.org/issue?@action=redirect&bpo=3487) [https://bugs.python.org/issue?@action=redirect&bpo=3487].)

- The [rlcompleter](#) module's `Completer.complete()` method will now ignore exceptions triggered while evaluating a name. (Fixed by Lorenz Quack; [bpo-2250](https://bugs.python.org/issue?@action=redirect&bpo=2250) [https://bugs.python.org/issue?@action=redirect&bpo=2250].)
- The [sched](#) module's `scheduler` instances now have a read-only [queue](#) attribute that returns the contents of the scheduler's queue, represented as a list of named tuples with the fields `(time, priority, action, argument)`. (Contributed by Raymond Hettinger; [bpo-1861](https://bugs.python.org/issue?@action=redirect&bpo=1861) [https://bugs.python.org/issue?@action=redirect&bpo=1861].)
- The [select](#) module now has wrapper functions for the Linux `epoll()` and BSD `kqueue()` system calls. `modify()` method was added to the existing `poll` objects; `pollobj.modify(fd, eventmask)` takes a file descriptor or file object and an event mask, modifying the recorded event mask for that file. (Contributed by Christian Heimes; [bpo-1657](https://bugs.python.org/issue?@action=redirect&bpo=1657) [https://bugs.python.org/issue?@action=redirect&bpo=1657].)
- The [shutil.copytree\(\)](#) function now has an optional *ignore* argument that takes a callable object. This callable will receive each directory path and a list of the directory's contents, and returns a list of names that will be ignored, not copied.

The [shutil](#) module also provides an `ignore_patterns()` function for use with this new parameter. `ignore_patterns()` takes an arbitrary number of glob-style patterns and returns a callable that will ignore

any files and directories that match any of these patterns. The following example copies a directory tree, but skips both `.svn` directories and Emacs backup files, which have names ending with `'~'`:

```
shutil.copytree('Doc/library', '/tmp/library',  
               ignore=shutil.ignore_patterns('*~',
```

(Contributed by Tarek Ziadé; [bpo-2663](https://bugs.python.org/issue?@action=redirect&bpo=2663) [https://bugs.python.org/issue?@action=redirect&bpo=2663].)

- Integrating signal handling with GUI handling event loops like those used by Tkinter or GTK+ has long been a problem; most software ends up polling, waking up every fraction of a second to check if any GUI events have occurred. The **signal** module can now make this more efficient. Calling `signal.set_wakeup_fd(fd)` sets a file descriptor to be used; when a signal is received, a byte is written to that file descriptor. There's also a C-level function, **PySignal\_SetWakeupFd()**, for setting the descriptor.

Event loops will use this by opening a pipe to create two descriptors, one for reading and one for writing. The writable descriptor will be passed to `set_wakeup_fd()`, and the readable descriptor will be added to the list of descriptors monitored by the event loop via `select()` or `poll()`. On receiving a signal, a byte will be written and the main event loop will be woken up, avoiding the need to poll.

(Contributed by Adam Olsen; [bpo-1583](https://bugs.python.org/issue?@action=redirect&bpo=1583) [https://bugs.python.org/issue?@action=redirect&bpo=1583].)

The **siginterrupt()** function is now available from Python code, and allows changing whether signals can interrupt system calls or not. (Contributed by Ralf Schmitt.)

The **setitimer()** and **getitimer()** functions have also been added (where they're available). **setitimer()** allows setting interval timers that will cause a signal to be delivered to the process after a specified time, measured in wall-clock time, consumed process time, or combined process + system

time. (Contributed by Guilherme Polo; [bpo-2240](https://bugs.python.org/issue/?@action=redirect&bpo=2240) [https://bugs.python.org/issue/?@action=redirect&bpo=2240].)

- The **smtplib** module now supports SMTP over SSL thanks to the addition of the **SMTP\_SSL** class. This class supports an interface identical to the existing **SMTP** class. (Contributed by Monty Taylor.) Both class constructors also have an optional `timeout` parameter that specifies a timeout for the initial connection attempt, measured in seconds. (Contributed by Facundo Batista.)

An implementation of the LMTP protocol ([RFC 2033](https://datatracker.ietf.org/doc/html/rfc2033) [https://datatracker.ietf.org/doc/html/rfc2033.html]) was also added to the module. LMTP is used in place of SMTP when transferring e-mail between agents that don't manage a mail queue. (LMTP implemented by Leif Hedstrom; [bpo-957003](https://bugs.python.org/issue/?@action=redirect&bpo=957003) [https://bugs.python.org/issue/?@action=redirect&bpo=957003].)

**SMTP.starttls()** now complies with [RFC 3207](https://datatracker.ietf.org/doc/html/rfc3207) [https://datatracker.ietf.org/doc/html/rfc3207.html] and forgets any knowledge obtained from the server not obtained from the TLS negotiation itself. (Patch contributed by Bill Fenner; [bpo-829951](https://bugs.python.org/issue/?@action=redirect&bpo=829951) [https://bugs.python.org/issue/?@action=redirect&bpo=829951].)

- The **socket** module now supports TIPC (<https://tipc.sourceforge.net/>), a high-performance non-IP-based protocol designed for use in clustered environments. TIPC addresses are 4- or 5-tuples. (Contributed by Alberto Bertogli; [bpo-1646](https://bugs.python.org/issue/?@action=redirect&bpo=1646) [https://bugs.python.org/issue/?@action=redirect&bpo=1646].)

A new function, **create\_connection()**, takes an address and connects to it using an optional timeout value, returning the connected socket object. This function also looks up the address's type and connects to it using IPv4 or IPv6 as appropriate. Changing your code to use **create\_connection()** instead of `socket(socket.AF_INET, ...)` may be all that's required to make your code work with IPv6.

- The base classes in the **SocketServer** module now support calling a **handle\_timeout()** method after a span of inactivity specified by the server's **timeout** attribute. (Contributed by Michael Pomraning.) The **serve\_forever()** method now takes an optional poll interval measured in seconds, controlling how often the server will check for a shutdown request. (Contributed by Pedro Werneck and Jeffrey Yasskin; [bpo-742598](https://bugs.python.org/issue?@action=redirect&bpo=742598) [<https://bugs.python.org/issue?@action=redirect&bpo=742598>], [bpo-1193577](https://bugs.python.org/issue?@action=redirect&bpo=1193577) [<https://bugs.python.org/issue?@action=redirect&bpo=1193577>].)
- The **sqlite3** module, maintained by Gerhard Häring, has been updated from version 2.3.2 in Python 2.5 to version 2.4.1.
- The **struct** module now supports the C99 **\_Bool** type, using the format character **'?'**. (Contributed by David Remahl.)
- The **Popen** objects provided by the **subprocess** module now have **terminate()**, **kill()**, and **send\_signal()** methods. On Windows, **send\_signal()** only supports the **SIGTERM** signal, and all these methods are aliases for the Win32 API function **TerminateProcess()**. (Contributed by Christian Heimes.)
- A new variable in the **sys** module, **float\_info**, is an object containing information derived from the **float.h** file about the platform's floating-point support. Attributes of this object include **mant\_dig** (number of digits in the mantissa), **epsilon** (smallest difference between 1.0 and the next largest value representable), and several others. (Contributed by Christian Heimes; [bpo-1534](https://bugs.python.org/issue?@action=redirect&bpo=1534) [<https://bugs.python.org/issue?@action=redirect&bpo=1534>].)

Another new variable, **dont\_write\_bytecode**, controls whether Python writes any **.pyc** or **.pyo** files on importing a module. If this variable is true, the compiled files are not written. The variable is initially set on start-up by supplying the **-B** switch to the Python interpreter, or by setting the **PYTHONDONTWRITEBYTECODE** environment variable before running the interpreter. Python code can subsequently change

the value of this variable to control whether bytecode files are written or not. (Contributed by Neal Norwitz and Georg Brandl.)

Information about the command-line arguments supplied to the Python interpreter is available by reading attributes of a named tuple available as `sys.flags`. For example, the **verbose** attribute is true if Python was executed in verbose mode, **debug** is true in debugging mode, etc. These attributes are all read-only. (Contributed by Christian Heimes.)

A new function, **getsizeof()**, takes a Python object and returns the amount of memory used by the object, measured in bytes. Built-in objects return correct results; third-party extensions may not, but can define a **\_\_sizeof\_\_()** method to return the object's size. (Contributed by Robert Schuppenies; [bpo-2898](https://bugs.python.org/issue?@action=redirect&bpo=2898) [https://bugs.python.org/issue?@action=redirect&bpo=2898].)

It's now possible to determine the current profiler and tracer functions by calling **sys.getprofile()** and **sys.gettrace()**. (Contributed by Georg Brandl; [bpo-1648](https://bugs.python.org/issue?@action=redirect&bpo=1648) [https://bugs.python.org/issue?@action=redirect&bpo=1648].)

- The **tarfile** module now supports POSIX.1-2001 (pax) tarfiles in addition to the POSIX.1-1988 (ustar) and GNU tar formats that were already supported. The default format is GNU tar; specify the `format` parameter to open a file using a different format:

```
tar = tarfile.open("output.tar", "w",  
                  format=tarfile.PAX_FORMAT)
```

The new `encoding` and `errors` parameters specify an encoding and an error handling scheme for character conversions. 'strict', 'ignore', and 'replace' are the three standard ways Python can handle errors;; 'utf-8' is a special value that replaces bad characters with their UTF-8 representation. (Character conversions occur because the PAX format supports Unicode filenames, defaulting to

UTF-8 encoding.)

The **TarFile.add()** method now accepts an `exclude` argument that's a function that can be used to exclude certain filenames from an archive. The function must take a filename and return true if the file should be excluded or false if it should be archived. The function is applied to both the name initially passed to **add()** and to the names of files in recursively added directories.

(All changes contributed by Lars Gustäbel).

- An optional `timeout` parameter was added to the **telnetlib.Telnet** class constructor, specifying a timeout measured in seconds. (Added by Facundo Batista.)
- The **tempfile.NamedTemporaryFile** class usually deletes the temporary file it created when the file is closed. This behaviour can now be changed by passing `delete=False` to the constructor. (Contributed by Damien Miller; [bpo-1537850](https://bugs.python.org/issue?@action=redirect&bpo=1537850) [https://bugs.python.org/issue?@action=redirect&bpo=1537850].)

A new class, **SpooledTemporaryFile**, behaves like a temporary file but stores its data in memory until a maximum size is exceeded. On reaching that limit, the contents will be written to an on-disk temporary file. (Contributed by Dustin J. Mitchell.)

The **NamedTemporaryFile** and **SpooledTemporaryFile** classes both work as context managers, so you can write with `tempfile.NamedTemporaryFile()` as `tmp`:  
.... (Contributed by Alexander Belopolsky; [bpo-2021](https://bugs.python.org/issue?@action=redirect&bpo=2021) [https://bugs.python.org/issue?@action=redirect&bpo=2021].)

- The **test.test\_support** module gained a number of context managers useful for writing tests.  
**EnvironmentVarGuard()** is a context manager that temporarily changes environment variables and automatically restores them to their old values.

Another context manager, **TransientResource**, can surround calls to resources that may or may not be available; it will catch and ignore a specified list of exceptions. For example, a network test may ignore certain failures when connecting to an external web site:

```
with test_support.TransientResource(IOError,
                                     errno=errno.ETIMEDO
    f = urllib.urlopen('https://sf.net')
    ...
```

Finally, **check\_warnings()** resets the **warning** module's warning filters and returns an object that will record all warning messages triggered ([bpo-3781](https://bugs.python.org/issue?@action=redirect&bpo=3781) [https://bugs.python.org/issue?@action=redirect&bpo=3781]):

```
with test_support.check_warnings() as wrec:
    warnings.simplefilter("always")
    # ... code that triggers a warning ...
    assert str(wrec.message) == "function is outdated"
    assert len(wrec.warnings) == 1, "Multiple warnings"
```

(Contributed by Brett Cannon.)

- The [textwrap](#) module can now preserve existing whitespace at the beginnings and ends of the newly created lines by specifying `drop_whitespace=False` as an argument:

```
>>> S = """This sentence has a bunch of
... extra whitespace."""
>>> print textwrap.fill(S, width=15)
This sentence
has a bunch
of extra
whitespace.
>>> print textwrap.fill(S, drop_whitespace=False, width=15)
This sentence
has a bunch
of extra
```

```
whitespace.  
>>>
```

(Contributed by Dwayne Bailey; [bpo-1581073](https://bugs.python.org/issue/?@action=redirect&bpo=1581073) [https://bugs.python.org/issue/?@action=redirect&bpo=1581073].)

- The **threading** module API is being changed to use properties such as **daemon** instead of **setDaemon()** and **isDaemon()** methods, and some methods have been renamed to use underscores instead of camel-case; for example, the **activeCount()** method is renamed to **active\_count()**. Both the 2.6 and 3.0 versions of the module support the same properties and renamed methods, but don't remove the old methods. No date has been set for the deprecation of the old APIs in Python 3.x; the old APIs won't be removed in any 2.x version. (Carried out by several people, most notably Benjamin Peterson.)

The **threading** module's **Thread** objects gained an **ident** property that returns the thread's identifier, a nonzero integer. (Contributed by Gregory P. Smith; [bpo-2871](https://bugs.python.org/issue/?@action=redirect&bpo=2871) [https://bugs.python.org/issue/?@action=redirect&bpo=2871].)

- The **timeit** module now accepts callables as well as strings for the statement being timed and for the setup code. Two convenience functions were added for creating **Timer** instances: **repeat(stmt, setup, time, repeat, number)** and **timeit(stmt, setup, time, number)** create an instance and call the corresponding method. (Contributed by Erik Demaine; [bpo-1533909](https://bugs.python.org/issue/?@action=redirect&bpo=1533909) [https://bugs.python.org/issue/?@action=redirect&bpo=1533909].)
- The **Tkinter** module now accepts lists and tuples for options, separating the elements by spaces before passing the resulting value to Tcl/Tk. (Contributed by Guilherme Polo; [bpo-2906](https://bugs.python.org/issue/?@action=redirect&bpo=2906) [https://bugs.python.org/issue/?@action=redirect&bpo=2906].)
- The **turtle** module for turtle graphics was greatly enhanced by Gregor Lingl. New features in the module include:

- Better animation of turtle movement and rotation.
- Control over turtle movement using the new **delay()**, **tracer()**, and **speed()** methods.
- The ability to set new shapes for the turtle, and to define a new coordinate system.
- Turtles now have an **undo()** method that can roll back actions.
- Simple support for reacting to input events such as mouse and keyboard activity, making it possible to write simple games.
- A `turtle.cfg` file can be used to customize the starting appearance of the turtle's screen.
- The module's docstrings can be replaced by new docstrings that have been translated into another language.

([bpo-1513695](https://bugs.python.org/issue?bpo=1513695) [<https://bugs.python.org/issue?@action=redirect&bpo=1513695>])

- An optional `timeout` parameter was added to the **urllib.urlopen()** function and the **urllib.ftplibwrapper** class constructor, as well as the **urllib2.urlopen()** function. The parameter specifies a timeout measured in seconds. For example:

```
>>> u = urllib2.urlopen("http://slow.example.com",
                        timeout=3)
Traceback (most recent call last):
...
urllib2.URLError: <urlopen error timed out>
>>>
```

(Added by Facundo Batista.)

- The Unicode database provided by the **unicodedata** module has been updated to version 5.1.0. (Updated by Martin von Löwis; [bpo-3811](https://bugs.python.org/issue?bpo=3811) [<https://bugs.python.org/issue?@action=redirect&bpo=3811>].)
- The **warnings** module's **formatwarning()** and **showwarning()** gained an optional *line* argument that can

be used to supply the line of source code. (Added as part of [bpo-1631171](https://bugs.python.org/issue?@action=redirect&bpo=1631171) [https://bugs.python.org/issue?@action=redirect&bpo=1631171], which re-implemented part of the **warnings** module in C code.)

A new function, **catch\_warnings()**, is a context manager intended for testing purposes that lets you temporarily modify the warning filters and then restore their original values ([bpo-3781](https://bugs.python.org/issue?@action=redirect&bpo=3781) [https://bugs.python.org/issue?@action=redirect&bpo=3781]).

- The XML-RPC **SimpleXMLRPCServer** and **DocXMLRPCServer** classes can now be prevented from immediately opening and binding to their socket by passing **False** as the *bind\_and\_activate* constructor parameter. This can be used to modify the instance's **allow\_reuse\_address** attribute before calling the **server\_bind()** and **server\_activate()** methods to open the socket and begin listening for connections. (Contributed by Peter Parente; [bpo-1599845](https://bugs.python.org/issue?@action=redirect&bpo=1599845) [https://bugs.python.org/issue?@action=redirect&bpo=1599845].)

**SimpleXMLRPCServer** also has a **\_send\_traceback\_header** attribute; if true, the exception and formatted traceback are returned as HTTP headers “X-Exception” and “X-Traceback”. This feature is for debugging purposes only and should not be used on production servers because the tracebacks might reveal passwords or other sensitive information. (Contributed by Alan McIntyre as part of his project for Google’s Summer of Code 2007.)

- The **xmlrpclib** module no longer automatically converts [datetime.date](https://bugs.python.org/issue?@action=redirect&bpo=1330538) and [datetime.time](https://bugs.python.org/issue?@action=redirect&bpo=1330538) to the **xmlrpclib.DateTime** type; the conversion semantics were not necessarily correct for all applications. Code using **xmlrpclib** should convert **date** and **time** instances. ([bpo-1330538](https://bugs.python.org/issue?@action=redirect&bpo=1330538) [https://bugs.python.org/issue?@action=redirect&bpo=1330538]) The code can also handle dates before 1900 (contributed by Ralf Schmitt; [bpo-2014](https://bugs.python.org/issue?@action=redirect&bpo=2014) [https://bugs.python.org/issue?@action=redirect&bpo=2014]) and 64-bit integers represented by using `<i8>` in XML-RPC responses

(contributed by Riku Lindblad; [bpo-2985](https://bugs.python.org/issue/?@action=redirect&bpo=2985) [https://bugs.python.org/issue/?@action=redirect&bpo=2985]).

- The **zipfile** module's **ZipFile** class now has **extract()** and **extractall()** methods that will unpack a single file or all the files in the archive to the current directory, or to a specified directory:

```
z = zipfile.ZipFile('python-251.zip')

# Unpack a single file, writing it relative
# to the /tmp directory.
z.extract('Python/sysmodule.c', '/tmp')

# Unpack all the files in the archive.
z.extractall()
```

(Contributed by Alan McIntyre; [bpo-467924](https://bugs.python.org/issue/?@action=redirect&bpo=467924) [https://bugs.python.org/issue/?@action=redirect&bpo=467924].)

The **open()**, **read()** and **extract()** methods can now take either a filename or a **ZipInfo** object. This is useful when an archive accidentally contains a duplicated filename. (Contributed by Graham Horler; [bpo-1775025](https://bugs.python.org/issue/?@action=redirect&bpo=1775025) [https://bugs.python.org/issue/?@action=redirect&bpo=1775025].)

Finally, **zipfile** now supports using Unicode filenames for archived files. (Contributed by Alexey Borzenkov; [bpo-1734346](https://bugs.python.org/issue/?@action=redirect&bpo=1734346) [https://bugs.python.org/issue/?@action=redirect&bpo=1734346].)

## The **ast** module

The **ast** module provides an Abstract Syntax Tree representation of Python code, and Armin Ronacher contributed a set of helper functions that perform a variety of common tasks. These will be useful for HTML templating packages, code analyzers, and similar tools that process Python code.

The **parse()** function takes an expression and returns an AST. The **dump()** function outputs a representation of a tree, suitable

for debugging:

```
import ast

t = ast.parse("""
d = {}
for i in 'abcdefghijklm':
    d[i + i] = ord(i) - ord('a') + 1
print d
""")
print ast.dump(t)
```

This outputs a deeply nested tree:

```
Module(body=[
  Assign(targets=[
    Name(id='d', ctx=Store())
  ], value=Dict(keys=[], values=[]))
For(target=Name(id='i', ctx=Store()),
  iter=Str(s='abcdefghijklm'), body=[
  Assign(targets=[
    Subscript(value=
      Name(id='d', ctx=Load()),
      slice=
        Index(value=
          BinOp(left=Name(id='i', ctx=Load()), op=Add(),
            right=Name(id='i', ctx=Load()))), ctx=Store()
        ], value=
      BinOp(left=
        BinOp(left=
          Call(func=
            Name(id='ord', ctx=Load()), args=[
              Name(id='i', ctx=Load())
            ], keywords=[], starargs=None, kwargs=None),
            op=Sub(), right=Call(func=
              Name(id='ord', ctx=Load()), args=[
                Str(s='a')
              ], keywords=[], starargs=None, kwargs=None)),
            op=Add(), right=Num(n=1)))
```

```

], or_else=[])
Print(dest=None, values=[
    Name(id='d', ctx=Load())
], nl=True)
])

```

The **literal\_eval()** method takes a string or an AST representing a literal expression, parses and evaluates it, and returns the resulting value. A literal expression is a Python expression containing only strings, numbers, dictionaries, etc. but no statements or function calls. If you need to evaluate an expression but cannot accept the security risk of using an **eval()** call, **literal\_eval()** will handle it safely:

```

>>> literal = '("a", "b", {2:4, 3:8, 1:2})'
>>> print ast.literal_eval(literal)
('a', 'b', {1: 2, 2: 4, 3: 8})
>>> print ast.literal_eval('"a" + "b"')
Traceback (most recent call last):
...
ValueError: malformed string

```

The module also includes **NodeVisitor** and **NodeTransformer** classes for traversing and modifying an AST, and functions for common transformations such as changing line numbers.

## The **future\_builtins** module

Python 3.0 makes many changes to the repertoire of built-in functions, and most of the changes can't be introduced in the Python 2.x series because they would break compatibility. The **future\_builtins** module provides versions of these built-in functions that can be imported when writing 3.0-compatible code.

The functions in this module currently include:

- **ascii(obj)**: equivalent to **repr()**. In Python 3.0, **repr()** will return a Unicode string, while **ascii()** will return a pure ASCII bytestring.
- **filter(predicate, iterable)**, **map(func,**

`iterable1, ...)`: the 3.0 versions return iterators, unlike the 2.x builtins which return lists.

- `hex(value)`, `oct(value)`: instead of calling the `__hex__()` or `__oct__()` methods, these versions will call the `__index__()` method and convert the result to hexadecimal or octal. `oct()` will use the new `0o` notation for its result.

## The `json` module: JavaScript Object Notation

The new `json` module supports the encoding and decoding of Python types in JSON (Javascript Object Notation). JSON is a lightweight interchange format often used in web applications. For more information about JSON, see <http://www.json.org>.

`json` comes with support for decoding and encoding most built-in Python types. The following example encodes and decodes a dictionary:

```
>>> import json
>>> data = {"spam": "foo", "parrot": 42}
>>> in_json = json.dumps(data) # Encode the data
>>> in_json
'{"parrot": 42, "spam": "foo"}'
>>> json.loads(in_json) # Decode into a Python object
{"spam": "foo", "parrot": 42}
```

It's also possible to write your own decoders and encoders to support more types. Pretty-printing of the JSON strings is also supported.

`json` (originally called `simplejson`) was written by Bob Ippolito.

## The `plistlib` module: A Property-List Parser

The `.plist` format is commonly used on Mac OS X to store basic data types (numbers, strings, lists, and dictionaries) by serializing them into an XML-based format. It resembles the XML-RPC serialization of data types.

Despite being primarily used on Mac OS X, the format has nothing Mac-specific about it and the Python implementation works on any platform that Python supports, so the `plistlib` module has been promoted to the standard library.

Using the module is simple:

```
import sys
import plistlib
import datetime

# Create data structure
data_struct = dict(lastAccessed=datetime.datetime.now(),
                   version=1,
                   categories=('Personal', 'Shared', 'Priv

# Create string containing XML.
plist_str = plistlib.writePlistToString(data_struct)
new_struct = plistlib.readPlistFromString(plist_str)
print data_struct
print new_struct

# Write data structure to a file and read it back.
plistlib.writePlist(data_struct, '/tmp/customizations.pli
new_struct = plistlib.readPlist('/tmp/customizations.pli

# read/writePlist accepts file-like objects as well as p
plistlib.writePlist(data_struct, sys.stdout)
```

## ctypes Enhancements

Thomas Heller continued to maintain and enhance the `ctypes` module.

`ctypes` now supports a `c_bool` datatype that represents the C99 `bool` type. (Contributed by David Remahl; [bpo-1649190](https://bugs.python.org/issue?@action=redirect&bpo=1649190) [https://bugs.python.org/issue?@action=redirect&bpo=1649190].)

The `ctypes` string, buffer and array types have improved support for extended slicing syntax, where various combinations of

(start, stop, step) are supplied. (Implemented by Thomas Wouters.)

All **ctypes** data types now support **from\_buffer()** and **from\_buffer\_copy()** methods that create a ctypes instance based on a provided buffer object. **from\_buffer\_copy()** copies the contents of the object, while **from\_buffer()** will share the same memory area.

A new calling convention tells **ctypes** to clear the `errno` or Win32 `LastError` variables at the outset of each wrapped call. (Implemented by Thomas Heller; [bpo-1798](https://bugs.python.org/issue?@action=redirect&bpo=1798) [<https://bugs.python.org/issue?@action=redirect&bpo=1798>].)

You can now retrieve the Unix `errno` variable after a function call. When creating a wrapped function, you can supply `use_errno=True` as a keyword parameter to the **DLL()** function and then call the module-level methods **set\_errno()** and **get\_errno()** to set and retrieve the error value.

The Win32 `LastError` variable is similarly supported by the **DLL()**, **OleDLL()**, and **WinDLL()** functions. You supply `use_last_error=True` as a keyword parameter and then call the module-level methods **set\_last\_error()** and **get\_last\_error()**.

The **byref()** function, used to retrieve a pointer to a ctypes instance, now has an optional *offset* parameter that is a byte count that will be added to the returned pointer.

## Improved SSL Support

Bill Janssen made extensive improvements to Python 2.6's support for the Secure Sockets Layer by adding a new module, **ssl**, that's built atop the [OpenSSL](https://www.openssl.org/) [<https://www.openssl.org/>] library. This new module provides more control over the protocol negotiated, the X.509 certificates used, and has better support for writing SSL servers (as opposed to clients) in Python. The existing SSL support in the **socket** module hasn't been removed and continues to work, though it will be removed in Python 3.0.

To use the new module, you must first create a TCP connection in the usual way and then pass it to the `ssl.wrap_socket()` function. It's possible to specify whether a certificate is required, and to obtain certificate info by calling the `getpeercert()` method.

### See also

The documentation for the `ssl` module.

## Deprecations and Removals

- String exceptions have been removed. Attempting to use them raises a `TypeError`.
- Changes to the `Exception` interface as dictated by [PEP 352](https://peps.python.org/pep-0352/) [https://peps.python.org/pep-0352/] continue to be made. For 2.6, the `message` attribute is being deprecated in favor of the `args` attribute.
- (3.0-warning mode) Python 3.0 will feature a reorganized standard library that will drop many outdated modules and rename others. Python 2.6 running in 3.0-warning mode will warn about these modules when they are imported.

The list of deprecated modules is: `audiodev`, `bgenlocations`, `buildtools`, `bundlebuilder`, `Canvas`, `compiler`, `dircache`, `dl`, `fpformat`, `gensuitemodule`, `ihooks`, `imageop`, `imgfile`, `linuxaudiodev`, `mhlib`, `mimetools`, `multifile`, `new`, `pure`, `statvfs`, `sunaudiodev`, `test.testall`, and `toaiff`.

- The `gopherlib` module has been removed.
- The `MimeWriter` module and `mimify` module have been deprecated; use the `email` package instead.
- The `md5` module has been deprecated; use the `hashlib` module instead.

- The `posixfile` module has been deprecated; `fcntl.lockf()` provides better locking.
- The `popen2` module has been deprecated; use the `subprocess` module.
- The `rgbimg` module has been removed.
- The `sets` module has been deprecated; it's better to use the built-in `set` and `frozenset` types.
- The `sha` module has been deprecated; use the `hashlib` module instead.

## Build and C API Changes

Changes to Python's build process and to the C API include:

- Python now must be compiled with C89 compilers (after 19 years!). This means that the Python source tree has dropped its own implementations of `memmove()` and `strerror()`, which are in the C89 standard library.
- Python 2.6 can be built with Microsoft Visual Studio 2008 (version 9.0), and this is the new default compiler. See the `PCbuild` directory for the build files. (Implemented by Christian Heimes.)
- On Mac OS X, Python 2.6 can be compiled as a 4-way universal build. The `configure` script can take a `--with-universal-archs=[32-bit|64-bit|all]` switch, controlling whether the binaries are built for 32-bit architectures (x86, PowerPC), 64-bit (x86-64 and PPC-64), or both. (Contributed by Ronald Oussoren.)
- The BerkeleyDB module now has a C API object, available as `bsddb.db.api`. This object can be used by other C extensions that wish to use the `bsddb` module for their own purposes. (Contributed by Duncan Grisby.)
- The new buffer interface, previously described in [the PEP](#)

3118 section, adds `PyObject_GetBuffer()` and `PyBuffer_Release()`, as well as a few other functions.

- Python's use of the C stdio library is now thread-safe, or at least as thread-safe as the underlying library is. A long-standing potential bug occurred if one thread closed a file object while another thread was reading from or writing to the object. In 2.6 file objects have a reference count, manipulated by the `PyFile_IncUseCount()` and `PyFile_DecUseCount()` functions. File objects can't be closed unless the reference count is zero. `PyFile_IncUseCount()` should be called while the GIL is still held, before carrying out an I/O operation using the `FILE *` pointer, and `PyFile_DecUseCount()` should be called immediately after the GIL is re-acquired. (Contributed by Antoine Pitrou and Gregory P. Smith.)
- Importing modules simultaneously in two different threads no longer deadlocks; it will now raise an `ImportError`. A new API function, `PyImport_ImportModuleNoBlock()`, will look for a module in `sys.modules` first, then try to import it after acquiring an import lock. If the import lock is held by another thread, an `ImportError` is raised. (Contributed by Christian Heimes.)
- Several functions return information about the platform's floating-point support. `PyFloat_GetMax()` returns the maximum representable floating point value, and `PyFloat_GetMin()` returns the minimum positive value. `PyFloat_GetInfo()` returns an object containing more information from the `float.h` file, such as "mant\_dig" (number of digits in the mantissa), "epsilon" (smallest difference between 1.0 and the next largest value representable), and several others. (Contributed by Christian Heimes; [bpo-1534](https://bugs.python.org/issue?@action=redirect&bpo=1534) [https://bugs.python.org/issue?@action=redirect&bpo=1534].)
- C functions and methods that use `PyComplex_AsCComplex()` will now accept arguments that have a `__complex__()` method. In particular, the functions in the `cmath` module will now accept objects with this

method. This is a backport of a Python 3.0 change.

(Contributed by Mark Dickinson; [bpo-1675423](https://bugs.python.org/issue?@action=redirect&bpo=1675423) [https://bugs.python.org/issue?@action=redirect&bpo=1675423].)

- Python's C API now includes two functions for case-insensitive string comparisons, `PyOS_stricmp(char*, char*)` and `PyOS_strnicmp(char*, char*, Py_ssize_t)`. (Contributed by Christian Heimes; [bpo-1635](https://bugs.python.org/issue?@action=redirect&bpo=1635) [https://bugs.python.org/issue?@action=redirect&bpo=1635].)
- Many C extensions define their own little macro for adding integers and strings to the module's dictionary in the `init*` function. Python 2.6 finally defines standard macros for adding values to a module, `PyModule_AddStringMacro` and `PyModule_AddIntMacro()`. (Contributed by Christian Heimes.)
- Some macros were renamed in both 3.0 and 2.6 to make it clearer that they are macros, not functions. `Py_Size()` became `Py_SIZE()`, `Py_Type()` became `Py_TYPE()`, and `Py_Refcnt()` became `Py_REFCNT()`. The mixed-case macros are still available in Python 2.6 for backward compatibility. ([bpo-1629](https://bugs.python.org/issue?@action=redirect&bpo=1629) [https://bugs.python.org/issue?@action=redirect&bpo=1629])
- Distutils now places C extensions it builds in a different directory when running on a debug version of Python. (Contributed by Collin Winter; [bpo-1530959](https://bugs.python.org/issue?@action=redirect&bpo=1530959) [https://bugs.python.org/issue?@action=redirect&bpo=1530959].)
- Several basic data types, such as integers and strings, maintain internal free lists of objects that can be re-used. The data structures for these free lists now follow a naming convention: the variable is always named `free_list`, the counter is always named `numfree`, and a macro `Py<typename>_MAXFREELIST` is always defined.
- A new Makefile target, "make patchcheck", prepares the Python source tree for making a patch: it fixes trailing whitespace in all modified `.py` files, checks whether the documentation has been changed, and reports whether the

Misc/ACKS and Misc/NEWS files have been updated.  
(Contributed by Brett Cannon.)

Another new target, “make profile-opt”, compiles a Python binary using GCC’s profile-guided optimization. It compiles Python with profiling enabled, runs the test suite to obtain a set of profiling results, and then compiles using these results for optimization. (Contributed by Gregory P. Smith.)

## Port-Specific Changes: Windows

- The support for Windows 95, 98, ME and NT4 has been dropped. Python 2.6 requires at least Windows 2000 SP4.
- The new default compiler on Windows is Visual Studio 2008 (version 9.0). The build directories for Visual Studio 2003 (version 7.1) and 2005 (version 8.0) were moved into the PC/ directory. The new PCbuild directory supports cross compilation for X64, debug builds and Profile Guided Optimization (PGO). PGO builds are roughly 10% faster than normal builds. (Contributed by Christian Heimes with help from Amaury Forgeot d’Arc and Martin von Löwis.)
- The `msvcrt` module now supports both the normal and wide char variants of the console I/O API. The `getwch()` function reads a keypress and returns a Unicode value, as does the `getwche()` function. The `putwch()` function takes a Unicode character and writes it to the console. (Contributed by Christian Heimes.)
- `os.path.expandvars()` will now expand environment variables in the form “%var%”, and “~user” will be expanded into the user’s home directory path. (Contributed by Josiah Carlson; [bpo-957650](https://bugs.python.org/issue?@action=redirect&bpo=957650) [https://bugs.python.org/issue?@action=redirect&bpo=957650].)
- The `socket` module’s socket objects now have an `ioctl()` method that provides a limited interface to the `WSAIoctl()` system interface.
- The `_winreg` module now has a function,

**ExpandEnvironmentStrings()**, that expands environment variable references such as `%NAME%` in an input string. The handle objects provided by this module now support the context protocol, so they can be used in **with** statements. (Contributed by Christian Heimes.)

**\_winreg** also has better support for x64 systems, exposing the **DisableReflectionKey()**, **EnableReflectionKey()**, and **QueryReflectionKey()** functions, which enable and disable registry reflection for 32-bit processes running on 64-bit systems. ([bpo-1753245](https://bugs.python.org/issue?@action=redirect&bpo=1753245) [<https://bugs.python.org/issue?@action=redirect&bpo=1753245>])

- The **msilib** module's **Record** object gained **GetInteger()** and **GetString()** methods that return field values as an integer or a string. (Contributed by Floris Bruynooghe; [bpo-2125](https://bugs.python.org/issue?@action=redirect&bpo=2125) [<https://bugs.python.org/issue?@action=redirect&bpo=2125>].)

## Port-Specific Changes: Mac OS X

- When compiling a framework build of Python, you can now specify the framework name to be used by providing the **--with-framework-name=** option to the **configure** script.
- The **macfs** module has been removed. This in turn required the **macostools.touched()** function to be removed because it depended on the **macfs** module. ([bpo-1490190](https://bugs.python.org/issue?@action=redirect&bpo=1490190) [<https://bugs.python.org/issue?@action=redirect&bpo=1490190>])
- Many other Mac OS modules have been deprecated and will be removed in Python 3.0: **\_builtinSuites**, **aepack**, **aetools**, **aetypes**, **applesingle**, **appletrawmain**, **appletrunner**, **argvemulator**, **Audio\_mac**, **autoGIL**, **Carbon**, **cfmfile**, **CodeWarrior**, **ColorPicker**, **EasyDialogs**, **Explorer**, **Finder**, **FrameWork**, **findertools**, **ic**, **icglue**, **icopen**, **macerrors**, **MacOS**, **macfs**, **macostools**, **macresource**, **MiniAEFrame**, **Nav**, **Netscape**, **OSATerminology**, **pimp**, **PixmapWrapper**, **StdSuites**, **SystemEvents**, **Terminal**, and **terminalcommand**.

## Port-Specific Changes: IRIX

A number of old IRIX-specific modules were deprecated and will be removed in Python 3.0: **al** and **AL**, **cd**, **cddb**, **cdplayer**, **CL** and **cl**, **DEVICE**, **ERRNO**, **FILE**, **FL** and **fl**, **flp**, **fm**, **GET**, **GLWS**, **GL** and **gl**, **IN**, **IOCTL**, **jpeg**, **panelparser**, **readcd**, **SV** and **sv**, **torgb**, **videoreader**, and **WAIT**.

## Porting to Python 2.6

This section lists previously described changes and other bugfixes that may require changes to your code:

- Classes that aren't supposed to be hashable should set `__hash__ = None` in their definitions to indicate the fact.
- String exceptions have been removed. Attempting to use them raises a **TypeError**.
- The `__init__()` method of `collections.deque` now clears any existing contents of the deque before adding elements from the iterable. This change makes the behavior match `list.__init__()`.
- `object.__init__()` previously accepted arbitrary arguments and keyword arguments, ignoring them. In Python 2.6, this is no longer allowed and will result in a **TypeError**. This will affect `__init__()` methods that end up calling the corresponding method on `object` (perhaps through using `super()`). See [bpo-1683368](https://bugs.python.org/issue?@action=redirect&bpo=1683368) [https://bugs.python.org/issue?@action=redirect&bpo=1683368] for discussion.
- The **Decimal** constructor now accepts leading and trailing whitespace when passed a string. Previously it would raise an **InvalidOperation** exception. On the other hand, the `create_decimal()` method of **Context** objects now explicitly disallows extra whitespace, raising a **ConversionSyntax** exception.
- Due to an implementation accident, if you passed a file path

to the built-in `__import__()` function, it would actually import the specified file. This was never intended to work, however, and the implementation now explicitly checks for this case and raises an `ImportError`.

- C API: the `PyImport_Import()` and `PyImport_ImportModule()` functions now default to absolute imports, not relative imports. This will affect C extensions that import other modules.
- C API: extension data types that shouldn't be hashable should define their `tp_hash` slot to `PyObject_HashNotImplemented()`.
- The `socket` module exception `socket.error` now inherits from `IOError`. Previously it wasn't a subclass of `StandardError` but now it is, through `IOError`. (Implemented by Gregory P. Smith; [bpo-1706815](https://bugs.python.org/issue?@action=redirect&bpo=1706815) [<https://bugs.python.org/issue?@action=redirect&bpo=1706815>].)
- The `xmlrpclib` module no longer automatically converts `datetime.date` and `datetime.time` to the `xmlrpclib.DateTime` type; the conversion semantics were not necessarily correct for all applications. Code using `xmlrpclib` should convert `date` and `time` instances. ([bpo-1330538](https://bugs.python.org/issue?@action=redirect&bpo=1330538) [<https://bugs.python.org/issue?@action=redirect&bpo=1330538>])
- (3.0-warning mode) The `Exception` class now warns when accessed using slicing or index access; having `Exception` behave like a tuple is being phased out.
- (3.0-warning mode) inequality comparisons between two dictionaries or two objects that don't implement comparison methods are reported as warnings. `dict1 == dict2` still works, but `dict1 < dict2` is being phased out.

Comparisons between cells, which are an implementation detail of Python's scoping rules, also cause warnings because such comparisons are forbidden entirely in 3.0.

# What's New in Python 2.5

## Author

A.M. Kuchling

This article explains the new features in Python 2.5. The final release of Python 2.5 is scheduled for August 2006; [PEP 356](https://peps.python.org/pep-0356/) [https://peps.python.org/pep-0356/] describes the planned release schedule. Python 2.5 was released on September 19, 2006.

The changes in Python 2.5 are an interesting mix of language and library improvements. The library enhancements will be more important to Python's user community, I think, because several widely useful packages were added. New modules include ElementTree for XML processing (`xml.etree`), the SQLite database module (`sqlite`), and the `ctypes` module for calling C functions.

The language changes are of middling significance. Some pleasant new features were added, but most of them aren't features that you'll use every day. Conditional expressions were finally added to the language using a novel syntax; see section [PEP 308: Conditional Expressions](#). The new `'with'` statement will make writing cleanup code easier (section [PEP 343: The 'with' statement](#)). Values can now be passed into generators (section [PEP 342: New Generator Features](#)). Imports are now visible as either absolute or relative (section [PEP 328: Absolute and Relative Imports](#)). Some corner cases of exception handling are handled better (section [PEP 341: Unified try/except/finally](#)). All these improvements are worthwhile, but they're improvements to one specific language feature or another; none of them are broad modifications to Python's semantics.

As well as the language and library additions, other improvements and bugfixes were made throughout the source tree. A search through the SVN change logs finds there were 353 patches applied and 458 bugs fixed between Python 2.4 and 2.5. (Both figures are

likely to be underestimates.)

This article doesn't try to be a complete specification of the new features; instead changes are briefly introduced using helpful examples. For full details, you should always refer to the documentation for Python 2.5 at <https://docs.python.org>. If you want to understand the complete implementation and design rationale, refer to the PEP for a particular new feature.

Comments, suggestions, and error reports for this document are welcome; please e-mail them to the author or open a bug in the Python bug tracker.

## PEP 308: Conditional Expressions

For a long time, people have been requesting a way to write conditional expressions, which are expressions that return value A or value B depending on whether a Boolean value is true or false. A conditional expression lets you write a single assignment statement that has the same effect as the following:

```
if condition:
    x = true_value
else:
    x = false_value
```

There have been endless tedious discussions of syntax on both python-dev and comp.lang.python. A vote was even held that found the majority of voters wanted conditional expressions in some form, but there was no syntax that was preferred by a clear majority. Candidates included C's `cond ? true_v : false_v`, `if cond then true_v else false_v`, and 16 other variations.

Guido van Rossum eventually chose a surprising syntax:

```
x = true_value if condition else false_value
```

Evaluation is still lazy as in existing Boolean expressions, so the order of evaluation jumps around a bit. The *condition* expression in the middle is evaluated first, and the *true\_value* expression is

evaluated only if the condition was true. Similarly, the *false\_value* expression is only evaluated when the condition is false.

This syntax may seem strange and backwards; why does the condition go in the *middle* of the expression, and not in the front as in C's `c ? x : y`? The decision was checked by applying the new syntax to the modules in the standard library and seeing how the resulting code read. In many cases where a conditional expression is used, one value seems to be the 'common case' and one value is an 'exceptional case', used only on rarer occasions when the condition isn't met. The conditional syntax makes this pattern a bit more obvious:

```
contents = ((doc + '\n') if doc else '')
```

I read the above statement as meaning "here *contents* is usually assigned a value of `doc+'\n'`; sometimes *doc* is empty, in which special case an empty string is returned." I doubt I will use conditional expressions very often where there isn't a clear common and uncommon case.

There was some discussion of whether the language should require surrounding conditional expressions with parentheses. The decision was made to *not* require parentheses in the Python language's grammar, but as a matter of style I think you should always use them. Consider these two statements:

```
# First version -- no parens
level = 1 if logging else 0
```

```
# Second version -- with parens
level = (1 if logging else 0)
```

In the first version, I think a reader's eye might group the statement into 'level = 1', 'if logging', 'else 0', and think that the condition decides whether the assignment to *level* is performed. The second version reads better, in my opinion, because it makes it clear that the assignment is always performed and the choice is being made between two values.

Another reason for including the brackets: a few odd combinations

of list comprehensions and lambdas could look like incorrect conditional expressions. See [PEP 308](https://peps.python.org/pep-0308/) [https://peps.python.org/pep-0308/] for some examples. If you put parentheses around your conditional expressions, you won't run into this case.

[PEP 308](https://peps.python.org/pep-0308/) [https://peps.python.org/pep-0308/] - Conditional Expressions

PEP written by Guido van Rossum and Raymond D. Hettinger; implemented by Thomas Wouters.

## PEP 309: Partial Function Application

The `functools` module is intended to contain tools for functional-style programming.

One useful tool in this module is the `partial()` function. For programs written in a functional style, you'll sometimes want to construct variants of existing functions that have some of the parameters filled in. Consider a Python function `f(a, b, c)`; you could create a new function `g(b, c)` that was equivalent to `f(1, b, c)`. This is called “partial function application”.

`partial()` takes the arguments (function, `arg1`, `arg2`, ... `kwarg1=value1`, `kwarg2=value2`). The resulting object is callable, so you can just call it to invoke *function* with the filled-in arguments.

Here's a small but realistic example:

```
import functools
```

```
def log (message, subsystem):  
    "Write the contents of 'message' to the specified sub-  
    print '%s: %s' % (subsystem, message)  
    ...
```

```
server_log = functools.partial(log, subsystem='server')
```

```
server_log('Unable to open socket')
```

Here's another example, from a program that uses PyGTK. Here a context-sensitive pop-up menu is being constructed dynamically. The callback provided for the menu option is a partially applied version of the `open_item()` method, where the first argument has been provided.

```
...
class Application:
    def open_item(self, path):
        ...
    def init (self):
        open_func = functools.partial(self.open_item, it
        popup_menu.append( ("Open", open_func, 1) )
```

Another function in the `functools` module is the `update_wrapper(wrapper, wrapped)` function that helps you write well-behaved decorators. `update_wrapper()` copies the name, module, and docstring attribute to a wrapper function so that tracebacks inside the wrapped function are easier to understand. For example, you might write:

```
def my_decorator(f):
    def wrapper(*args, **kwds):
        print 'Calling decorated function'
        return f(*args, **kwds)
    functools.update_wrapper(wrapper, f)
    return wrapper
```

**`wraps()`** is a decorator that can be used inside your own decorators to copy the wrapped function's information. An alternate version of the previous example would be:

```
def my_decorator(f):
    @functools.wraps(f)
    def wrapper(*args, **kwds):
        print 'Calling decorated function'
        return f(*args, **kwds)
    return wrapper
```

**PEP 309** [<https://peps.python.org/pep-0309/>] - **Partial Function Application**

PEP proposed and written by Peter Harris; implemented by Hye-Shik Chang and Nick Coghlan, with adaptations by Raymond Hettinger.

## PEP 314: Metadata for Python Software Packages v1.1

Some simple dependency support was added to Distutils. The **setup()** function now has `requires`, `provides`, and `obsoletes` keyword parameters. When you build a source distribution using the `sdist` command, the dependency information will be recorded in the `PKG-INFO` file.

Another new keyword parameter is `download_url`, which should be set to a URL for the package's source code. This means it's now possible to look up an entry in the package index, determine the dependencies for a package, and download the required packages.

```
VERSION = '1.0'
setup(name='PyPackage',
      version=VERSION,
      requires=['numpy', 'zlib (>=1.1.4)'],
      obsoletes=['OldPackage']
      download_url=('http://www.example.com/pypackage/di
                    % VERSION'),
      )
```

Another new enhancement to the Python package index at <https://pypi.org> is storing source and binary archives for a package. The new **upload** Distutils command will upload a package to the repository.

Before a package can be uploaded, you must be able to build a distribution using the **sdist** Distutils command. Once that works,

you can run `python setup.py upload` to add your package to the PyPI archive. Optionally you can GPG-sign the package by supplying the `--sign` and `--identity` options.

Package uploading was implemented by Martin von Löwis and Richard Jones.

**PEP 314** [<https://peps.python.org/pep-0314/>] - Metadata for Python Software Packages v1.1

PEP proposed and written by A.M. Kuchling, Richard Jones, and Fred Drake; implemented by Richard Jones and Fred Drake.

## PEP 328: Absolute and Relative Imports

The simpler part of **PEP 328** [<https://peps.python.org/pep-0328/>] was implemented in Python 2.4: parentheses could now be used to enclose the names imported from a module using the `from ... import ...` statement, making it easier to import many different names.

The more complicated part has been implemented in Python 2.5: importing a module can be specified to use absolute or package-relative imports. The plan is to move toward making absolute imports the default in future versions of Python.

Let's say you have a package directory like this:

```
pkg/  
pkg/__init__.py  
pkg/main.py  
pkg/string.py
```

This defines a package named **pkg** containing the **pkg.main** and **pkg.string** submodules.

Consider the code in the `main.py` module. What happens if it

executes the statement `import string`? In Python 2.4 and earlier, it will first look in the package's directory to perform a relative import, finds `pkg/string.py`, imports the contents of that file as the `pkg.string` module, and that module is bound to the name `string` in the `pkg.main` module's namespace.

That's fine if `pkg.string` was what you wanted. But what if you wanted Python's standard `string` module? There's no clean way to ignore `pkg.string` and look for the standard module; generally you had to look at the contents of `sys.modules`, which is slightly unclean. Holger Krekel's `py.std` package provides a tidier way to perform imports from the standard library, `import py; py.std.string.join()`, but that package isn't available on all Python installations.

Reading code which relies on relative imports is also less clear, because a reader may be confused about which module, `string` or `pkg.string`, is intended to be used. Python users soon learned not to duplicate the names of standard library modules in the names of their packages' submodules, but you can't protect against having your submodule's name being used for a new module added in a future version of Python.

In Python 2.5, you can switch `import`'s behaviour to absolute imports using a `from __future__ import absolute_import` directive. This absolute-import behaviour will become the default in a future version (probably Python 2.7). Once absolute imports are the default, `import string` will always find the standard library's version. It's suggested that users should begin using absolute imports as much as possible, so it's preferable to begin writing `from pkg import string` in your code.

Relative imports are still possible by adding a leading period to the module name when using the `from ... import` form:

```
# Import names from pkg.string
from .string import name1, name2
# Import pkg.string
from . import string
```

This imports the `string` module relative to the current package,

so in `pkg.main` this will import `name1` and `name2` from `pkg.string`. Additional leading periods perform the relative import starting from the parent of the current package. For example, code in the `A.B.C` module can do:

```
from . import D                # Imports A.B.D
from .. import E              # Imports A.E
from ..F import G             # Imports A.F.G
```

Leading periods cannot be used with the `import modname` form of the import statement, only the `from ... import` form.

PEP written by Aahz; implemented by Thomas Wouters.

<https://pylib.readthedocs.io/>

The `py` library by Holger Krekel, which contains the `py.std` package.

## PEP 338: Executing Modules as Scripts

The `-m` switch added in Python 2.4 to execute a module as a script gained a few more abilities. Instead of being implemented in C code inside the Python interpreter, the switch now uses an implementation in a new module, `runpy`.

The `runpy` module implements a more sophisticated import mechanism so that it's now possible to run modules in a package such as `pychecker.checker`. The module also supports alternative import mechanisms such as the `zipimport` module. This means you can add a .zip archive's path to `sys.path` and then use the `-m` switch to execute code from the archive.

**PEP 338** [<https://peps.python.org/pep-0338/>] - Executing modules

as scripts

PEP written and implemented by Nick Coghlan.

## PEP 341: Unified try/except/finally

Until Python 2.5, the **try** statement came in two flavours. You could use a **finally** block to ensure that code is always executed, or one or more **except** blocks to catch specific exceptions. You couldn't combine both **except** blocks and a **finally** block, because generating the right bytecode for the combined version was complicated and it wasn't clear what the semantics of the combined statement should be.

Guido van Rossum spent some time working with Java, which does support the equivalent of combining **except** blocks and a **finally** block, and this clarified what the statement should mean. In Python 2.5, you can now write:

```
try:
    block-1 ...
except Exception1:
    handler-1 ...
except Exception2:
    handler-2 ...
else:
    else-block
finally:
    final-block
```

The code in *block-1* is executed. If the code raises an exception, the various **except** blocks are tested: if the exception is of class **Exception1**, *handler-1* is executed; otherwise if it's of class **Exception2**, *handler-2* is executed, and so forth. If no exception is raised, the *else-block* is executed.

No matter what happened previously, the *final-block* is executed once the code block is complete and any raised exceptions handled. Even if there's an error in an exception handler or the *else-block* and a new exception is raised, the code in the *final-block* is still run.

## PEP 342: New Generator Features

Python 2.5 adds a simple way to pass values *into* a generator. As introduced in Python 2.3, generators only produce output; once a generator's code was invoked to create an iterator, there was no way to pass any new information into the function when its execution is resumed. Sometimes the ability to pass in some information would be useful. Hackish solutions to this include making the generator's code look at a global variable and then changing the global variable's value, or passing in some mutable object that callers then modify.

To refresh your memory of basic generators, here's a simple example:

```
def counter (maximum):  
    i = 0  
    while i < maximum:  
        yield i  
        i += 1
```

When you call `counter(10)`, the result is an iterator that returns the values from 0 up to 9. On encountering the **yield** statement, the iterator returns the provided value and suspends the function's execution, preserving the local variables. Execution resumes on the following call to the iterator's **next()** method, picking up after the **yield** statement.

In Python 2.3, **yield** was a statement; it didn't return any value. In 2.5, **yield** is now an expression, returning a value that can be assigned to a variable or otherwise operated on:

```
val = (yield i)
```

I recommend that you always put parentheses around a **yield** expression when you're doing something with the returned value, as in the above example. The parentheses aren't always necessary, but it's easier to always add them instead of having to remember when they're needed.

(**PEP 342** [<https://peps.python.org/pep-0342/>] explains the exact rules, which are that a **yield**-expression must always be parenthesized except when it occurs at the top-level expression on the right-hand side of an assignment. This means you can write `val = yield i` but have to use parentheses when there's an operation, as in `val = (yield i) + 12.`)

Values are sent into a generator by calling its `send(value)` method. The generator's code is then resumed and the **yield** expression returns the specified *value*. If the regular `next()` method is called, the **yield** returns **None**.

Here's the previous example, modified to allow changing the value of the internal counter.

```
def counter (maximum):
    i = 0
    while i < maximum:
        val = (yield i)
        # If value provided, change counter
        if val is not None:
            i = val
        else:
            i += 1
```

And here's an example of changing the counter:

```
>>> it = counter(10)
>>> print it.next()
0
>>> print it.next()
1
```

```
>>> print it.send(8)
8
>>> print it.next()
9
>>> print it.next()
Traceback (most recent call last):
  File "t.py", line 15, in ?
    print it.next()
StopIteration
```

**yield** will usually return **None**, so you should always check for this case. Don't just use its value in expressions unless you're sure that the **send()** method will be the only method used to resume your generator function.

In addition to **send()**, there are two other new methods on generators:

- **throw(type, value=None, traceback=None)** is used to raise an exception inside the generator; the exception is raised by the **yield** expression where the generator's execution is paused.
- **close()** raises a new **GeneratorExit** exception inside the generator to terminate the iteration. On receiving this exception, the generator's code must either raise **GeneratorExit** or **StopIteration**. Catching the **GeneratorExit** exception and returning a value is illegal and will trigger a **RuntimeError**; if the function raises some other exception, that exception is propagated to the caller. **close()** will also be called by Python's garbage collector when the generator is garbage-collected.

If you need to run cleanup code when a **GeneratorExit** occurs, I suggest using a **try: ... finally: suite** instead of catching **GeneratorExit**.

The cumulative effect of these changes is to turn generators from one-way producers of information into both producers and consumers.

Generators also become *coroutines*, a more generalized form of subroutines. Subroutines are entered at one point and exited at another point (the top of the function, and a `return` statement), but coroutines can be entered, exited, and resumed at many different points (the `yield` statements). We'll have to figure out patterns for using coroutines effectively in Python.

The addition of the `close()` method has one side effect that isn't obvious. `close()` is called when a generator is garbage-collected, so this means the generator's code gets one last chance to run before the generator is destroyed. This last chance means that `try...finally` statements in generators can now be guaranteed to work; the `finally` clause will now always get a chance to run. The syntactic restriction that you couldn't mix `yield` statements with a `try...finally` suite has therefore been removed. This seems like a minor bit of language trivia, but using generators and `try...finally` is actually necessary in order to implement the `with` statement described by [PEP 343](https://peps.python.org/pep-0343/) [https://peps.python.org/pep-0343/]. I'll look at this new statement in the following section.

Another even more esoteric effect of this change: previously, the `gi_frame` attribute of a generator was always a frame object. It's now possible for `gi_frame` to be `None` once the generator has been exhausted.

## PEP 343: The ‘with’ statement

The ‘**with**’ statement clarifies code that previously would use `try...finally` blocks to ensure that clean-up code is executed. In this section, I’ll discuss the statement as it will commonly be used. In the next section, I’ll examine the implementation details and show how to write objects for use with this statement.

The ‘**with**’ statement is a new control-flow structure whose basic structure is:

```
with expression [as variable]:  
    with-block
```

The expression is evaluated, and it should result in an object that supports the context management protocol (that is, has `__enter__()` and `__exit__()` methods.

The object’s `__enter__()` is called before *with-block* is executed and therefore can run set-up code. It also may return a value that is bound to the name *variable*, if given. (Note carefully that *variable* is *not* assigned the result of *expression*.)

After execution of the *with-block* is finished, the object’s `__exit__()` method is called, even if the block raised an exception, and can therefore run clean-up code.

To enable the statement in Python 2.5, you need to add the following directive to your module:

```
from __future__ import with_statement
```

The statement will always be enabled in Python 2.6.

Some standard Python objects now support the context

management protocol and can be used with the ‘**with**’ statement. File objects are one example:

```
with open('/etc/passwd', 'r') as f:
    for line in f:
        print line
    ... more processing code ...
```

After this statement has executed, the file object in *f* will have been automatically closed, even if the **for** loop raised an exception part-way through the block.

### Note

In this case, *f* is the same object created by **open()**, because **file.\_\_enter\_\_()** returns *self*.

The **threading** module’s locks and condition variables also support the ‘**with**’ statement:

```
lock = threading.Lock()
with lock:
    # Critical section of code
    ...
```

The lock is acquired before the block is executed and always released once the block is complete.

The new **localcontext()** function in the **decimal** module makes it easy to save and restore the current decimal context, which encapsulates the desired precision and rounding characteristics for computations:

```
from decimal import Decimal, Context, localcontext

# Displays with default precision of 28 digits
v = Decimal('578')
print v.sqrt()

with localcontext(Context(prec=16)):
```

```
# All code in this block uses a precision of 16 digits
# The original context is restored on exiting the block
print v.sqrt()
```

## Writing Context Managers

Under the hood, the `with` statement is fairly complicated. Most people will only use `with` in company with existing objects and don't need to know these details, so you can skip the rest of this section if you like. Authors of new objects will need to understand the details of the underlying implementation and should keep reading.

A high-level explanation of the context management protocol is:

- The expression is evaluated and should result in an object called a “context manager”. The context manager must have `__enter__()` and `__exit__()` methods.
- The context manager's `__enter__()` method is called. The value returned is assigned to `VAR`. If no `'as VAR'` clause is present, the value is simply discarded.
- The code in *BLOCK* is executed.
- If *BLOCK* raises an exception, the `__exit__(type, value, traceback)` is called with the exception details, the same values returned by `sys.exc_info()`. The method's return value controls whether the exception is re-raised: any false value re-raises the exception, and `True` will result in suppressing it. You'll only rarely want to suppress the exception, because if you do the author of the code containing the `with` statement will never realize anything went wrong.
- If *BLOCK* didn't raise an exception, the `__exit__()` method is still called, but `type`, `value`, and `traceback` are all `None`.

Let's think through an example. I won't present detailed code but will only sketch the methods necessary for a database that supports transactions.

(For people unfamiliar with database terminology: a set of changes to the database are grouped into a transaction. Transactions can be

either committed, meaning that all the changes are written into the database, or rolled back, meaning that the changes are all discarded and the database is unchanged. See any database textbook for more information.)

Let's assume there's an object representing a database connection. Our goal will be to let the user write code like this:

```
db_connection = DatabaseConnection()
with db_connection as cursor:
    cursor.execute('insert into ...')
    cursor.execute('delete from ...')
    # ... more operations ...
```

The transaction should be committed if the code in the block runs flawlessly or rolled back if there's an exception. Here's the basic interface for **DatabaseConnection** that I'll assume:

```
class DatabaseConnection:
    # Database interface
    def cursor (self):
        "Returns a cursor object and starts a new transaction"
    def commit (self):
        "Commits current transaction"
    def rollback (self):
        "Rolls back current transaction"
```

The **`__enter__()`** method is pretty easy, having only to start a new transaction. For this application the resulting cursor object would be a useful result, so the method will return it. The user can then add `as cursor` to their '**`with`**' statement to bind the cursor to a variable name.

```
class DatabaseConnection:
    ...
    def __enter__ (self):
        # Code to start a new transaction
        cursor = self.cursor()
        return cursor
```

The `__exit__()` method is the most complicated because it's where most of the work has to be done. The method has to check if an exception occurred. If there was no exception, the transaction is committed. The transaction is rolled back if there was an exception.

In the code below, execution will just fall off the end of the function, returning the default value of `None`. `None` is false, so the exception will be re-raised automatically. If you wished, you could be more explicit and add a `return` statement at the marked location.

```
class DatabaseConnection:
    ...
    def __exit__(self, type, value, tb):
        if tb is None:
            # No exception, so commit
            self.commit()
        else:
            # Exception occurred, so rollback.
            self.rollback()
            # return False
```

## The contextlib module

The new `contextlib` module provides some functions and a decorator that are useful for writing objects for use with the `'with'` statement.

The decorator is called `contextmanager()`, and lets you write a single generator function instead of defining a new class. The generator should yield exactly one value. The code up to the `yield` will be executed as the `__enter__()` method, and the value yielded will be the method's return value that will get bound to the variable in the `'with'` statement's `as` clause, if any. The code after the `yield` will be executed in the `__exit__()` method. Any exception raised in the block will be raised by the `yield` statement.

Our database example from the previous section could be written using this decorator as:

```
from contextlib import contextmanager
```

```
@contextmanager
```

```
def db_transaction (connection):  
    cursor = connection.cursor()  
    try:  
        yield cursor  
    except:  
        connection.rollback()  
        raise  
    else:  
        connection.commit()
```

```
db = DatabaseConnection()  
with db_transaction(db) as cursor:  
    ...
```

The `contextlib` module also has a `nested(mgr1, mgr2, ...)` function that combines a number of context managers so you don't need to write nested `'with'` statements. In this example, the single `'with'` statement both starts a database transaction and acquires a thread lock:

```
lock = threading.Lock()  
with nested (db_transaction(db), lock) as (cursor, locke  
    ...
```

Finally, the `closing(object)` function returns *object* so that it can be bound to a variable, and calls `object.close` at the end of the block.

```
import urllib, sys  
from contextlib import closing
```

```
with closing(urllib.urlopen('http://www.yahoo.com')) as  
    for line in f:  
        sys.stdout.write(line)
```

## PEP 343 [<https://peps.python.org/pep-0343/>] - The “with” statement

PEP written by Guido van Rossum and Nick Coghlan; implemented by Mike Bland, Guido van Rossum, and Neal Norwitz. The PEP shows the code generated for a ‘**with**’ statement, which can be helpful in learning how the statement works.

The documentation for the `contextlib` module.

## PEP 352: Exceptions as New-Style Classes

Exception classes can now be new-style classes, not just classic classes, and the built-in `Exception` class and all the standard built-in exceptions (`NameError`, `ValueError`, etc.) are now new-style classes.

The inheritance hierarchy for exceptions has been rearranged a bit. In 2.5, the inheritance relationships are:

```
BaseException          # New in Python 2.5
|- KeyboardInterrupt
|- SystemExit
|- Exception
  |- (all other current built-in exceptions)
```

This rearrangement was done because people often want to catch all exceptions that indicate program errors. `KeyboardInterrupt` and `SystemExit` aren’t errors, though, and usually represent an explicit action such as the user hitting Control-C or code calling `sys.exit()`. A bare `except:` will catch all exceptions, so you commonly need to list `KeyboardInterrupt` and `SystemExit` in order to re-raise them. The usual pattern is:

```
try:
    ...
except (KeyboardInterrupt, SystemExit):
    raise
except:
```

```
# Log error...
# Continue running program...
```

In Python 2.5, you can now write `except Exception` to achieve the same result, catching all the exceptions that usually indicate errors but leaving `KeyboardInterrupt` and `SystemExit` alone. As in previous versions, a bare `except:` still catches all exceptions.

The goal for Python 3.0 is to require any class raised as an exception to derive from `BaseException` or some descendant of `BaseException`, and future releases in the Python 2.x series may begin to enforce this constraint. Therefore, I suggest you begin making all your exception classes derive from `Exception` now. It's been suggested that the bare `except:` form should be removed in Python 3.0, but Guido van Rossum hasn't decided whether to do this or not.

Raising of strings as exceptions, as in the statement `raise "Error occurred"`, is deprecated in Python 2.5 and will trigger a warning. The aim is to be able to remove the string-exception feature in a few releases.

PEP written by Brett Cannon and Guido van Rossum; implemented by Brett Cannon.

## PEP 353: Using `ssize_t` as the index type

A wide-ranging change to Python's C API, using a new `Py_ssize_t` type definition instead of `int`, will permit the interpreter to handle more data on 64-bit platforms. This change doesn't affect Python's capacity on 32-bit platforms.

Various pieces of the Python interpreter used C's `int` type to store sizes or counts; for example, the number of items in a list or tuple

were stored in an int. The C compilers for most 64-bit platforms still define int as a 32-bit type, so that meant that lists could only hold up to  $2^{31} - 1 = 2147483647$  items. (There are actually a few different programming models that 64-bit C compilers can use – see [https://unix.org/version2/whatsnew/lp64\\_wp.html](https://unix.org/version2/whatsnew/lp64_wp.html) for a discussion – but the most commonly available model leaves int as 32 bits.)

A limit of 2147483647 items doesn't really matter on a 32-bit platform because you'll run out of memory before hitting the length limit. Each list item requires space for a pointer, which is 4 bytes, plus space for a `PyObject` representing the item.  $2147483647 * 4$  is already more bytes than a 32-bit address space can contain.

It's possible to address that much memory on a 64-bit platform, however. The pointers for a list that size would only require 16 GiB of space, so it's not unreasonable that Python programmers might construct lists that large. Therefore, the Python interpreter had to be changed to use some type other than int, and this will be a 64-bit type on 64-bit platforms. The change will cause incompatibilities on 64-bit machines, so it was deemed worth making the transition now, while the number of 64-bit users is still relatively small. (In 5 or 10 years, we may *all* be on 64-bit machines, and the transition would be more painful then.)

This change most strongly affects authors of C extension modules. Python strings and container types such as lists and tuples now use `Py_ssize_t` to store their size. Functions such as `PyList_Size()` now return `Py_ssize_t`. Code in extension modules may therefore need to have some variables changed to `Py_ssize_t`.

The `PyArg_ParseTuple()` and `Py_BuildValue()` functions have a new conversion code, `n`, for `Py_ssize_t`. `PyArg_ParseTuple()`'s `s#` and `t#` still output int by default, but you can define the macro `PY_SSIZE_T_CLEAN` before including `Python.h` to make them return `Py_ssize_t`.

**PEP 353** [<https://peps.python.org/pep-0353/>] has a section on conversion guidelines that extension authors should read to learn about supporting 64-bit platforms.

See also

**PEP 353** [<https://peps.python.org/pep-0353/>] - Using `ssize_t` as the index type

PEP written and implemented by Martin von Löwis.

## PEP 357: The ‘`__index__`’ method

The NumPy developers had a problem that could only be solved by adding a new special method, `__index__()`. When using slice notation, as in `[start:stop:step]`, the values of the *start*, *stop*, and *step* indexes must all be either integers or long integers. NumPy defines a variety of specialized integer types corresponding to unsigned and signed integers of 8, 16, 32, and 64 bits, but there was no way to signal that these types could be used as slice indexes.

Slicing can’t just use the existing `__int__()` method because that method is also used to implement coercion to integers. If slicing used `__int__()`, floating-point numbers would also become legal slice indexes and that’s clearly an undesirable behaviour.

Instead, a new special method called `__index__()` was added. It takes no arguments and returns an integer giving the slice index to use. For example:

```
class C:
    def __index__(self):
        return self.value
```

The return value must be either a Python integer or long integer. The interpreter will check that the type returned is correct, and raises a **`TypeError`** if this requirement isn’t met.

A corresponding `nb_index` slot was added to the C-level **`PyNumberMethods`** structure to let C extensions implement this protocol. `PyNumber_Index(obj)` can be used in extension code to call the `__index__()` function and retrieve its result.

## PEP 357 [<https://peps.python.org/pep-0357/>] - Allowing Any Object to be Used for Slicing

PEP written and implemented by Travis Oliphant.

## Other Language Changes

Here are all of the changes that Python 2.5 makes to the core Python language.

- The **dict** type has a new hook for letting subclasses provide a default value when a key isn't contained in the dictionary. When a key isn't found, the dictionary's `__missing__(key)` method will be called. This hook is used to implement the new **defaultdict** class in the **collections** module. The following example defines a dictionary that returns zero for any missing key:

```
class zerodict (dict):  
    def __missing__ (self, key):  
        return 0
```

```
d = zerodict({1:1, 2:2})  
print d[1], d[2]      # Prints 1, 2  
print d[3], d[4]      # Prints 0, 0
```

- Both 8-bit and Unicode strings have new `partition(sep)` and `rpartition(sep)` methods that simplify a common use case.

The `find(S)` method is often used to get an index which is then used to slice the string and obtain the pieces that are before and after the separator. `partition(sep)` condenses this pattern into a single method call that returns a 3-tuple containing the substring before the separator, the separator itself, and the substring after the separator. If the separator isn't found, the first element of the tuple is the entire string and the other two elements are empty. `rpartition(sep)` also returns a 3-tuple but starts searching from the end of the string; the `r` stands for 'reverse'.

Some examples:

```
>>> ('http://www.python.org').partition('/://')
('http', '://', 'www.python.org')
>>> ('file:/usr/share/doc/index.html').partition(':')
('file:/usr/share/doc/index.html', '', '')
>>> (u'Subject: a quick question').partition(':')
(u'Subject', u':', u' a quick question')
>>> 'www.python.org'.rpartition('.')
('www.python', '.', 'org')
>>> 'www.python.org'.rpartition(':')
('', '', 'www.python.org')
```

(Implemented by Fredrik Lundh following a suggestion by Raymond Hettinger.)

- The **startswith()** and **endswith()** methods of string types now accept tuples of strings to check for.

```
def is_image_file (filename):
    return filename.endswith(('.gif', '.jpg', '.tif
```

(Implemented by Georg Brandl following a suggestion by Tom Lynn.)

- The **min()** and **max()** built-in functions gained a **key** keyword parameter analogous to the **key** argument for **sort()**. This parameter supplies a function that takes a single argument and is called for every value in the list; **min()/max()** will return the element with the smallest/largest return value from this function. For example, to find the longest string in a list, you can do:

```
L = ['medium', 'longest', 'short']
# Prints 'longest'
print max(L, key=len)
# Prints 'short', because lexicographically 'short'
print max(L)
```

(Contributed by Steven Bethard and Raymond Hettinger.)

- Two new built-in functions, `any()` and `all()`, evaluate whether an iterator contains any true or false values. `any()` returns `True` if any value returned by the iterator is true; otherwise it will return `False`. `all()` returns `True` only if all of the values returned by the iterator evaluate as true. (Suggested by Guido van Rossum, and implemented by Raymond Hettinger.)
- The result of a class's `__hash__()` method can now be either a long integer or a regular integer. If a long integer is returned, the hash of that value is taken. In earlier versions the hash value was required to be a regular integer, but in 2.5 the `id()` built-in was changed to always return non-negative numbers, and users often seem to use `id(self)` in `__hash__()` methods (though this is discouraged).
- ASCII is now the default encoding for modules. It's now a syntax error if a module contains string literals with 8-bit characters but doesn't have an encoding declaration. In Python 2.4 this triggered a warning, not a syntax error. See [PEP 263](https://peps.python.org/pep-0263/) [https://peps.python.org/pep-0263/] for how to declare a module's encoding; for example, you might add a line like this near the top of the source file:

```
# -*- coding: latin1 -*-
```

- A new warning, `UnicodeWarning`, is triggered when you attempt to compare a Unicode string and an 8-bit string that can't be converted to Unicode using the default ASCII encoding. The result of the comparison is false:

```
>>> chr(128) == unichr(128)    # Can't convert chr(1
__main__:1: UnicodeWarning: Unicode equal compariso
    to convert both arguments to Unicode - interpreti
    as being unequal
False
>>> chr(127) == unichr(127)    # chr(127) can be con
True
```

Previously this would raise a `UnicodeDecodeError` exception, but in 2.5 this could result in puzzling problems

when accessing a dictionary. If you looked up `unichr(128)` and `chr(128)` was being used as a key, you'd get a **UnicodeDecodeError** exception. Other changes in 2.5 resulted in this exception being raised instead of suppressed by the code in `dictobject.c` that implements dictionaries.

Raising an exception for such a comparison is strictly correct, but the change might have broken code, so instead **UnicodeWarning** was introduced.

(Implemented by Marc-André Lemburg.)

- One error that Python programmers sometimes make is forgetting to include an `__init__.py` module in a package directory. Debugging this mistake can be confusing, and usually requires running Python with the `-v` switch to log all the paths searched. In Python 2.5, a new **ImportWarning** warning is triggered when an import would have picked up a directory as a package but no `__init__.py` was found. This warning is silently ignored by default; provide the `-Wd` option when running the Python executable to display the warning message. (Implemented by Thomas Wouters.)
- The list of base classes in a class definition can now be empty. As an example, this is now legal:

```
class C():  
    pass
```

(Implemented by Brett Cannon.)

## Interactive Interpreter Changes

In the interactive interpreter, `quit` and `exit` have long been strings so that new users get a somewhat helpful message when they try to quit:

```
>>> quit  
'Use Ctrl-D (i.e. EOF) to exit.'
```

In Python 2.5, `quit` and `exit` are now objects that still produce

string representations of themselves, but are also callable. Newbies who try `quit()` or `exit()` will now exit the interpreter as they expect. (Implemented by Georg Brandl.)

The Python executable now accepts the standard long options `--help` and `--version`; on Windows, it also accepts the `/?` option for displaying a help message. (Implemented by Georg Brandl.)

## Optimizations

Several of the optimizations were developed at the NeedForSpeed sprint, an event held in Reykjavik, Iceland, from May 21–28 2006. The sprint focused on speed enhancements to the CPython implementation and was funded by EWT LLC with local support from CCP Games. Those optimizations added at this sprint are specially marked in the following list.

- When they were introduced in Python 2.4, the built-in `set` and `frozenset` types were built on top of Python's dictionary type. In 2.5 the internal data structure has been customized for implementing sets, and as a result sets will use a third less memory and are somewhat faster. (Implemented by Raymond Hettinger.)
- The speed of some Unicode operations, such as finding substrings, string splitting, and character map encoding and decoding, has been improved. (Substring search and splitting improvements were added by Fredrik Lundh and Andrew Dalke at the NeedForSpeed sprint. Character maps were improved by Walter Dörwald and Martin von Löwis.)
- The `long(str, base)` function is now faster on long digit strings because fewer intermediate results are calculated. The peak is for strings of around 800–1000 digits where the function is 6 times faster. (Contributed by Alan McIntyre and committed at the NeedForSpeed sprint.)
- It's now illegal to mix iterating over a file with `for line in file` and calling the file object's `read()/readline()/readlines()` methods. Iteration uses an internal buffer and the `read*()` methods don't use that buffer. Instead they would return the data following the buffer, causing the data to appear out of order. Mixing iteration and these methods

will now trigger a `ValueError` from the `read*()` method. (Implemented by Thomas Wouters.)

- The `struct` module now compiles structure format strings into an internal representation and caches this representation, yielding a 20% speedup. (Contributed by Bob Ippolito at the NeedForSpeed sprint.)
- The `re` module got a 1 or 2% speedup by switching to Python's allocator functions instead of the system's `malloc()` and `free()`. (Contributed by Jack Diederich at the NeedForSpeed sprint.)
- The code generator's peephole optimizer now performs simple constant folding in expressions. If you write something like `a = 2+3`, the code generator will do the arithmetic and produce code corresponding to `a = 5`. (Proposed and implemented by Raymond Hettinger.)
- Function calls are now faster because code objects now keep the most recently finished frame (a "zombie frame") in an internal field of the code object, reusing it the next time the code object is invoked. (Original patch by Michael Hudson, modified by Armin Rigo and Richard Jones; committed at the NeedForSpeed sprint.) Frame objects are also slightly smaller, which may improve cache locality and reduce memory usage a bit. (Contributed by Neal Norwitz.)
- Python's built-in exceptions are now new-style classes, a change that speeds up instantiation considerably. Exception handling in Python 2.5 is therefore about 30% faster than in 2.4. (Contributed by Richard Jones, Georg Brandl and Sean Reifschneider at the NeedForSpeed sprint.)
- Importing now caches the paths tried, recording whether they exist or not so that the interpreter makes fewer `open()` and `stat()` calls on startup. (Contributed by Martin von Löwis and Georg Brandl.)

## New, Improved, and Removed Modules

The standard library received many enhancements and bug fixes in Python 2.5. Here's a partial list of the most notable changes, sorted alphabetically by module name. Consult the `Misc/NEWS` file in the source tree for a more complete list of changes, or look through the

SVN logs for all the details.

- The **audioop** module now supports the a-LAW encoding, and the code for u-LAW encoding has been improved. (Contributed by Lars Immisch.)
- The **codecs** module gained support for incremental codecs. The **codec.lookup()** function now returns a **CodecInfo** instance instead of a tuple. **CodecInfo** instances behave like a 4-tuple to preserve backward compatibility but also have the attributes **encode**, **decode**, **incrementalencoder**, **incrementaldecoder**, **streamwriter**, and **streamreader**. Incremental codecs can receive input and produce output in multiple chunks; the output is the same as if the entire input was fed to the non-incremental codec. See the **codecs** module documentation for details. (Designed and implemented by Walter Dörwald.)
- The **collections** module gained a new type, **defaultdict**, that subclasses the standard **dict** type. The new type mostly behaves like a dictionary but constructs a default value when a key isn't present, automatically adding it to the dictionary for the requested key value.

The first argument to **defaultdict**'s constructor is a factory function that gets called whenever a key is requested but not found. This factory function receives no arguments, so you can use built-in type constructors such as **list()** or **int()**. For example, you can make an index of words based on their initial letter like this:

```
words = ""Nel mezzo del cammin di nostra vita
mi ritrovai per una selva oscura
che la diritta via era smarrita"".lower().split()

index = defaultdict(list)

for w in words:
    init_letter = w[0]
    index[init_letter].append(w)
```

Printing index results in the following output:

```
defaultdict(<type 'list'>, {'c': ['cammin', 'che'],  
    'd': ['del', 'di', 'diritta'], 'm': ['mezzo'],  
    'l': ['la'], 'o': ['oscura'], 'n': ['nel'],  
    'p': ['per'], 's': ['selva', 'smarrita'],  
    'r': ['ritrovai'], 'u': ['una'], 'v': ['vit']})
```

(Contributed by Guido van Rossum.)

- The **deque** double-ended queue type supplied by the **collections** module now has a `remove(value)` method that removes the first occurrence of *value* in the queue, raising **ValueError** if the value isn't found. (Contributed by Raymond Hettinger.)
- New module: The **contextlib** module contains helper functions for use with the new **'with'** statement. See section [The contextlib module](#) for more about this module.
- New module: The **cProfile** module is a C implementation of the existing **profile** module that has much lower overhead. The module's interface is the same as **profile**: you run `cProfile.run('main()')` to profile a function, can save profile data to a file, etc. It's not yet known if the Hotshot profiler, which is also written in C but doesn't match the **profile** module's interface, will continue to be maintained in future versions of Python. (Contributed by Armin Rigo.)

Also, the **pstats** module for analyzing the data measured by the profiler now supports directing the output to any file object by supplying a *stream* argument to the **Stats** constructor. (Contributed by Skip Montanaro.)

- The **csv** module, which parses files in comma-separated value format, received several enhancements and a number of bugfixes. You can now set the maximum size in bytes of a field by calling the `csv.field_size_limit(new_limit)` function; omitting the *new\_limit* argument will return the currently set limit. The **reader** class now has a **line\_num**

attribute that counts the number of physical lines read from the source; records can span multiple physical lines, so **line\_num** is not the same as the number of records read.

The CSV parser is now stricter about multi-line quoted fields. Previously, if a line ended within a quoted field without a terminating newline character, a newline would be inserted into the returned field. This behavior caused problems when reading files that contained carriage return characters within fields, so the code was changed to return the field without inserting newlines. As a consequence, if newlines embedded within fields are important, the input should be split into lines in a manner that preserves the newline characters.

(Contributed by Skip Montanaro and Andrew McNamara.)

- The **datetime** class in the **datetime** module now has a `strptime(string, format)` method for parsing date strings, contributed by Josh Spoerri. It uses the same format characters as `time.strptime()` and `time.strftime()`:

```
from datetime import datetime

ts = datetime.strptime('10:13:15 2006-03-07',
                      '%H:%M:%S %Y-%m-%d')
```

- The **SequenceMatcher.get\_matching\_blocks()** method in the **difflib** module now guarantees to return a minimal list of blocks describing matching subsequences. Previously, the algorithm would occasionally break a block of matching elements into two list entries. (Enhancement by Tim Peters.)
- The **doctest** module gained a `SKIP` option that keeps an example from being executed at all. This is intended for code snippets that are usage examples intended for the reader and aren't actually test cases.

An *encoding* parameter was added to the **testfile()** function and the **DocFileSuite** class to specify the file's encoding. This makes it easier to use non-ASCII characters in

tests contained within a docstring. (Contributed by Bjorn Tillenius.)

- The `email` package has been updated to version 4.0. (Contributed by Barry Warsaw.)
- The `fileinput` module was made more flexible. Unicode filenames are now supported, and a `mode` parameter that defaults to `"r"` was added to the `input()` function to allow opening files in binary or `universal newlines` mode. Another new parameter, `openhook`, lets you use a function other than `open()` to open the input files. Once you're iterating over the set of files, the `FileInput` object's new `fileno()` returns the file descriptor for the currently opened file. (Contributed by Georg Brandl.)
- In the `gc` module, the new `get_count()` function returns a 3-tuple containing the current collection counts for the three GC generations. This is accounting information for the garbage collector; when these counts reach a specified threshold, a garbage collection sweep will be made. The existing `gc.collect()` function now takes an optional `generation` argument of 0, 1, or 2 to specify which generation to collect. (Contributed by Barry Warsaw.)
- The `nsmallest()` and `nlargest()` functions in the `heapq` module now support a `key` keyword parameter similar to the one provided by the `min()/max()` functions and the `sort()` methods. For example:

```
>>> import heapq
>>> L = ["short", 'medium', 'longest', 'longer still']
>>> heapq.nsmallest(2, L)  # Return two lowest elements
['longer still', 'longest']
>>> heapq.nsmallest(2, L, key=len)  # Return two shortest
['short', 'medium']
```

(Contributed by Raymond Hettinger.)

- The `itertools.islice()` function now accepts `None` for the start and step arguments. This makes it more compatible

with the attributes of slice objects, so that you can now write the following:

```
s = slice(5)          # Create slice object
itertools.islice(iterable, s.start, s.stop, s.step)
```

(Contributed by Raymond Hettinger.)

- The `format()` function in the `locale` module has been modified and two new functions were added, `format_string()` and `currency()`.

The `format()` function's *val* parameter could previously be a string as long as no more than one `%char` specifier appeared; now the parameter must be exactly one `%char` specifier with no surrounding text. An optional *monetary* parameter was also added which, if `True`, will use the locale's rules for formatting currency in placing a separator between groups of three digits.

To format strings with multiple `%char` specifiers, use the new `format_string()` function that works like `format()` but also supports mixing `%char` specifiers with arbitrary text.

A new `currency()` function was also added that formats a number according to the current locale's settings.

(Contributed by Georg Brandl.)

- The `mailbox` module underwent a massive rewrite to add the capability to modify mailboxes in addition to reading them. A new set of classes that include `mbox`, `MH`, and `Maildir` are used to read mailboxes, and have an `add(message)` method to add messages, `remove(key)` to remove messages, and `lock()/unlock()` to lock/unlock the mailbox. The following example converts a maildir-format mailbox into an mbox-format one:

```
import mailbox
```

```
# 'factory=None' uses email.Message.Message as the
```

```
# individual messages.  
src = mailbox.Maildir('maildir', factory=None)  
dest = mailbox.mbox('/tmp/mbox')  
  
for msg in src:  
    dest.add(msg)
```

(Contributed by Gregory K. Johnson. Funding was provided by Google's 2005 Summer of Code.)

- New module: the **msilib** module allows creating Microsoft Installer `.msi` files and CAB files. Some support for reading the `.msi` database is also included. (Contributed by Martin von Löwis.)
- The **nis** module now supports accessing domains other than the system default domain by supplying a *domain* argument to the **nis.match()** and **nis.maps()** functions. (Contributed by Ben Bell.)
- The **operator** module's **itemgetter()** and **attrgetter()** functions now support multiple fields. A call such as `operator.attrgetter('a', 'b')` will return a function that retrieves the **a** and **b** attributes. Combining this new feature with the **sort()** method's *key* parameter lets you easily sort lists using multiple fields. (Contributed by Raymond Hettinger.)
- The **optparse** module was updated to version 1.5.1 of the Optik library. The **OptionParser** class gained an **epilog** attribute, a string that will be printed after the help message, and a **destroy()** method to break reference cycles created by the object. (Contributed by Greg Ward.)
- The **os** module underwent several changes. The **stat\_float\_times** variable now defaults to true, meaning that **os.stat()** will now return time values as floats. (This doesn't necessarily mean that **os.stat()** will return times that are precise to fractions of a second; not all systems support such precision.)

Constants named `os.SEEK_SET`, `os.SEEK_CUR`, and `os.SEEK_END` have been added; these are the parameters to the `os.lseek()` function. Two new constants for locking are `os.O_SHLOCK` and `os.O_EXLOCK`.

Two new functions, `wait3()` and `wait4()`, were added. They're similar the `waitpid()` function which waits for a child process to exit and returns a tuple of the process ID and its exit status, but `wait3()` and `wait4()` return additional information. `wait3()` doesn't take a process ID as input, so it waits for any child process to exit and returns a 3-tuple of *process-id*, *exit-status*, *resource-usage* as returned from the `resource.getrusage()` function. `wait4(pid)` does take a process ID. (Contributed by Chad J. Schroeder.)

On FreeBSD, the `os.stat()` function now returns times with nanosecond resolution, and the returned object now has `st_gen` and `st_birthtime`. The `st_flags` attribute is also available, if the platform supports it. (Contributed by Antti Louko and Diego Pettenò.)

- The Python debugger provided by the `pdb` module can now store lists of commands to execute when a breakpoint is reached and execution stops. Once breakpoint #1 has been created, enter `commands 1` and enter a series of commands to be executed, finishing the list with `end`. The command list can include commands that resume execution, such as `continue` or `next`. (Contributed by Grégoire Doms.)
- The `pickle` and `cPickle` modules no longer accept a return value of `None` from the `__reduce__()` method; the method must return a tuple of arguments instead. The ability to return `None` was deprecated in Python 2.4, so this completes the removal of the feature.
- The `pkgutil` module, containing various utility functions for finding packages, was enhanced to support [PEP 302](https://peps.python.org/pep-0302/) [https://peps.python.org/pep-0302/]’s import hooks and now also works for packages stored in ZIP-format archives. (Contributed by Phillip J. Eby.)

- The pybench benchmark suite by Marc-André Lemburg is now included in the `Tools/pybench` directory. The pybench suite is an improvement on the commonly used `pystone.py` program because pybench provides a more detailed measurement of the interpreter's speed. It times particular operations such as function calls, tuple slicing, method lookups, and numeric operations, instead of performing many different operations and reducing the result to a single number as `pystone.py` does.
- The **pyexpat** module now uses version 2.0 of the Expat parser. (Contributed by Trent Mick.)
- The **Queue** class provided by the **Queue** module gained two new methods. `join()` blocks until all items in the queue have been retrieved and all processing work on the items have been completed. Worker threads call the other new method, `task_done()`, to signal that processing for an item has been completed. (Contributed by Raymond Hettinger.)
- The old **regex** and **regsub** modules, which have been deprecated ever since Python 2.0, have finally been deleted. Other deleted modules: **statcache**, **tzparse**, **whrandom**.
- Also deleted: the `lib-old` directory, which includes ancient modules such as **dircmp** and **ni**, was removed. `lib-old` wasn't on the default `sys.path`, so unless your programs explicitly added the directory to `sys.path`, this removal shouldn't affect your code.
- The **rlcompleter** module is no longer dependent on importing the **readline** module and therefore now works on non-Unix platforms. (Patch from Robert Kiendl.)
- The **SimpleXMLRPCServer** and **DocXMLRPCServer** classes now have a **rpc\_paths** attribute that constrains XML-RPC operations to a limited set of URL paths; the default is to allow only `'/'` and `'/RPC2'`. Setting **rpc\_paths** to `None` or an empty tuple disables this path checking.
- The **socket** module now supports **AF\_NETLINK** sockets on

Linux, thanks to a patch from Philippe Biondi. Netlink sockets are a Linux-specific mechanism for communications between a user-space process and kernel code; an introductory article about them is at <https://www.linuxjournal.com/article/7356>. In Python code, netlink addresses are represented as a tuple of 2 integers, (pid, group\_mask).

Two new methods on socket objects, `recv_into(buffer)` and `recvfrom_into(buffer)`, store the received data in an object that supports the buffer protocol instead of returning the data as a string. This means you can put the data directly into an array or a memory-mapped file.

Socket objects also gained `getfamily()`, `gettype()`, and `getproto()` accessor methods to retrieve the family, type, and protocol values for the socket.

- New module: the `spwd` module provides functions for accessing the shadow password database on systems that support shadow passwords.
- The `struct` is now faster because it compiles format strings into `Struct` objects with `pack()` and `unpack()` methods. This is similar to how the `re` module lets you create compiled regular expression objects. You can still use the module-level `pack()` and `unpack()` functions; they'll create `Struct` objects and cache them. Or you can use `Struct` instances directly:

```
s = struct.Struct('ih3s')  
  
data = s.pack(1972, 187, 'abc')  
year, number, name = s.unpack(data)
```

You can also pack and unpack data to and from buffer objects directly using the `pack_into(buffer, offset, v1, v2, ...)` and `unpack_from(buffer, offset)` methods. This lets you store data directly into an array or a memory-mapped file.

(`Struct` objects were implemented by Bob Ippolito at the

NeedForSpeed sprint. Support for buffer objects was added by Martin Blais, also at the NeedForSpeed sprint.)

- The Python developers switched from CVS to Subversion during the 2.5 development process. Information about the exact build version is available as the `sys.subversion` variable, a 3-tuple of (interpreter-name, branch-name, revision-range). For example, at the time of writing my copy of 2.5 was reporting ('CPython', 'trunk', '45313:45315').

This information is also available to C extensions via the `Py_GetBuildInfo()` function that returns a string of build information like this: "trunk:45355:45356M, Apr 13 2006, 07:42:19". (Contributed by Barry Warsaw.)

- Another new function, `sys._current_frames()`, returns the current stack frames for all running threads as a dictionary mapping thread identifiers to the topmost stack frame currently active in that thread at the time the function is called. (Contributed by Tim Peters.)
- The `TarFile` class in the `tarfile` module now has an `extractall()` method that extracts all members from the archive into the current working directory. It's also possible to set a different directory as the extraction target, and to unpack only a subset of the archive's members.

The compression used for a tarfile opened in stream mode can now be autodetected using the mode `'r|*'`. (Contributed by Lars Gustäbel.)

- The `threading` module now lets you set the stack size used when new threads are created. The `stack_size([*size*])` function returns the currently configured stack size, and supplying the optional `size` parameter sets a new value. Not all platforms support changing the stack size, but Windows, POSIX threading, and OS/2 all do. (Contributed by Andrew MacIntyre.)
- The `unicodedata` module has been updated to use version

4.1.0 of the Unicode character database. Version 3.2.0 is required by some specifications, so it's still available as `unicodedata.ucd_3_2_0`.

- New module: the `uuid` module generates universally unique identifiers (UUIDs) according to [RFC 4122](https://datatracker.ietf.org/doc/html/rfc4122.html) [https://datatracker.ietf.org/doc/html/rfc4122.html]. The RFC defines several different UUID versions that are generated from a starting string, from system properties, or purely randomly. This module contains a `UUID` class and functions named `uuid1()`, `uuid3()`, `uuid4()`, and `uuid5()` to generate different versions of UUID. (Version 2 UUIDs are not specified in [RFC 4122](https://datatracker.ietf.org/doc/html/rfc4122.html) [https://datatracker.ietf.org/doc/html/rfc4122.html] and are not supported by this module.)

```
>>> import uuid
>>> # make a UUID based on the host ID and current
>>> uuid.uuid1()
UUID('a8098c1a-f86e-11da-bd1a-00112444be1e')

>>> # make a UUID using an MD5 hash of a namespace
>>> uuid.uuid3(uuid.NAMESPACE_DNS, 'python.org')
UUID('6fa459ea-ee8a-3ca4-894e-db77e160355e')

>>> # make a random UUID
>>> uuid.uuid4()
UUID('16fd2706-8baf-433b-82eb-8c7fada847da')

>>> # make a UUID using a SHA-1 hash of a namespace
>>> uuid.uuid5(uuid.NAMESPACE_DNS, 'python.org')
UUID('886313e1-3b8a-5372-9b90-0c9aee199e5d')
```

(Contributed by Ka-Ping Yee.)

- The `weakref` module's `WeakKeyDictionary` and `WeakValueDictionary` types gained new methods for iterating over the weak references contained in the dictionary. `iterkeyrefs()` and `keyrefs()` methods were added to `WeakKeyDictionary`, and `intervaluerefs()` and `valuerefs()` were added to

**WeakValueDictionary**. (Contributed by Fred L. Drake, Jr.)

- The **webbrowser** module received a number of enhancements. It's now usable as a script with `python -m webbrowser`, taking a URL as the argument; there are a number of switches to control the behaviour (`-n` for a new browser window, `-t` for a new tab). New module-level functions, `open_new()` and `open_new_tab()`, were added to support this. The module's `open()` function supports an additional feature, an *autoraise* parameter that signals whether to raise the open window when possible. A number of additional browsers were added to the supported list such as Firefox, Opera, Konqueror, and elinks. (Contributed by Oleg Broytmann and Georg Brandl.)
- The **xmlrpclib** module now supports returning **datetime** objects for the XML-RPC date type. Supply `use_datetime=True` to the `loads()` function or the **Unmarshaller** class to enable this feature. (Contributed by Skip Montanaro.)
- The **zipfile** module now supports the ZIP64 version of the format, meaning that a .zip archive can now be larger than 4 GiB and can contain individual files larger than 4 GiB. (Contributed by Ronald Oussoren.)
- The **zlib** module's **Compress** and **Decompress** objects now support a `copy()` method that makes a copy of the object's internal state and returns a new **Compress** or **Decompress** object. (Contributed by Chris AtLee.)

## The ctypes package

The **ctypes** package, written by Thomas Heller, has been added to the standard library. **ctypes** lets you call arbitrary functions in shared libraries or DLLs. Long-time users may remember the **dl** module, which provides functions for loading shared libraries and calling functions in them. The **ctypes** package is much fancier.

To load a shared library or DLL, you must create an instance of the **CDLL** class and provide the name or path of the shared library or

DLL. Once that's done, you can call arbitrary functions by accessing them as attributes of the **CDLL** object.

```
import ctypes

libc = ctypes.CDLL('libc.so.6')
result = libc.printf("Line of output\n")
```

Type constructors for the various C types are provided: **c\_int()**, **c\_float()**, **c\_double()**, **c\_char\_p()** (equivalent to `char*`), and so forth. Unlike Python's types, the C versions are all mutable; you can assign to their **value** attribute to change the wrapped value. Python integers and strings will be automatically converted to the corresponding C types, but for other types you must call the correct type constructor. (And I mean *must*; getting it wrong will often result in the interpreter crashing with a segmentation fault.)

You shouldn't use **c\_char\_p()** with a Python string when the C function will be modifying the memory area, because Python strings are supposed to be immutable; breaking this rule will cause puzzling bugs. When you need a modifiable memory area, use **create\_string\_buffer()**:

```
s = "this is a string"
buf = ctypes.create_string_buffer(s)
libc.strfry(buf)
```

C functions are assumed to return integers, but you can set the **restype** attribute of the function object to change this:

```
>>> libc.atof('2.71828')
-1783957616
>>> libc.atof.restype = ctypes.c_double
>>> libc.atof('2.71828')
2.71828
```

**ctypes** also provides a wrapper for Python's C API as the **ctypes.pythonapi** object. This object does *not* release the global interpreter lock before calling a function, because the lock must be held when calling into the interpreter's code. There's a **py\_object()** type constructor that will create a **PyObject\***

pointer. A simple usage:

```
import ctypes

d = {}
ctypes.pythonapi.PyObject_SetItem(ctypes.py_object(d),
                                   ctypes.py_object("abc"), ctypes.py_object(1))
# d is now {'abc', 1}.
```

Don't forget to use `py_object()`; if it's omitted you end up with a segmentation fault.

`ctypes` has been around for a while, but people still write and distribution hand-coded extension modules because you can't rely on `ctypes` being present. Perhaps developers will begin to write Python wrappers atop a library accessed through `ctypes` instead of extension modules, now that `ctypes` is included with core Python.

The documentation for the `ctypes` module.

## The ElementTree package

A subset of Fredrik Lundh's ElementTree library for processing XML has been added to the standard library as `xml.etree`. The available modules are `ElementTree`, `ElementPath`, and `ElementInclude` from ElementTree 1.2.6. The `cElementTree` accelerator module is also included.

The rest of this section will provide a brief overview of using ElementTree. Full documentation for ElementTree is available at <https://web.archive.org/web/20201124024954/http://effbot.org/zone/element-index.htm>.

`ElementTree` represents an XML document as a tree of element nodes. The text content of the document is stored as the **text** and **tail** attributes of (This is one of the major differences between `ElementTree` and the Document Object Model; in the DOM there are many different types of node, including **TextNode**.)

The most commonly used parsing function is **parse()**, that takes either a string (assumed to contain a filename) or a file-like object and returns an **ElementTree** instance:

```
from xml.etree import ElementTree as ET

tree = ET.parse('ex-1.xml')

feed = urllib.urlopen(
    'http://planet.python.org/rss10.xml')
tree = ET.parse(feed)
```

Once you have an **ElementTree** instance, you can call its **getroot()** method to get the root **Element** node.

There's also an **XML()** function that takes a string literal and returns an **Element** node (not an **ElementTree**). This function provides a tidy way to incorporate XML fragments, approaching the convenience of an XML literal:

```
svg = ET.XML("<svg width='10px' version='1.0'>
              </svg>")
svg.set('height', '320px')
svg.append(elem1)
```

Each XML element supports some dictionary-like and some list-like access methods. Dictionary-like operations are used to access attribute values, and list-like operations are used to access child nodes.

### **Operation**

---

**Returns** n'th child element.

---

**Returns** list of m'th through n'th child elements.

---

**Returns** number of child elements.

---

**Returns** list of child elements.

---

Adds *elem2* as a child.

Inserts *elem2* at the specified location.

Deletes an child element.

Returns list of attribute names.

Returns value of attribute *name*.

Sets new value for attribute *name*.

Retrieves the dictionary containing attributes.

Deletes attribute *name*.

Comments and processing instructions are also represented as **Element** nodes. To check if a node is a comment or processing instructions:

```
if elem.tag is ET.Comment:
    ...
elif elem.tag is ET.ProcessingInstruction:
    ...
```

To generate XML output, you should call the **ElementTree.write()** method. Like **parse()**, it can take either a string or a file-like object:

```
# Encoding is US-ASCII
tree.write('output.xml')

# Encoding is UTF-8
f = open('output.xml', 'w')
tree.write(f, encoding='utf-8')
```

(Caution: the default encoding used for output is ASCII. For general XML work, where an element's name may contain arbitrary Unicode characters, ASCII isn't a very useful encoding because it will raise an exception if an element's name contains any characters with values greater than 127. Therefore, it's best to specify a different encoding such as UTF-8 that can handle any Unicode character.)

This section is only a partial description of the **ElementTree** interfaces. Please read the package's official documentation for more details.

Official documentation for ElementTree.

## The hashlib package

A new **hashlib** module, written by Gregory P. Smith, has been added to replace the **md5** and **sha** modules. **hashlib** adds support for additional secure hashes (SHA-224, SHA-256, SHA-384, and SHA-512). When available, the module uses OpenSSL for fast platform optimized implementations of algorithms.

The old **md5** and **sha** modules still exist as wrappers around hashlib to preserve backwards compatibility. The new module's interface is very close to that of the old modules, but not identical. The most significant difference is that the constructor functions for creating new hashing objects are named differently.

```
# Old versions
```

```
h = md5.md5()
```

```
h = md5.new()
```

```
# New version
```

```
h = hashlib.md5()
```

```
# Old versions
```

```
h = sha.sha()
```

```
h = sha.new()
```

```
# New version
```

```
h = hashlib.shal()
```

```
# Hash that weren't previously available
```

```
h = hashlib.sha224()
```

```
h = hashlib.sha256()
```

```
h = hashlib.sha384()
```

```
h = hashlib.sha512()
```

```
# Alternative form
h = hashlib.new('md5') # Provide algorithm as a
```

Once a hash object has been created, its methods are the same as before: `update(string)` hashes the specified string into the current digest state, `digest()` and `hexdigest()` return the digest value as a binary string or a string of hex digits, and `copy()` returns a new hashing object with the same digest state.

## The sqlite3 package

The `pysqlite` module (<https://www.pysqlite.org>), a wrapper for the SQLite embedded database, has been added to the standard library under the package name `sqlite3`.

SQLite is a C library that provides a lightweight disk-based database that doesn't require a separate server process and allows accessing the database using a nonstandard variant of the SQL query language. Some applications can use SQLite for internal data storage. It's also possible to prototype an application using SQLite and then port the code to a larger database such as PostgreSQL or Oracle.

`pysqlite` was written by Gerhard Häring and provides a SQL interface compliant with the DB-API 2.0 specification described by [PEP 249](https://peps.python.org/pep-0249/) [https://peps.python.org/pep-0249/].

If you're compiling the Python source yourself, note that the source tree doesn't include the SQLite code, only the wrapper module. You'll need to have the SQLite libraries and headers installed before compiling Python, and the build process will compile the module when the necessary headers are available.

To use the module, you must first create a `Connection` object that represents the database. Here the data will be stored in the `/tmp/`

example file:

```
conn = sqlite3.connect('/tmp/example')
```

You can also supply the special name `:memory:` to create a database in RAM.

Once you have a **Connection**, you can create a **Cursor** object and call its **execute()** method to perform SQL commands:

```
c = conn.cursor()
```

```
# Create table
```

```
c.execute('''create table stocks
(date text, trans text, symbol text,
qty real, price real)''')
```

```
# Insert a row of data
```

```
c.execute("""insert into stocks
          values ('2006-01-05', 'BUY', 'RHAT', 100, 35.14) """)
```

Usually your SQL operations will need to use values from Python variables. You shouldn't assemble your query using Python's string operations because doing so is insecure; it makes your program vulnerable to an SQL injection attack.

Instead, use the DB-API's parameter substitution. Put `?` as a placeholder wherever you want to use a value, and then provide a tuple of values as the second argument to the cursor's **execute()** method. (Other database modules may use a different placeholder, such as `%s` or `:1.`) For example:

```
# Never do this -- insecure!
```

```
symbol = 'IBM'
```

```
c.execute("... where symbol = '%s'" % symbol)
```

```
# Do this instead
```

```
t = (symbol,)
```

```
c.execute('select * from stocks where symbol=?', t)
```

## **PEP 249** [<https://peps.python.org/pep-0249/>] - Database API Specification 2.0

PEP written by Marc-André Lemburg.

## **The wsgiref package**

The Web Server Gateway Interface (WSGI) v1.0 defines a standard interface between web servers and Python web applications and is described in **PEP 333** [<https://peps.python.org/pep-0333/>]. The **wsgiref** package is a reference implementation of the WSGI specification.

The package includes a basic HTTP server that will run a WSGI application; this server is useful for debugging but isn't intended for production use. Setting up a server takes only a few lines of code:

```
from wsgiref import simple_server

wsgi_app = ...

host = ''
port = 8000
httpd = simple_server.make_server(host, port, wsgi_app)
httpd.serve_forever()
```

## **PEP 333** [<https://peps.python.org/pep-0333/>] - Python Web Server Gateway Interface v1.0

PEP written by Phillip J. Eby.

## **Build and C API Changes**

Changes to Python's build process and to the C API include:

- The Python source tree was converted from CVS to Subversion, in a complex migration procedure that was supervised and flawlessly carried out by Martin von Löwis. The procedure was developed as [PEP 347](https://peps.python.org/pep-0347/) [https://peps.python.org/pep-0347/].
- Coverity, a company that markets a source code analysis tool called Prevent, provided the results of their examination of the Python source code. The analysis found about 60 bugs that were quickly fixed. Many of the bugs were refcounting problems, often occurring in error-handling code. See <https://scan.coverity.com> for the statistics.
- The largest change to the C API came from [PEP 353](https://peps.python.org/pep-0353/) [https://peps.python.org/pep-0353/], which modifies the interpreter to use a `Py_ssize_t` type definition instead of `int`. See the earlier section [PEP 353: Using `ssize\_t` as the index type](#) for a discussion of this change.
- The design of the bytecode compiler has changed a great deal, no longer generating bytecode by traversing the parse tree. Instead the parse tree is converted to an abstract syntax tree (or AST), and it is the abstract syntax tree that's traversed to produce the bytecode.

It's possible for Python code to obtain AST objects by using the `compile()` built-in and specifying `_ast.PyCF_ONLY_AST` as the value of the *flags* parameter:

```
from _ast import PyCF_ONLY_AST
ast = compile("""a=0
for i in range(10):
    a += i
""", "<string>", 'exec', PyCF_ONLY_AST)

assignment = ast.body[0]
for_loop = ast.body[1]
```

No official documentation has been written for the AST code yet, but [PEP 339](https://peps.python.org/pep-0339/) [https://peps.python.org/pep-0339/] discusses the design. To start learning about the code, read the definition of

the various AST nodes in `Parser/Python.asdl`. A Python script reads this file and generates a set of C structure definitions in `Include/Python-ast.h`. The **`PyParser_ASTFromString()`** and **`PyParser_ASTFromFile()`**, defined in `Include/pythonrun.h`, take Python source as input and return the root of an AST representing the contents. This AST can then be turned into a code object by **`PyAST_Compile()`**. For more information, read the source code, and then ask questions on `python-dev`.

The AST code was developed under Jeremy Hylton's management, and implemented by (in alphabetical order) Brett Cannon, Nick Coghlan, Grant Edwards, John Ehresman, Kurt Kaiser, Neal Norwitz, Tim Peters, Armin Rigo, and Neil Schemenauer, plus the participants in a number of AST sprints at conferences such as PyCon.

- Evan Jones's patch to `obmalloc`, first described in a talk at PyCon DC 2005, was applied. Python 2.4 allocated small objects in 256K-sized arenas, but never freed arenas. With this patch, Python will free arenas when they're empty. The net effect is that on some platforms, when you allocate many objects, Python's memory usage may actually drop when you delete them and the memory may be returned to the operating system. (Implemented by Evan Jones, and reworked by Tim Peters.)

Note that this change means extension modules must be more careful when allocating memory. Python's API has many different functions for allocating memory that are grouped into families. For example, **`PyMem_Malloc()`**, **`PyMem_Realloc()`**, and **`PyMem_Free()`** are one family that allocates raw memory, while **`PyObject_Malloc()`**, **`PyObject_Realloc()`**, and **`PyObject_Free()`** are another family that's supposed to be used for creating Python objects.

Previously these different families all reduced to the platform's **`malloc()`** and **`free()`** functions. This meant it didn't matter if you got things wrong and allocated memory

with the `PyMem()` function but freed it with the `PyObject()` function. With 2.5's changes to obmalloc, these families now do different things and mismatches will probably result in a segfault. You should carefully test your C extension modules with Python 2.5.

- The built-in set types now have an official C API. Call `PySet_New()` and `PyFrozenSet_New()` to create a new set, `PySet_Add()` and `PySet_Discard()` to add and remove elements, and `PySet_Contains()` and `PySet_Size()` to examine the set's state. (Contributed by Raymond Hettinger.)
- C code can now obtain information about the exact revision of the Python interpreter by calling the `Py_GetBuildInfo()` function that returns a string of build information like this: "trunk:45355:45356M, Apr 13 2006, 07:42:19". (Contributed by Barry Warsaw.)
- Two new macros can be used to indicate C functions that are local to the current file so that a faster calling convention can be used. `Py_LOCAL(type)` declares the function as returning a value of the specified *type* and uses a fast-calling qualifier. `Py_LOCAL_INLINE(type)` does the same thing and also requests the function be inlined. If `PY_LOCAL_AGGRESSIVE()` is defined before `python.h` is included, a set of more aggressive optimizations are enabled for the module; you should benchmark the results to find out if these optimizations actually make the code faster. (Contributed by Fredrik Lundh at the NeedForSpeed sprint.)
- `PyErr_NewException(name, base, dict)` can now accept a tuple of base classes as its *base* argument. (Contributed by Georg Brandl.)
- The `PyErr_Warn()` function for issuing warnings is now deprecated in favour of `PyErr_WarnEx(category, message, stacklevel)` which lets you specify the number of stack frames separating this function and the caller. A *stacklevel* of 1 is the function calling `PyErr_WarnEx()`, 2 is the function above that, and so forth. (Added by Neal

Norwitz.)

- The CPython interpreter is still written in C, but the code can now be compiled with a C++ compiler without errors. (Implemented by Anthony Baxter, Martin von Löwis, Skip Montanaro.)
- The **PyRange\_New()** function was removed. It was never documented, never used in the core code, and had dangerously lax error checking. In the unlikely case that your extensions were using it, you can replace it by something like the following:

```
range = PyObject_CallFunction((PyObject*) &PyRange_
                             start, stop, step);
```

## Port-Specific Changes

- MacOS X (10.3 and higher): dynamic loading of modules now uses the **dlopen()** function instead of MacOS-specific functions.
- MacOS X: an **--enable-universalsdk** switch was added to the **configure** script that compiles the interpreter as a universal binary able to run on both PowerPC and Intel processors. (Contributed by Ronald Oussoren; [bpo-2573](https://bugs.python.org/issue?@action=redirect&bpo=2573) [<https://bugs.python.org/issue?@action=redirect&bpo=2573>].)
- Windows: **.dll** is no longer supported as a filename extension for extension modules. **.pyd** is now the only filename extension that will be searched for.

## Porting to Python 2.5

This section lists previously described changes that may require changes to your code:

- ASCII is now the default encoding for modules. It's now a syntax error if a module contains string literals with 8-bit characters but doesn't have an encoding declaration. In Python 2.4 this triggered a warning, not a syntax error.
- Previously, the **gi\_frame** attribute of a generator was

always a frame object. Because of the [PEP 342](https://peps.python.org/pep-0342/) [https://peps.python.org/pep-0342/] changes described in section [PEP 342: New Generator Features](#), it's now possible for `gi_frame` to be `None`.

- A new warning, `UnicodeWarning`, is triggered when you attempt to compare a Unicode string and an 8-bit string that can't be converted to Unicode using the default ASCII encoding. Previously such comparisons would raise a `UnicodeDecodeError` exception.
- Library: the `csv` module is now stricter about multi-line quoted fields. If your files contain newlines embedded within fields, the input should be split into lines in a manner which preserves the newline characters.
- Library: the `locale` module's `format()` function's would previously accept any string as long as no more than one `%char` specifier appeared. In Python 2.5, the argument must be exactly one `%char` specifier with no surrounding text.
- Library: The `pickle` and `cPickle` modules no longer accept a return value of `None` from the `__reduce__()` method; the method must return a tuple of arguments instead. The modules also no longer accept the deprecated `bin` keyword parameter.
- Library: The `SimpleXMLRPCServer` and `DocXMLRPCServer` classes now have a `rpc_paths` attribute that constrains XML-RPC operations to a limited set of URL paths; the default is to allow only `'/'` and  `'/RPC2'`. Setting `rpc_paths` to `None` or an empty tuple disables this path checking.
- C API: Many functions now use `Py_ssize_t` instead of `int` to allow processing more data on 64-bit machines. Extension code may need to make the same change to avoid warnings and to support 64-bit machines. See the earlier section [PEP 353: Using `ssize\_t` as the index type](#) for a discussion of this change.
- C API: The obmalloc changes mean that you must be careful to not mix usage of the `PyMem_*` and `PyObject_*` families of functions. Memory allocated with one family's `*_Malloc` must be freed with the corresponding family's `*_Free` function.

# What's New in Python 2.4

Author

A.M. Kuchling

This article explains the new features in Python 2.4.1, released on March 30, 2005.

Python 2.4 is a medium-sized release. It doesn't introduce as many changes as the radical Python 2.2, but introduces more features than the conservative 2.3 release. The most significant new language features are function decorators and generator expressions; most other changes are to the standard library.

According to the CVS change logs, there were 481 patches applied and 502 bugs fixed between Python 2.3 and 2.4. Both figures are likely to be underestimates.

This article doesn't attempt to provide a complete specification of every single new feature, but instead provides a brief introduction to each feature. For full details, you should refer to the documentation for Python 2.4, such as the Python Library Reference and the Python Reference Manual. Often you will be referred to the PEP for a particular new feature for explanations of the implementation and design rationale.

## PEP 218: Built-In Set Objects

Python 2.3 introduced the **sets** module. C implementations of set data types have now been added to the Python core as two new built-in types, `set(iterable)` and `frozenset(iterable)`. They provide high speed operations for membership testing, for eliminating duplicates from sequences, and for mathematical operations like unions, intersections, differences, and symmetric differences.

```

>>> a = set('abracadabra')           # form a set from string
>>> 'z' in a                          # fast membership test
False
>>> a                                 # unique letters only
set(['a', 'r', 'b', 'c', 'd'])
>>> ''.join(a)                       # convert back to string
'arbcd'

>>> b = set('alacazam')              # form a second set
>>> a - b                             # letters in a but not in b
set(['r', 'd', 'b'])
>>> a | b                             # letters in either a or b
set(['a', 'c', 'r', 'd', 'b', 'm', 'z', 'l'])
>>> a & b                             # letters in both a and b
set(['a', 'c'])
>>> a ^ b                             # letters in a or b but not in both
set(['r', 'd', 'b', 'm', 'z', 'l'])

>>> a.add('z')                       # add a new element
>>> a.update('wxy')                 # add multiple elements
>>> a
set(['a', 'c', 'b', 'd', 'r', 'w', 'y', 'x', 'z'])
>>> a.remove('x')                   # take one element away
>>> a
set(['a', 'c', 'b', 'd', 'r', 'w', 'y', 'z'])

```

The `frozenset()` type is an immutable version of `set()`. Since it is immutable and hashable, it may be used as a dictionary key or as a member of another set.

The `sets` module remains in the standard library, and may be useful if you wish to subclass the `Set` or `ImmutableSet` classes. There are currently no plans to deprecate the module.

## See also

**PEP 218** [<https://peps.python.org/pep-0218/>] - Adding a Built-In Set Object Type

Originally proposed by Greg Wilson and ultimately

implemented by Raymond Hettinger.

## PEP 237: Unifying Long Integers and Integers

The lengthy transition process for this PEP, begun in Python 2.2, takes another step forward in Python 2.4. In 2.3, certain integer operations that would behave differently after int/long unification triggered **FutureWarning** warnings and returned values limited to 32 or 64 bits (depending on your platform). In 2.4, these expressions no longer produce a warning and instead produce a different result that's usually a long integer.

The problematic expressions are primarily left shifts and lengthy hexadecimal and octal constants. For example, `2 << 32` results in a warning in 2.3, evaluating to 0 on 32-bit platforms. In Python 2.4, this expression now returns the correct answer, 8589934592.

See also

**PEP 237** [<https://peps.python.org/pep-0237/>] - Unifying Long Integers and Integers

Original PEP written by Moshe Zadka and GvR. The changes for 2.4 were implemented by Kalle Svensson.

## PEP 289: Generator Expressions

The iterator feature introduced in Python 2.2 and the **itertools** module make it easier to write programs that loop through large data sets without having the entire data set in memory at one time. List comprehensions don't fit into this picture very well because they produce a Python list object containing all of the items. This unavoidably pulls all of the objects into memory, which can be a problem if your data set is very large. When trying to write a functionally styled program, it would be natural to write something like:

```
links = [link for link in get_all_links() if not link.followed]
for link in links:
    ...
```

instead of

```
for link in get_all_links():
    if link.followed:
        continue
    ...
```

The first form is more concise and perhaps more readable, but if you're dealing with a large number of link objects you'd have to write the second form to avoid having all link objects in memory at the same time.

Generator expressions work similarly to list comprehensions but don't materialize the entire list; instead they create a generator that will return elements one by one. The above example could be written as:

```
links = (link for link in get_all_links() if not link.followed)
for link in links:
    ...
```

Generator expressions always have to be written inside parentheses, as in the above example. The parentheses signalling a function call also count, so if you want to create an iterator that will be immediately passed to a function you could write:

```
print sum(obj.count for obj in list_all_objects())
```

Generator expressions differ from list comprehensions in various small ways. Most notably, the loop variable (*obj* in the above example) is not accessible outside of the generator expression. List comprehensions leave the variable assigned to its last value; future versions of Python will change this, making list comprehensions match generator expressions in this respect.

**PEP 289** [<https://peps.python.org/pep-0289/>] - **Generator**

## Expressions

Proposed by Raymond Hettinger and implemented by Jiwon Seo with early efforts steered by Hye-Shik Chang.

# PEP 292: Simpler String Substitutions

Some new classes in the standard library provide an alternative mechanism for substituting variables into strings; this style of substitution may be better for applications where untrained users need to edit templates.

The usual way of substituting variables by name is the `%` operator:

```
>>> '%(page)i: %(title)s' % {'page':2, 'title': 'The Best of Times'}
'2: The Best of Times'
```

When writing the template string, it can be easy to forget the `i` or `s` after the closing parenthesis. This isn't a big problem if the template is in a Python module, because you run the code, get an "Unsupported format character" **ValueError**, and fix the problem. However, consider an application such as Mailman where template strings or translations are being edited by users who aren't aware of the Python language. The format string's syntax is complicated to explain to such users, and if they make a mistake, it's difficult to provide helpful feedback to them.

PEP 292 adds a **Template** class to the **string** module that uses `$` to indicate a substitution:

```
>>> import string
>>> t = string.Template('$page: $title')
>>> t.substitute({'page':2, 'title': 'The Best of Times'})
'2: The Best of Times'
```

If a key is missing from the dictionary, the **substitute()** method will raise a **KeyError**. There's also a **safe\_substitute()** method that ignores missing keys:

```
>>> t = string.Template('$page: $title')
```

```
>>> t.safe_substitute({'page':3})  
'3: $title'
```

**PEP 292** [<https://peps.python.org/pep-0292/>] - **Simpler String Substitutions**

Written and implemented by Barry Warsaw.

## PEP 318: Decorators for Functions and Methods

Python 2.2 extended Python’s object model by adding static methods and class methods, but it didn’t extend Python’s syntax to provide any new way of defining static or class methods. Instead, you had to write a `def` statement in the usual way, and pass the resulting method to a `staticmethod()` or `classmethod()` function that would wrap up the function as a method of the new type. Your code would look like this:

```
class C:  
    def meth (cls):  
        ...  
  
    meth = classmethod(meth)    # Rebind name to wrapped-u
```

If the method was very long, it would be easy to miss or forget the `classmethod()` invocation after the function body.

The intention was always to add some syntax to make such definitions more readable, but at the time of 2.2’s release a good syntax was not obvious. Today a good syntax *still* isn’t obvious but users are asking for easier access to the feature; a new syntactic feature has been added to meet this need.

The new feature is called “function decorators”. The name comes from the idea that `classmethod()`, `staticmethod()`, and friends are storing additional information on a function object; they’re *decorating* functions with more details.

The notation borrows from Java and uses the '@' character as an indicator. Using the new syntax, the example above would be written:

```
class C:

    @classmethod
    def meth (cls):
        ...
```

The `@classmethod` is shorthand for the `meth=classmethod(meth)` assignment. More generally, if you have the following:

```
@A
@B
@C
def f ():
    ...
```

It's equivalent to the following pre-decorator code:

```
def f(): ...
f = A(B(C(f)))
```

Decorators must come on the line before a function definition, one decorator per line, and can't be on the same line as the `def` statement, meaning that `@A def f(): ...` is illegal. You can only decorate function definitions, either at the module level or inside a class; you can't decorate class definitions.

A decorator is just a function that takes the function to be decorated as an argument and returns either the same function or some new object. The return value of the decorator need not be callable (though it typically is), unless further decorators will be applied to the result. It's easy to write your own decorators. The following simple example just sets an attribute on the function object:

```
>>> def deco(func):
...     func.attr = 'decorated'
...     return func
```

```
...
>>> @deco
... def f(): pass
...
>>> f
<function f at 0x402ef0d4>
>>> f.attr
'decorated'
>>>
```

As a slightly more realistic example, the following decorator checks that the supplied argument is an integer:

```
def require_int (func):
    def wrapper (arg):
        assert isinstance(arg, int)
        return func(arg)

    return wrapper

@require_int
def p1 (arg):
    print arg

@require_int
def p2(arg):
    print arg*2
```

An example in [PEP 318](https://peps.python.org/pep-0318/) [https://peps.python.org/pep-0318/] contains a fancier version of this idea that lets you both specify the required type and check the returned type.

Decorator functions can take arguments. If arguments are supplied, your decorator function is called with only those arguments and must return a new decorator function; this function must take a single function and return a function, as previously described. In other words, `@A @B @C(args)` becomes:

```
def f(): ...
_deco = C(args)
```

```
f = A(B(_deco(f)))
```

Getting this right can be slightly brain-bending, but it's not too difficult.

A small related change makes the **func\_name** attribute of functions writable. This attribute is used to display function names in tracebacks, so decorators should change the name of any new function that's constructed and returned.

Written by Kevin D. Smith, Jim Jewett, and Skip Montanaro. Several people wrote patches implementing function decorators, but the one that was actually checked in was patch #979728, written by Mark Russell.

<https://wiki.python.org/moin/PythonDecoratorLibrary>

This Wiki page contains several examples of decorators.

## PEP 322: Reverse Iteration

A new built-in function, `reversed(seq)`, takes a sequence and returns an iterator that loops over the elements of the sequence in reverse order.

```
>>> for i in reversed(xrange(1,4)):  
...     print i  
...  
3  
2  
1
```

Compared to extended slicing, such as `range(1,4)[::-1]`, **`reversed()`** is easier to read, runs faster, and uses substantially less memory.

Note that `reversed()` only accepts sequences, not arbitrary iterators. If you want to reverse an iterator, first convert it to a list with `list()`.

```
>>> input = open('/etc/passwd', 'r')
>>> for line in reversed(list(input)):
...     print line
...
root:*:0:0:System Administrator:/var/root:/bin/tcsh
...
```

Written and implemented by Raymond Hettinger.

## PEP 324: New subprocess Module

The standard library provides a number of ways to execute a subprocess, offering different features and different levels of complexity. `os.system(command)` is easy to use, but slow (it runs a shell process which executes the command) and dangerous (you have to be careful about escaping the shell's metacharacters). The `popen2` module offers classes that can capture standard output and standard error from the subprocess, but the naming is confusing. The `subprocess` module cleans this up, providing a unified interface that offers all the features you might need.

Instead of `popen2`'s collection of classes, `subprocess` contains a single class called `Popen` whose constructor supports a number of different keyword arguments.

```
class Popen(args, bufsize=0, executable=None,
            stdin=None, stdout=None, stderr=None,
            preexec_fn=None, close_fds=False, shell=False,
            cwd=None, env=None, universal_newlines=False,
            startupinfo=None, creationflags=0):
```

*args* is commonly a sequence of strings that will be the arguments to

the program executed as the subprocess. (If the *shell* argument is true, *args* can be a string which will then be passed on to the shell for interpretation, just as `os.system()` does.)

*stdin*, *stdout*, and *stderr* specify what the subprocess's input, output, and error streams will be. You can provide a file object or a file descriptor, or you can use the constant `subprocess.PIPE` to create a pipe between the subprocess and the parent.

The constructor has a number of handy options:

- *close\_fds* requests that all file descriptors be closed before running the subprocess.
- *cwd* specifies the working directory in which the subprocess will be executed (defaulting to whatever the parent's working directory is).
- *env* is a dictionary specifying environment variables.
- *preexec\_fn* is a function that gets called before the child is started.
- *universal\_newlines* opens the child's input and output using Python's [universal newlines](#) feature.

Once you've created the **Popen** instance, you can call its `wait()` method to pause until the subprocess has exited, `poll()` to check if it's exited without pausing, or `communicate(data)` to send the string *data* to the subprocess's standard input.

`communicate(data)` then reads any data that the subprocess has sent to its standard output or standard error, returning a tuple (`stdout_data`, `stderr_data`).

**call()** is a shortcut that passes its arguments along to the **Popen** constructor, waits for the command to complete, and returns the status code of the subprocess. It can serve as a safer analog to `os.system()`:

```
sts = subprocess.call(['dpkg', '-i', '/tmp/new-package.o
if sts == 0:
    # Success
    ...
else:
    # dpkg returned an error
```

...

The command is invoked without use of the shell. If you really do want to use the shell, you can add `shell=True` as a keyword argument and provide a string instead of a sequence:

```
sts = subprocess.call('dpkg -i /tmp/new-package.deb', sh
```

The PEP takes various examples of shell and Python code and shows how they'd be translated into Python code that uses `subprocess`. Reading this section of the PEP is highly recommended.

Written and implemented by Peter Åstrand, with assistance from Fredrik Lundh and others.

## PEP 327: Decimal Data Type

Python has always supported floating-point (FP) numbers, based on the underlying C double type, as a data type. However, while most programming languages provide a floating-point type, many people (even programmers) are unaware that floating-point numbers don't represent certain decimal fractions accurately. The new **Decimal** type can represent these fractions accurately, up to a user-specified precision limit.

### Why is Decimal needed?

The limitations arise from the representation used for floating-point numbers. FP numbers are made up of three components:

- The sign, which is positive or negative.
- The mantissa, which is a single-digit binary number followed by a fractional part. For example, `1.01` in base-2 notation is  $1 + 0/2 + 1/4$ , or `1.25` in decimal notation.
- The exponent, which tells where the decimal point is located

in the number represented.

For example, the number 1.25 has positive sign, a mantissa value of 1.01 (in binary), and an exponent of 0 (the decimal point doesn't need to be shifted). The number 5 has the same sign and mantissa, but the exponent is 2 because the mantissa is multiplied by 4 (2 to the power of the exponent 2);  $1.25 * 4$  equals 5.

Modern systems usually provide floating-point support that conforms to a standard called IEEE 754. C's double type is usually implemented as a 64-bit IEEE 754 number, which uses 52 bits of space for the mantissa. This means that numbers can only be specified to 52 bits of precision. If you're trying to represent numbers whose expansion repeats endlessly, the expansion is cut off after 52 bits. Unfortunately, most software needs to produce output in base 10, and common fractions in base 10 are often repeating decimals in binary. For example, 1.1 decimal is binary  $1.0001100110011 \dots$ ;  $.1 = 1/16 + 1/32 + 1/256$  plus an infinite number of additional terms. IEEE 754 has to chop off that infinitely repeated decimal after 52 digits, so the representation is slightly inaccurate.

Sometimes you can see this inaccuracy when the number is printed:

```
>>> 1.1
1.10000000000000001
```

The inaccuracy isn't always visible when you print the number because the FP-to-decimal-string conversion is provided by the C library, and most C libraries try to produce sensible output. Even if it's not displayed, however, the inaccuracy is still there and subsequent operations can magnify the error.

For many applications this doesn't matter. If I'm plotting points and displaying them on my monitor, the difference between 1.1 and 1.10000000000000001 is too small to be visible. Reports often limit output to a certain number of decimal places, and if you round the number to two or three or even eight decimal places, the error is never apparent. However, for applications where it does matter, it's a lot of work to implement your own custom arithmetic routines.

Hence, the **Decimal** type was created.

## The **Decimal** type

A new module, **decimal**, was added to Python's standard library. It contains two classes, **Decimal** and **Context**. **Decimal** instances represent numbers, and **Context** instances are used to wrap up various settings such as the precision and default rounding mode.

**Decimal** instances are immutable, like regular Python integers and FP numbers; once it's been created, you can't change the value an instance represents. **Decimal** instances can be created from integers or strings:

```
>>> import decimal
>>> decimal.Decimal(1972)
Decimal("1972")
>>> decimal.Decimal("1.1")
Decimal("1.1")
```

You can also provide tuples containing the sign, the mantissa represented as a tuple of decimal digits, and the exponent:

```
>>> decimal.Decimal((1, (1, 4, 7, 5), -2))
Decimal("-14.75")
```

Cautionary note: the sign bit is a Boolean value, so 0 is positive and 1 is negative.

Converting from floating-point numbers poses a bit of a problem: should the FP number representing 1.1 turn into the decimal number for exactly 1.1, or for 1.1 plus whatever inaccuracies are introduced? The decision was to dodge the issue and leave such a conversion out of the API. Instead, you should convert the floating-point number into a string using the desired precision and pass the string to the **Decimal** constructor:

```
>>> f = 1.1
>>> decimal.Decimal(str(f))
Decimal("1.1")
```

```
>>> decimal.Decimal('%12f' % f)
Decimal("1.100000000000")
```

Once you have **Decimal** instances, you can perform the usual mathematical operations on them. One limitation: exponentiation requires an integer exponent:

```
>>> a = decimal.Decimal('35.72')
>>> b = decimal.Decimal('1.73')
>>> a+b
Decimal("37.45")
>>> a-b
Decimal("33.99")
>>> a*b
Decimal("61.7956")
>>> a/b
Decimal("20.64739884393063583815028902")
>>> a ** 2
Decimal("1275.9184")
>>> a**b
Traceback (most recent call last):
...
decimal.InvalidOperation: x ** (non-integer)
```

You can combine **Decimal** instances with integers, but not with floating-point numbers:

```
>>> a + 4
Decimal("39.72")
>>> a + 4.5
Traceback (most recent call last):
...
TypeError: You can interact Decimal only with int, long
>>>
```

**Decimal** numbers can be used with the [math](#) and [cmath](#) modules, but note that they'll be immediately converted to floating-point numbers before the operation is performed, resulting in a possible loss of precision and accuracy. You'll also get back a regular floating-point number and not a **Decimal**.

```
>>> import math, cmath
>>> d = decimal.Decimal('123456789012.345')
>>> math.sqrt(d)
351364.18288201344
>>> cmath.sqrt(-d)
351364.18288201344j
```

**Decimal** instances have a **sqrt()** method that returns a **Decimal**, but if you need other things such as trigonometric functions you'll have to implement them.

```
>>> d.sqrt()
Decimal("351364.1828820134592177245001")
```

## The Context type

Instances of the **Context** class encapsulate several settings for decimal operations:

- **prec** is the precision, the number of decimal places.
- **rounding** specifies the rounding mode. The **decimal** module has constants for the various possibilities: **ROUND\_DOWN**, **ROUND\_CEILING**, **ROUND\_HALF\_EVEN**, and various others.
- **traps** is a dictionary specifying what happens on encountering certain error conditions: either an exception is raised or a value is returned. Some examples of error conditions are division by zero, loss of precision, and overflow.

There's a thread-local default context available by calling **getcontext()**; you can change the properties of this context to alter the default precision, rounding, or trap handling. The following example shows the effect of changing the precision of the default context:

```
>>> decimal.getcontext().prec
28
>>> decimal.Decimal(1) / decimal.Decimal(7)
Decimal("0.1428571428571428571428571429")
```

```
>>> decimal.getcontext().prec = 9
>>> decimal.Decimal(1) / decimal.Decimal(7)
Decimal("0.142857143")
```

The default action for error conditions is selectable; the module can either return a special value such as infinity or not-a-number, or exceptions can be raised:

```
>>> decimal.Decimal(1) / decimal.Decimal(0)
Traceback (most recent call last):
...
decimal.DivisionByZero: x / 0
>>> decimal.getcontext().traps[decimal.DivisionByZero] =
>>> decimal.Decimal(1) / decimal.Decimal(0)
Decimal("Infinity")
>>>
```

The **Context** instance also has various methods for formatting numbers such as **to\_eng\_string()** and **to\_sci\_string()**.

For more information, see the documentation for the [decimal](#) module, which includes a quick-start tutorial and a reference.

**PEP 327** [<https://peps.python.org/pep-0327/>] - **Decimal Data Type**  
Written by Facundo Batista and implemented by Facundo Batista, Eric Price, Raymond Hettinger, Aahz, and Tim Peters.

<http://www.lahey.com/float.htm>

The article uses Fortran code to illustrate many of the problems that floating-point inaccuracy can cause.

<http://speleotrove.com/decimal/>

A description of a decimal-based representation. This representation is being proposed as a standard, and underlies the new Python decimal type. Much of this material was written by Mike Cowlshaw, designer of the Rexx language.

# PEP 328: Multi-line Imports

One language change is a small syntactic tweak aimed at making it easier to import many names from a module. In a `from module import names` statement, *names* is a sequence of names separated by commas. If the sequence is very long, you can either write multiple imports from the same module, or you can use backslashes to escape the line endings like this:

```
from SimpleXMLRPCServer import SimpleXMLRPCServer, \
    SimpleXMLRPCRequestHandler, \
    CGIXMLRPCRequestHandler, \
    resolve_dotted_attribute
```

The syntactic change in Python 2.4 simply allows putting the names within parentheses. Python ignores newlines within a parenthesized expression, so the backslashes are no longer needed:

```
from SimpleXMLRPCServer import (SimpleXMLRPCServer,
                                SimpleXMLRPCRequestHandler,
                                CGIXMLRPCRequestHandler,
                                resolve_dotted_attribute)
```

The PEP also proposes that all `import` statements be absolute imports, with a leading `.` character to indicate a relative import. This part of the PEP was not implemented for Python 2.4, but was completed for Python 2.5.

Written by Aahz. Multi-line imports were implemented by Dima Dorfman.

# PEP 331: Locale-Independent Float/String Conversions

The `locale` module lets Python software select various conversions and display conventions that are localized to a particular country or language. However, the module was careful to not change the numeric locale because various functions in Python's implementation required that the numeric locale remain set to the 'C' locale. Often this was because the code was using the C library's `atof()` function.

Not setting the numeric locale caused trouble for extensions that used third-party C libraries, however, because they wouldn't have the correct locale set. The motivating example was GTK+, whose user interface widgets weren't displaying numbers in the current locale.

The solution described in the PEP is to add three new functions to the Python API that perform ASCII-only conversions, ignoring the locale setting:

- `PyOS_ascii_strtod(str, ptr)` and `PyOS_ascii_atof(str, ptr)` both convert a string to a C double.
- `PyOS_ascii_formatd(buffer, buf_len, format, d)` converts a double to an ASCII string.

The code for these functions came from the GLib library (<https://developer-old.gnome.org/glib/2.26/>), whose developers kindly relicensed the relevant functions and donated them to the Python Software Foundation. The `locale` module can now change the numeric locale, letting extensions such as GTK+ produce the correct results.

Written by Christian R. Reis, and implemented by Gustavo Carneiro.

## Other Language Changes

Here are all of the changes that Python 2.4 makes to the core Python language.

- Decorators for functions and methods were added ([PEP 318](https://peps.python.org/pep-0318/) [https://peps.python.org/pep-0318/]).
- Built-in `set()` and `frozenset()` types were added ([PEP 218](https://peps.python.org/pep-0218/) [https://peps.python.org/pep-0218/]). Other new built-ins include the `reversed(seq)` function ([PEP 322](https://peps.python.org/pep-0322/) [https://peps.python.org/pep-0322/]).
- Generator expressions were added ([PEP 289](https://peps.python.org/pep-0289/) [https://peps.python.org/pep-0289/]).
- Certain numeric expressions no longer return values restricted to 32 or 64 bits ([PEP 237](https://peps.python.org/pep-0237/) [https://peps.python.org/pep-0237/]).
- You can now put parentheses around the list of names in a `from module import names` statement ([PEP 328](https://peps.python.org/pep-0328/) [https://peps.python.org/pep-0328/]).
- The `dict.update()` method now accepts the same argument forms as the `dict` constructor. This includes any mapping, any iterable of key/value pairs, and keyword arguments. (Contributed by Raymond Hettinger.)
- The string methods `ljust()`, `rjust()`, and `center()` now take an optional argument for specifying a fill character other than a space. (Contributed by Raymond Hettinger.)
- Strings also gained an `rsplit()` method that works like the `split()` method but splits from the end of the string. (Contributed by Sean Reifschneider.)

```
>>> 'www.python.org'.split('.', 1)
['www', 'python.org']
'www.python.org'.rsplit('.', 1)
['www.python', 'org']
```

- Three keyword parameters, *cmp*, *key*, and *reverse*, were added to the `sort()` method of lists. These parameters make some

common usages of `sort()` simpler. All of these parameters are optional.

For the *cmp* parameter, the value should be a comparison function that takes two parameters and returns -1, 0, or +1 depending on how the parameters compare. This function will then be used to sort the list. Previously this was the only parameter that could be provided to `sort()`.

*key* should be a single-parameter function that takes a list element and returns a comparison key for the element. The list is then sorted using the comparison keys. The following example sorts a list case-insensitively:

```
>>> L = ['A', 'b', 'c', 'D']
>>> L.sort()                                # Case-sensitive sort
>>> L
['A', 'D', 'b', 'c']
>>> # Using 'key' parameter to sort list
>>> L.sort(key=lambda x: x.lower())
>>> L
['A', 'b', 'c', 'D']
>>> # Old-fashioned way
>>> L.sort(cmp=lambda x,y: cmp(x.lower(), y.lower()))
>>> L
['A', 'b', 'c', 'D']
```

The last example, which uses the *cmp* parameter, is the old way to perform a case-insensitive sort. It works but is slower than using a *key* parameter. Using *key* calls `lower()` method once for each element in the list while using *cmp* will call it twice for each comparison, so using *key* saves on invocations of the `lower()` method.

For simple key functions and comparison functions, it is often possible to avoid a `lambda` expression by using an unbound method instead. For example, the above case-insensitive sort is best written as:

```
>>> L.sort(key=str.lower)
```

```
>>> L
['A', 'b', 'c', 'D']
```

Finally, the *reverse* parameter takes a Boolean value. If the value is true, the list will be sorted into reverse order. Instead of `L.sort(); L.reverse()`, you can now write `L.sort(reverse=True)`.

The results of sorting are now guaranteed to be stable. This means that two entries with equal keys will be returned in the same order as they were input. For example, you can sort a list of people by name, and then sort the list by age, resulting in a list sorted by age where people with the same age are in name-sorted order.

(All changes to `sort()` contributed by Raymond Hettinger.)

- There is a new built-in function `sorted(iterable)` that works like the in-place `list.sort()` method but can be used in expressions. The differences are:
- the input may be any iterable;
- a newly formed copy is sorted, leaving the original intact; and
- the expression returns the new sorted copy

```
>>> L = [9,7,8,3,2,4,1,6,5]
>>> [10+i for i in sorted(L)]           # usable in a list
[11, 12, 13, 14, 15, 16, 17, 18, 19]
>>> L                                   # original is list
[9,7,8,3,2,4,1,6,5]
>>> sorted('Monty Python')             # any iterable
[' ', 'M', 'P', 'h', 'n', 'n', 'o', 'o', 't', 't',

>>> # List the contents of a dict sorted by key value
>>> colormap = dict(red=1, blue=2, green=3, black=4)
>>> for k, v in sorted(colormap.iteritems()):
...     print k, v
...
black 4
```

```
blue 2
green 3
red 1
yellow 5
```

(Contributed by Raymond Hettinger.)

- Integer operations will no longer trigger an **OverflowWarning**. The **OverflowWarning** warning will disappear in Python 2.5.
- The interpreter gained a new switch, **-m**, that takes a name, searches for the corresponding module on `sys.path`, and runs the module as a script. For example, you can now run the Python profiler with `python -m profile`.  
(Contributed by Nick Coghlan.)
- The `eval(expr, globals, locals)` and `execfile(filename, globals, locals)` functions and the `exec` statement now accept any mapping type for the *locals* parameter. Previously this had to be a regular Python dictionary. (Contributed by Raymond Hettinger.)
- The **zip()** built-in function and **itertools.izip()** now return an empty list if called with no arguments. Previously they raised a **TypeError** exception. This makes them more suitable for use with variable length argument lists:

```
>>> def transpose(array):
...     return zip(*array)
...
>>> transpose([(1,2,3), (4,5,6)])
[(1, 4), (2, 5), (3, 6)]
>>> transpose([])
[]
```

(Contributed by Raymond Hettinger.)

- Encountering a failure while importing a module no longer leaves a partially initialized module object in `sys.modules`. The incomplete module object left behind would fool further

imports of the same module into succeeding, leading to confusing errors. (Fixed by Tim Peters.)

- **None** is now a constant; code that binds a new value to the name `None` is now a syntax error. (Contributed by Raymond Hettinger.)

## Optimizations

- The inner loops for list and tuple slicing were optimized and now run about one-third faster. The inner loops for dictionaries were also optimized, resulting in performance boosts for **keys()**, **values()**, **items()**, **iterkeys()**, **itervalues()**, and **iteritems()**. (Contributed by Raymond Hettinger.)
- The machinery for growing and shrinking lists was optimized for speed and for space efficiency. Appending and popping from lists now runs faster due to more efficient code paths and less frequent use of the underlying system **realloc()**. List comprehensions also benefit. **list.extend()** was also optimized and no longer converts its argument into a temporary list before extending the base list. (Contributed by Raymond Hettinger.)
- **list()**, **tuple()**, **map()**, **filter()**, and **zip()** now run several times faster with non-sequence arguments that supply a **\_\_len\_\_()** method. (Contributed by Raymond Hettinger.)
- The methods **list.\_\_getitem\_\_()**, **dict.\_\_getitem\_\_()**, and **dict.\_\_contains\_\_()** are now implemented as **method\_descriptor** objects rather than **wrapper\_descriptor** objects. This form of access doubles their performance and makes them more suitable for use as arguments to functionals:  
`map(mydict.__getitem__, keylist)`. (Contributed by Raymond Hettinger.)
- Added a new opcode, **LIST\_APPEND**, that simplifies the generated bytecode for list comprehensions and speeds them up by about a third. (Contributed by Raymond Hettinger.)
- The peephole bytecode optimizer has been improved to produce shorter, faster bytecode; remarkably, the resulting

bytecode is more readable. (Enhanced by Raymond Hettinger.)

- String concatenations in statements of the form `s = s + "abc"` and `s += "abc"` are now performed more efficiently in certain circumstances. This optimization won't be present in other Python implementations such as Jython, so you shouldn't rely on it; using the `join()` method of strings is still recommended when you want to efficiently glue a large number of strings together. (Contributed by Armin Rigo.)

The net result of the 2.4 optimizations is that Python 2.4 runs the pystone benchmark around 5% faster than Python 2.3 and 35% faster than Python 2.2. (pystone is not a particularly good benchmark, but it's the most commonly used measurement of Python's performance. Your own applications may show greater or smaller benefits from Python 2.4.)

## New, Improved, and Deprecated Modules

As usual, Python's standard library received a number of enhancements and bug fixes. Here's a partial list of the most notable changes, sorted alphabetically by module name. Consult the `Misc/NEWS` file in the source tree for a more complete list of changes, or look through the CVS logs for all the details.

- The `asyncore` module's `loop()` function now has a *count* parameter that lets you perform a limited number of passes through the polling loop. The default is still to loop forever.
- The `base64` module now has more complete [RFC 3548](https://datatracker.ietf.org/doc/html/rfc3548.html) [https://datatracker.ietf.org/doc/html/rfc3548.html] support for Base64, Base32, and Base16 encoding and decoding, including optional case folding and optional alternative alphabets. (Contributed by Barry Warsaw.)
- The `bisect` module now has an underlying C implementation for improved performance. (Contributed by Dmitry Vasiliev.)
- The CJKCodecs collections of East Asian codecs, maintained

by Hye-Shik Chang, was integrated into 2.4. The new encodings are:

- Chinese (PRC): gb2312, gbk, gb18030, big5hkscs, hz
- Chinese (ROC): big5, cp950
- Japanese: cp932, euc-jis-2004, euc-jp, euc-jisx0213, iso-2022-jp, iso-2022-jp-1, iso-2022-jp-2, iso-2022-jp-3, iso-2022-jp-ext, iso-2022-jp-2004, shift-jis, shift-jisx0213, shift-jis-2004
- Korean: cp949, euc-kr, johab, iso-2022-kr
- Some other new encodings were added: HP Roman8, ISO\_8859-11, ISO\_8859-16, PCTP-154, and TIS-620.
- The UTF-8 and UTF-16 codecs now cope better with receiving partial input. Previously the **StreamReader** class would try to read more data, making it impossible to resume decoding from the stream. The **read()** method will now return as much data as it can and future calls will resume decoding where previous ones left off. (Implemented by Walter Dörwald.)
- There is a new **collections** module for various specialized collection datatypes. Currently it contains just one type, **deque**, a double-ended queue that supports efficiently adding and removing elements from either end:

```
>>> from collections import deque
>>> d = deque('ghi')           # make a new deque with
>>> d.append('j')              # add a new entry to the
>>> d.appendleft('f')          # add a new entry to the
>>> d                          # show the representation
deque(['f', 'g', 'h', 'i', 'j'])
>>> d.pop()                    # return and remove the
'j'
>>> d.popleft()                # return and remove the
'f'
```

```
>>> list(d)                                # list the contents of
['g', 'h', 'i']
>>> 'h' in d                                # search the deque
True
```

Several modules, such as the `Queue` and `threading` modules, now take advantage of `collections.deque` for improved performance. (Contributed by Raymond Hettinger.)

- The `ConfigParser` classes have been enhanced slightly. The `read()` method now returns a list of the files that were successfully parsed, and the `set()` method raises `TypeError` if passed a *value* argument that isn't a string. (Contributed by John Belmonte and David Goodger.)
- The `curses` module now supports the ncurses extension `use_default_colors()`. On platforms where the terminal supports transparency, this makes it possible to use a transparent background. (Contributed by Jörg Lehmann.)
- The `difflib` module now includes an `HtmlDiff` class that creates an HTML table showing a side by side comparison of two versions of a text. (Contributed by Dan Gass.)
- The `email` package was updated to version 3.0, which dropped various deprecated APIs and removes support for Python versions earlier than 2.3. The 3.0 version of the package uses a new incremental parser for MIME messages, available in the `email.FeedParser` module. The new parser doesn't require reading the entire message into memory, and doesn't raise exceptions if a message is malformed; instead it records any problems in the `defect` attribute of the message. (Developed by Anthony Baxter, Barry Warsaw, Thomas Wouters, and others.)
- The `heapq` module has been converted to C. The resulting tenfold improvement in speed makes the module suitable for handling high volumes of data. In addition, the module has two new functions `nlargest()` and `nsmallest()` that use heaps to find the N largest or smallest values in a dataset without the expense of a full sort. (Contributed by Raymond

Hettinger.)

- The **httplib** module now contains constants for HTTP status codes defined in various HTTP-related RFC documents. Constants have names such as **OK**, **CREATED**, **CONTINUE**, and **MOVED\_PERMANENTLY**; use pydoc to get a full list. (Contributed by Andrew Eland.)
- The **imaplib** module now supports IMAP's **THREAD** command (contributed by Yves Dionne) and new **deleteacl()** and **myrights()** methods (contributed by Arnaud Mazin).
- The **itertools** module gained a `groupby(iterable[, *func*])` function. *iterable* is something that can be iterated over to return a stream of elements, and the optional *func* parameter is a function that takes an element and returns a key value; if omitted, the key is simply the element itself. **groupby()** then groups the elements into subsequences which have matching values of the key, and returns a series of 2-tuples containing the key value and an iterator over the subsequence.

Here's an example to make this clearer. The *key* function simply returns whether a number is even or odd, so the result of **groupby()** is to return consecutive runs of odd or even numbers.

```
>>> import itertools
>>> L = [2, 4, 6, 7, 8, 9, 11, 12, 14]
>>> for key_val, it in itertools.groupby(L, lambda
...     print key_val, list(it)
...
0 [2, 4, 6]
1 [7]
0 [8]
1 [9, 11]
0 [12, 14]
>>>
```

**groupby()** is typically used with sorted input. The logic for **groupby()** is similar to the Unix `uniq` filter which makes it handy for eliminating, counting, or identifying duplicate elements:

```
>>> word = 'abracadabra'
>>> letters = sorted(word)      # Turn string into a sorted list
>>> letters
['a', 'a', 'a', 'a', 'a', 'b', 'b', 'c', 'd', 'r', 'r']
>>> for k, g in itertools.groupby(letters):
...     print k, list(g)
...
a ['a', 'a', 'a', 'a', 'a']
b ['b', 'b']
c ['c']
d ['d']
r ['r', 'r']
>>> # List unique letters
>>> [k for k, g in groupby(letters)]
['a', 'b', 'c', 'd', 'r']
>>> # Count letter occurrences
>>> [(k, len(list(g))) for k, g in groupby(letters)]
[('a', 5), ('b', 2), ('c', 1), ('d', 1), ('r', 2)]
```

(Contributed by Hye-Shik Chang.)

- **itertools** also gained a function named `tee(iterator, N)` that returns  $N$  independent iterators that replicate *iterator*. If  $N$  is omitted, the default is 2.

```
>>> L = [1, 2, 3]
>>> i1, i2 = itertools.tee(L)
>>> i1, i2
(<itertools.tee object at 0x402c2080>, <itertools.tee object at 0x402c2080>)
>>> list(i1)                                # Run the first iterator
[1, 2, 3]
>>> list(i2)                                # Run the second iterator
[1, 2, 3]
```

Note that **tee()** has to keep copies of the values returned by

the iterator; in the worst case, it may need to keep all of them. This should therefore be used carefully if the leading iterator can run far ahead of the trailing iterator in a long stream of inputs. If the separation is large, then you might as well use `list()` instead. When the iterators track closely with one another, `tee()` is ideal. Possible applications include bookmarking, windowing, or lookahead iterators. (Contributed by Raymond Hettinger.)

- A number of functions were added to the `locale` module, such as `bind_textdomain_codeset()` to specify a particular encoding and a family of `l*gettext()` functions that return messages in the chosen encoding. (Contributed by Gustavo Niemeyer.)
- Some keyword arguments were added to the `logging` package's `basicConfig()` function to simplify log configuration. The default behavior is to log messages to standard error, but various keyword arguments can be specified to log to a particular file, change the logging format, or set the logging level. For example:

```
import logging
logging.basicConfig(filename='/var/log/application.
    level=0, # Log all messages
    format='%(levelname):%(process):%(thread):%(mes
```

Other additions to the `logging` package include a `log(level, msg)` convenience method, as well as a `TimedRotatingFileHandler` class that rotates its log files at a timed interval. The module already had `RotatingFileHandler`, which rotated logs once the file exceeded a certain size. Both classes derive from a new `BaseRotatingHandler` class that can be used to implement other rotating handlers.

(Changes implemented by Vinay Sajip.)

- The `marshal` module now shares interned strings on unpacking a data structure. This may shrink the size of certain pickle strings, but the primary effect is to make `.pyc`

files significantly smaller. (Contributed by Martin von Löwis.)

- The **nntplib** module's **NNTP** class gained **description()** and **descriptions()** methods to retrieve newsgroup descriptions for a single group or for a range of groups. (Contributed by Jürgen A. Erhard.)
- Two new functions were added to the **operator** module, **attrgetter(attr)** and **itemgetter(index)**. Both functions return callables that take a single argument and return the corresponding attribute or item; these callables make excellent data extractors when used with **map()** or **sorted()**. For example:

```
>>> L = [('c', 2), ('d', 1), ('a', 4), ('b', 3)]
>>> map(operator.itemgetter(0), L)
['c', 'd', 'a', 'b']
>>> map(operator.itemgetter(1), L)
[2, 1, 4, 3]
>>> sorted(L, key=operator.itemgetter(1)) # Sort li
[('d', 1), ('c', 2), ('b', 3), ('a', 4)]
```

(Contributed by Raymond Hettinger.)

- The **optparse** module was updated in various ways. The module now passes its messages through **gettext.gettext()**, making it possible to internationalize Optik's help and error messages. Help messages for options can now include the string '%default', which will be replaced by the option's default value. (Contributed by Greg Ward.)
- The long-term plan is to deprecate the **rfc822** module in some future Python release in favor of the **email** package. To this end, the **email.Utils.formatdate()** function has been changed to make it usable as a replacement for **rfc822.formatdate()**. You may want to write new e-mail processing code with this in mind. (Change implemented by Anthony Baxter.)
- A new **urandom(n)** function was added to the **os** module,

returning a string containing  $n$  bytes of random data. This function provides access to platform-specific sources of randomness such as `/dev/urandom` on Linux or the Windows CryptoAPI. (Contributed by Trevor Perrin.)

- Another new function: `os.path.lexists(path)` returns true if the file specified by *path* exists, whether or not it's a symbolic link. This differs from the existing `os.path.exists(path)` function, which returns false if *path* is a symlink that points to a destination that doesn't exist. (Contributed by Beni Cherniavsky.)
- A new `getsid()` function was added to the `posix` module that underlies the `os` module. (Contributed by J. Raynor.)
- The `poplib` module now supports POP over SSL. (Contributed by Hector Urtubia.)
- The `profile` module can now profile C extension functions. (Contributed by Nick Bastin.)
- The `random` module has a new method called `getrandbits(N)` that returns a long integer  $N$  bits in length. The existing `randrange()` method now uses `getrandbits()` where appropriate, making generation of arbitrarily large random numbers more efficient. (Contributed by Raymond Hettinger.)
- The regular expression language accepted by the `re` module was extended with simple conditional expressions, written as `(?(group)A|B)`. *group* is either a numeric group ID or a group name defined with `(?P<group>...)` earlier in the expression. If the specified group matched, the regular expression pattern *A* will be tested against the string; if the group didn't match, the pattern *B* will be used instead. (Contributed by Gustavo Niemeyer.)
- The `re` module is also no longer recursive, thanks to a massive amount of work by Gustavo Niemeyer. In a recursive regular expression engine, certain patterns result in a large amount of C stack space being consumed, and it was possible

to overflow the stack. For example, if you matched a 30000-byte string of `a` characters against the expression `(a|b)+`, one stack frame was consumed per character. Python 2.3 tried to check for stack overflow and raise a `RuntimeError` exception, but certain patterns could sidestep the checking and if you were unlucky Python could segfault. Python 2.4's regular expression engine can match this pattern without problems.

- The `signal` module now performs tighter error-checking on the parameters to the `signal.signal()` function. For example, you can't set a handler on the `SIGKILL` signal; previous versions of Python would quietly accept this, but 2.4 will raise a `RuntimeError` exception.
- Two new functions were added to the `socket` module. `socketpair()` returns a pair of connected sockets and `getservbyport(port)` looks up the service name for a given port number. (Contributed by Dave Cole and Barry Warsaw.)
- The `sys.exitfunc()` function has been deprecated. Code should be using the existing `atexit` module, which correctly handles calling multiple exit functions. Eventually `sys.exitfunc()` will become a purely internal interface, accessed only by `atexit`.
- The `tarfile` module now generates GNU-format tar files by default. (Contributed by Lars Gustäbel.)
- The `threading` module now has an elegantly simple way to support thread-local data. The module contains a `local` class whose attribute values are local to different threads.

```
import threading

data = threading.local()
data.number = 42
data.url = ('www.python.org', 80)
```

Other threads can assign and retrieve their own values for the

**number** and **url** attributes. You can subclass **local** to initialize attributes or to add methods. (Contributed by Jim Fulton.)

- The **timeit** module now automatically disables periodic garbage collection during the timing loop. This change makes consecutive timings more comparable. (Contributed by Raymond Hettinger.)
- The **weakref** module now supports a wider variety of objects including Python functions, class instances, sets, frozensets, deque, arrays, files, sockets, and regular expression pattern objects. (Contributed by Raymond Hettinger.)
- The **xmlrpclib** module now supports a multi-call extension for transmitting multiple XML-RPC calls in a single HTTP operation. (Contributed by Brian Quinlan.)
- The **mpz**, **rotor**, and **xreadlines** modules have been removed.

## cookielib

The **cookielib** library supports client-side handling for HTTP cookies, mirroring the **Cookie** module's server-side cookie support. Cookies are stored in cookie jars; the library transparently stores cookies offered by the web server in the cookie jar, and fetches the cookie from the jar when connecting to the server. As in web browsers, policy objects control whether cookies are accepted or not.

In order to store cookies across sessions, two implementations of cookie jars are provided: one that stores cookies in the Netscape format so applications can use the Mozilla or Lynx cookie files, and one that stores cookies in the same format as the Perl libwww library.

**urllib2** has been changed to interact with **cookielib**: **HTTPCookieProcessor** manages a cookie jar that is used when accessing URLs.

This module was contributed by John J. Lee.

## doctest

The `doctest` module underwent considerable refactoring thanks to Edward Loper and Tim Peters. Testing can still be as simple as running `doctest.testmod()`, but the refactorings allow customizing the module's operation in various ways

The new **DocTestFinder** class extracts the tests from a given object's docstrings:

```
def f (x, y):
    """>>> f(2,2)
4
>>> f(3,2)
6
    """
    return x*y
```

```
finder = doctest.DocTestFinder()
```

```
# Get list of DocTest instances
tests = finder.find(f)
```

The new **DocTestRunner** class then runs individual tests and can produce a summary of the results:

```
runner = doctest.DocTestRunner()
for t in tests:
    tried, failed = runner.run(t)

runner.summarize(verbose=1)
```

The above example produces the following output:

```
1 items passed all tests:
  2 tests in f
2 tests in 1 items.
2 passed and 0 failed.
```

Test passed.

**DTestCaseRunner** uses an instance of the **OutputChecker** class to compare the expected output with the actual output. This class takes a number of different flags that customize its behaviour; ambitious users can also write a completely new subclass of **OutputChecker**.

The default output checker provides a number of handy features. For example, with the **doctest.ELLIPSIS** option flag, an ellipsis (...) in the expected output matches any substring, making it easier to accommodate outputs that vary in minor ways:

```
def o (n):
    """>>> o(1)
<__main__.C instance at 0x...>
>>>
"""
```

Another special string, **<BLANKLINE>**, matches a blank line:

```
def p (n):
    """>>> p(1)
<BLANKLINE>
>>>
"""
```

Another new capability is producing a diff-style display of the output by specifying the **doctest.REPORT\_UDIFF** (unified diffs), **doctest.REPORT\_CDIFF** (context diffs), or **doctest.REPORT\_NDIFF** (delta-style) option flags. For example:

```
def g (n):
    """>>> g(4)
here
is
a
lengthy
>>>"""
    L = 'here is a rather lengthy list of words'.split()
```

```
for word in L[:n]:
    print word
```

Running the above function's tests with `doctest.REPORT_UDIFF` specified, you get the following output:

```
*****
File "t.py", line 15, in g
Failed example:
    g(4)
Differences (unified diff with -expected +actual):
    @@ -2,3 +2,3 @@
        is
        a
    -lengthy
    +rather
*****
```

## Build and C API Changes

Some of the changes to Python's build process and to the C API are:

- Three new convenience macros were added for common return values from extension functions: `Py_RETURN_NONE`, `Py_RETURN_TRUE`, and `Py_RETURN_FALSE`. (Contributed by Brett Cannon.)
- Another new macro, `Py_CLEAR`, decreases the reference count of *obj* and sets *obj* to the null pointer. (Contributed by Jim Fulton.)
- A new function, `PyTuple_Pack(N, obj1, obj2, ..., objN)`, constructs tuples from a variable length argument list of Python objects. (Contributed by Raymond Hettinger.)
- A new function, `PyDict_Contains(d, k)`, implements fast dictionary lookups without masking exceptions raised during the look-up process. (Contributed by Raymond Hettinger.)
- The `Py_IS_NAN(X)` macro returns 1 if its float or double argument *X* is a NaN. (Contributed by Tim Peters.)
- C code can avoid unnecessary locking by using the new

`PyEval_ThreadsInitialized()` function to tell if any thread operations have been performed. If this function returns false, no lock operations are needed. (Contributed by Nick Coghlan.)

- A new function, `PyArg_VaParseTupleAndKeywords()`, is the same as `PyArg_ParseTupleAndKeywords()` but takes a `va_list` instead of a number of arguments. (Contributed by Greg Chapman.)
- A new method flag, `METH_COEXISTS`, allows a function defined in slots to co-exist with a `PyCFunction` having the same name. This can halve the access time for a method such as `set.__contains__()`. (Contributed by Raymond Hettinger.)
- Python can now be built with additional profiling for the interpreter itself, intended as an aid to people developing the Python core. Providing `--enable-profiling` to the `configure` script will let you profile the interpreter with `gprof`, and providing the `--with-tsc` switch enables profiling using the Pentium's Time-Stamp-Counter register. Note that the `--with-tsc` switch is slightly misnamed, because the profiling feature also works on the PowerPC platform, though that processor architecture doesn't call that register "the TSC register". (Contributed by Jeremy Hylton.)
- The `tracebackobject` type has been renamed to `PyTracebackObject`.

## Port-Specific Changes

- The Windows port now builds under MSVC + + 7.1 as well as version 6. (Contributed by Martin von Löwis.)

## Porting to Python 2.4

This section lists previously described changes that may require changes to your code:

- Left shifts and hexadecimal/octal constants that are too large no longer trigger a `FutureWarning` and return a value limited to 32 or 64 bits; instead they return a long integer.

- Integer operations will no longer trigger an **OverflowWarning**. The **OverflowWarning** warning will disappear in Python 2.5.
- The **zip()** built-in function and **itertools.izip()** now return an empty list instead of raising a **TypeError** exception if called with no arguments.
- You can no longer compare the **date** and **datetime** instances provided by the **datetime** module. Two instances of different classes will now always be unequal, and relative comparisons (**<**, **>**) will raise a **TypeError**.
- **dircache.listdir()** now passes exceptions to the caller instead of returning empty lists.
- **LexicalHandler.startDTD()** used to receive the public and system IDs in the wrong order. This has been corrected; applications relying on the wrong order need to be fixed.
- **fcntl.ioctl()** now warns if the *mutate* argument is omitted and relevant.
- The **tarfile** module now generates GNU-format tar files by default.
- Encountering a failure while importing a module no longer leaves a partially initialized module object in **sys.modules**.
- **None** is now a constant; code that binds a new value to the name **None** is now a syntax error.
- The **signals.signal()** function now raises a **RuntimeError** exception for certain illegal values; previously these errors would pass silently. For example, you can no longer set a handler on the **SIGKILL** signal.

## Acknowledgements

The author would like to thank the following people for offering suggestions, corrections and assistance with various drafts of this article: Koray Can, Hye-Shik Chang, Michael Dyck, Raymond Hettinger, Brian Hurt, Hamish Lawson, Fredrik Lundh, Sean Reifschneider, Sadrudin Rejeb.

# What's New in Python 2.3

Author

A.M. Kuchling

This article explains the new features in Python 2.3. Python 2.3 was released on July 29, 2003.

The main themes for Python 2.3 are polishing some of the features added in 2.2, adding various small but useful enhancements to the core language, and expanding the standard library. The new object model introduced in the previous version has benefited from 18 months of bugfixes and from optimization efforts that have improved the performance of new-style classes. A few new built-in functions have been added such as `sum()` and `enumerate()`. The `in` operator can now be used for substring searches (e.g. `"ab" in "abc"` returns `True`).

Some of the many new library features include Boolean, set, heap, and date/time data types, the ability to import modules from ZIP-format archives, metadata support for the long-awaited Python catalog, an updated version of IDLE, and modules for logging messages, wrapping text, parsing CSV files, processing command-line options, using BerkeleyDB databases... the list of new and enhanced modules is lengthy.

This article doesn't attempt to provide a complete specification of the new features, but instead provides a convenient overview. For full details, you should refer to the documentation for Python 2.3, such as the Python Library Reference and the Python Reference Manual. If you want to understand the complete implementation and design rationale, refer to the PEP for a particular new feature.

## PEP 218: A Standard Set Datatype

The new `sets` module contains an implementation of a set

datatype. The **Set** class is for mutable sets, sets that can have members added and removed. The **ImmutableSet** class is for sets that can't be modified, and instances of **ImmutableSet** can therefore be used as dictionary keys. Sets are built on top of dictionaries, so the elements within a set must be hashable.

Here's a simple example:

```
>>> import sets
>>> S = sets.Set([1,2,3])
>>> S
Set([1, 2, 3])
>>> 1 in S
True
>>> 0 in S
False
>>> S.add(5)
>>> S.remove(3)
>>> S
Set([1, 2, 5])
>>>
```

The union and intersection of sets can be computed with the **union()** and **intersection()** methods; an alternative notation uses the bitwise operators **&** and **|**. Mutable sets also have in-place versions of these methods, **union\_update()** and **intersection\_update()**.

```
>>> S1 = sets.Set([1,2,3])
>>> S2 = sets.Set([4,5,6])
>>> S1.union(S2)
Set([1, 2, 3, 4, 5, 6])
>>> S1 | S2                                     # Alternative notation
Set([1, 2, 3, 4, 5, 6])
>>> S1.intersection(S2)
Set([])
>>> S1 & S2                                     # Alternative notation
Set([])
>>> S1.union_update(S2)
>>> S1
```

```
Set([1, 2, 3, 4, 5, 6])
>>>
```

It's also possible to take the symmetric difference of two sets. This is the set of all elements in the union that aren't in the intersection. Another way of putting it is that the symmetric difference contains all elements that are in exactly one set. Again, there's an alternative notation (^), and an in-place version with the ungainly name **`symmetric_difference_update()`**.

```
>>> S1 = sets.Set([1,2,3,4])
>>> S2 = sets.Set([3,4,5,6])
>>> S1.symmetric_difference(S2)
Set([1, 2, 5, 6])
>>> S1 ^ S2
Set([1, 2, 5, 6])
>>>
```

There are also **`issubset()`** and **`issuperset()`** methods for checking whether one set is a subset or superset of another:

```
>>> S1 = sets.Set([1,2,3])
>>> S2 = sets.Set([2,3])
>>> S2.issubset(S1)
True
>>> S1.issubset(S2)
False
>>> S1.issuperset(S2)
True
>>>
```

**PEP 218** [<https://peps.python.org/pep-0218/>] - Adding a Built-In Set Object Type

PEP written by Greg V. Wilson. Implemented by Greg V. Wilson, Alex Martelli, and GvR.

## PEP 255: Simple Generators

In Python 2.2, generators were added as an optional feature, to be enabled by a `from __future__ import generators` directive. In 2.3 generators no longer need to be specially enabled, and are now always present; this means that **yield** is now always a keyword. The rest of this section is a copy of the description of generators from the “What’s New in Python 2.2” document; if you read it back when Python 2.2 came out, you can skip the rest of this section.

You’re doubtless familiar with how function calls work in Python or C. When you call a function, it gets a private namespace where its local variables are created. When the function reaches a **return** statement, the local variables are destroyed and the resulting value is returned to the caller. A later call to the same function will get a fresh new set of local variables. But, what if the local variables weren’t thrown away on exiting a function? What if you could later resume the function where it left off? This is what generators provide; they can be thought of as resumable functions.

Here’s the simplest example of a generator function:

```
def generate_ints(N):  
    for i in range(N):  
        yield i
```

A new keyword, **yield**, was introduced for generators. Any function containing a **yield** statement is a generator function; this is detected by Python’s bytecode compiler which compiles the function specially as a result.

When you call a generator function, it doesn’t return a single value; instead it returns a generator object that supports the iterator protocol. On executing the **yield** statement, the generator outputs the value of `i`, similar to a **return** statement. The big difference between **yield** and a **return** statement is that on reaching a **yield** the generator’s state of execution is suspended and local variables are preserved. On the next call to the generator’s `.next()` method, the function will resume executing immediately after the **yield** statement. (For complicated reasons, the **yield** statement isn’t allowed inside the **try** block of a **try...finally** statement; read [PEP 255](https://peps.python.org/pep-0255/) [https://peps.python.org/pep-0255/] for a full

explanation of the interaction between **yield** and exceptions.)

Here's a sample usage of the **generate\_ints()** generator:

```
>>> gen = generate_ints(3)
>>> gen
<generator object at 0x8117f90>
>>> gen.next()
0
>>> gen.next()
1
>>> gen.next()
2
>>> gen.next()
Traceback (most recent call last):
  File "stdin", line 1, in ?
  File "stdin", line 2, in generate_ints
StopIteration
```

You could equally write `for i in generate_ints(5), or a,b,c = generate_ints(3).`

Inside a generator function, the **return** statement can only be used without a value, and signals the end of the procession of values; afterwards the generator cannot return any further values. **return** with a value, such as `return 5`, is a syntax error inside a generator function. The end of the generator's results can also be indicated by raising **StopIteration** manually, or by just letting the flow of execution fall off the bottom of the function.

You could achieve the effect of generators manually by writing your own class and storing all the local variables of the generator as instance variables. For example, returning a list of integers could be done by setting `self.count` to 0, and having the **next()** method increment `self.count` and return it. However, for a moderately complicated generator, writing a corresponding class would be much messier. `Lib/test/test_generators.py` contains a number of more interesting examples. The simplest one implements an in-order traversal of a tree using generators recursively.

```
# A recursive generator that generates Tree leaves in in
def inorder(t):
    if t:
        for x in inorder(t.left):
            yield x
        yield t.label
        for x in inorder(t.right):
            yield x
```

Two other examples in `Lib/test/test_generators.py` produce solutions for the N-Queens problem (placing  $N$  queens on an  $N \times N$  chess board so that no queen threatens another) and the Knight's Tour (a route that takes a knight to every square of an  $N \times N$  chessboard without visiting any square twice).

The idea of generators comes from other programming languages, especially Icon (<https://www2.cs.arizona.edu/icon/>), where the idea of generators is central. In Icon, every expression and function call behaves like a generator. One example from “An Overview of the Icon Programming Language” at <https://www2.cs.arizona.edu/icon/docs/ipd266.htm> gives an idea of what this looks like:

```
sentence := "Store it in the neighboring harbor"
if (i := find("or", sentence)) > 5 then write(i)
```

In Icon the `find()` function returns the indexes at which the substring “or” is found: 3, 23, 33. In the `if` statement, `i` is first assigned a value of 3, but 3 is less than 5, so the comparison fails, and Icon retries it with the second value of 23. 23 is greater than 5, so the comparison now succeeds, and the code prints the value 23 to the screen.

Python doesn't go nearly as far as Icon in adopting generators as a central concept. Generators are considered part of the core Python language, but learning or using them isn't compulsory; if they don't solve any problems that you have, feel free to ignore them. One novel feature of Python's interface as compared to Icon's is that a generator's state is represented as a concrete object (the iterator) that can be passed around to other functions or stored in a data structure.

**PEP 255** [<https://peps.python.org/pep-0255/>] - **Simple Generators**

Written by Neil Schemenauer, Tim Peters, Magnus Lie Hetland. Implemented mostly by Neil Schemenauer and Tim Peters, with other fixes from the Python Labs crew.

## PEP 263: Source Code Encodings

Python source files can now be declared as being in different character set encodings. Encodings are declared by including a specially formatted comment in the first or second line of the source file. For example, a UTF-8 file can be declared with:

```
#!/usr/bin/env python
# -*- coding: UTF-8 -*-
```

Without such an encoding declaration, the default encoding used is 7-bit ASCII. Executing or importing modules that contain string literals with 8-bit characters and have no encoding declaration will result in a **DeprecationWarning** being signalled by Python 2.3; in 2.4 this will be a syntax error.

The encoding declaration only affects Unicode string literals, which will be converted to Unicode using the specified encoding. Note that Python identifiers are still restricted to ASCII characters, so you can't have variable names that use characters outside of the usual alphanumerics.

See also

**PEP 263** [<https://peps.python.org/pep-0263/>] - **Defining Python Source Code Encodings**

Written by Marc-André Lemburg and Martin von Löwis; implemented by Suzuki Hisao and Martin von Löwis.

## PEP 273: Importing Modules from ZIP Archives

The new `zipimport` module adds support for importing modules from a ZIP-format archive. You don't need to import the module explicitly; it will be automatically imported if a ZIP archive's filename is added to `sys.path`. For example:

```
amk@nyman:~/src/python$ unzip -l /tmp/example.zip
Archive:  /tmp/example.zip
  Length      Date    Time    Name
-----
      8467   11-26-02  22:30   jwzthreading.py
-----
      8467                     1 file

amk@nyman:~/src/python$ ./python
Python 2.3 (#1, Aug 1 2003, 19:54:32)
>>> import sys
>>> sys.path.insert(0, '/tmp/example.zip') # Add .zip f
>>> import jwzthreading
>>> jwzthreading.__file__
'/tmp/example.zip/jwzthreading.py'
>>>
```

An entry in `sys.path` can now be the filename of a ZIP archive. The ZIP archive can contain any kind of files, but only files named `*.py`, `*.pyc`, or `*.pyo` can be imported. If an archive only contains `*.py` files, Python will not attempt to modify the archive by adding the corresponding `*.pyc` file, meaning that if a ZIP archive doesn't contain `*.pyc` files, importing may be rather slow.

A path within the archive can also be specified to only import from a subdirectory; for example, the path `/tmp/example.zip/lib/` would only import from the `lib/` subdirectory within the archive.

## See also

### **PEP 273** [<https://peps.python.org/pep-0273/>] - Import Modules from Zip Archives

Written by James C. Ahlstrom, who also provided an implementation. Python 2.3 follows the specification in **PEP 273** [<https://peps.python.org/pep-0273/>], but uses an implementation written by Just van Rossum that uses the

import hooks described in [PEP 302](https://peps.python.org/pep-0302/) [https://peps.python.org/pep-0302/]. See section [PEP 302: New Import Hooks](#) for a description of the new import hooks.

## PEP 277: Unicode file name support for Windows NT

On Windows NT, 2000, and XP, the system stores file names as Unicode strings. Traditionally, Python has represented file names as byte strings, which is inadequate because it renders some file names inaccessible.

Python now allows using arbitrary Unicode strings (within the limitations of the file system) for all functions that expect file names, most notably the `open()` built-in function. If a Unicode string is passed to `os.listdir()`, Python now returns a list of Unicode strings. A new function, `os.getcwd()`, returns the current directory as a Unicode string.

Byte strings still work as file names, and on Windows Python will transparently convert them to Unicode using the `mbcs` encoding.

Other systems also allow Unicode strings as file names but convert them to byte strings before passing them to the system, which can cause a `UnicodeError` to be raised. Applications can test whether arbitrary Unicode strings are supported as file names by checking `os.path.supports_unicode_filenames`, a Boolean value.

Under MacOS, `os.listdir()` may now return Unicode filenames.

See also

[PEP 277](https://peps.python.org/pep-0277/) [https://peps.python.org/pep-0277/] - Unicode file name support for Windows NT

Written by Neil Hodgson; implemented by Neil Hodgson, Martin von Löwis, and Mark Hammond.

## PEP 278: Universal Newline Support

The three major operating systems used today are Microsoft Windows, Apple's Macintosh OS, and the various Unix derivatives. A minor irritation of cross-platform work is that these three platforms all use different characters to mark the ends of lines in text files. Unix uses the linefeed (ASCII character 10), MacOS uses the carriage return (ASCII character 13), and Windows uses a two-character sequence of a carriage return plus a newline.

Python's file objects can now support end of line conventions other than the one followed by the platform on which Python is running. Opening a file with the mode `'U'` or `'rU'` will open a file for reading in [universal newlines](#) mode. All three line ending conventions will be translated to a `'\n'` in the strings returned by the various file methods such as `read()` and `readline()`.

Universal newline support is also used when importing modules and when executing a file with the `execfile()` function. This means that Python modules can be shared between all three operating systems without needing to convert the line-endings.

This feature can be disabled when compiling Python by specifying the `--without-universal-newlines` switch when running Python's `configure` script.

See also

[PEP 278](#) [<https://peps.python.org/pep-0278/>] - Universal Newline Support

Written and implemented by Jack Jansen.

## PEP 279: `enumerate()`

A new built-in function, `enumerate()`, will make certain loops a bit clearer. `enumerate(thing)`, where *thing* is either an iterator or a sequence, returns an iterator that will return `(0, thing[0])`, `(1, thing[1])`, `(2, thing[2])`, and so forth.

A common idiom to change every element of a list looks like this:

```
for i in range(len(L)):
    item = L[i]
    # ... compute some result based on item ...
    L[i] = result
```

This can be rewritten using `enumerate()` as:

```
for i, item in enumerate(L):
    # ... compute some result based on item ...
    L[i] = result
```

See also

**PEP 279** [<https://peps.python.org/pep-0279/>] - The `enumerate()` built-in function

Written and implemented by Raymond D. Hettinger.

## PEP 282: The logging Package

A standard package for writing logs, `logging`, has been added to Python 2.3. It provides a powerful and flexible mechanism for generating logging output which can then be filtered and processed in various ways. A configuration file written in a standard format can be used to control the logging behavior of a program. Python includes handlers that will write log records to standard error or to a file or socket, send them to the system log, or even e-mail them to a particular address; of course, it's also possible to write your own handler classes.

The **Logger** class is the primary class. Most application code will deal with one or more **Logger** objects, each one used by a particular subsystem of the application. Each **Logger** is identified by a name, and names are organized into a hierarchy using `.` as the component separator. For example, you might have **Logger** instances named `server`, `server.auth` and `server.network`. The latter two instances are below `server` in the hierarchy. This means that if you turn up the verbosity for `server` or direct `server` messages to a different handler, the changes will also apply to records logged to `server.auth` and `server.network`.

There's also a root **Logger** that's the parent of all other loggers.

For simple uses, the **logging** package contains some convenience functions that always use the root log:

```
import logging

logging.debug('Debugging information')
logging.info('Informational message')
logging.warning('Warning:config file %s not found', 'server.conf')
logging.error('Error occurred')
logging.critical('Critical error -- shutting down')
```

This produces the following output:

```
WARNING:root:Warning:config file server.conf not found
ERROR:root:Error occurred
CRITICAL:root:Critical error -- shutting down
```

In the default configuration, informational and debugging messages are suppressed and the output is sent to standard error. You can enable the display of informational and debugging messages by calling the **setLevel()** method on the root logger.

Notice the **warning()** call's use of string formatting operators; all of the functions for logging messages take the arguments (*msg*, *arg1*, *arg2*, ...) and log the string resulting from *msg* % (*arg1*, *arg2*, ...).

There's also an **exception()** function that records the most recent traceback. Any of the other functions will also record the traceback if you specify a true value for the keyword argument *exc\_info*.

```
def f():
    try:
        1/0
    except:
        logging.exception('Problem recorded')

f()
```

This produces the following output:

```
ERROR:root:Problem recorded
Traceback (most recent call last):
  File "t.py", line 6, in f
    1/0
ZeroDivisionError: integer division or modulo by zero
```

Slightly more advanced programs will use a logger other than the root logger. The `getLogger(name)` function is used to get a particular log, creating it if it doesn't exist yet. `getLogger(None)` returns the root logger.

```
log = logging.getLogger('server')
...
log.info('Listening on port %i', port)
...
log.critical('Disk full')
...
```

Log records are usually propagated up the hierarchy, so a message logged to `server.auth` is also seen by `server` and `root`, but a **Logger** can prevent this by setting its **propagate** attribute to **False**.

There are more classes provided by the **logging** package that can be customized. When a **Logger** instance is told to log a message, it creates a **LogRecord** instance that is sent to any number of different **Handler** instances. Loggers and handlers can also have an attached list of filters, and each filter can cause the **LogRecord** to be ignored or can modify the record before passing it along. When they're finally output, **LogRecord** instances are converted to text by a **Formatter** class. All of these classes can be replaced by your own specially written classes.

With all of these features the **logging** package should provide enough flexibility for even the most complicated applications. This is only an incomplete overview of its features, so please see the package's reference documentation for all of the details. Reading **PEP 282** [<https://peps.python.org/pep-0282/>] will also be helpful.

**PEP 282** [<https://peps.python.org/pep-0282/>] - A Logging System  
Written by Vinay Sajip and Trent Mick; implemented by  
Vinay Sajip.

## PEP 285: A Boolean Type

A Boolean type was added to Python 2.3. Two new constants were added to the `__builtin__` module, `True` and `False`. (`True` and `False` constants were added to the built-ins in Python 2.2.1, but the 2.2.1 versions are simply set to integer values of 1 and 0 and aren't a different type.)

The type object for this new type is named `bool`; the constructor for it takes any Python value and converts it to `True` or `False`.

```
>>> bool(1)
True
>>> bool(0)
False
>>> bool([])
False
>>> bool( (1,) )
True
```

Most of the standard library modules and built-in functions have been changed to return Booleans.

```
>>> obj = []
>>> hasattr(obj, 'append')
True
>>> isinstance(obj, list)
True
>>> isinstance(obj, tuple)
False
```

Python's Booleans were added with the primary goal of making code clearer. For example, if you're reading a function and encounter the statement `return 1`, you might wonder whether the `1` represents a Boolean truth value, an index, or a coefficient

that multiplies some other quantity. If the statement is `return True`, however, the meaning of the return value is quite clear.

Python's Booleans were *not* added for the sake of strict type-checking. A very strict language such as Pascal would also prevent you performing arithmetic with Booleans, and would require that the expression in an `if` statement always evaluate to a Boolean result. Python is not this strict and never will be, as [PEP 285](https://peps.python.org/pep-0285/) [https://peps.python.org/pep-0285/] explicitly says. This means you can still use any expression in an `if` statement, even ones that evaluate to a list or tuple or some random object. The Boolean type is a subclass of the `int` class so that arithmetic using a Boolean still works.

```
>>> True + 1
2
>>> False + 1
1
>>> False * 75
0
>>> True * 75
75
```

To sum up `True` and `False` in a sentence: they're alternative ways to spell the integer values 1 and 0, with the single difference that `str()` and `repr()` return the strings `'True'` and `'False'` instead of `'1'` and `'0'`.

**See also**

Written and implemented by GvR.

## PEP 293: Codec Error Handling Callbacks

When encoding a Unicode string into a byte string, unencodable characters may be encountered. So far, Python has allowed specifying the error processing as either “strict” (raising `UnicodeError`), “ignore” (skipping the character), or “replace”

(using a question mark in the output string), with “strict” being the default behavior. It may be desirable to specify alternative processing of such errors, such as inserting an XML character reference or HTML entity reference into the converted string.

Python now has a flexible framework to add different processing strategies. New error handlers can be added with `codecs.register_error()`, and codecs then can access the error handler with `codecs.lookup_error()`. An equivalent C API has been added for codecs written in C. The error handler gets the necessary state information such as the string being converted, the position in the string where the error was detected, and the target encoding. The handler can then either raise an exception or return a replacement string.

Two additional error handlers have been implemented using this framework: “backslashreplace” uses Python backslash quoting to represent unencodable characters and “xmlcharrefreplace” emits XML character references.

**See also**

**PEP 293** [<https://peps.python.org/pep-0293/>] - **Codec Error Handling Callbacks**

Written and implemented by Walter Dörwald.

## PEP 301: Package Index and Metadata for Distutils

Support for the long-requested Python catalog makes its first appearance in 2.3.

The heart of the catalog is the new Distutils **register** command. Running `python setup.py register` will collect the metadata describing a package, such as its name, version, maintainer, description, &c., and send it to a central catalog server. The resulting catalog is available from <https://pypi.org>.

To make the catalog a bit more useful, a new optional *classifiers*

keyword argument has been added to the Distutils `setup()` function. A list of [Trove](http://catb.org/~esr/trove/) [http://catb.org/~esr/trove/]-style strings can be supplied to help classify the software.

Here's an example `setup.py` with classifiers, written to be compatible with older versions of the Distutils:

```
from distutils import core
kw = {'name': "Quixote",
      'version': "0.5.1",
      'description': "A highly Pythonic Web application",
      # ...
    }

if (hasattr(core, 'setup_keywords') and
    'classifiers' in core.setup_keywords):
    kw['classifiers'] = \
        ['Topic :: Internet :: WWW/HTTP :: Dynamic Content',
         'Environment :: No Input/Output (Daemon)',
         'Intended Audience :: Developers'],

core.setup(**kw)
```

The full list of classifiers can be obtained by running `python setup.py register --list-classifiers`.

### See also

**PEP 301** [<https://peps.python.org/pep-0301/>] - **Package Index and Metadata for Distutils**

Written and implemented by Richard Jones.

## PEP 302: New Import Hooks

While it's been possible to write custom import hooks ever since the `ihooks` module was introduced in Python 1.3, no one has ever been really happy with it because writing new import hooks is difficult and messy. There have been various proposed alternatives such as the `importlib` and `iu` modules, but none of them has ever

gained much acceptance, and none of them were easily usable from C code.

**PEP 302** [<https://peps.python.org/pep-0302/>] borrows ideas from its predecessors, especially from Gordon McMillan's `iu` module. Three new items are added to the `sys` module:

- `sys.path_hooks` is a list of callable objects; most often they'll be classes. Each callable takes a string containing a path and either returns an importer object that will handle imports from this path or raises an `ImportError` exception if it can't handle this path.
- `sys.path_importer_cache` caches importer objects for each path, so `sys.path_hooks` will only need to be traversed once for each path.
- `sys.meta_path` is a list of importer objects that will be traversed before `sys.path` is checked. This list is initially empty, but user code can add objects to it. Additional built-in and frozen modules can be imported by an object added to this list.

Importer objects must have a single method,

`find_module(fullname, path=None)`. *fullname* will be a module or package name, e.g. `string` or `distutils.core`. **`find_module()`** must return a loader object that has a single method, `load_module(fullname)`, that creates and returns the corresponding module object.

Pseudo-code for Python's new import logic, therefore, looks something like this (simplified a bit; see **PEP 302** [<https://peps.python.org/pep-0302/>] for the full details):

```
for mp in sys.meta_path:
    loader = mp(fullname)
    if loader is not None:
        <module> = loader.load_module(fullname)

for path in sys.path:
    for hook in sys.path_hooks:
        try:
```

```

        importer = hook(path)
    except ImportError:
        # ImportError, so try the other path hooks
        pass
    else:
        loader = importer.find_module(fullname)
        <module> = loader.load_module(fullname)

# Not found!
raise ImportError

```

### See also

 Written by Just van Rossum and Paul Moore. Implemented  
 by Just van Rossum.

## PEP 305: Comma-separated Files

Comma-separated files are a format frequently used for exporting data from databases and spreadsheets. Python 2.3 adds a parser for comma-separated files.

Comma-separated format is deceptively simple at first glance:

```
Costs,150,200,3.95
```

Read a line and call `line.split(',')`: what could be simpler? But toss in string data that can contain commas, and things get more complicated:

```
"Costs",150,200,3.95,"Includes taxes, shipping, and sundries"
```

A big ugly regular expression can parse this, but using the new **csv** package is much simpler:

```
import csv

input = open('datafile', 'rb')
```

```
reader = csv.reader(input)
for line in reader:
    print line
```

The **reader()** function takes a number of different options. The field separator isn't limited to the comma and can be changed to any character, and so can the quoting and line-ending characters.

Different dialects of comma-separated files can be defined and registered; currently there are two dialects, both used by Microsoft Excel. A separate **csv.writer** class will generate comma-separated files from a succession of tuples or lists, quoting strings that contain the delimiter.

Written and implemented by Kevin Altis, Dave Cole,  
Andrew McNamara, Skip Montanaro, Cliff Wells.

## PEP 307: Pickle Enhancements

The **pickle** and **cPickle** modules received some attention during the 2.3 development cycle. In 2.2, new-style classes could be pickled without difficulty, but they weren't pickled very compactly; **PEP 307** [<https://peps.python.org/pep-0307/>] quotes a trivial example where a new-style class results in a pickled string three times longer than that for a classic class.

The solution was to invent a new pickle protocol. The **pickle.dumps()** function has supported a text-or-binary flag for a long time. In 2.3, this flag is redefined from a Boolean to an integer: 0 is the old text-mode pickle format, 1 is the old binary format, and now 2 is a new 2.3-specific format. A new constant, **pickle.HIGHEST\_PROTOCOL**, can be used to select the fanciest protocol available.

Unpickling is no longer considered a safe operation. 2.2's **pickle** provided hooks for trying to prevent unsafe classes from being

unpickled (specifically, a `__safe_for_unpickling__` attribute), but none of this code was ever audited and therefore it's all been ripped out in 2.3. You should not unpickle untrusted data in any version of Python.

To reduce the pickling overhead for new-style classes, a new interface for customizing pickling was added using three special methods: `__getstate__()`, `__setstate__()`, and `__getnewargs__()`. Consult [PEP 307](https://peps.python.org/pep-0307/) [https://peps.python.org/pep-0307/] for the full semantics of these methods.

As a way to compress pickles yet further, it's now possible to use integer codes instead of long strings to identify pickled classes. The Python Software Foundation will maintain a list of standardized codes; there's also a range of codes for private use. Currently no codes have been specified.

**See also**

[PEP 307](https://peps.python.org/pep-0307/) [https://peps.python.org/pep-0307/] - **Extensions to the pickle protocol**

Written and implemented by Guido van Rossum and Tim Peters.

## Extended Slices

Ever since Python 1.4, the slicing syntax has supported an optional third “step” or “stride” argument. For example, these are all legal Python syntax: `L[1:10:2]`, `L[:-1:1]`, `L[::-1]`. This was added to Python at the request of the developers of Numerical Python, which uses the third argument extensively. However, Python's built-in list, tuple, and string sequence types have never supported this feature, raising a `TypeError` if you tried it. Michael Hudson contributed a patch to fix this shortcoming.

For example, you can now easily extract the elements of a list that have even indexes:

```
>>> L = range(10)
```

```
>>> L[::2]
[0, 2, 4, 6, 8]
```

Negative values also work to make a copy of the same list in reverse order:

```
>>> L[::-1]
[9, 8, 7, 6, 5, 4, 3, 2, 1, 0]
```

This also works for tuples, arrays, and strings:

```
>>> s='abcd'
>>> s[::2]
'ac'
>>> s[::-1]
'dcba'
```

If you have a mutable sequence such as a list or an array you can assign to or delete an extended slice, but there are some differences between assignment to extended and regular slices. Assignment to a regular slice can be used to change the length of the sequence:

```
>>> a = range(3)
>>> a
[0, 1, 2]
>>> a[1:3] = [4, 5, 6]
>>> a
[0, 4, 5, 6]
```

Extended slices aren't this flexible. When assigning to an extended slice, the list on the right hand side of the statement must contain the same number of items as the slice it is replacing:

```
>>> a = range(4)
>>> a
[0, 1, 2, 3]
>>> a[::2]
[0, 2]
>>> a[::2] = [0, -1]
>>> a
```

```
[0, 1, -1, 3]
>>> a[::2] = [0,1,2]
Traceback (most recent call last):
  File "<stdin>", line 1, in ?
ValueError: attempt to assign sequence of size 3 to extended slice
```

Deletion is more straightforward:

```
>>> a = range(4)
>>> a
[0, 1, 2, 3]
>>> a[::2]
[0, 2]
>>> del a[::2]
>>> a
[1, 3]
```

One can also now pass slice objects to the `__getitem__()` methods of the built-in sequences:

```
>>> range(10).__getitem__(slice(0, 5, 2))
[0, 2, 4]
```

Or use slice objects directly in subscripts:

```
>>> range(10)[slice(0, 5, 2)]
[0, 2, 4]
```

To simplify implementing sequences that support extended slicing, slice objects now have a method `indices(length)` which, given the length of a sequence, returns a `(start, stop, step)` tuple that can be passed directly to `range()`. `indices()` handles omitted and out-of-bounds indices in a manner consistent with regular slices (and this innocuous phrase hides a welter of confusing details!). The method is intended to be used like this:

```
class FakeSeq:
    ...
    def calc_item(self, i):
        ...
```

```
def __getitem__(self, item):
    if isinstance(item, slice):
        indices = item.indices(len(self))
        return FakeSeq([self.calc_item(i) for i in range(*indices)])
    else:
        return self.calc_item(item)
```

From this example you can also see that the built-in `slice` object is now the type object for the slice type, and is no longer a function. This is consistent with Python 2.2, where `int`, `str`, etc., underwent the same change.

## Other Language Changes

Here are all of the changes that Python 2.3 makes to the core Python language.

- The `yield` statement is now always a keyword, as described in section [PEP 255: Simple Generators](#) of this document.
- A new built-in function `enumerate()` was added, as described in section [PEP 279: enumerate\(\)](#) of this document.
- Two new constants, `True` and `False` were added along with the built-in `bool` type, as described in section [PEP 285: A Boolean Type](#) of this document.
- The `int()` type constructor will now return a long integer instead of raising an `OverflowError` when a string or floating-point number is too large to fit into an integer. This can lead to the paradoxical result that `isinstance(int(expression), int)` is false, but that seems unlikely to cause problems in practice.
- Built-in types now support the extended slicing syntax, as described in section [Extended Slices](#) of this document.
- A new built-in function, `sum(iterable, start=0)`, adds up the numeric items in the iterable object and returns their sum. `sum()` only accepts numbers, meaning that you can't

use it to concatenate a bunch of strings. (Contributed by Alex Martelli.)

- `list.insert(pos, value)` used to insert *value* at the front of the list when *pos* was negative. The behaviour has now been changed to be consistent with slice indexing, so when *pos* is -1 the value will be inserted before the last element, and so forth.
- `list.index(value)`, which searches for *value* within the list and returns its index, now takes optional *start* and *stop* arguments to limit the search to only part of the list.
- Dictionaries have a new method, `pop(key[, *default*])`, that returns the value corresponding to *key* and removes that key/value pair from the dictionary. If the requested key isn't present in the dictionary, *default* is returned if it's specified and **KeyError** raised if it isn't.

```
>>> d = {1:2}
>>> d
{1: 2}
>>> d.pop(4)
Traceback (most recent call last):
  File "stdin", line 1, in ?
KeyError: 4
>>> d.pop(1)
2
>>> d.pop(1)
Traceback (most recent call last):
  File "stdin", line 1, in ?
KeyError: 'pop(): dictionary is empty'
>>> d
{}
>>>
```

There's also a new class method, `dict.fromkeys(iterable, value)`, that creates a dictionary with keys taken from the supplied iterator *iterable* and all values set to *value*, defaulting to `None`.

(Patches contributed by Raymond Hettinger.)

Also, the `dict()` constructor now accepts keyword arguments to simplify creating small dictionaries:

```
>>> dict(red=1, blue=2, green=3, black=4)
{'blue': 2, 'black': 4, 'green': 3, 'red': 1}
```

(Contributed by Just van Rossum.)

- The `assert` statement no longer checks the `__debug__` flag, so you can no longer disable assertions by assigning to `__debug__`. Running Python with the `-O` switch will still generate code that doesn't execute any assertions.
- Most type objects are now callable, so you can use them to create new objects such as functions, classes, and modules. (This means that the `new` module can be deprecated in a future Python version, because you can now use the type objects available in the `types` module.) For example, you can create a new module object with the following code:

```
>>> import types
>>> m = types.ModuleType('abc', 'docstring')
>>> m
<module 'abc' (built-in)>
>>> m.__doc__
'docstring'
```

- A new warning, `PendingDeprecationWarning` was added to indicate features which are in the process of being deprecated. The warning will *not* be printed by default. To check for use of features that will be deprecated in the future, supply `-Wallways::PendingDeprecationWarning::` on the command line or use `warnings.filterwarnings()`.
- The process of deprecating string-based exceptions, as in `raise "Error occurred"`, has begun. Raising a string will now trigger `PendingDeprecationWarning`.
- Using `None` as a variable name will now result in a

**SyntaxWarning** warning. In a future version of Python, `None` may finally become a keyword.

- The **`xreadlines()`** method of file objects, introduced in Python 2.1, is no longer necessary because files now behave as their own iterator. **`xreadlines()`** was originally introduced as a faster way to loop over all the lines in a file, but now you can simply write `for line in file_obj`. File objects also have a new read-only **`encoding`** attribute that gives the encoding used by the file; Unicode strings written to the file will be automatically converted to bytes using the given encoding.
- The method resolution order used by new-style classes has changed, though you'll only notice the difference if you have a really complicated inheritance hierarchy. Classic classes are unaffected by this change. Python 2.2 originally used a topological sort of a class's ancestors, but 2.3 now uses the C3 algorithm as described in the paper "[A Monotonic Superclass Linearization for Dylan](https://citeseerx.ist.psu.edu/viewdoc/summary?doi=10.1.1.19.3910)" [https://citeseerx.ist.psu.edu/viewdoc/summary?doi=10.1.1.19.3910]. To understand the motivation for this change, read Michele Simionato's article "[Python 2.3 Method Resolution Order](http://www.phyast.pitt.edu/~micheles/mro.html)" [http://www.phyast.pitt.edu/~micheles/mro.html], or read the thread on python-dev starting with the message at <https://mail.python.org/pipermail/python-dev/2002-October/029035.html>. Samuele Pedroni first pointed out the problem and also implemented the fix by coding the C3 algorithm.
- Python runs multithreaded programs by switching between threads after executing N bytecodes. The default value for N has been increased from 10 to 100 bytecodes, speeding up single-threaded applications by reducing the switching overhead. Some multithreaded applications may suffer slower response time, but that's easily fixed by setting the limit back to a lower number using `sys.setcheckinterval(N)`. The limit can be retrieved with the new **`sys.getcheckinterval()`** function.
- One minor but far-reaching change is that the names of extension types defined by the modules included with Python

now contain the module and a `'.'` in front of the type name. For example, in Python 2.2, if you created a socket and printed its `__class__`, you'd get this output:

```
>>> s = socket.socket()
>>> s.__class__
<type 'socket'>
```

In 2.3, you get this:

```
>>> s.__class__
<type '_socket.socket'>
```

- One of the noted incompatibilities between old- and new-style classes has been removed: you can now assign to the `__name__` and `__bases__` attributes of new-style classes. There are some restrictions on what can be assigned to `__bases__` along the lines of those relating to assigning to an instance's `__class__` attribute.

## String Changes

- The `in` operator now works differently for strings. Previously, when evaluating `X in Y` where `X` and `Y` are strings, `X` could only be a single character. That's now changed; `X` can be a string of any length, and `X in Y` will return `True` if `X` is a substring of `Y`. If `X` is the empty string, the result is always `True`.

```
>>> 'ab' in 'abcd'
True
>>> 'ad' in 'abcd'
False
>>> '' in 'abcd'
True
```

Note that this doesn't tell you where the substring starts; if you need that information, use the `find()` string method.

- The `strip()`, `lstrip()`, and `rstrip()` string methods now have an optional argument for specifying the characters

to `strip`. The default is still to remove all whitespace characters:

```
>>> '  abc '.strip()
'abc'
>>> '><><abc><><>'.strip('<>')
'abc'
>>> '><><abc><><>\n'.strip('<>')
'abc<><><>\n'
>>> u'\u4000\u4001abc\u4000'.strip(u'\u4000')
u'\u4001abc'
>>>
```

(Suggested by Simon Brunning and implemented by Walter Dörwald.)

- The **`startswith()`** and **`endswith()`** string methods now accept negative numbers for the *start* and *end* parameters.
- Another new string method is **`zfill()`**, originally a function in the **`string`** module. **`zfill()`** pads a numeric string with zeros on the left until it's the specified width. Note that the `%` operator is still more flexible and powerful than **`zfill()`**.

```
>>> '45'.zfill(4)
'0045'
>>> '12345'.zfill(4)
'12345'
>>> 'goofy'.zfill(6)
'0goofy'
```

(Contributed by Walter Dörwald.)

- A new type object, **`basestring`**, has been added. Both 8-bit strings and Unicode strings inherit from this type, so `isinstance(obj, basestring)` will return **`True`** for either kind of string. It's a completely abstract type, so you can't create **`basestring`** instances.
- Interned strings are no longer immortal and will now be garbage-collected in the usual way when the only reference to

them is from the internal dictionary of interned strings. (Implemented by Oren Tirosh.)

## Optimizations

- The creation of new-style class instances has been made much faster; they're now faster than classic classes!
- The **sort()** method of list objects has been extensively rewritten by Tim Peters, and the implementation is significantly faster.
- Multiplication of large long integers is now much faster thanks to an implementation of Karatsuba multiplication, an algorithm that scales better than the  $O(n^2)$  required for the grade-school multiplication algorithm. (Original patch by Christopher A. Craig, and significantly reworked by Tim Peters.)
- The **SET\_LINENO** opcode is now gone. This may provide a small speed increase, depending on your compiler's idiosyncrasies. See section [Other Changes and Fixes](#) for a longer explanation. (Removed by Michael Hudson.)
- **xrange()** objects now have their own iterator, making `for i in xrange(n)` slightly faster than `for i in range(n)`. (Patch by Raymond Hettinger.)
- A number of small rearrangements have been made in various hotspots to improve performance, such as inlining a function or removing some code. (Implemented mostly by GvR, but lots of people have contributed single changes.)

The net result of the 2.3 optimizations is that Python 2.3 runs the pystone benchmark around 25% faster than Python 2.2.

## New, Improved, and Deprecated Modules

As usual, Python's standard library received a number of enhancements and bug fixes. Here's a partial list of the most notable changes, sorted alphabetically by module name. Consult the `Misc/NEWS` file in the source tree for a more complete list of changes, or look through the CVS logs for all the details.

- The **array** module now supports arrays of Unicode

characters using the 'u' format character. Arrays also now support using the += assignment operator to add another array's contents, and the \*= assignment operator to repeat an array. (Contributed by Jason Orendorff.)

- The **bsddb** module has been replaced by version 4.1.6 of the [PyBSddb](https://pybsddb.sourceforge.net) [https://pybsddb.sourceforge.net] package, providing a more complete interface to the transactional features of the BerkeleyDB library.

The old version of the module has been renamed to **bsddb185** and is no longer built automatically; you'll have to edit `Modules/Setup` to enable it. Note that the new **bsddb** package is intended to be compatible with the old module, so be sure to file bugs if you discover any incompatibilities.

When upgrading to Python 2.3, if the new interpreter is compiled with a new version of the underlying BerkeleyDB library, you will almost certainly have to convert your database files to the new version. You can do this fairly easily with the new scripts `db2pickle.py` and `pickle2db.py` which you will find in the distribution's `Tools/scripts` directory. If you've already been using the PyBSddb package and importing it as **bsddb3**, you will have to change your `import` statements to import it as **bsddb**.

- The new **bz2** module is an interface to the bz2 data compression library. bz2-compressed data is usually smaller than corresponding **zlib**-compressed data. (Contributed by Gustavo Niemeyer.)
- A set of standard date/time types has been added in the new **datetime** module. See the following section for more details.
- The Distutils **Extension** class now supports an extra constructor argument named *depends* for listing additional source files that an extension depends on. This lets Distutils recompile the module if any of the dependency files are modified. For example, if `sampmodule.c` includes the header file `sample.h`, you would create the **Extension** object like this:

```
ext = Extension("samp",
                sources=["sampmodule.c"],
                depends=["sample.h"])
```

Modifying `sample.h` would then cause the module to be recompiled. (Contributed by Jeremy Hylton.)

- Other minor changes to Distutils: it now checks for the `CC`, `CFLAGS`, `CPP`, `LDFLAGS`, and `CPPFLAGS` environment variables, using them to override the settings in Python's configuration (contributed by Robert Weber).
- Previously the `doctest` module would only search the docstrings of public methods and functions for test cases, but it now also examines private ones as well. The `DocTestSuite()` function creates a `unittest.TestSuite` object from a set of `doctest` tests.
- The new `gc.get_referents(object)` function returns a list of all the objects referenced by *object*.
- The `getopt` module gained a new function, `gnu_getopt()`, that supports the same arguments as the existing `getopt()` function but uses GNU-style scanning mode. The existing `getopt()` stops processing options as soon as a non-option argument is encountered, but in GNU-style mode processing continues, meaning that options and arguments can be mixed. For example:

```
>>> getopt.getopt(['-f', 'filename', 'output', '-v',
                  [['-f', 'filename']], ['output', '-v']])
>>> getopt.gnu_getopt(['-f', 'filename', 'output',
                      [['-f', 'filename'), ('-v', '')], ['output']])
```

(Contributed by Peter Åstrand.)

- The `grp`, `pwd`, and `resource` modules now return enhanced tuples:

```
>>> import grp
>>> g = grp.getgrnam('amk')
```

```
>>> g.gr_name, g.gr_gid  
('amk', 500)
```

- The **gzip** module can now handle files exceeding 2 GiB.
- The new **heapq** module contains an implementation of a heap queue algorithm. A heap is an array-like data structure that keeps items in a partially sorted order such that, for every index  $k$ ,  $\text{heap}[k] \leq \text{heap}[2*k+1]$  and  $\text{heap}[k] \leq \text{heap}[2*k+2]$ . This makes it quick to remove the smallest item, and inserting a new item while maintaining the heap property is  $O(\lg n)$ . (See <https://xlinux.nist.gov/dads/HTML/priorityqueue.html> for more information about the priority queue data structure.)

The **heapq** module provides **heappush()** and **heappop()** functions for adding and removing items while maintaining the heap property on top of some other mutable Python sequence type. Here's an example that uses a Python list:

```
>>> import heapq  
>>> heap = []  
>>> for item in [3, 7, 5, 11, 1]:  
...     heapq.heappush(heap, item)  
...  
>>> heap  
[1, 3, 5, 11, 7]  
>>> heapq.heappop(heap)  
1  
>>> heapq.heappop(heap)  
3  
>>> heap  
[5, 7, 11]
```

(Contributed by Kevin O'Connor.)

- The IDLE integrated development environment has been updated using the code from the IDLEfork project (<https://idlefork.sourceforge.net>). The most notable feature is that the code being developed is now executed in a subprocess,

meaning that there's no longer any need for manual `reload()` operations. IDLE's core code has been incorporated into the standard library as the `idlelib` package.

- The `imaplib` module now supports IMAP over SSL. (Contributed by Piers Lauder and Tino Lange.)
- The `itertools` contains a number of useful functions for use with iterators, inspired by various functions provided by the ML and Haskell languages. For example, `itertools.ifilter(predicate, iterator)` returns all elements in the iterator for which the function `predicate()` returns `True`, and `itertools.repeat(obj, N)` returns `obj` *N* times. There are a number of other functions in the module; see the package's reference documentation for details. (Contributed by Raymond Hettinger.)
- Two new functions in the `math` module, `degrees(rads)` and `radians(degs)`, convert between radians and degrees. Other functions in the `math` module such as `math.sin()` and `math.cos()` have always required input values measured in radians. Also, an optional *base* argument was added to `math.log()` to make it easier to compute logarithms for bases other than *e* and 10. (Contributed by Raymond Hettinger.)
- Several new POSIX functions (`getpgid()`, `killpg()`, `lchown()`, `loadavg()`, `major()`, `makedev()`, `minor()`, and `mknod()`) were added to the `posix` module that underlies the `os` module. (Contributed by Gustavo Niemeyer, Geert Jansen, and Denis S. Otkidach.)
- In the `os` module, the `*stat()` family of functions can now report fractions of a second in a timestamp. Such time stamps are represented as floats, similar to the value returned by `time.time()`.

During testing, it was found that some applications will break if time stamps are floats. For compatibility, when using the

tuple interface of the **stat\_result** time stamps will be represented as integers. When using named fields (a feature first introduced in Python 2.2), time stamps are still represented as integers, unless **os.stat\_float\_times()** is invoked to enable float return values:

```
>>> os.stat("/tmp").st_mtime
1034791200
>>> os.stat_float_times(True)
>>> os.stat("/tmp").st_mtime
1034791200.6335014
```

In Python 2.4, the default will change to always returning floats.

Application developers should enable this feature only if all their libraries work properly when confronted with floating point time stamps, or if they use the tuple API. If used, the feature should be activated on an application level instead of trying to enable it on a per-use basis.

- The **optparse** module contains a new parser for command-line arguments that can convert option values to a particular Python type and will automatically generate a usage message. See the following section for more details.
- The old and never-documented **linuxaudiodev** module has been deprecated, and a new version named **ossaudiodev** has been added. The module was renamed because the OSS sound drivers can be used on platforms other than Linux, and the interface has also been tidied and brought up to date in various ways. (Contributed by Greg Ward and Nicholas FitzRoy-Dale.)
- The new **platform** module contains a number of functions that try to determine various properties of the platform you're running on. There are functions for getting the architecture, CPU type, the Windows OS version, and even the Linux distribution version. (Contributed by Marc-André Lemburg.)
- The parser objects provided by the **pyexpat** module can

now optionally buffer character data, resulting in fewer calls to your character data handler and therefore faster performance. Setting the parser object's **buffer\_text** attribute to **True** will enable buffering.

- The `sample(population, k)` function was added to the **random** module. *population* is a sequence or **xrange** object containing the elements of a population, and **sample()** chooses *k* elements from the population without replacing chosen elements. *k* can be any value up to `len(population)`. For example:

```
>>> days = ['Mo', 'Tu', 'We', 'Th', 'Fr', 'St', 'Sn']
>>> random.sample(days, 3)          # Choose 3 elements
['St', 'Sn', 'Th']
>>> random.sample(days, 7)          # Choose 7 elements
['Tu', 'Th', 'Mo', 'We', 'St', 'Fr', 'Sn']
>>> random.sample(days, 7)          # Choose 7 again
['We', 'Mo', 'Sn', 'Fr', 'Tu', 'St', 'Th']
>>> random.sample(days, 8)          # Can't choose eight
Traceback (most recent call last):
  File "<stdin>", line 1, in ?
  File "random.py", line 414, in sample
    raise ValueError, "sample larger than population"
ValueError: sample larger than population
>>> random.sample(xrange(1,10000,2), 10)  # Choose
[3407, 3805, 1505, 7023, 2401, 2267, 9733, 3151, 80
```

The **random** module now uses a new algorithm, the Mersenne Twister, implemented in C. It's faster and more extensively studied than the previous algorithm.

(All changes contributed by Raymond Hettinger.)

- The **readline** module also gained a number of new functions: **get\_history\_item()**, **get\_current\_history\_length()**, and **redisplay()**.
- The **rexec** and **Bastion** modules have been declared dead, and attempts to import them will fail with a

**RuntimeError**. New-style classes provide new ways to break out of the restricted execution environment provided by **rexec**, and no one has interest in fixing them or time to do so. If you have applications using **rexec**, rewrite them to use something else.

(Sticking with Python 2.2 or 2.1 will not make your applications any safer because there are known bugs in the **rexec** module in those versions. To repeat: if you're using **rexec**, stop using it immediately.)

- The **rotor** module has been deprecated because the algorithm it uses for encryption is not believed to be secure. If you need encryption, use one of the several AES Python modules that are available separately.
- The **shutil** module gained a `move(src, dest)` function that recursively moves a file or directory to a new location.
- Support for more advanced POSIX signal handling was added to the **signal** but then removed again as it proved impossible to make it work reliably across platforms.
- The **socket** module now supports timeouts. You can call the `settimeout(t)` method on a socket object to set a timeout of *t* seconds. Subsequent socket operations that take longer than *t* seconds to complete will abort and raise a **socket.timeout** exception.

The original timeout implementation was by Tim O'Malley. Michael Gilfix integrated it into the Python **socket** module and shepherded it through a lengthy review. After the code was checked in, Guido van Rossum rewrote parts of it. (This is a good example of a collaborative development process in action.)

- On Windows, the **socket** module now ships with Secure Sockets Layer (SSL) support.
- The value of the C **PYTHON\_API\_VERSION** macro is now exposed at the Python level as `sys.api_version`. The

current exception can be cleared by calling the new `sys.exc_clear()` function.

- The new `tarfile` module allows reading from and writing to tar-format archive files. (Contributed by Lars Gustäbel.)
- The new `textwrap` module contains functions for wrapping strings containing paragraphs of text. The `wrap(text, width)` function takes a string and returns a list containing the text split into lines of no more than the chosen width. The `fill(text, width)` function returns a single string, reformatted to fit into lines no longer than the chosen width. (As you can guess, `fill()` is built on top of `wrap()`. For example:

```
>>> import textwrap
>>> paragraph = "Not a whit, we defy augury: ... mo
>>> textwrap.wrap(paragraph, 60)
["Not a whit, we defy augury: there's a special pro
  "the fall of a sparrow. If it be now, 'tis not to
  ...]
>>> print textwrap.fill(paragraph, 35)
Not a whit, we defy augury: there's
a special providence in the fall of
a sparrow. If it be now, 'tis not
to come; if it be not to come, it
will be now; if it be not now, yet
it will come: the readiness is all.
>>>
```

The module also contains a `TextWrapper` class that actually implements the text wrapping strategy. Both the `TextWrapper` class and the `wrap()` and `fill()` functions support a number of additional keyword arguments for fine-tuning the formatting; consult the module's documentation for details. (Contributed by Greg Ward.)

- The `thread` and `threading` modules now have companion modules, `dummy_thread` and `dummy_threading`, that provide a do-nothing implementation of the `thread`

module's interface for platforms where threads are not supported. The intention is to simplify thread-aware modules (ones that *don't* rely on threads to run) by putting the following code at the top:

```
try:
    import threading as _threading
except ImportError:
    import dummy_threading as _threading
```

In this example, **`_threading`** is used as the module name to make it clear that the module being used is not necessarily the actual **`threading`** module. Code can call functions and use classes in **`_threading`** whether or not threads are supported, avoiding an **`if`** statement and making the code slightly clearer. This module will not magically make multithreaded code run without threads; code that waits for another thread to return or to do something will simply hang forever.

- The **`time`** module's **`strptime()`** function has long been an annoyance because it uses the platform C library's **`strptime()`** implementation, and different platforms sometimes have odd bugs. Brett Cannon contributed a portable implementation that's written in pure Python and should behave identically on all platforms.
- The new **`timeit`** module helps measure how long snippets of Python code take to execute. The `timeit.py` file can be run directly from the command line, or the module's **`Timer`** class can be imported and used directly. Here's a short example that figures out whether it's faster to convert an 8-bit string to Unicode by appending an empty Unicode string to it or by using the **`unicode()`** function:

```
import timeit

timer1 = timeit.Timer('unicode("abc")')
timer2 = timeit.Timer('"abc" + u" "')
```

```
# Run three trials
print timer1.repeat(repeat=3, number=100000)
print timer2.repeat(repeat=3, number=100000)

# On my laptop this outputs:
# [0.36831796169281006, 0.37441694736480713, 0.3530
# [0.17574405670166016, 0.18193507194519043, 0.1756
```

- The **Tix** module has received various bug fixes and updates for the current version of the Tix package.
- The **Tkinter** module now works with a thread-enabled version of Tcl. Tcl's threading model requires that widgets only be accessed from the thread in which they're created; accesses from another thread can cause Tcl to panic. For certain Tcl interfaces, **Tkinter** will now automatically avoid this when a widget is accessed from a different thread by marshalling a command, passing it to the correct thread, and waiting for the results. Other interfaces can't be handled automatically but **Tkinter** will now raise an exception on such an access so that you can at least find out about the problem. See <https://mail.python.org/pipermail/python-dev/2002-December/031107.html> for a more detailed explanation of this change. (Implemented by Martin von Löwis.)
- Calling Tcl methods through **\_tkinter** no longer returns only strings. Instead, if Tcl returns other objects those objects are converted to their Python equivalent, if one exists, or wrapped with a **\_tkinter.Tcl\_Obj** object if no Python equivalent exists. This behavior can be controlled through the **wantobjects()** method of **tkapp** objects.

When using **\_tkinter** through the **Tkinter** module (as most Tkinter applications will), this feature is always activated. It should not cause compatibility problems, since Tkinter would always convert string results to Python types where possible.

If any incompatibilities are found, the old behavior can be

restored by setting the **wantobjects** variable in the **Tkinter** module to false before creating the first **tkapp** object.

```
import Tkinter
Tkinter.wantobjects = 0
```

Any breakage caused by this change should be reported as a bug.

- The **UserDict** module has a new **DictMixin** class which defines all dictionary methods for classes that already have a minimum mapping interface. This greatly simplifies writing classes that need to be substitutable for dictionaries, such as the classes in the **shelve** module.

Adding the mix-in as a superclass provides the full dictionary interface whenever the class defines **\_\_getitem\_\_()**, **\_\_setitem\_\_()**, **\_\_delitem\_\_()**, and **keys()**. For example:

```
>>> import UserDict
>>> class SeqDict(UserDict.DictMixin):
...     """Dictionary lookalike implemented with list"""
...     def __init__(self):
...         self.keylist = []
...         self.valuelist = []
...     def __getitem__(self, key):
...         try:
...             i = self.keylist.index(key)
...         except ValueError:
...             raise KeyError
...         return self.valuelist[i]
...     def __setitem__(self, key, value):
...         try:
...             i = self.keylist.index(key)
...             self.valuelist[i] = value
...         except ValueError:
...             self.keylist.append(key)
...             self.valuelist.append(value)
```

```

...     def __delitem__(self, key):
...         try:
...             i = self.keylist.index(key)
...             except ValueError:
...                 raise KeyError
...             self.keylist.pop(i)
...             self.valuelist.pop(i)
...     def keys(self):
...         return list(self.keylist)
...
>>> s = SeqDict()
>>> dir(s)          # See that other dictionary methods
['__cmp__', '__contains__', '__delitem__', '__doc__',
 '__init__', '__iter__', '__len__', '__module__', '
 '__getitem__', 'clear', 'get', 'has_key', 'items',
 'iterkeys', 'itervalues', 'keylist', 'keys', 'pop',
 'setdefault', 'update', 'valuelist', 'values']

```

(Contributed by Raymond Hettinger.)

- The DOM implementation in `xml.dom.minidom` can now generate XML output in a particular encoding by providing an optional encoding argument to the `toxml()` and `toprettyxml()` methods of DOM nodes.
- The `xmlrpclib` module now supports an XML-RPC extension for handling nil data values such as Python's `None`. Nil values are always supported on unmarshalling an XML-RPC response. To generate requests containing `None`, you must supply a true value for the `allow_none` parameter when creating a `Marshaller` instance.
- The new `DocXMLRPCServer` module allows writing self-documenting XML-RPC servers. Run it in demo mode (as a program) to see it in action. Pointing the web browser to the RPC server produces pydoc-style documentation; pointing `xmlrpclib` to the server allows invoking the actual methods. (Contributed by Brian Quinlan.)
- Support for internationalized domain names (RFCs 3454,

3490, 3491, and 3492) has been added. The “idna” encoding can be used to convert between a Unicode domain name and the ASCII-compatible encoding (ACE) of that name.

```
>{}>{}> u"www.Alliancefrançaise.nu".encode("idna")  
'www.xn--alliancefranaise-npb.nu'
```

The **socket** module has also been extended to transparently convert Unicode hostnames to the ACE version before passing them to the C library. Modules that deal with hostnames such as **httplib** and **ftplib**) also support Unicode host names; **httplib** also sends HTTP Host headers using the ACE version of the domain name. **urllib** supports Unicode URLs with non-ASCII host names as long as the path part of the URL is ASCII only.

To implement this change, the **stringprep** module, the **mkstringprep** tool and the **punycode** encoding have been added.

## Date/Time Type

Date and time types suitable for expressing timestamps were added as the **datetime** module. The types don’t support different calendars or many fancy features, and just stick to the basics of representing time.

The three primary types are: **date**, representing a day, month, and year; **time**, consisting of hour, minute, and second; and **datetime**, which contains all the attributes of both **date** and **time**. There’s also a **timedelta** class representing differences between two points in time, and time zone logic is implemented by classes inheriting from the abstract **tzinfo** class.

You can create instances of **date** and **time** by either supplying keyword arguments to the appropriate constructor, e.g. `datetime.date(year=1972, month=10, day=15)`, or by using one of a number of class methods. For example, the **date.today()** class method returns the current local date.

Once created, instances of the date/time classes are all immutable.

There are a number of methods for producing formatted strings from objects:

```
>>> import datetime
>>> now = datetime.datetime.now()
>>> now.isoformat()
'2002-12-30T21:27:03.994956'
>>> now.ctime() # Only available on date, datetime
'Mon Dec 30 21:27:03 2002'
>>> now.strftime('%Y %d %b')
'2002 30 Dec'
```

The **replace()** method allows modifying one or more fields of a **date** or **datetime** instance, returning a new instance:

```
>>> d = datetime.datetime.now()
>>> d
datetime.datetime(2002, 12, 30, 22, 15, 38, 827738)
>>> d.replace(year=2001, hour = 12)
datetime.datetime(2001, 12, 30, 12, 15, 38, 827738)
>>>
```

Instances can be compared, hashed, and converted to strings (the result is the same as that of **isoformat()**). **date** and **datetime** instances can be subtracted from each other, and added to **timedelta** instances. The largest missing feature is that there's no standard library support for parsing strings and getting back a **date** or **datetime**.

For more information, refer to the module's reference documentation. (Contributed by Tim Peters.)

## The optparse Module

The **getopt** module provides simple parsing of command-line arguments. The new **optparse** module (originally named Optik) provides more elaborate command-line parsing that follows the Unix conventions, automatically creates the output for **--help**, and can perform different actions for different options.

You start by creating an instance of **OptionParser** and telling it what your program's options are.

```
import sys
from optparse import OptionParser

op = OptionParser()
op.add_option('-i', '--input',
               action='store', type='string', dest='input',
               help='set input filename')
op.add_option('-l', '--length',
               action='store', type='int', dest='length',
               help='set maximum length of output')
```

Parsing a command line is then done by calling the **parse\_args()** method.

```
options, args = op.parse_args(sys.argv[1:])
print options
print args
```

This returns an object containing all of the option values, and a list of strings containing the remaining arguments.

Invoking the script with the various arguments now works as you'd expect it to. Note that the length argument is automatically converted to an integer.

```
$ ./python opt.py -i data arg1
<Values at 0x400cad4c: {'input': 'data', 'length': None}>
['arg1']
$ ./python opt.py --input=data --length=4
<Values at 0x400cad2c: {'input': 'data', 'length': 4}>
[]
$
```

The help message is automatically generated for you:

```
$ ./python opt.py --help
usage: opt.py [options]
```

```
options:
  -h, --help                show this help message and exit
  -iINPUT, --input=INPUT    set input filename
  -lLENGTH, --length=LENGTH set maximum length of output
$
```

See the module's documentation for more details.

Optik was written by Greg Ward, with suggestions from the readers of the Getopt SIG.

## Pymalloc: A Specialized Object Allocator

Pymalloc, a specialized object allocator written by Vladimir Marangozov, was a feature added to Python 2.1. Pymalloc is intended to be faster than the system `malloc()` and to have less memory overhead for allocation patterns typical of Python programs. The allocator uses C's `malloc()` function to get large pools of memory and then fulfills smaller memory requests from these pools.

In 2.1 and 2.2, pymalloc was an experimental feature and wasn't enabled by default; you had to explicitly enable it when compiling Python by providing the `--with-pymalloc` option to the `configure` script. In 2.3, pymalloc has had further enhancements and is now enabled by default; you'll have to supply `--without-pymalloc` to disable it.

This change is transparent to code written in Python; however, pymalloc may expose bugs in C extensions. Authors of C extension modules should test their code with pymalloc enabled, because some incorrect code may cause core dumps at runtime.

There's one particularly common error that causes problems. There are a number of memory allocation functions in Python's C API that have previously just been aliases for the C library's `malloc()` and `free()`, meaning that if you accidentally called mismatched

functions the error wouldn't be noticeable. When the object allocator is enabled, these functions aren't aliases of `malloc()` and `free()` any more, and calling the wrong function to free memory may get you a core dump. For example, if memory was allocated using `PyObject_Malloc()`, it has to be freed using `PyObject_Free()`, not `free()`. A few modules included with Python fell afoul of this and had to be fixed; doubtless there are more third-party modules that will have the same problem.

As part of this change, the confusing multiple interfaces for allocating memory have been consolidated down into two API families. Memory allocated with one family must not be manipulated with functions from the other family. There is one family for allocating chunks of memory and another family of functions specifically for allocating Python objects.

- To allocate and free an undistinguished chunk of memory use the “raw memory” family: `PyMem_Malloc()`, `PyMem_Realloc()`, and `PyMem_Free()`.
- The “object memory” family is the interface to the pymalloc facility described above and is biased towards a large number of “small” allocations: `PyObject_Malloc()`, `PyObject_Realloc()`, and `PyObject_Free()`.
- To allocate and free Python objects, use the “object” family `PyObject_New()`, `PyObject_NewVar()`, and `PyObject_Del()`.

Thanks to lots of work by Tim Peters, pymalloc in 2.3 also provides debugging features to catch memory overwrites and doubled frees in both extension modules and in the interpreter itself. To enable this support, compile a debugging version of the Python interpreter by running `configure` with `--with-pydebug`.

To aid extension writers, a header file `Misc/pymemcompat.h` is distributed with the source to Python 2.3 that allows Python extensions to use the 2.3 interfaces to memory allocation while compiling against any version of Python since 1.5.2. You would copy the file from Python's source distribution and bundle it with the source of your extension.

<https://hg.python.org/cpython/file/default/Objects/obmalloc.c>

For the full details of the pymalloc implementation, see the comments at the top of the file `Objects/obmalloc.c` in the Python source code. The above link points to the file within the python.org SVN browser.

## Build and C API Changes

Changes to Python's build process and to the C API include:

- The cycle detection implementation used by the garbage collection has proven to be stable, so it's now been made mandatory. You can no longer compile Python without it, and the **--with-cycle-gc** switch to **configure** has been removed.
- Python can now optionally be built as a shared library (`libpython2.3.so`) by supplying **--enable-shared** when running Python's **configure** script. (Contributed by Ondrej Palkovsky.)
- The **DL\_EXPORT** and **DL\_IMPORT** macros are now deprecated. Initialization functions for Python extension modules should now be declared using the new macro **PyMODINIT\_FUNC**, while the Python core will generally use the **PyAPI\_FUNC** and **PyAPI\_DATA** macros.
- The interpreter can be compiled without any docstrings for the built-in functions and modules by supplying **--without-doc-strings** to the **configure** script. This makes the Python executable about 10% smaller, but will also mean that you can't get help for Python's built-ins. (Contributed by Gustavo Niemeyer.)
- The **PyArg\_NoArgs()** macro is now deprecated, and code that uses it should be changed. For Python 2.2 and later, the method definition table can specify the **METH\_NOARGS** flag, signalling that there are no arguments, and the argument checking can then be removed. If compatibility with pre-2.2 versions of Python is important, the code could use

`PyArg_ParseTuple(args, "")` instead, but this will be slower than using `METH_NOARGS`.

- `PyArg_ParseTuple()` accepts new format characters for various sizes of unsigned integers: `B` for unsigned char, `H` for unsigned short int, `I` for unsigned int, and `K` for unsigned long long.
- A new function, `PyObject_DelItemString(mapping, char *key)` was added as shorthand for `PyObject_DelItem(mapping, PyString_New(key))`.
- File objects now manage their internal string buffer differently, increasing it exponentially when needed. This results in the benchmark tests in `Lib/test/test_bufio.py` speeding up considerably (from 57 seconds to 1.7 seconds, according to one measurement).
- It's now possible to define class and static methods for a C extension type by setting either the `METH_CLASS` or `METH_STATIC` flags in a method's `PyMethodDef` structure.
- Python now includes a copy of the Expat XML parser's source code, removing any dependence on a system version or local installation of Expat.
- If you dynamically allocate type objects in your extension, you should be aware of a change in the rules relating to the `__module__` and `__name__` attributes. In summary, you will want to ensure the type's dictionary contains a `'__module__'` key; making the module name the part of the type name leading up to the final period will no longer have the desired effect. For more detail, read the API reference documentation or the source.

## Port-Specific Changes

Support for a port to IBM's OS/2 using the EMX runtime environment was merged into the main Python source tree. EMX is a POSIX emulation layer over the OS/2 system APIs. The Python port for EMX tries to support all the POSIX-like capability exposed by the EMX runtime, and mostly succeeds; `fork()` and `fcntl()` are restricted by the limitations of the underlying emulation layer. The standard OS/2 port, which uses IBM's Visual Age compiler, also gained support for case-sensitive import semantics as part of the integration of the EMX port into CVS. (Contributed by Andrew

MacIntyre.)

On MacOS, most toolbox modules have been weaklinked to improve backward compatibility. This means that modules will no longer fail to load if a single routine is missing on the current OS version.

Instead calling the missing routine will raise an exception.

(Contributed by Jack Jansen.)

The RPM spec files, found in the `Misc/RPM/` directory in the Python source distribution, were updated for 2.3. (Contributed by Sean Reifschneider.)

Other new platforms now supported by Python include AtheOS (<http://www.atheos.cx/>), GNU/Hurd, and OpenVMS.

## Other Changes and Fixes

As usual, there were a bunch of other improvements and bugfixes scattered throughout the source tree. A search through the CVS change logs finds there were 523 patches applied and 514 bugs fixed between Python 2.2 and 2.3. Both figures are likely to be underestimates.

Some of the more notable changes are:

- If the `PYTHONINSPECT` environment variable is set, the Python interpreter will enter the interactive prompt after running a Python program, as if Python had been invoked with the `-i` option. The environment variable can be set before running the Python interpreter, or it can be set by the Python program as part of its execution.
- The `regtest.py` script now provides a way to allow “all resources except *foo*.” A resource name passed to the `-u` option can now be prefixed with a hyphen ('-') to mean “remove this resource.” For example, the option `'-uall,-bsddb'` could be used to enable the use of all resources except `bsddb`.
- The tools used to build the documentation now work under Cygwin as well as Unix.

- The `SET_LINENO` opcode has been removed. Back in the mists of time, this opcode was needed to produce line numbers in tracebacks and support trace functions (for, e.g., `pdb`). Since Python 1.5, the line numbers in tracebacks have been computed using a different mechanism that works with “python -O”. For Python 2.3 Michael Hudson implemented a similar scheme to determine when to call the trace function, removing the need for `SET_LINENO` entirely.

It would be difficult to detect any resulting difference from Python code, apart from a slight speed up when Python is run without `-O`.

C extensions that access the `f_lineno` field of frame objects should instead call `PyCode_Addr2Line(f->f_code, f->f_lasti)`. This will have the added effect of making the code work as desired under “python -O” in earlier versions of Python.

A nifty new feature is that trace functions can now assign to the `f_lineno` attribute of frame objects, changing the line that will be executed next. A `jump` command has been added to the `pdb` debugger taking advantage of this new feature. (Implemented by Richie Hindle.)

## Porting to Python 2.3

This section lists previously described changes that may require changes to your code:

- `yield` is now always a keyword; if it’s used as a variable name in your code, a different name must be chosen.
- For strings `X` and `Y`, `X in Y` now works if `X` is more than one character long.
- The `int()` type constructor will now return a long integer instead of raising an `OverflowError` when a string or floating-point number is too large to fit into an integer.
- If you have Unicode strings that contain 8-bit characters, you

must declare the file's encoding (UTF-8, Latin-1, or whatever) by adding a comment to the top of the file. See section [PEP 263: Source Code Encodings](#) for more information.

- Calling Tcl methods through `_tkinter` no longer returns only strings. Instead, if Tcl returns other objects those objects are converted to their Python equivalent, if one exists, or wrapped with a `_tkinter.Tcl_Obj` object if no Python equivalent exists.
- Large octal and hex literals such as `0xffffffff` now trigger a [FutureWarning](#). Currently they're stored as 32-bit numbers and result in a negative value, but in Python 2.4 they'll become positive long integers.

There are a few ways to fix this warning. If you really need a positive number, just add an `L` to the end of the literal. If you're trying to get a 32-bit integer with low bits set and have previously used an expression such as `~(1 << 31)`, it's probably clearest to start with all bits set and clear the desired upper bits. For example, to clear just the top bit (bit 31), you could write `0xffffffffL & ~(1L<<31)`.

- You can no longer disable assertions by assigning to `__debug__`.
- The Distutils `setup()` function has gained various new keyword arguments such as *depends*. Old versions of the Distutils will abort if passed unknown keywords. A solution is to check for the presence of the new `get_distutil_options()` function in your `setup.py` and only uses the new keywords with a version of the Distutils that supports them:

```
from distutils import core

kw = {'sources': 'foo.c', ...}
if hasattr(core, 'get_distutil_options'):
    kw['depends'] = ['foo.h']
ext = Extension(**kw)
```

- Using `None` as a variable name will now result in a **SyntaxWarning** warning.
- Names of extension types defined by the modules included with Python now contain the module and a `'.'` in front of the type name.

# What's New in Python 2.2

Author

A.M. Kuchling

## Introduction

This article explains the new features in Python 2.2.2, released on October 14, 2002. Python 2.2.2 is a bugfix release of Python 2.2, originally released on December 21, 2001.

Python 2.2 can be thought of as the “cleanup release”. There are some features such as generators and iterators that are completely new, but most of the changes, significant and far-reaching though they may be, are aimed at cleaning up irregularities and dark corners of the language design.

This article doesn't attempt to provide a complete specification of the new features, but instead provides a convenient overview. For full details, you should refer to the documentation for Python 2.2, such as the [Python Library Reference](https://docs.python.org/2.2/lib/lib.html) [https://docs.python.org/2.2/lib/lib.html] and the [Python Reference Manual](https://docs.python.org/2.2/ref/ref.html) [https://docs.python.org/2.2/ref/ref.html]. If you want to understand the complete implementation and design rationale for a change, refer to the PEP for a particular new feature.

## PEPs 252 and 253: Type and Class Changes

The largest and most far-reaching changes in Python 2.2 are to Python's model of objects and classes. The changes should be backward compatible, so it's likely that your code will continue to run unchanged, but the changes provide some amazing new capabilities. Before beginning this, the longest and most

complicated section of this article, I'll provide an overview of the changes and offer some comments.

A long time ago I wrote a web page listing flaws in Python's design. One of the most significant flaws was that it's impossible to subclass Python types implemented in C. In particular, it's not possible to subclass built-in types, so you can't just subclass, say, lists in order to add a single useful method to them. The **UserList** module provides a class that supports all of the methods of lists and that can be subclassed further, but there's lots of C code that expects a regular Python list and won't accept a **UserList** instance.

Python 2.2 fixes this, and in the process adds some exciting new capabilities. A brief summary:

- You can subclass built-in types such as lists and even integers, and your subclasses should work in every place that requires the original type.
- It's now possible to define static and class methods, in addition to the instance methods available in previous versions of Python.
- It's also possible to automatically call methods on accessing or setting an instance attribute by using a new mechanism called *properties*. Many uses of `__getattr__()` can be rewritten to use properties instead, making the resulting code simpler and faster. As a small side benefit, attributes can now have docstrings, too.
- The list of legal attributes for an instance can be limited to a particular set using *slots*, making it possible to safeguard against typos and perhaps make more optimizations possible in future versions of Python.

Some users have voiced concern about all these changes. Sure, they say, the new features are neat and lend themselves to all sorts of tricks that weren't possible in previous versions of Python, but they also make the language more complicated. Some people have said that they've always recommended Python for its simplicity, and feel that its simplicity is being lost.

Personally, I think there's no need to worry. Many of the new features are quite esoteric, and you can write a lot of Python code

without ever needed to be aware of them. Writing a simple class is no more difficult than it ever was, so you don't need to bother learning or teaching them unless they're actually needed. Some very complicated tasks that were previously only possible from C will now be possible in pure Python, and to my mind that's all for the better.

I'm not going to attempt to cover every single corner case and small change that were required to make the new features work. Instead this section will paint only the broad strokes. See section [Related Links](#), "Related Links", for further sources of information about Python 2.2's new object model.

## Old and New Classes

First, you should know that Python 2.2 really has two kinds of classes: classic or old-style classes, and new-style classes. The old-style class model is exactly the same as the class model in earlier versions of Python. All the new features described in this section apply only to new-style classes. This divergence isn't intended to last forever; eventually old-style classes will be dropped, possibly in Python 3.0.

So how do you define a new-style class? You do it by subclassing an existing new-style class. Most of Python's built-in types, such as integers, lists, dictionaries, and even files, are new-style classes now. A new-style class named [object](#), the base class for all built-in types, has also been added so if no built-in type is suitable, you can just subclass [object](#):

```
class C(object):
    def __init__(self):
        ...
    ...
```

This means that [class](#) statements that don't have any base classes are always classic classes in Python 2.2. (Actually you can also change this by setting a module-level variable named `__metaclass__` — see [PEP 253](#) [<https://peps.python.org/pep-0253/>] for the details — but it's easier to just subclass [object](#).)

The type objects for the built-in types are available as built-ins, named using a clever trick. Python has always had built-in functions named `int()`, `float()`, and `str()`. In 2.2, they aren't functions any more, but type objects that behave as factories when called.

```
>>> int
<type 'int'>
>>> int('123')
123
```

To make the set of types complete, new type objects such as `dict()` and `file()` have been added. Here's a more interesting example, adding a `lock()` method to file objects:

```
class LockableFile(file):
    def lock (self, operation, length=0, start=0, whence=None):
        import fcntl
        return fcntl.lockf(self.fileno(), operation,
                           length, start, whence)
```

The now-obsolete `posixfile` module contained a class that emulated all of a file object's methods and also added a `lock()` method, but this class couldn't be passed to internal functions that expected a built-in file, something which is possible with our new `LockableFile`.

## Descriptors

In previous versions of Python, there was no consistent way to discover what attributes and methods were supported by an object. There were some informal conventions, such as defining `__members__` and `__methods__` attributes that were lists of names, but often the author of an extension type or a class wouldn't bother to define them. You could fall back on inspecting the `__dict__` of an object, but when class inheritance or an arbitrary `__getattr__()` hook were in use this could still be inaccurate.

The one big idea underlying the new class model is that an API for describing the attributes of an object using *descriptors* has been

formalized. Descriptors specify the value of an attribute, stating whether it's a method or a field. With the descriptor API, static methods and class methods become possible, as well as more exotic constructs.

Attribute descriptors are objects that live inside class objects, and have a few attributes of their own:

- `__name__` is the attribute's name.
- `__doc__` is the attribute's docstring.
- `__get__(object)` is a method that retrieves the attribute value from *object*.
- `__set__(object, value)` sets the attribute on *object* to *value*.
- `__delete__(object, value)` deletes the *value* attribute of *object*.

For example, when you write `obj.x`, the steps that Python actually performs are:

```
descriptor = obj.__class__.x
descriptor.__get__(obj)
```

For methods, `descriptor.__get__()` returns a temporary object that's callable, and wraps up the instance and the method to be called on it. This is also why static methods and class methods are now possible; they have descriptors that wrap up just the method, or the method and the class. As a brief explanation of these new kinds of methods, static methods aren't passed the instance, and therefore resemble regular functions. Class methods are passed the class of the object, but not the object itself. Static and class methods are defined like this:

```
class C(object):
    def f(arg1, arg2):
        ...
    f = staticmethod(f)

    def g(cls, arg1, arg2):
        ...
    g = classmethod(g)
```

The `staticmethod()` function takes the function `f()`, and returns it wrapped up in a descriptor so it can be stored in the class object. You might expect there to be special syntax for creating such methods (`def static f`, `defstatic f()`, or something like that) but no such syntax has been defined yet; that's been left for future versions of Python.

More new features, such as slots and properties, are also implemented as new kinds of descriptors, and it's not difficult to write a descriptor class that does something novel. For example, it would be possible to write a descriptor class that made it possible to write Eiffel-style preconditions and postconditions for a method. A class that used this feature might be defined like this:

```
from eiffel import eiffelmethod

class C(object):
    def f(self, arg1, arg2):
        # The actual function
        ...
    def pre_f(self):
        # Check preconditions
        ...
    def post_f(self):
        # Check postconditions
        ...

    f = eiffelmethod(f, pre_f, post_f)
```

Note that a person using the new `eiffelmethod()` doesn't have to understand anything about descriptors. This is why I think the new features don't increase the basic complexity of the language. There will be a few wizards who need to know about it in order to write `eiffelmethod()` or the ZODB or whatever, but most users will just write code on top of the resulting libraries and ignore the implementation details.

## Multiple Inheritance: The Diamond Rule

Multiple inheritance has also been made more useful through

changing the rules under which names are resolved. Consider this set of classes (diagram taken from [PEP 253](https://peps.python.org/pep-0253/) [https://peps.python.org/pep-0253/] by Guido van Rossum):

The lookup rule for classic classes is simple but not very smart; the base classes are searched depth-first, going from left to right. A reference to **D.save()** will search the classes **D**, **B**, and then **A**, where **save()** would be found and returned. **C.save()** would never be found at all. This is bad, because if **C's save()** method is saving some internal state specific to **C**, not calling it will result in that state never getting saved.

New-style classes follow a different algorithm that's a bit more complicated to explain, but does the right thing in this situation. (Note that Python 2.3 changes this algorithm to one that produces the same results in most cases, but produces more useful results for really complicated inheritance graphs.)

1. List all the base classes, following the classic lookup rule and include a class multiple times if it's visited repeatedly. In the above example, the list of visited classes is [**D**, **B**, **A**, **C**, **A**].
2. Scan the list for duplicated classes. If any are found, remove all but one occurrence, leaving the *last* one in the list. In the above example, the list becomes [**D**, **B**, **C**, **A**] after dropping duplicates.

Following this rule, referring to `D.save()` will return `C.save()`, which is the behaviour we're after. This lookup rule is the same as the one followed by Common Lisp. A new built-in function, `super()`, provides a way to get at a class's superclasses without having to reimplement Python's algorithm. The most commonly used form will be `super(class, obj)`, which returns a bound superclass object (not the actual class object). This form will be used in methods to call a method in the superclass; for example, `D's save()` method would look like this:

```
class D (B,C):
    def save (self):
        # Call superclass .save()
        super(D, self).save()
        # Save D's private information here
        ...
```

`super()` can also return unbound superclass objects when called as `super(class)` or `super(class1, class2)`, but this probably won't often be useful.

## Attribute Access

A fair number of sophisticated Python classes define hooks for attribute access using `__getattr__()`; most commonly this is done for convenience, to make code more readable by automatically mapping an attribute access such as `obj.parent` into a method call such as `obj.get_parent`. Python 2.2 adds some new ways of controlling attribute access.

First, `__getattr__(attr_name)` is still supported by new-style classes, and nothing about it has changed. As before, it will be called when an attempt is made to access `obj.foo` and no attribute named `foo` is found in the instance's dictionary.

New-style classes also support a new method, `__getattribute__(attr_name)`. The difference between the two methods is that `__getattribute__()` is *always* called whenever any attribute is accessed, while the old `__getattr__()` is only called if `foo` isn't found in the instance's dictionary.

However, Python 2.2's support for *properties* will often be a simpler way to trap attribute references. Writing a `__getattr__()` method is complicated because to avoid recursion you can't use regular attribute accesses inside them, and instead have to mess around with the contents of `__dict__`. `__getattr__()` methods also end up being called by Python when it checks for other methods such as `__repr__()` or `__coerce__()`, and so have to be written with this in mind. Finally, calling a function on every attribute access results in a sizable performance loss.

`property` is a new built-in type that packages up three functions that get, set, or delete an attribute, and a docstring. For example, if you want to define a `size` attribute that's computed, but also settable, you could write:

```
class C(object):
    def get_size (self):
        result = ... computation ...
        return result
    def set_size (self, size):
        ... compute something based on the size
        and set internal state appropriately ...

    # Define a property.  The 'delete this attribute'
    # method is defined as None, so the attribute
    # can't be deleted.
    size = property(get_size, set_size,
                    None,
                    "Storage size of this instance")
```

That is certainly clearer and easier to write than a pair of `__getattr__()/__setattr__()` methods that check for the `size` attribute and handle it specially while retrieving all other attributes from the instance's `__dict__`. Accesses to `size` are also the only ones which have to perform the work of calling a function, so references to other attributes run at their usual speed.

Finally, it's possible to constrain the list of attributes that can be referenced on an object using the new `__slots__` class attribute. Python objects are usually very dynamic; at any time it's possible to

define a new attribute on an instance by just doing `obj.new_attr=1`. A new-style class can define a class attribute named `__slots__` to limit the legal attributes to a particular set of names. An example will make this clear:

```
>>> class C(object):
...     __slots__ = ('template', 'name')
...
>>> obj = C()
>>> print obj.template
None
>>> obj.template = 'Test'
>>> print obj.template
Test
>>> obj.newattr = None
Traceback (most recent call last):
  File "<stdin>", line 1, in ?
AttributeError: 'C' object has no attribute 'newattr'
```

Note how you get an **AttributeError** on the attempt to assign to an attribute not listed in `__slots__`.

## Related Links

This section has just been a quick overview of the new features, giving enough of an explanation to start you programming, but many details have been simplified or ignored. Where should you go to get a more complete picture?

The [Descriptor HowTo Guide](#) is a lengthy tutorial introduction to the descriptor features, written by Guido van Rossum. If my description has whetted your appetite, go read this tutorial next, because it goes into much more detail about the new features while still remaining quite easy to read.

Next, there are two relevant PEPs, [PEP 252](#) [<https://peps.python.org/pep-0252/>] and [PEP 253](#) [<https://peps.python.org/pep-0253/>]. [PEP 252](#) [<https://peps.python.org/pep-0252/>] is titled “Making Types Look More Like Classes”, and covers the descriptor API. [PEP 253](#) [<https://peps.python.org/pep-0253/>] is titled “Subtyping Built-in Types”, and

describes the changes to type objects that make it possible to subtype built-in objects. **PEP 253** [<https://peps.python.org/pep-0253/>] is the more complicated PEP of the two, and at a few points the necessary explanations of types and meta-types may cause your head to explode. Both PEPs were written and implemented by Guido van Rossum, with substantial assistance from the rest of the Zope Corp. team.

Finally, there's the ultimate authority: the source code. Most of the machinery for the type handling is in `Objects/typeobject.c`, but you should only resort to it after all other avenues have been exhausted, including posting a question to `python-list` or `python-dev`.

## PEP 234: Iterators

Another significant addition to 2.2 is an iteration interface at both the C and Python levels. Objects can define how they can be looped over by callers.

In Python versions up to 2.1, the usual way to make `for item in obj` work is to define a `__getitem__()` method that looks something like this:

```
def __getitem__(self, index):  
    return <next item>
```

`__getitem__()` is more properly used to define an indexing operation on an object so that you can write `obj[5]` to retrieve the sixth element. It's a bit misleading when you're using this only to support `for` loops. Consider some file-like object that wants to be looped over; the *index* parameter is essentially meaningless, as the class probably assumes that a series of `__getitem__()` calls will be made with *index* incrementing by one each time. In other words, the presence of the `__getitem__()` method doesn't mean that using `file[5]` to randomly access the sixth element will work, though it really should.

In Python 2.2, iteration can be implemented separately, and `__getitem__()` methods can be limited to classes that really do

support random access. The basic idea of iterators is simple. A new built-in function, `iter(obj)` or `iter(C, sentinel)`, is used to get an iterator. `iter(obj)` returns an iterator for the object *obj*, while `iter(C, sentinel)` returns an iterator that will invoke the callable object *C* until it returns *sentinel* to signal that the iterator is done.

Python classes can define an `__iter__()` method, which should create and return a new iterator for the object; if the object is its own iterator, this method can just return `self`. In particular, iterators will usually be their own iterators. Extension types implemented in C can implement a `tp_iter` function in order to return an iterator, and extension types that want to behave as iterators can define a `tp_iternext` function.

So, after all this, what do iterators actually do? They have one required method, `next()`, which takes no arguments and returns the next value. When there are no more values to be returned, calling `next()` should raise the `StopIteration` exception.

```
>>> L = [1,2,3]
>>> i = iter(L)
>>> print i
<iterator object at 0x8116870>
>>> i.next()
1
>>> i.next()
2
>>> i.next()
3
>>> i.next()
Traceback (most recent call last):
  File "<stdin>", line 1, in ?
StopIteration
>>>
```

In 2.2, Python's `for` statement no longer expects a sequence; it expects something for which `iter()` will return an iterator. For backward compatibility and convenience, an iterator is automatically constructed for sequences that don't implement

`__iter__()` or a `tp_iter` slot, so `for i in [1,2,3]` will still work. Wherever the Python interpreter loops over a sequence, it's been changed to use the iterator protocol. This means you can do things like this:

```
>>> L = [1,2,3]
>>> i = iter(L)
>>> a,b,c = i
>>> a,b,c
(1, 2, 3)
```

Iterator support has been added to some of Python's basic types. Calling `iter()` on a dictionary will return an iterator which loops over its keys:

```
>>> m = {'Jan': 1, 'Feb': 2, 'Mar': 3, 'Apr': 4, 'May': 5,
...      'Jun': 6, 'Jul': 7, 'Aug': 8, 'Sep': 9, 'Oct': 10, 'Nov': 11, 'Dec': 12}
>>> for key in m: print key, m[key]
...
Mar 3
Feb 2
Aug 8
Sep 9
May 5
Jun 6
Jul 7
Jan 1
Apr 4
Nov 11
Dec 12
Oct 10
```

That's just the default behaviour. If you want to iterate over keys, values, or key/value pairs, you can explicitly call the `iterkeys()`, `itervalues()`, or `iteritems()` methods to get an appropriate iterator. In a minor related change, the `in` operator now works on dictionaries, so `key in dict` is now equivalent to `dict.has_key(key)`.

Files also provide an iterator, which calls the `readline()` method

until there are no more lines in the file. This means you can now read each line of a file using code like this:

```
for line in file:
    # do something for each line
    ...
```

Note that you can only go forward in an iterator; there's no way to get the previous element, reset the iterator, or make a copy of it. An iterator object could provide such additional capabilities, but the iterator protocol only requires a `next()` method.

## PEP 255: Simple Generators

Generators are another new feature, one that interacts with the introduction of iterators.

You're doubtless familiar with how function calls work in Python or C. When you call a function, it gets a private namespace where its local variables are created. When the function reaches a `return` statement, the local variables are destroyed and the resulting value is returned to the caller. A later call to the same function will get a fresh new set of local variables. But, what if the local variables weren't thrown away on exiting a function? What if you could later resume the function where it left off? This is what generators provide; they can be thought of as resumable functions.

Here's the simplest example of a generator function:

```
def generate_ints(N):
    for i in range(N):
        yield i
```

A new keyword, **yield**, was introduced for generators. Any function containing a **yield** statement is a generator function; this is detected by Python's bytecode compiler which compiles the function specially as a result. Because a new keyword was introduced, generators must be explicitly enabled in a module by including a `from __future__ import generators` statement near the top of the module's source code. In Python 2.3 this statement will become unnecessary.

When you call a generator function, it doesn't return a single value; instead it returns a generator object that supports the iterator protocol. On executing the **yield** statement, the generator outputs the value of `i`, similar to a **return** statement. The big difference between **yield** and a **return** statement is that on reaching a **yield** the generator's state of execution is suspended and local variables are preserved. On the next call to the generator's `next()` method, the function will resume executing immediately after the **yield** statement. (For complicated reasons, the **yield** statement isn't allowed inside the **try** block of a **try...finally** statement; read [PEP 255](https://peps.python.org/pep-0255/) [https://peps.python.org/pep-0255/] for a full explanation of the interaction between **yield** and exceptions.)

Here's a sample usage of the **generate\_ints()** generator:

```
>>> gen = generate_ints(3)
>>> gen
<generator object at 0x8117f90>
>>> gen.next()
0
>>> gen.next()
1
>>> gen.next()
2
>>> gen.next()
Traceback (most recent call last):
  File "<stdin>", line 1, in ?
  File "<stdin>", line 2, in generate_ints
StopIteration
```

You could equally write `for i in generate_ints(5), or`

```
a,b,c = generate_ints(3).
```

Inside a generator function, the **return** statement can only be used without a value, and signals the end of the procession of values; afterwards the generator cannot return any further values. **return** with a value, such as `return 5`, is a syntax error inside a generator function. The end of the generator's results can also be indicated by raising **StopIteration** manually, or by just letting the flow of execution fall off the bottom of the function.

You could achieve the effect of generators manually by writing your own class and storing all the local variables of the generator as instance variables. For example, returning a list of integers could be done by setting `self.count` to 0, and having the **next()** method increment `self.count` and return it. However, for a moderately complicated generator, writing a corresponding class would be much messier. `Lib/test/test_generators.py` contains a number of more interesting examples. The simplest one implements an in-order traversal of a tree using generators recursively.

```
# A recursive generator that generates Tree leaves in in
def inorder(t):
    if t:
        for x in inorder(t.left):
            yield x
        yield t.label
        for x in inorder(t.right):
            yield x
```

Two other examples in `Lib/test/test_generators.py` produce solutions for the N-Queens problem (placing  $N$  queens on an  $N \times N$  chess board so that no queen threatens another) and the Knight's Tour (a route that takes a knight to every square of an  $N \times N$  chessboard without visiting any square twice).

The idea of generators comes from other programming languages, especially Icon (<https://www2.cs.arizona.edu/icon/>), where the idea of generators is central. In Icon, every expression and function call behaves like a generator. One example from “An Overview of

the Icon Programming Language” at <https://www2.cs.arizona.edu/icon/docs/ipd266.htm> gives an idea of what this looks like:

```
sentence := "Store it in the neighboring harbor"
if (i := find("or", sentence)) > 5 then write(i)
```

In Icon the **find()** function returns the indexes at which the substring “or” is found: 3, 23, 33. In the **if** statement, **i** is first assigned a value of 3, but 3 is less than 5, so the comparison fails, and Icon retries it with the second value of 23. 23 is greater than 5, so the comparison now succeeds, and the code prints the value 23 to the screen.

Python doesn’t go nearly as far as Icon in adopting generators as a central concept. Generators are considered a new part of the core Python language, but learning or using them isn’t compulsory; if they don’t solve any problems that you have, feel free to ignore them. One novel feature of Python’s interface as compared to Icon’s is that a generator’s state is represented as a concrete object (the iterator) that can be passed around to other functions or stored in a data structure.

## PEP 237: Unifying Long Integers and Integers

In recent versions, the distinction between regular integers, which are 32-bit values on most machines, and long integers, which can be of arbitrary size, was becoming an annoyance. For example, on platforms that support files larger than  $2^{32}$  bytes, the **tell()** method of file objects has to return a long integer. However, there were various bits of Python that expected plain integers and would raise an error if a long integer was provided instead. For example,

in Python 1.5, only regular integers could be used as a slice index, and `'abc'[1L:]` would raise a `TypeError` exception with the message ‘slice index must be int’.

Python 2.2 will shift values from short to long integers as required. The ‘L’ suffix is no longer needed to indicate a long integer literal, as now the compiler will choose the appropriate type. (Using the ‘L’ suffix will be discouraged in future 2.x versions of Python, triggering a warning in Python 2.4, and probably dropped in Python 3.0.) Many operations that used to raise an `OverflowError` will now return a long integer as their result. For example:

```
>>> 1234567890123
1234567890123L
>>> 2 ** 64
18446744073709551616L
```

In most cases, integers and long integers will now be treated identically. You can still distinguish them with the `type()` built-in function, but that’s rarely needed.

## PEP 238: Changing the Division Operator

The most controversial change in Python 2.2 heralds the start of an effort to fix an old design flaw that’s been in Python from the beginning. Currently Python’s division operator, `/`, behaves like C’s division operator when presented with two integer arguments: it returns an integer result that’s truncated down when there would be a fractional part. For example,  $3/2$  is 1, not 1.5, and  $(-1)/2$  is -1, not -0.5. This means that the results of division can vary unexpectedly depending on the type of the two operands and

because Python is dynamically typed, it can be difficult to determine the possible types of the operands.

(The controversy is over whether this is *really* a design flaw, and whether it's worth breaking existing code to fix this. It's caused endless discussions on python-dev, and in July 2001 erupted into a storm of acidly sarcastic postings on *comp.lang.python*. I won't argue for either side here and will stick to describing what's implemented in 2.2. Read [PEP 238](https://peps.python.org/pep-0238/) [https://peps.python.org/pep-0238/] for a summary of arguments and counter-arguments.)

Because this change might break code, it's being introduced very gradually. Python 2.2 begins the transition, but the switch won't be complete until Python 3.0.

First, I'll borrow some terminology from [PEP 238](https://peps.python.org/pep-0238/) [https://peps.python.org/pep-0238/]. “True division” is the division that most non-programmers are familiar with:  $3/2$  is 1.5,  $1/4$  is 0.25, and so forth. “Floor division” is what Python's `/` operator currently does when given integer operands; the result is the floor of the value returned by true division. “Classic division” is the current mixed behaviour of `/`; it returns the result of floor division when the operands are integers, and returns the result of true division when one of the operands is a floating-point number.

Here are the changes 2.2 introduces:

- A new operator, `//`, is the floor division operator. (Yes, we know it looks like C++'s comment symbol.) `//` *always* performs floor division no matter what the types of its operands are, so `1 // 2` is 0 and `1.0 // 2.0` is also 0.0.

`//` is always available in Python 2.2; you don't need to enable it using a `__future__` statement.

- By including a `from __future__ import division` in a module, the `/` operator will be changed to return the result of true division, so `1/2` is 0.5. Without the `__future__` statement, `/` still means classic division. The default meaning of `/` will not change until Python 3.0.

- Classes can define methods called `__truediv__()` and `__floordiv__()` to overload the two division operators. At the C level, there are also slots in the `PyNumberMethods` structure so extension types can define the two operators.
- Python 2.2 supports some command-line arguments for testing whether code will work with the changed division semantics. Running python with `-Q warn` will cause a warning to be issued whenever division is applied to two integers. You can use this to find code that's affected by the change and fix it. By default, Python 2.2 will simply perform classic division without a warning; the warning will be turned on by default in Python 2.3.

Implemented by Guido van Rossum..

## Unicode Changes

Python's Unicode support has been enhanced a bit in 2.2. Unicode strings are usually stored as UCS-2, as 16-bit unsigned integers. Python 2.2 can also be compiled to use UCS-4, 32-bit unsigned integers, as its internal encoding by supplying `--enable-unicode=ucs4` to the configure script. (It's also possible to specify `--disable-unicode` to completely disable Unicode support.)

When built to use UCS-4 (a “wide Python”), the interpreter can natively handle Unicode characters from U + 000000 to U + 110000, so the range of legal values for the `unichr()` function is expanded accordingly. Using an interpreter compiled to use UCS-2 (a “narrow Python”), values greater than 65535 will still cause `unichr()` to raise a `ValueError` exception. This is all described in **PEP 261** [<https://peps.python.org/pep-0261/>], “Support for ‘wide’ Unicode characters”; consult it for further details.

Another change is simpler to explain. Since their introduction, Unicode strings have supported an **encode()** method to convert the string to a selected encoding such as UTF-8 or Latin-1. A symmetric **decode([\*encoding\*])** method has been added to 8-bit strings (though not to Unicode strings) in 2.2. **decode()** assumes that the string is in the specified encoding and decodes it, returning whatever is returned by the codec.

Using this new feature, codecs have been added for tasks not directly related to Unicode. For example, codecs have been added for uu-encoding, MIME's base64 encoding, and compression with the **zlib** module:

```
>>> s = """Here is a lengthy piece of redundant, overly
... and repetitive text.
... """
>>> data = s.encode('zlib')
>>> data
'x\x9c\r\xc9\xc1\r\x80 \x10\x04\xc0?U1...'
>>> data.decode('zlib')
'Here is a lengthy piece of redundant, overly verbose,\n'
>>> print s.encode('uu')
begin 666 <data>
M2&5R92!I<R!A(&QE;F=T:'D@<&EE8V4@;V8@<F5D=6YD86YT+"!O=F5
>=F5R8F]S92P*86YD(')E<&5T:71I=F4@=&5X="X*

end
>>> "sheesh".encode('rot-13')
'furrfu'
```

To convert a class instance to Unicode, a **\_\_unicode\_\_()** method can be defined by a class, analogous to **\_\_str\_\_()**.

**encode()**, **decode()**, and **\_\_unicode\_\_()** were implemented by Marc-André Lemburg. The changes to support using UCS-4 internally were implemented by Fredrik Lundh and Martin von Löwis.

**See also**

## PEP 261 [<https://peps.python.org/pep-0261/>] - Support for ‘wide’ Unicode characters

Written by Paul Prescod.

## PEP 227: Nested Scopes

In Python 2.1, statically nested scopes were added as an optional feature, to be enabled by a `from __future__ import nested_scopes` directive. In 2.2 nested scopes no longer need to be specially enabled, and are now always present. The rest of this section is a copy of the description of nested scopes from my “What’s New in Python 2.1” document; if you read it when 2.1 came out, you can skip the rest of this section.

The largest change introduced in Python 2.1, and made complete in 2.2, is to Python’s scoping rules. In Python 2.0, at any given time there are at most three namespaces used to look up variable names: local, module-level, and the built-in namespace. This often surprised people because it didn’t match their intuitive expectations. For example, a nested recursive function definition doesn’t work:

```
def f():
    ...
    def g(value):
        ...
        return g(value-1) + 1
    ...
```

The function `g()` will always raise a `NameError` exception, because the binding of the name `g` isn’t in either its local namespace or in the module-level namespace. This isn’t much of a problem in practice (how often do you recursively define interior functions like this?), but this also made using the `lambda` expression clumsier, and this was a problem in practice. In code which uses `lambda` you can often find local variables being copied by passing them as the default values of arguments.

```
def find(self, name):
```

```
"Return list of any entries equal to 'name'"
L = filter(lambda x, name=name: x == name,
           self.list_attribute)
return L
```

The readability of Python code written in a strongly functional style suffers greatly as a result.

The most significant change to Python 2.2 is that static scoping has been added to the language to fix this problem. As a first effect, the `name=name` default argument is now unnecessary in the above example. Put simply, when a given variable name is not assigned a value within a function (by an assignment, or the `def`, `class`, or `import` statements), references to the variable will be looked up in the local namespace of the enclosing scope. A more detailed explanation of the rules, and a dissection of the implementation, can be found in the PEP.

This change may cause some compatibility problems for code where the same variable name is used both at the module level and as a local variable within a function that contains further function definitions. This seems rather unlikely though, since such code would have been pretty confusing to read in the first place.

One side effect of the change is that the `from module import *` and `exec` statements have been made illegal inside a function scope under certain conditions. The Python reference manual has said all along that `from module import *` is only legal at the top level of a module, but the CPython interpreter has never enforced this before. As part of the implementation of nested scopes, the compiler which turns Python source into bytecodes has to generate different code to access variables in a containing scope. `from module import *` and `exec` make it impossible for the compiler to figure this out, because they add names to the local namespace that are unknowable at compile time. Therefore, if a function contains function definitions or `lambda` expressions with free variables, the compiler will flag this by raising a `SyntaxError` exception.

To make the preceding explanation a bit clearer, here's an example:

```
x = 1
def f():
    # The next line is a syntax error
    exec 'x=2'
    def g():
        return x
```

Line 4 containing the `exec` statement is a syntax error, since `exec` would define a new local variable named `x` whose value should be accessed by `g()`.

This shouldn't be much of a limitation, since `exec` is rarely used in most Python code (and when it is used, it's often a sign of a poor design anyway).

Written and implemented by Jeremy Hylton.

## New and Improved Modules

- The **xmlrpclib** module was contributed to the standard library by Fredrik Lundh, providing support for writing XML-RPC clients. XML-RPC is a simple remote procedure call protocol built on top of HTTP and XML. For example, the following snippet retrieves a list of RSS channels from the O'Reilly Network, and then lists the recent headlines for one channel:

```
import xmlrpclib
s = xmlrpclib.Server(
    'http://www.oreillynet.com/meerkat/xml-rpc/se
channels = s.meerkat.getChannels()
# channels is a list of dictionaries, like this:
# [{ 'id': 4, 'title': 'Freshmeat Daily News' }
#   { 'id': 190, 'title': '32Bits Online' },
#   { 'id': 4549, 'title': '3DGamers' }, ... ]
```

```
# Get the items for one channel
items = s.meerkat.getItems( {'channel': 4} )

# 'items' is another list of dictionaries, like this
# [{'link': 'http://freshmeat.net/releases/52719/',
#   'description': 'A utility which converts HTML to
#   'title': 'html2fo 0.3 (Default)'}], ... ]
```

The **SimpleXMLRPCServer** module makes it easy to create straightforward XML-RPC servers. See <http://xmlrpc.scripting.com/> for more information about XML-RPC.

- The new **hmac** module implements the HMAC algorithm described by **RFC 2104** [<https://datatracker.ietf.org/doc/html/rfc2104.html>]. (Contributed by Gerhard Häring.)
- Several functions that originally returned lengthy tuples now return pseudo-sequences that still behave like tuples but also have mnemonic attributes such as `memberst_mtime` or `tm_year`. The enhanced functions include **stat()**, **fstat()**, **statvfs()**, and **fstatvfs()** in the **os** module, and **localtime()**, **gmtime()**, and **strptime()** in the **time** module.

For example, to obtain a file's size using the old tuples, you'd end up writing something like `file_size = os.stat(filename)[stat.ST_SIZE]`, but now this can be written more clearly as `file_size = os.stat(filename).st_size`.

The original patch for this feature was contributed by Nick Mathewson.

- The Python profiler has been extensively reworked and various errors in its output have been corrected. (Contributed by Fred L. Drake, Jr. and Tim Peters.)
- The **socket** module can be compiled to support IPv6; specify the **--enable-ipv6** option to Python's configure script. (Contributed by Jun-ichiro "itojun" Hagino.)

- Two new format characters were added to the `struct` module for 64-bit integers on platforms that support the C long long type. `q` is for a signed 64-bit integer, and `Q` is for an unsigned one. The value is returned in Python's long integer type. (Contributed by Tim Peters.)
- In the interpreter's interactive mode, there's a new built-in function `help()` that uses the `pydoc` module introduced in Python 2.1 to provide interactive help. `help(object)` displays any available help text about *object*. `help()` with no argument puts you in an online help utility, where you can enter the names of functions, classes, or modules to read their help text. (Contributed by Guido van Rossum, using Ka-Ping Yee's `pydoc` module.)
- Various bugfixes and performance improvements have been made to the SRE engine underlying the `re` module. For example, the `re.sub()` and `re.split()` functions have been rewritten in C. Another contributed patch speeds up certain Unicode character ranges by a factor of two, and a new `finditer()` method that returns an iterator over all the non-overlapping matches in a given string. (SRE is maintained by Fredrik Lundh. The BIGCHARSET patch was contributed by Martin von Löwis.)
- The `smtplib` module now supports [RFC 2487](https://datatracker.ietf.org/doc/html/rfc2487) [https://datatracker.ietf.org/doc/html/rfc2487.html], "Secure SMTP over TLS", so it's now possible to encrypt the SMTP traffic between a Python program and the mail transport agent being handed a message. `smtplib` also supports SMTP authentication. (Contributed by Gerhard Häring.)
- The `imaplib` module, maintained by Piers Lauder, has support for several new extensions: the NAMESPACE extension defined in [RFC 2342](https://datatracker.ietf.org/doc/html/rfc2342) [https://datatracker.ietf.org/doc/html/rfc2342.html], SORT, GETACL and SETACL. (Contributed by Anthony Baxter and Michel Pelletier.)
- The `rfc822` module's parsing of email addresses is now compliant with [RFC 2822](https://datatracker.ietf.org/doc/html/rfc2822) [https://datatracker.ietf.org/doc/html/rfc2822.html], an update to [RFC 822](https://datatracker.ietf.org/doc/) [https://datatracker.ietf.org/doc/

html/rfc822.html]. (The module's name is *not* going to be changed to `rfc2822`.) A new package, `email`, has also been added for parsing and generating e-mail messages. (Contributed by Barry Warsaw, and arising out of his work on Mailman.)

- The `difflib` module now contains a new `Differ` class for producing human-readable lists of changes (a “delta”) between two sequences of lines of text. There are also two generator functions, `ndiff()` and `restore()`, which respectively return a delta from two sequences, or one of the original sequences from a delta. (Grunt work contributed by David Goodger, from `ndiff.py` code by Tim Peters who then did the generatorization.)
- New constants `ascii_letters`, `ascii_lowercase`, and `ascii_uppercase` were added to the `string` module. There were several modules in the standard library that used `string.letters` to mean the ranges A-Za-z, but that assumption is incorrect when locales are in use, because `string.letters` varies depending on the set of legal characters defined by the current locale. The buggy modules have all been fixed to use `ascii_letters` instead. (Reported by an unknown person; fixed by Fred L. Drake, Jr.)
- The `mimetypes` module now makes it easier to use alternative MIME-type databases by the addition of a `MimeTypes` class, which takes a list of filenames to be parsed. (Contributed by Fred L. Drake, Jr.)
- A `Timer` class was added to the `threading` module that allows scheduling an activity to happen at some future time. (Contributed by Itamar Shtull-Trauring.)

## Interpreter Changes and Fixes

Some of the changes only affect people who deal with the Python interpreter at the C level because they're writing Python extension modules, embedding the interpreter, or just hacking on the interpreter itself. If you only write Python code, none of the

changes described here will affect you very much.

- Profiling and tracing functions can now be implemented in C, which can operate at much higher speeds than Python-based functions and should reduce the overhead of profiling and tracing. This will be of interest to authors of development environments for Python. Two new C functions were added to Python's API, `PyEval_SetProfile()` and `PyEval_SetTrace()`. The existing `sys.setprofile()` and `sys.settrace()` functions still exist, and have simply been changed to use the new C-level interface. (Contributed by Fred L. Drake, Jr.)
- Another low-level API, primarily of interest to implementors of Python debuggers and development tools, was added. `PyInterpreterState_Head()` and `PyInterpreterState_Next()` let a caller walk through all the existing interpreter objects; `PyInterpreterState_ThreadHead()` and `PyThreadState_Next()` allow looping over all the thread states for a given interpreter. (Contributed by David Beazley.)
- The C-level interface to the garbage collector has been changed to make it easier to write extension types that support garbage collection and to debug misuses of the functions. Various functions have slightly different semantics, so a bunch of functions had to be renamed. Extensions that use the old API will still compile but will *not* participate in garbage collection, so updating them for 2.2 should be considered fairly high priority.

To upgrade an extension module to the new API, perform the following steps:

- Rename `Py_TPFLAGS_GC()` to `Py_TPFLAGS_HAVE_GC()`.
- Use `PyObject_GC_New()` or `PyObject_GC_NewVar()` to allocate objects, and `PyObject_GC_Del()` to deallocate them.
- Rename `PyObject_GC_Init()` to

`PyObject_GC_Track()` and  
`PyObject_GC_Fini()` to  
`PyObject_GC_UnTrack()`.

- Remove `PyGC_HEAD_SIZE()` from object size calculations.
- Remove calls to `PyObject_AS_GC()` and `PyObject_FROM_GC()`.
- A new `et` format sequence was added to `PyArg_ParseTuple()`; `et` takes both a parameter and an encoding name, and converts the parameter to the given encoding if the parameter turns out to be a Unicode string, or leaves it alone if it's an 8-bit string, assuming it to already be in the desired encoding. This differs from the `es` format character, which assumes that 8-bit strings are in Python's default ASCII encoding and converts them to the specified new encoding. (Contributed by M.-A. Lemburg, and used for the MBCS support on Windows described in the following section.)
- A different argument parsing function, `PyArg_UnpackTuple()`, has been added that's simpler and presumably faster. Instead of specifying a format string, the caller simply gives the minimum and maximum number of arguments expected, and a set of pointers to `PyObject*` variables that will be filled in with argument values.
- Two new flags `METH_NOARGS` and `METH_O` are available in method definition tables to simplify implementation of methods with no arguments or a single untyped argument. Calling such methods is more efficient than calling a corresponding method that uses `METH_VARARGS`. Also, the old `METH_OLDARGS` style of writing C methods is now officially deprecated.
- Two new wrapper functions, `PyOS_snprintf()` and `PyOS_vsnprintf()` were added to provide cross-platform implementations for the relatively new `snprintf()` and `vsnprintf()` C lib APIs. In contrast to the standard `sprintf()` and `vsprintf()` functions, the Python versions

check the bounds of the buffer used to protect against buffer overruns. (Contributed by M.-A. Lemburg.)

- The `_PyTuple_Resize()` function has lost an unused parameter, so now it takes 2 parameters instead of 3. The third argument was never used, and can simply be discarded when porting code from earlier versions to Python 2.2.

## Other Changes and Fixes

As usual there were a bunch of other improvements and bugfixes scattered throughout the source tree. A search through the CVS change logs finds there were 527 patches applied and 683 bugs fixed between Python 2.1 and 2.2; 2.2.1 applied 139 patches and fixed 143 bugs; 2.2.2 applied 106 patches and fixed 82 bugs. These figures are likely to be underestimates.

Some of the more notable changes are:

- The code for the MacOS port for Python, maintained by Jack Jansen, is now kept in the main Python CVS tree, and many changes have been made to support MacOS X.

The most significant change is the ability to build Python as a framework, enabled by supplying the `--enable-framework` option to the configure script when compiling Python. According to Jack Jansen, “This installs a self-contained Python installation plus the OS X framework “glue” into `/Library/Frameworks/Python.framework` (or another location of choice). For now there is little immediate added benefit to this (actually, there is the disadvantage that you have to change your PATH to be able to find Python), but it is the basis for creating a full-blown Python application, porting the MacPython IDE, possibly using Python as a standard OSA scripting language and much more.”

Most of the MacPython toolbox modules, which interface to MacOS APIs such as windowing, QuickTime, scripting, etc. have been ported to OS X, but they’ve been left commented out in `setup.py`. People who want to experiment with these

modules can uncomment them manually.

- Keyword arguments passed to built-in functions that don't take them now cause a `TypeError` exception to be raised, with the message “*function* takes no keyword arguments”.
- Weak references, added in Python 2.1 as an extension module, are now part of the core because they're used in the implementation of new-style classes. The `ReferenceError` exception has therefore moved from the `weakref` module to become a built-in exception.
- A new script, `Tools/scripts/cleanfuture.py` by Tim Peters, automatically removes obsolete `__future__` statements from Python source code.
- An additional *flags* argument has been added to the built-in function `compile()`, so the behaviour of `__future__` statements can now be correctly observed in simulated shells, such as those presented by IDLE and other development environments. This is described in [PEP 264](https://peps.python.org/pep-0264/) [https://peps.python.org/pep-0264/]. (Contributed by Michael Hudson.)
- The new license introduced with Python 1.6 wasn't GPL-compatible. This is fixed by some minor textual changes to the 2.2 license, so it's now legal to embed Python inside a GPLed program again. Note that Python itself is not GPLed, but instead is under a license that's essentially equivalent to the BSD license, same as it always was. The license changes were also applied to the Python 2.0.1 and 2.1.1 releases.
- When presented with a Unicode filename on Windows, Python will now convert it to an MBCS encoded string, as used by the Microsoft file APIs. As MBCS is explicitly used by the file APIs, Python's choice of ASCII as the default encoding turns out to be an annoyance. On Unix, the locale's character set is used if `locale.nl_langinfo(CODESET)` is available. (Windows support was contributed by Mark Hammond with assistance from Marc-André Lemburg. Unix support was added by Martin von Löwis.)

- Large file support is now enabled on Windows. (Contributed by Tim Peters.)
- The `Tools/scripts/ftpmirror.py` script now parses a `.netrc` file, if you have one. (Contributed by Mike Romberg.)
- Some features of the object returned by the `xrange()` function are now deprecated, and trigger warnings when they're accessed; they'll disappear in Python 2.3. `xrange` objects tried to pretend they were full sequence types by supporting slicing, sequence multiplication, and the `in` operator, but these features were rarely used and therefore buggy. The `tolist()` method and the `start`, `stop`, and `step` attributes are also being deprecated. At the C level, the fourth argument to the `PyRange_New()` function, `repeat`, has also been deprecated.
- There were a bunch of patches to the dictionary implementation, mostly to fix potential core dumps if a dictionary contains objects that sneakily changed their hash value, or mutated the dictionary they were contained in. For a while python-dev fell into a gentle rhythm of Michael Hudson finding a case that dumped core, Tim Peters fixing the bug, Michael finding another case, and round and round it went.
- On Windows, Python can now be compiled with Borland C thanks to a number of patches contributed by Stephen Hansen, though the result isn't fully functional yet. (But this is progress...)
- Another Windows enhancement: Wise Solutions generously offered PythonLabs use of their InstallerMaster 8.1 system. Earlier PythonLabs Windows installers used Wise 5.0a, which was beginning to show its age. (Packaged up by Tim Peters.)
- Files ending in `.pyw` can now be imported on Windows. `.pyw` is a Windows-only thing, used to indicate that a script needs to be run using PYTHONW.EXE instead of PYTHON.EXE in order to prevent a DOS console from

popping up to display the output. This patch makes it possible to import such scripts, in case they're also usable as modules. (Implemented by David Bolen.)

- On platforms where Python uses the C `dlopen()` function to load extension modules, it's now possible to set the flags used by `dlopen()` using the `sys.getdlopenflags()` and `sys.setdlopenflags()` functions. (Contributed by Bram Stolk.)
- The `pow()` built-in function no longer supports 3 arguments when floating-point numbers are supplied. `pow(x, y, z)` returns  $(x**y) \% z$ , but this is never useful for floating point numbers, and the final result varies unpredictably depending on the platform. A call such as `pow(2.0, 8.0, 7.0)` will now raise a `TypeError` exception.

# What's New in Python 2.1

Author

A.M. Kuchling

## Introduction

This article explains the new features in Python 2.1. While there aren't as many changes in 2.1 as there were in Python 2.0, there are still some pleasant surprises in store. 2.1 is the first release to be steered through the use of Python Enhancement Proposals, or PEPs, so most of the sizable changes have accompanying PEPs that provide more complete documentation and a design rationale for the change. This article doesn't attempt to document the new features completely, but simply provides an overview of the new features for Python programmers. Refer to the Python 2.1 documentation, or to the specific PEP, for more details about any new feature that particularly interests you.

One recent goal of the Python development team has been to accelerate the pace of new releases, with a new release coming every 6 to 9 months. 2.1 is the first release to come out at this faster pace, with the first alpha appearing in January, 3 months after the final version of 2.0 was released.

The final release of Python 2.1 was made on April 17, 2001.

## PEP 227: Nested Scopes

The largest change in Python 2.1 is to Python's scoping rules. In Python 2.0, at any given time there are at most three namespaces used to look up variable names: local, module-level, and the built-in namespace. This often surprised people because it didn't match their intuitive expectations. For example, a nested recursive function definition doesn't work:

```
def f():
    ...
    def g(value):
        ...
        return g(value-1) + 1
    ...
```

The function `g()` will always raise a `NameError` exception, because the binding of the name `g` isn't in either its local namespace or in the module-level namespace. This isn't much of a problem in practice (how often do you recursively define interior functions like this?), but this also made using the `lambda` expression clumsier, and this was a problem in practice. In code which uses `lambda` you can often find local variables being copied by passing them as the default values of arguments.

```
def find(self, name):
    "Return list of any entries equal to 'name'"
    L = filter(lambda x, name=name: x == name,
               self.list_attribute)
    return L
```

The readability of Python code written in a strongly functional style suffers greatly as a result.

The most significant change to Python 2.1 is that static scoping has been added to the language to fix this problem. As a first effect, the `name=name` default argument is now unnecessary in the above example. Put simply, when a given variable name is not assigned a value within a function (by an assignment, or the `def`, `class`, or `import` statements), references to the variable will be looked up in the local namespace of the enclosing scope. A more detailed explanation of the rules, and a dissection of the implementation, can be found in the PEP.

This change may cause some compatibility problems for code where the same variable name is used both at the module level and as a local variable within a function that contains further function definitions. This seems rather unlikely though, since such code would have been pretty confusing to read in the first place.

One side effect of the change is that the `from module import *` and `exec` statements have been made illegal inside a function scope under certain conditions. The Python reference manual has said all along that `from module import *` is only legal at the top level of a module, but the CPython interpreter has never enforced this before. As part of the implementation of nested scopes, the compiler which turns Python source into bytecodes has to generate different code to access variables in a containing scope. `from module import *` and `exec` make it impossible for the compiler to figure this out, because they add names to the local namespace that are unknowable at compile time. Therefore, if a function contains function definitions or `lambda` expressions with free variables, the compiler will flag this by raising a `SyntaxError` exception.

To make the preceding explanation a bit clearer, here's an example:

```
x = 1
def f():
    # The next line is a syntax error
    exec 'x=2'
    def g():
        return x
```

Line 4 containing the `exec` statement is a syntax error, since `exec` would define a new local variable named `x` whose value should be accessed by `g()`.

This shouldn't be much of a limitation, since `exec` is rarely used in most Python code (and when it is used, it's often a sign of a poor design anyway).

Compatibility concerns have led to nested scopes being introduced gradually; in Python 2.1, they aren't enabled by default, but can be turned on within a module by using a `future` statement as described in [PEP 236](https://peps.python.org/pep-0236/) [https://peps.python.org/pep-0236/]. (See the following section for further discussion of [PEP 236](https://peps.python.org/pep-0236/) [https://peps.python.org/pep-0236/].) In Python 2.2, nested scopes will become the default and there will be no way to turn them off, but users will have had all of 2.1's lifetime to fix any breakage resulting from their introduction.

See also

**PEP 227** [<https://peps.python.org/pep-0227/>] - **Statically Nested Scopes**

Written and implemented by Jeremy Hylton.

## PEP 236: `__future__` Directives

The reaction to nested scopes was widespread concern about the dangers of breaking code with the 2.1 release, and it was strong enough to make the Pythoners take a more conservative approach. This approach consists of introducing a convention for enabling optional functionality in release N that will become compulsory in release N + 1.

The syntax uses a `from...import` statement using the reserved module name `__future__`. Nested scopes can be enabled by the following statement:

```
from __future__ import nested_scopes
```

While it looks like a normal `import` statement, it's not; there are strict rules on where such a future statement can be put. They can only be at the top of a module, and must precede any Python code or regular `import` statements. This is because such statements can affect how the Python bytecode compiler parses code and generates bytecode, so they must precede any statement that will result in bytecodes being produced.

**PEP 236** [<https://peps.python.org/pep-0236/>] - **Back to the `__future__`**

Written by Tim Peters, and primarily implemented by Jeremy Hylton.

## PEP 207: Rich Comparisons

In earlier versions, Python's support for implementing comparisons on user-defined classes and extension types was quite simple. Classes could implement a `__cmp__()` method that was given two instances of a class, and could only return 0 if they were equal or +1 or -1 if they weren't; the method couldn't raise an exception or return anything other than a Boolean value. Users of Numeric Python often found this model too weak and restrictive, because in the number-crunching programs that numeric Python is used for, it would be more useful to be able to perform elementwise comparisons of two matrices, returning a matrix containing the results of a given comparison for each element. If the two matrices are of different sizes, then the compare has to be able to raise an exception to signal the error.

In Python 2.1, rich comparisons were added in order to support this need. Python classes can now individually overload each of the `<`, `<=`, `>`, `>=`, `==`, and `!=` operations. The new magic method names are:

Operator	Method name
<code>&lt;</code>	<code>__lt__()</code>
<code>&lt;=</code>	<code>__le__()</code>
<code>&gt;</code>	<code>__gt__()</code>
<code>&gt;=</code>	<code>__ge__()</code>
<code>==</code>	<code>__eq__()</code>
<code>!=</code>	<code>__ne__()</code>

(The magic methods are named after the corresponding Fortran operators `.LT..` `.LE.`, &c. Numeric programmers are almost certainly quite familiar with these names and will find them easy to remember.)

Each of these magic methods is of the form `method(self, other)`, where `self` will be the object on the left-hand side of the operator, while `other` will be the object on the right-hand side. For example, the expression `A < B` will cause `A.__lt__(B)` to be called.

Each of these magic methods can return anything at all: a Boolean, a matrix, a list, or any other Python object. Alternatively they can raise an exception if the comparison is impossible, inconsistent, or

otherwise meaningless.

The built-in `cmp(A, B)` function can use the rich comparison machinery, and now accepts an optional argument specifying which comparison operation to use; this is given as one of the strings `"<"`, `"<="`, `">"`, `">="`, `"=="`, or `"!="`. If called without the optional third argument, `cmp()` will only return -1, 0, or +1 as in previous versions of Python; otherwise it will call the appropriate method and can return any Python object.

There are also corresponding changes of interest to C programmers; there's a new slot `tp_richcmp` in type objects and an API for performing a given rich comparison. I won't cover the C API here, but will refer you to [PEP 207](https://peps.python.org/pep-0207/) [https://peps.python.org/pep-0207/], or to 2.1's C API documentation, for the full list of related functions.

**See also**

[PEP 207](https://peps.python.org/pep-0207/) [https://peps.python.org/pep-0207/] - **Rich Comparisons**

Written by Guido van Rossum, heavily based on earlier work by David Ascher, and implemented by Guido van Rossum.

## PEP 230: Warning Framework

Over its 10 years of existence, Python has accumulated a certain number of obsolete modules and features along the way. It's difficult to know when a feature is safe to remove, since there's no way of knowing how much code uses it — perhaps no programs depend on the feature, or perhaps many do. To enable removing old features in a more structured way, a warning framework was added. When the Python developers want to get rid of a feature, it will first trigger a warning in the next version of Python. The following Python version can then drop the feature, and users will have had a full release cycle to remove uses of the old feature.

Python 2.1 adds the warning framework to be used in this scheme. It adds a [warnings](#) module that provide functions to issue warnings, and to filter out warnings that you don't want to be

displayed. Third-party modules can also use this framework to deprecate old features that they no longer wish to support.

For example, in Python 2.1 the **regex** module is deprecated, so importing it causes a warning to be printed:

```
>>> import regex
__main__:1: DeprecationWarning: the regex module
        is deprecated; please use the re module
>>>
```

Warnings can be issued by calling the `warnings.warn()` function:

```
warnings.warn("feature X no longer supported")
```

The first parameter is the warning message; an additional optional parameters can be used to specify a particular warning category.

Filters can be added to disable certain warnings; a regular expression pattern can be applied to the message or to the module name in order to suppress a warning. For example, you may have a program that uses the **regex** module and not want to spare the time to convert it to use the **re** module right now. The warning can be suppressed by calling

```
import warnings
warnings.filterwarnings(action = 'ignore',
                        message='.*regex module is depre
                        category=DeprecationWarning,
                        module = '__main__')
```

This adds a filter that will apply only to warnings of the class `DeprecationWarning` triggered in the `__main__` module, and applies a regular expression to only match the message about the **regex** module being deprecated, and will cause such warnings to be ignored. Warnings can also be printed only once, printed every time the offending code is executed, or turned into exceptions that will cause the program to stop (unless the exceptions are caught in the usual way, of course).

Functions were also added to Python's C API for issuing warnings; refer to PEP 230 or to Python's API documentation for the details.

Written and implemented by Guido van Rossum.

## **PEP 229: New Build System**

When compiling Python, the user had to go in and edit the `Modules/Setup` file in order to enable various additional modules; the default set is relatively small and limited to modules that compile on most Unix platforms. This means that on Unix platforms with many more features, most notably Linux, Python installations often don't contain all useful modules they could.

Python 2.0 added the Distutils, a set of modules for distributing and installing extensions. In Python 2.1, the Distutils are used to compile much of the standard library of extension modules, autodetecting which ones are supported on the current machine. It's hoped that this will make Python installations easier and more featureful.

Instead of having to edit the `Modules/Setup` file in order to enable modules, a `setup.py` script in the top directory of the Python source distribution is run at build time, and attempts to discover which modules can be enabled by examining the modules and header files on the system. If a module is configured in `Modules/Setup`, the `setup.py` script won't attempt to compile

that module and will defer to the `Modules/Setup` file's contents. This provides a way to specify any strange command-line flags or libraries that are required for a specific platform.

In another far-reaching change to the build mechanism, Neil Schemenauer restructured things so Python now uses a single makefile that isn't recursive, instead of makefiles in the top directory and in each of the `Python/`, `Parser/`, `Objects/`, and `Modules/` subdirectories. This makes building Python faster and also makes hacking the Makefiles clearer and simpler.

Written and implemented by A.M. Kuchling.

## PEP 205: Weak References

Weak references, available through the [weakref](#) module, are a minor but useful new data type in the Python programmer's toolbox.

Storing a reference to an object (say, in a dictionary or a list) has the side effect of keeping that object alive forever. There are a few specific cases where this behaviour is undesirable, object caches being the most common one, and another being circular references in data structures such as trees.

For example, consider a memoizing function that caches the results of another function `f(x)` by storing the function's argument and its result in a dictionary:

```
_cache = {}
def memoize(x):
    if _cache.has_key(x):
        return _cache[x]

    retval = f(x)
```

```
# Cache the returned object
_cache[x] = retval

return retval
```

This version works for simple things such as integers, but it has a side effect; the `_cache` dictionary holds a reference to the return values, so they'll never be deallocated until the Python process exits and cleans up. This isn't very noticeable for integers, but if `f()` returns an object, or a data structure that takes up a lot of memory, this can be a problem.

Weak references provide a way to implement a cache that won't keep objects alive beyond their time. If an object is only accessible through weak references, the object will be deallocated and the weak references will now indicate that the object it referred to no longer exists. A weak reference to an object *obj* is created by calling `wr = weakref.ref(obj)`. The object being referred to is returned by calling the weak reference as if it were a function: `wr()`. It will return the referenced object, or `None` if the object no longer exists.

This makes it possible to write a **`memoize()`** function whose cache doesn't keep objects alive, by storing weak references in the cache.

```
_cache = {}
def memoize(x):
    if _cache.has_key(x):
        obj = _cache[x]()
        # If weak reference object still exists,
        # return it
        if obj is not None: return obj

    retval = f(x)

    # Cache a weak reference
    _cache[x] = weakref.ref(retval)

    return retval
```

The **`weakref`** module also allows creating proxy objects which behave like weak references — an object referenced only by proxy objects is deallocated – but instead of requiring an explicit call to retrieve the object, the proxy transparently forwards all operations to the object as long as the object still exists. If the object is deallocated, attempting to use a proxy will cause a **`weakref.ReferenceError`** exception to be raised.

```
proxy = weakref.proxy(obj)
proxy.attr    # Equivalent to obj.attr
proxy.meth()  # Equivalent to obj.meth()
del obj
proxy.attr    # raises weakref.ReferenceError
```

Written and implemented by Fred L. Drake, Jr.

## PEP 232: Function Attributes

In Python 2.1, functions can now have arbitrary information attached to them. People were often using docstrings to hold information about functions and methods, because the `__doc__` attribute was the only way of attaching any information to a function. For example, in the Zope web application server, functions are marked as safe for public access by having a docstring, and in John Aycock's SPARK parsing framework, docstrings hold parts of the BNF grammar to be parsed. This overloading is unfortunate, since docstrings are really intended to hold a function's documentation; for example, it means you can't properly document functions intended for private use in Zope.

Arbitrary attributes can now be set and retrieved on functions using the regular Python syntax:

```
def f(): pass

f.publish = 1
```

```
f.secure = 1
f.grammar = "A ::= B (C D) *"
```

The dictionary containing attributes can be accessed as the function's `__dict__`. Unlike the `__dict__` attribute of class instances, in functions you can actually assign a new dictionary to `__dict__`, though the new value is restricted to a regular Python dictionary; you *can't* be tricky and set it to a `UserDict` instance, or any other random object that behaves like a mapping.

Written and implemented by Barry Warsaw.

## PEP 235: Importing Modules on Case-Insensitive Platforms

Some operating systems have filesystems that are case-insensitive, MacOS and Windows being the primary examples; on these systems, it's impossible to distinguish the filenames `FILE.PY` and `file.py`, even though they do store the file's name in its original case (they're case-preserving, too).

In Python 2.1, the `import` statement will work to simulate case-sensitivity on case-insensitive platforms. Python will now search for the first case-sensitive match by default, raising an `ImportError` if no such file is found, so `import file` will not import a module named `FILE.PY`. Case-insensitive matching can be requested by setting the `PYTHONCASEOK` environment variable before starting the Python interpreter.

## PEP 217: Interactive Display Hook

When using the Python interpreter interactively, the output of commands is displayed using the built-in `repr()` function. In Python 2.1, the variable `sys.displayhook()` can be set to a callable object which will be called instead of `repr()`. For

example, you can set it to a special pretty-printing function:

```
>>> # Create a recursive data structure
... L = [1,2,3]
>>> L.append(L)
>>> L # Show Python's default output
[1, 2, 3, [...]]
>>> # Use pprint.pprint() as the display function
... import sys, pprint
>>> sys.displayhook = pprint.pprint
>>> L
[1, 2, 3,  <Recursion on list with id=135143996>]
>>>
```

## PEP 208: New Coercion Model

How numeric coercion is done at the C level was significantly modified. This will only affect the authors of C extensions to Python, allowing them more flexibility in writing extension types that support numeric operations.

Extension types can now set the type flag `Py_TPFLAGS_CHECKTYPES` in their `PyTypeObject` structure to indicate that they support the new coercion model. In such extension types, the numeric slot functions can no longer assume that they'll be passed two arguments of the same type; instead they may be passed two arguments of differing types, and can then perform their own internal coercion. If the slot function is passed a type it can't handle, it can indicate the failure by returning a reference to the `Py_NotImplemented` singleton value. The numeric functions of the other type will then be tried, and perhaps they can handle the operation; if the other type also returns `Py_NotImplemented`, then a **`TypeError`** will be raised. Numeric

methods written in Python can also return `Py_NotImplemented`, causing the interpreter to act as if the method did not exist (perhaps raising a **`TypeError`**, perhaps trying another object's numeric methods).

Written and implemented by Neil Schemenauer, heavily based upon earlier work by Marc-André Lemburg. Read this to understand the fine points of how numeric operations will now be processed at the C level.

## **PEP 241: Metadata in Python Packages**

A common complaint from Python users is that there's no single catalog of all the Python modules in existence. T. Middleton's Vaults of Parnassus at [www.vex.net/parnassus/](http://www.vex.net/parnassus/) (retired in February 2009, [available in the Internet Archive Wayback Machine](https://web.archive.org/web/20090130140102/http://www.vex.net/parnassus/) [<https://web.archive.org/web/20090130140102/http://www.vex.net/parnassus/>]) was the largest catalog of Python modules, but registering software at the Vaults is optional, and many people did not bother.

As a first small step toward fixing the problem, Python software packaged using the Distutils **`sdist`** command will include a file named `PKG-INFO` containing information about the package such as its name, version, and author (metadata, in cataloguing terminology). **PEP 241** [<https://peps.python.org/pep-0241/>] contains the full list of fields that can be present in the `PKG-INFO` file. As people began to package their software using Python 2.1, more and more packages will include metadata, making it possible to build automated cataloguing systems and experiment with them. With the result experience, perhaps it'll be possible to design a really good catalog and then build support for it into Python 2.2. For example, the Distutils **`sdist`** and **`bdist_*`** commands could support an `upload` option that would automatically upload your package to a catalog server.

You can start creating packages containing `PKG-INFO` even if you're not using Python 2.1, since a new release of the Distutils will be made for users of earlier Python versions. Version 1.0.2 of the Distutils includes the changes described in [PEP 241](https://peps.python.org/pep-0241/) [https://peps.python.org/pep-0241/], as well as various bugfixes and enhancements. It will be available from the Distutils SIG at <https://www.python.org/community/sigs/current/distutils-sig/>.

### [PEP 243](https://peps.python.org/pep-0243/) [https://peps.python.org/pep-0243/] - Module Repository Upload Mechanism

Written by Sean Reifschneider, this draft PEP describes a proposed mechanism for uploading Python packages to a central server.

## New and Improved Modules

- Ka-Ping Yee contributed two new modules: `inspect.py`, a module for getting information about live Python code, and `pydoc.py`, a module for interactively converting docstrings to HTML or text. As a bonus, `Tools/scripts/pydoc`, which is now automatically installed, uses `pydoc.py` to display documentation given a Python module, package, or class name. For example, `pydoc xml.dom` displays the following:

```
Python Library Documentation: package xml.dom in xm
```

```
NAME
```

```
xml.dom - W3C Document Object Model implementat
```

```
FILE
```

```
/usr/local/lib/python2.1/xml/dom/__init__.pyc
```

## DESCRIPTION

The Python mapping of the Document Object Model  
Python Library Reference in the section on the

This package contains the following modules:

...

pydoc also includes a Tk-based interactive help browser.  
pydoc quickly becomes addictive; try it out!

- Two different modules for unit testing were added to the standard library. The `doctest` module, contributed by Tim Peters, provides a testing framework based on running embedded examples in docstrings and comparing the results against the expected output. PyUnit, contributed by Steve Purcell, is a unit testing framework inspired by JUnit, which was in turn an adaptation of Kent Beck's Smalltalk testing framework. See <https://pyunit.sourceforge.net/> for more information about PyUnit.
- The `difflib` module contains a class, `SequenceMatcher`, which compares two sequences and computes the changes required to transform one sequence into the other. For example, this module can be used to write a tool similar to the Unix `diff` program, and in fact the sample program `Tools/scripts/ndiff.py` demonstrates how to write such a script.
- `curses.panel`, a wrapper for the panel library, part of ncurses and of SYSV curses, was contributed by Thomas Gellekum. The panel library provides windows with the additional feature of depth. Windows can be moved higher or lower in the depth ordering, and the panel library figures out where panels overlap and which sections are visible.
- The PyXML package has gone through a few releases since Python 2.0, and Python 2.1 includes an updated version of the `xml` package. Some of the noteworthy changes include support for Expat 1.2 and later versions, the ability for Expat parsers to handle files in any encoding supported by Python, and various bugfixes for SAX, DOM, and the `minidom`

module.

- Ping also contributed another hook for handling uncaught exceptions. `sys.excepthook()` can be set to a callable object. When an exception isn't caught by any `try...except` blocks, the exception will be passed to `sys.excepthook()`, which can then do whatever it likes. At the Ninth Python Conference, Ping demonstrated an application for this hook: printing an extended traceback that not only lists the stack frames, but also lists the function arguments and the local variables for each frame.
- Various functions in the `time` module, such as `asctime()` and `localtime()`, require a floating point argument containing the time in seconds since the epoch. The most common use of these functions is to work with the current time, so the floating point argument has been made optional; when a value isn't provided, the current time will be used. For example, log file entries usually need a string containing the current time; in Python 2.1, `time.asctime()` can be used, instead of the lengthier `time.asctime(time.localtime(time.time()))` that was previously required.

This change was proposed and implemented by Thomas Wouters.

- The `ftplib` module now defaults to retrieving files in passive mode, because passive mode is more likely to work from behind a firewall. This request came from the Debian bug tracking system, since other Debian packages use `ftplib` to retrieve files and then don't work from behind a firewall. It's deemed unlikely that this will cause problems for anyone, because Netscape defaults to passive mode and few people complain, but if passive mode is unsuitable for your application or network setup, call `set_pasv(0)` on FTP objects to disable passive mode.
- Support for raw socket access has been added to the `socket` module, contributed by Grant Edwards.

- The `pstats` module now contains a simple interactive statistics browser for displaying timing profiles for Python programs, invoked when the module is run as a script. Contributed by Eric S. Raymond.
- A new implementation-dependent function, `sys._getframe([depth])`, has been added to return a given frame object from the current call stack. `sys._getframe()` returns the frame at the top of the call stack; if the optional integer argument *depth* is supplied, the function returns the frame that is *depth* calls below the top of the stack. For example, `sys._getframe(1)` returns the caller's frame object.

This function is only present in CPython, not in Jython or the .NET implementation. Use it for debugging, and resist the temptation to put it into production code.

## Other Changes and Fixes

There were relatively few smaller changes made in Python 2.1 due to the shorter release cycle. A search through the CVS change logs turns up 117 patches applied, and 136 bugs fixed; both figures are likely to be underestimates. Some of the more notable changes are:

- A specialized object allocator is now optionally available, that should be faster than the system `malloc()` and have less memory overhead. The allocator uses C's `malloc()` function to get large pools of memory, and then fulfills smaller memory requests from these pools. It can be enabled by providing the `--with-pymalloc` option to the `configure` script; see `Objects/obmalloc.c` for the implementation details.

Authors of C extension modules should test their code with the object allocator enabled, because some incorrect code may break, causing core dumps at runtime. There are a bunch of memory allocation functions in Python's C API that have previously been just aliases for the C library's `malloc()` and `free()`, meaning that if you accidentally called mismatched

functions, the error wouldn't be noticeable. When the object allocator is enabled, these functions aren't aliases of **malloc()** and **free()** any more, and calling the wrong function to free memory will get you a core dump. For example, if memory was allocated using **PyMem\_New()**, it has to be freed using **PyMem\_Del()**, not **free()**. A few modules included with Python fell afoul of this and had to be fixed; doubtless there are more third-party modules that will have the same problem.

The object allocator was contributed by Vladimir Marangozov.

- The speed of line-oriented file I/O has been improved because people often complain about its lack of speed, and because it's often been used as a naïve benchmark. The **readline()** method of file objects has therefore been rewritten to be much faster. The exact amount of the speedup will vary from platform to platform depending on how slow the C library's **getc()** was, but is around 66%, and potentially much faster on some particular operating systems. Tim Peters did much of the benchmarking and coding for this change, motivated by a discussion in [comp.lang.python](http://comp.lang.python).

A new module and method for file objects was also added, contributed by Jeff Epler. The new method, **xreadlines()**, is similar to the existing **xrange()** built-in.

**xreadlines()** returns an opaque sequence object that only supports being iterated over, reading a line on every iteration but not reading the entire file into memory as the existing **readlines()** method does. You'd use it like this:

```
for line in sys.stdin.xreadlines():
    # ... do something for each line ...
    ...
```

For a fuller discussion of the line I/O changes, see the python-dev summary for January 1–15, 2001 at <https://mail.python.org/pipermail/python-dev/2001-January/>.

- A new method, **popitem()**, was added to dictionaries to

enable destructively iterating through the contents of a dictionary; this can be faster for large dictionaries because there's no need to construct a list containing all the keys or values. `D.popitem()` removes a random (key, value) pair from the dictionary `D` and returns it as a 2-tuple. This was implemented mostly by Tim Peters and Guido van Rossum, after a suggestion and preliminary patch by Moshe Zadka.

- Modules can now control which names are imported when `from module import *` is used, by defining an `__all__` attribute containing a list of names that will be imported. One common complaint is that if the module imports other modules such as `sys` or `string`, `from module import *` will add them to the importing module's namespace. To fix this, simply list the public names in `__all__`:

```
# List public names
__all__ = ['Database', 'open']
```

A stricter version of this patch was first suggested and implemented by Ben Wolfson, but after some python-dev discussion, a weaker final version was checked in.

- Applying `repr()` to strings previously used octal escapes for non-printable characters; for example, a newline was `'\012'`. This was a vestigial trace of Python's C ancestry, but today octal is of very little practical use. Ka-Ping Yee suggested using hex escapes instead of octal ones, and using the `\n`, `\t`, `\r` escapes for the appropriate characters, and implemented this new formatting.
- Syntax errors detected at compile-time can now raise exceptions containing the filename and line number of the error, a pleasant side effect of the compiler reorganization done by Jeremy Hylton.
- C extensions which import other modules have been changed to use `PyImport_ImportModule()`, which means that they will use any import hooks that have been installed. This is also encouraged for third-party extensions that need to

import some other module from C code.

- The size of the Unicode character database was shrunk by another 340K thanks to Fredrik Lundh.
- Some new ports were contributed: MacOS X (by Steven Majewski), Cygwin (by Jason Tishler); RISCOS (by Dietmar Schwertberger); Unixware 7 (by Billy G. Allie).

And there's the usual list of minor bugfixes, minor memory leaks, docstring edits, and other tweaks, too lengthy to be worth itemizing; see the CVS logs for the full details if you want them.

# What's New in Python 2.0

**Author**

A.M. Kuchling and Moshe Zadka

## Introduction

A new release of Python, version 2.0, was released on October 16, 2000. This article covers the exciting new features in 2.0, highlights some other useful changes, and points out a few incompatible changes that may require rewriting code.

Python's development never completely stops between releases, and a steady flow of bug fixes and improvements are always being submitted. A host of minor fixes, a few optimizations, additional docstrings, and better error messages went into 2.0; to list them all would be impossible, but they're certainly significant. Consult the publicly available CVS logs if you want to see the full list. This progress is due to the five developers working for PythonLabs are now getting paid to spend their days fixing bugs, and also due to the improved communication resulting from moving to SourceForge.

## What About Python 1.6?

Python 1.6 can be thought of as the Contractual Obligations Python release. After the core development team left CNRI in May 2000, CNRI requested that a 1.6 release be created, containing all the work on Python that had been performed at CNRI. Python 1.6 therefore represents the state of the CVS tree as of May 2000, with the most significant new feature being Unicode support. Development continued after May, of course, so the 1.6 tree received a few fixes to ensure that it's forward-compatible with Python 2.0. 1.6 is therefore part of Python's evolution, and not a side branch.

So, should you take much interest in Python 1.6? Probably not. The 1.6final and 2.0beta1 releases were made on the same day (September 5, 2000), the plan being to finalize Python 2.0 within a month or so. If you have applications to maintain, there seems little point in breaking things by moving to 1.6, fixing them, and then having another round of breakage within a month by moving to 2.0; you're better off just going straight to 2.0. Most of the really interesting features described in this document are only in 2.0, because a lot of work was done between May and September.

## New Development Process

The most important change in Python 2.0 may not be to the code at all, but to how Python is developed: in May 2000 the Python developers began using the tools made available by SourceForge for storing source code, tracking bug reports, and managing the queue of patch submissions. To report bugs or submit patches for Python 2.0, use the bug tracking and patch manager tools available from Python's project page, located at <https://sourceforge.net/projects/python/>.

The most important of the services now hosted at SourceForge is the Python CVS tree, the version-controlled repository containing the source code for Python. Previously, there were roughly 7 or so people who had write access to the CVS tree, and all patches had to be inspected and checked in by one of the people on this short list. Obviously, this wasn't very scalable. By moving the CVS tree to SourceForge, it became possible to grant write access to more people; as of September 2000 there were 27 people able to check in changes, a fourfold increase. This makes possible large-scale changes that wouldn't be attempted if they'd have to be filtered through the small group of core developers. For example, one day Peter Schneider-Kamp took it into his head to drop K&R C compatibility and convert the C source for Python to ANSI C. After getting approval on the python-dev mailing list, he launched into a flurry of checkins that lasted about a week, other developers joined in to help, and the job was done. If there were only 5 people with write access, probably that task would have been viewed as "nice, but not worth the time and effort needed" and it would never have gotten done.

The shift to using SourceForge's services has resulted in a remarkable increase in the speed of development. Patches now get submitted, commented on, revised by people other than the original submitter, and bounced back and forth between people until the patch is deemed worth checking in. Bugs are tracked in one central location and can be assigned to a specific person for fixing, and we can count the number of open bugs to measure progress. This didn't come without a cost: developers now have more e-mail to deal with, more mailing lists to follow, and special tools had to be written for the new environment. For example, SourceForge sends default patch and bug notification e-mail messages that are completely unhelpful, so Ka-Ping Yee wrote an HTML screen-scraper that sends more useful messages.

The ease of adding code caused a few initial growing pains, such as code was checked in before it was ready or without getting clear agreement from the developer group. The approval process that has emerged is somewhat similar to that used by the Apache group. Developers can vote +1, +0, -0, or -1 on a patch; +1 and -1 denote acceptance or rejection, while +0 and -0 mean the developer is mostly indifferent to the change, though with a slight positive or negative slant. The most significant change from the Apache model is that the voting is essentially advisory, letting Guido van Rossum, who has Benevolent Dictator For Life status, know what the general opinion is. He can still ignore the result of a vote, and approve or reject a change even if the community disagrees with him.

Producing an actual patch is the last step in adding a new feature, and is usually easy compared to the earlier task of coming up with a good design. Discussions of new features can often explode into lengthy mailing list threads, making the discussion hard to follow, and no one can read every posting to python-dev. Therefore, a relatively formal process has been set up to write Python Enhancement Proposals (PEPs), modelled on the internet RFC process. PEPs are draft documents that describe a proposed new feature, and are continually revised until the community reaches a consensus, either accepting or rejecting the proposal. Quoting from the introduction to [PEP 1](https://peps.python.org/pep-0001/) [https://peps.python.org/pep-0001/], "PEP Purpose and Guidelines":

PEP stands for Python Enhancement Proposal. A PEP is a design document providing information to the Python community, or describing a new feature for Python. The PEP should provide a concise technical specification of the feature and a rationale for the feature.

We intend PEPs to be the primary mechanisms for proposing new features, for collecting community input on an issue, and for documenting the design decisions that have gone into Python. The PEP author is responsible for building consensus within the community and documenting dissenting opinions.

Read the rest of **PEP 1** [<https://peps.python.org/pep-0001/>] for the details of the PEP editorial process, style, and format. PEPs are kept in the Python CVS tree on SourceForge, though they're not part of the Python 2.0 distribution, and are also available in HTML form from <https://peps.python.org/>. As of September 2000, there are 25 PEPs, ranging from **PEP 201** [<https://peps.python.org/pep-0201/>], "Lockstep Iteration", to PEP 225, "Elementwise/Objectwise Operators".

## Unicode

The largest new feature in Python 2.0 is a new fundamental data type: Unicode strings. Unicode uses 16-bit numbers to represent characters instead of the 8-bit number used by ASCII, meaning that 65,536 distinct characters can be supported.

The final interface for Unicode support was arrived at through countless often-stormy discussions on the python-dev mailing list, and mostly implemented by Marc-André Lemburg, based on a Unicode string type implementation by Fredrik Lundh. A detailed explanation of the interface was written up as **PEP 100** [<https://peps.python.org/pep-0100/>], "Python Unicode Integration". This article will simply cover the most significant points about the Unicode interfaces.

In Python source code, Unicode strings are written as `u"string"`.

Arbitrary Unicode characters can be written using a new escape sequence, `\uHHHH`, where *HHHH* is a 4-digit hexadecimal number from 0000 to FFFF. The existing `\xHHHH` escape sequence can also be used, and octal escapes can be used for characters up to U+01FF, which is represented by `\777`.

Unicode strings, just like regular strings, are an immutable sequence type. They can be indexed and sliced, but not modified in place. Unicode strings have an `encode( [encoding] )` method that returns an 8-bit string in the desired encoding. Encodings are named by strings, such as `'ascii'`, `'utf-8'`, `'iso-8859-1'`, or whatever. A codec API is defined for implementing and registering new encodings that are then available throughout a Python program. If an encoding isn't specified, the default encoding is usually 7-bit ASCII, though it can be changed for your Python installation by calling the `sys.setdefaultencoding(encoding)` function in a customized version of `site.py`.

Combining 8-bit and Unicode strings always coerces to Unicode, using the default ASCII encoding; the result of `'a' + u'bc'` is `u'abc'`.

New built-in functions have been added, and existing built-ins modified to support Unicode:

- `unichr(ch)` returns a Unicode string 1 character long, containing the character *ch*.
- `ord(u)`, where *u* is a 1-character regular or Unicode string, returns the number of the character as an integer.
- `unicode(string [, encoding] [, errors] )` creates a Unicode string from an 8-bit string. *encoding* is a string naming the encoding to use. The *errors* parameter specifies the treatment of characters that are invalid for the current encoding; passing `'strict'` as the value causes an exception to be raised on any encoding error, while `'ignore'` causes errors to be silently ignored and `'replace'` uses U+FFFD, the official replacement character, in case of any problems.
- The `exec` statement, and various built-ins such as `eval()`, `getattr()`, and `setattr()` will also accept Unicode

strings as well as regular strings. (It's possible that the process of fixing this missed some built-ins; if you find a built-in function that accepts strings but doesn't accept Unicode strings at all, please report it as a bug.)

A new module, `unicodedata`, provides an interface to Unicode character properties. For example, `unicodedata.category(u'A')` returns the 2-character string 'Lu', the 'L' denoting it's a letter, and 'u' meaning that it's uppercase. `unicodedata.bidirectional(u'\u0660')` returns 'AN', meaning that U+0660 is an Arabic number.

The `codecs` module contains functions to look up existing encodings and register new ones. Unless you want to implement a new encoding, you'll most often use the `codecs.lookup(encoding)` function, which returns a 4-element tuple: `(encode_func, decode_func, stream_reader, stream_writer)`.

- *encode\_func* is a function that takes a Unicode string, and returns a 2-tuple `(string, length)`. *string* is an 8-bit string containing a portion (perhaps all) of the Unicode string converted into the given encoding, and *length* tells you how much of the Unicode string was converted.
- *decode\_func* is the opposite of *encode\_func*, taking an 8-bit string and returning a 2-tuple `(ustring, length)`, consisting of the resulting Unicode string *ustring* and the integer *length* telling how much of the 8-bit string was consumed.
- *stream\_reader* is a class that supports decoding input from a stream. `stream_reader(file_obj)` returns an object that supports the `read()`, `readline()`, and `readlines()` methods. These methods will all translate from the given encoding and return Unicode strings.
- *stream\_writer*, similarly, is a class that supports encoding output to a stream. `stream_writer(file_obj)` returns an object that supports the `write()` and `writelines()` methods. These methods expect Unicode strings, translating them to the given encoding on output.

For example, the following code writes a Unicode string into a file,

encoding it as UTF-8:

```
import codecs

unistr = u'\u0660\u2000ab ...'

(UTF8_encode, UTF8_decode,
 UTF8_streamreader, UTF8_streamwriter) = codecs.lookup('utf-8')

output = UTF8_streamwriter( open( '/tmp/output', 'wb' ) )
output.write( unistr )
output.close()
```

The following code would then read UTF-8 input from the file:

```
input = UTF8_streamreader( open( '/tmp/output', 'rb' ) )
print repr(input.read())
input.close()
```

Unicode-aware regular expressions are available through the [re](#) module, which has a new underlying implementation called SRE written by Fredrik Lundh of Secret Labs AB.

A `-U` command line option was added which causes the Python compiler to interpret all string literals as Unicode string literals. This is intended to be used in testing and future-proofing your Python code, since some future version of Python may drop support for 8-bit strings and provide only Unicode strings.

## List Comprehensions

Lists are a workhorse data type in Python, and many programs manipulate a list at some point. Two common operations on lists are to loop over them, and either pick out the elements that meet a certain criterion, or apply some function to each element. For example, given a list of strings, you might want to pull out all the strings containing a given substring, or strip off trailing whitespace from each line.

The existing [map\(\)](#) and [filter\(\)](#) functions can be used for this

purpose, but they require a function as one of their arguments. This is fine if there's an existing built-in function that can be passed directly, but if there isn't, you have to create a little function to do the required work, and Python's scoping rules make the result ugly if the little function needs additional information. Take the first example in the previous paragraph, finding all the strings in the list containing a given substring. You could write the following to do it:

```
# Given the list L, make a list of all strings
# containing the substring S.
sublist = filter( lambda s, substring=S:
                  string.find(s, substring) != -1,
                  L)
```

Because of Python's scoping rules, a default argument is used so that the anonymous function created by the `lambda` expression knows what substring is being searched for. List comprehensions make this cleaner:

```
sublist = [ s for s in L if string.find(s, S) != -1 ]
```

List comprehensions have the form:

```
[ expression for expr in sequence1
  for expr2 in sequence2 ...
  for exprN in sequenceN
  if condition ]
```

The **for...in** clauses contain the sequences to be iterated over. The sequences do not have to be the same length, because they are *not* iterated over in parallel, but from left to right; this is explained more clearly in the following paragraphs. The elements of the generated list will be the successive values of *expression*. The final **if** clause is optional; if present, *expression* is only evaluated and added to the result if *condition* is true.

To make the semantics very clear, a list comprehension is equivalent to the following Python code:

```
for expr1 in sequence1:
    for expr2 in sequence2:
```

```
...
    for exprN in sequenceN:
        if (condition):
            # Append the value of
            # the expression to the
            # resulting list.
```

This means that when there are multiple **for...in** clauses, the resulting list will be equal to the product of the lengths of all the sequences. If you have two lists of length 3, the output list is 9 elements long:

```
seq1 = 'abc'
seq2 = (1,2,3)
>>> [ (x,y) for x in seq1 for y in seq2]
[('a', 1), ('a', 2), ('a', 3), ('b', 1), ('b', 2), ('b', 3),
('c', 1), ('c', 2), ('c', 3)]
```

To avoid introducing an ambiguity into Python's grammar, if *expression* is creating a tuple, it must be surrounded with parentheses. The first list comprehension below is a syntax error, while the second one is correct:

```
# Syntax error
[ x,y for x in seq1 for y in seq2]
# Correct
[ (x,y) for x in seq1 for y in seq2]
```

The idea of list comprehensions originally comes from the functional programming language Haskell (<https://www.haskell.org>). Greg Ewing argued most effectively for adding them to Python and wrote the initial list comprehension patch, which was then discussed for a seemingly endless time on the python-dev mailing list and kept up-to-date by Skip Montanaro.

## Augmented Assignment

Augmented assignment operators, another long-requested feature, have been added to Python 2.0. Augmented assignment operators include `+=`, `-=`, `*=`, and so forth. For example, the statement `a`

`+= 2` increments the value of the variable `a` by 2, equivalent to the slightly lengthier `a = a + 2`.

The full list of supported assignment operators is `+=`, `-=`, `*=`, `/=`, `%=`, `**=`, `&=`, `|=`, `^=`, `>>=`, and `<<=`. Python classes can override the augmented assignment operators by defining methods named `__iadd__()`, `__isub__()`, etc. For example, the following **Number** class stores a number and supports using `+=` to create a new instance with an incremented value.

```
class Number:
    def __init__(self, value):
        self.value = value
    def __iadd__(self, increment):
        return Number( self.value + increment)

n = Number(5)
n += 3
print n.value
```

The `__iadd__()` special method is called with the value of the increment, and should return a new instance with an appropriately modified value; this return value is bound as the new value of the variable on the left-hand side.

Augmented assignment operators were first introduced in the C programming language, and most C-derived languages, such as **awk**, **C++**, **Java**, **Perl**, and **PHP** also support them. The augmented assignment patch was implemented by Thomas Wouters.

## String Methods

Until now string-manipulation functionality was in the **string** module, which was usually a front-end for the **strop** module written in C. The addition of Unicode posed a difficulty for the **strop** module, because the functions would all need to be rewritten in order to accept either 8-bit or Unicode strings. For functions such as **string.replace()**, which takes 3 string arguments, that means eight possible permutations, and correspondingly complicated code.

Instead, Python 2.0 pushes the problem onto the string type, making string manipulation functionality available through methods on both 8-bit strings and Unicode strings.

```
>>> 'andrew'.capitalize()
'Andrew'
>>> 'hostname'.replace('os', 'linux')
'hlinuxtname'
>>> 'moshe'.find('sh')
2
```

One thing that hasn't changed, a noteworthy April Fools' joke notwithstanding, is that Python strings are immutable. Thus, the string methods return new strings, and do not modify the string on which they operate.

The old **string** module is still around for backwards compatibility, but it mostly acts as a front-end to the new string methods.

Two methods which have no parallel in pre-2.0 versions, although they did exist in JPython for quite some time, are **startswith()** and **endswith()**. `s.startswith(t)` is equivalent to `s[:len(t)] == t`, while `s.endswith(t)` is equivalent to `s[-len(t):] == t`.

One other method which deserves special mention is **join()**. The **join()** method of a string receives one parameter, a sequence of strings, and is equivalent to the **string.join()** function from the old **string** module, with the arguments reversed. In other words, `s.join(seq)` is equivalent to the old `string.join(seq, s)`.

## Garbage Collection of Cycles

The C implementation of Python uses reference counting to implement garbage collection. Every Python object maintains a count of the number of references pointing to itself, and adjusts the count as references are created or destroyed. Once the reference count reaches zero, the object is no longer accessible, since you

need to have a reference to an object to access it, and if the count is zero, no references exist any longer.

Reference counting has some pleasant properties: it's easy to understand and implement, and the resulting implementation is portable, fairly fast, and reacts well with other libraries that implement their own memory handling schemes. The major problem with reference counting is that it sometimes doesn't realise that objects are no longer accessible, resulting in a memory leak. This happens when there are cycles of references.

Consider the simplest possible cycle, a class instance which has a reference to itself:

```
instance = SomeClass()  
instance.myself = instance
```

After the above two lines of code have been executed, the reference count of `instance` is 2; one reference is from the variable named `'instance'`, and the other is from the `myself` attribute of the instance.

If the next line of code is `del instance`, what happens? The reference count of `instance` is decreased by 1, so it has a reference count of 1; the reference in the `myself` attribute still exists. Yet the instance is no longer accessible through Python code, and it could be deleted. Several objects can participate in a cycle if they have references to each other, causing all of the objects to be leaked.

Python 2.0 fixes this problem by periodically executing a cycle detection algorithm which looks for inaccessible cycles and deletes the objects involved. A new **gc** module provides functions to perform a garbage collection, obtain debugging statistics, and tuning the collector's parameters.

Running the cycle detection algorithm takes some time, and therefore will result in some additional overhead. It is hoped that after we've gotten experience with the cycle collection from using 2.0, Python 2.1 will be able to minimize the overhead with careful tuning. It's not yet obvious how much performance is lost, because

benchmarking this is tricky and depends crucially on how often the program creates and destroys objects. The detection of cycles can be disabled when Python is compiled, if you can't afford even a tiny speed penalty or suspect that the cycle collection is buggy, by specifying the **--without-cycle-gc** switch when running the **configure** script.

Several people tackled this problem and contributed to a solution. An early implementation of the cycle detection approach was written by Toby Kelsey. The current algorithm was suggested by Eric Tiedemann during a visit to CNRI, and Guido van Rossum and Neil Schemenauer wrote two different implementations, which were later integrated by Neil. Lots of other people offered suggestions along the way; the March 2000 archives of the python-dev mailing list contain most of the relevant discussion, especially in the threads titled "Reference cycle collection for Python" and "Finalization again".

## Other Core Changes

Various minor changes have been made to Python's syntax and built-in functions. None of the changes are very far-reaching, but they're handy conveniences.

### Minor Language Changes

A new syntax makes it more convenient to call a given function with a tuple of arguments and/or a dictionary of keyword arguments. In Python 1.5 and earlier, you'd use the **apply()** built-in function: `apply(f, args, kw)` calls the function `f()` with the argument tuple `args` and the keyword arguments in the dictionary `kw`. **apply()** is the same in 2.0, but thanks to a patch from Greg Ewing, `f(*args, **kw)` is a shorter and clearer way to achieve the same effect. This syntax is symmetrical with the syntax for defining functions:

```
def f(*args, **kw):  
    # args is a tuple of positional args,  
    # kw is a dictionary of keyword args
```

...

The `print` statement can now have its output directed to a file-like object by following the `print` with `>> file`, similar to the redirection operator in Unix shells. Previously you'd either have to use the `write()` method of the file-like object, which lacks the convenience and simplicity of `print`, or you could assign a new value to `sys.stdout` and then restore the old value. For sending output to standard error, it's much easier to write this:

```
print >> sys.stderr, "Warning: action field not supplied"
```

Modules can now be renamed on importing them, using the syntax `import module as name` or `from module import name as othename`. The patch was submitted by Thomas Wouters.

A new format style is available when using the `%` operator; `'%r'` will insert the `repr()` of its argument. This was also added from symmetry considerations, this time for symmetry with the existing `'%s'` format style, which inserts the `str()` of its argument. For example, `'%r %s' % ('abc', 'abc')` returns a string containing `'abc' abc`.

Previously there was no way to implement a class that overrode Python's built-in `in` operator and implemented a custom version. `obj in seq` returns true if `obj` is present in the sequence `seq`; Python computes this by simply trying every index of the sequence until either `obj` is found or an `IndexError` is encountered. Moshe Zadka contributed a patch which adds a `__contains__()` magic method for providing a custom implementation for `in`. Additionally, new built-in objects written in C can define what `in` means for them via a new slot in the sequence protocol.

Earlier versions of Python used a recursive algorithm for deleting objects. Deeply nested data structures could cause the interpreter to fill up the C stack and crash; Christian Tismer rewrote the deletion logic to fix this problem. On a related note, comparing recursive objects recursed infinitely and crashed; Jeremy Hylton rewrote the code to no longer crash, producing a useful result instead. For example, after this code:

```
a = []
b = []
a.append(a)
b.append(b)
```

The comparison `a==b` returns true, because the two recursive data structures are isomorphic. See the thread “trashcan and PR#7” in the April 2000 archives of the python-dev mailing list for the discussion leading up to this implementation, and some useful relevant links. Note that comparisons can now also raise exceptions. In earlier versions of Python, a comparison operation such as `cmp(a,b)` would always produce an answer, even if a user-defined `__cmp__()` method encountered an error, since the resulting exception would simply be silently swallowed.

Work has been done on porting Python to 64-bit Windows on the Itanium processor, mostly by Trent Mick of ActiveState. (Confusingly, `sys.platform` is still 'win32' on Win64 because it seems that for ease of porting, MS Visual C++ treats code as 32 bit on Itanium.) PythonWin also supports Windows CE; see the Python CE page at <https://pythonce.sourceforge.net/> for more information.

Another new platform is Darwin/MacOS X; initial support for it is in Python 2.0. Dynamic loading works, if you specify “configure –with-dyld –with-suffix=.x”. Consult the README in the Python source distribution for more instructions.

An attempt has been made to alleviate one of Python’s warts, the often-confusing `NameError` exception when code refers to a local variable before the variable has been assigned a value. For example, the following code raises an exception on the `print` statement in both 1.5.2 and 2.0; in 1.5.2 a `NameError` exception is raised, while 2.0 raises a new `UnboundLocalError` exception. `UnboundLocalError` is a subclass of `NameError`, so any existing code that expects `NameError` to be raised should still work.

```
def f():
    print "i=",i
    i = i + 1
```

`f()`

Two new exceptions, `TabError` and `IndentationError`, have been introduced. They're both subclasses of `SyntaxError`, and are raised when Python code is found to be improperly indented.

## Changes to Built-in Functions

A new built-in, `zip(seq1, seq2, ...)`, has been added. `zip()` returns a list of tuples where each tuple contains the *i*-th element from each of the argument sequences. The difference between `zip()` and `map(None, seq1, seq2)` is that `map()` pads the sequences with `None` if the sequences aren't all of the same length, while `zip()` truncates the returned list to the length of the shortest argument sequence.

The `int()` and `long()` functions now accept an optional “base” parameter when the first argument is a string. `int('123', 10)` returns 123, while `int('123', 16)` returns 291. `int(123, 16)` raises a `TypeError` exception with the message “can't convert non-string with explicit base”.

A new variable holding more detailed version information has been added to the `sys` module. `sys.version_info` is a tuple (major, minor, micro, level, serial). For example, in a hypothetical 2.0.1beta1, `sys.version_info` would be (2, 0, 1, 'beta', 1). `level` is a string such as “alpha”, “beta”, or “final” for a final release.

Dictionaries have an odd new method, `setdefault(key, default)`, which behaves similarly to the existing `get()` method. However, if the key is missing, `setdefault()` both returns the value of `default` as `get()` would do, and also inserts it into the dictionary as the value for `key`. Thus, the following lines of code:

```
if dict.has_key( key ): return dict[key]
else:
    dict[key] = []
    return dict[key]
```

can be reduced to a single `return dict.setdefault(key,`

[ ] ) statement.

The interpreter sets a maximum recursion depth in order to catch runaway recursion before filling the C stack and causing a core dump or GPF.. Previously this limit was fixed when you compiled Python, but in 2.0 the maximum recursion depth can be read and modified using `sys.getrecursionlimit()` and `sys.setrecursionlimit()`. The default value is 1000, and a rough maximum value for a given platform can be found by running a new script, `Misc/find_recursionlimit.py`.

## Porting to 2.0

New Python releases try hard to be compatible with previous releases, and the record has been pretty good. However, some changes are considered useful enough, usually because they fix initial design decisions that turned out to be actively mistaken, that breaking backward compatibility can't always be avoided. This section lists the changes in Python 2.0 that may cause old Python code to break.

The change which will probably break the most code is tightening up the arguments accepted by some methods. Some methods would take multiple arguments and treat them as a tuple, particularly various list methods such as `append()` and `insert()`. In earlier versions of Python, if `L` is a list, `L.append( 1,2 )` appends the tuple `(1,2)` to the list. In Python 2.0 this causes a `TypeError` exception to be raised, with the message: 'append requires exactly 1 argument; 2 given'. The fix is to simply add an extra set of parentheses to pass both values as a tuple: `L.append( (1,2) )`.

The earlier versions of these methods were more forgiving because they used an old function in Python's C interface to parse their arguments; 2.0 modernizes them to use `PyArg_ParseTuple()`, the current argument parsing function, which provides more helpful error messages and treats multi-argument calls as errors. If you absolutely must use 2.0 but can't fix your code, you can edit `Objects/listobject.c` and define the preprocessor symbol `NO_STRICT_LIST_APPEND` to preserve the old behaviour; this isn't recommended.

Some of the functions in the `socket` module are still forgiving in this way. For example, `socket.connect( ('hostname', 25) )()` is the correct form, passing a tuple representing an IP address, but `socket.connect( 'hostname', 25 )()` also works. `socket.connect_ex()` and `socket.bind()` are similarly easy-going. 2.0alpha1 tightened these functions up, but because the documentation actually used the erroneous multiple argument form, many people wrote code which would break with the stricter checking. GvR backed out the changes in the face of public reaction, so for the `socket` module, the documentation was fixed and the multiple argument form is simply marked as deprecated; it *will* be tightened up again in a future Python version.

The `\x` escape in string literals now takes exactly 2 hex digits. Previously it would consume all the hex digits following the 'x' and take the lowest 8 bits of the result, so `\x123456` was equivalent to `\x56`.

The `AttributeError` and `NameError` exceptions have a more friendly error message, whose text will be something like 'Spam' instance has no attribute 'eggs' or name 'eggs' is not defined. Previously the error message was just the missing attribute name `eggs`, and code written to take advantage of this fact will break in 2.0.

Some work has been done to make integers and long integers a bit more interchangeable. In 1.5.2, large-file support was added for Solaris, to allow reading files larger than 2 GiB; this made the `tell()` method of file objects return a long integer instead of a regular integer. Some code would subtract two file offsets and attempt to use the result to multiply a sequence or slice a string, but this raised a `TypeError`. In 2.0, long integers can be used to multiply or slice a sequence, and it'll behave as you'd intuitively expect it to; `3L * 'abc'` produces `'abcabcabc'`, and `(0,1,2,3)[2L:4L]` produces `(2,3)`. Long integers can also be used in various contexts where previously only integers were accepted, such as in the `seek()` method of file objects, and in the formats supported by the `%` operator (`%d`, `%i`, `%x`, etc.). For example, `"%d" % 2L**64` will produce the string `18446744073709551616`.

The subtlest long integer change of all is that the `str()` of a long

integer no longer has a trailing 'L' character, though `repr()` still includes it. The 'L' annoyed many people who wanted to print long integers that looked just like regular integers, since they had to go out of their way to chop off the character. This is no longer a problem in 2.0, but code which does `str(longval)[-1]` and assumes the 'L' is there, will now lose the final digit.

Taking the `repr()` of a float now uses a different formatting precision than `str()`. `repr()` uses `%.17g` format string for C's `sprintf()`, while `str()` uses `%.12g` as before. The effect is that `repr()` may occasionally show more decimal places than `str()`, for certain numbers. For example, the number 8.1 can't be represented exactly in binary, so `repr(8.1)` is `'8.0999999999999996'`, while `str(8.1)` is `'8.1'`.

The `-X` command-line option, which turned all standard exceptions into strings instead of classes, has been removed; the standard exceptions will now always be classes. The `exceptions` module containing the standard exceptions was translated from Python to a built-in C module, written by Barry Warsaw and Fredrik Lundh.

## Extending/Embedding Changes

Some of the changes are under the covers, and will only be apparent to people writing C extension modules or embedding a Python interpreter in a larger application. If you aren't dealing with Python's C API, you can safely skip this section.

The version number of the Python C API was incremented, so C extensions compiled for 1.5.2 must be recompiled in order to work with 2.0. On Windows, it's not possible for Python 2.0 to import a third party extension built for Python 1.5.x due to how Windows DLLs work, so Python will raise an exception and the import will fail.

Users of Jim Fulton's `ExtensionClass` module will be pleased to find out that hooks have been added so that `ExtensionClasses` are now supported by `isinstance()` and `issubclass()`. This means you no longer have to remember to write code such as `if type(obj) == myExtensionClass`, but can use the more

```
natural if isinstance(obj, myExtensionClass).
```

The `Python/importdl.c` file, which was a mass of `#ifdefs` to support dynamic loading on many different platforms, was cleaned up and reorganised by Greg Stein. `importdl.c` is now quite small, and platform-specific code has been moved into a bunch of `Python/dynload_*.c` files. Another cleanup: there were also a number of `my*.h` files in the `Include/` directory that held various portability hacks; they've been merged into a single file, `Include/pyport.h`.

Vladimir Marangozov's long-awaited `malloc` restructuring was completed, to make it easy to have the Python interpreter use a custom allocator instead of C's standard `malloc()`. For documentation, read the comments in `Include/pymem.h` and `Include/objimpl.h`. For the lengthy discussions during which the interface was hammered out, see the web archives of the 'patches' and 'python-dev' lists at [python.org](http://python.org).

Recent versions of the GUSI development environment for MacOS support POSIX threads. Therefore, Python's POSIX threading support now works on the Macintosh. Threading support using the user-space GNU `pth` library was also contributed.

Threading support on Windows was enhanced, too. Windows supports thread locks that use kernel objects only in case of contention; in the common case when there's no contention, they use simpler functions which are an order of magnitude faster. A threaded version of Python 1.5.2 on NT is twice as slow as an unthreaded version; with the 2.0 changes, the difference is only 10%. These improvements were contributed by Yakov Markovitch.

Python 2.0's source now uses only ANSI C prototypes, so compiling Python now requires an ANSI C compiler, and can no longer be done using a compiler that only supports K&R C.

Previously the Python virtual machine used 16-bit numbers in its bytecode, limiting the size of source files. In particular, this affected the maximum size of literal lists and dictionaries in Python source; occasionally people who are generating Python code would run into this limit. A patch by Charles G. Waldman raises the limit from

`2**16` to `2**32`.

Three new convenience functions intended for adding constants to a module's dictionary at module initialization time were added:

**`PyModule_AddObject()`**, **`PyModule_AddIntConstant()`**, and **`PyModule_AddStringConstant()`**. Each of these functions takes a module object, a null-terminated C string containing the name to be added, and a third argument for the value to be assigned to the name. This third argument is, respectively, a Python object, a C long, or a C string.

A wrapper API was added for Unix-style signal handlers.

**`PyOS_getsig()`** gets a signal handler and **`PyOS_setsig()`** will set a new handler.

## Distutils: Making Modules Easy to Install

Before Python 2.0, installing modules was a tedious affair – there was no way to figure out automatically where Python is installed, or what compiler options to use for extension modules. Software authors had to go through an arduous ritual of editing Makefiles and configuration files, which only really work on Unix and leave Windows and MacOS unsupported. Python users faced wildly differing installation instructions which varied between different extension packages, which made administering a Python installation something of a chore.

The SIG for distribution utilities, shepherded by Greg Ward, has created the Distutils, a system to make package installation much easier. They form the **distutils** package, a new part of Python's standard library. In the best case, installing a Python module from source will require the same steps: first you simply mean unpack the tarball or zip archive, and then run “`python setup.py install`”. The platform will be automatically detected, the compiler will be recognized, C extension modules will be compiled, and the distribution installed into the proper directory. Optional command-line arguments provide more control over the installation process, the distutils package offers many places to override defaults – separating the build from the install, building or installing in non-default directories, and more.

In order to use the Distutils, you need to write a `setup.py` script. For the simple case, when the software contains only `.py` files, a minimal `setup.py` can be just a few lines long:

```
from distutils.core import setup
setup (name = "foo", version = "1.0",
      py_modules = ["module1", "module2"])
```

The `setup.py` file isn't much more complicated if the software consists of a few packages:

```
from distutils.core import setup
setup (name = "foo", version = "1.0",
      packages = ["package", "package.subpackage"])
```

A C extension can be the most complicated case; here's an example taken from the PyXML package:

```
from distutils.core import setup, Extension

expat_extension = Extension('xml.parsers.pyexpat',
    define_macros = [('XML_NS', None)],
    include_dirs = [ 'extensions/expat/xmltok',
                     'extensions/expat/xmlparse' ],
    sources = [ 'extensions/pyexpat.c',
                'extensions/expat/xmltok/xmltok.c',
                'extensions/expat/xmltok/xmlrole.c', ]
    )
setup (name = "PyXML", version = "0.5.4",
      ext_modules=[ expat_extension ] )
```

The Distutils can also take care of creating source and binary distributions. The “`sdist`” command, run by “`python setup.py sdist`”, builds a source distribution such as `foo-1.0.tar.gz`. Adding new commands isn't difficult, “`bdist_rpm`” and “`bdist_wininst`” commands have already been contributed to create an RPM distribution and a Windows installer for the software, respectively. Commands to create other distribution formats such as Debian packages and Solaris `.pkg` files are in various stages of development.

All this is documented in a new manual, *Distributing Python Modules*, that joins the basic set of Python documentation.

## XML Modules

Python 1.5.2 included a simple XML parser in the form of the **xml11ib** module, contributed by Sjoerd Mullender. Since 1.5.2's release, two different interfaces for processing XML have become common: SAX2 (version 2 of the Simple API for XML) provides an event-driven interface with some similarities to **xml11ib**, and the DOM (Document Object Model) provides a tree-based interface, transforming an XML document into a tree of nodes that can be traversed and modified. Python 2.0 includes a SAX2 interface and a stripped-down DOM interface as part of the **xml** package. Here we will give a brief overview of these new interfaces; consult the Python documentation or the source code for complete details. The Python XML SIG is also working on improved documentation.

### SAX2 Support

SAX defines an event-driven interface for parsing XML. To use SAX, you must write a SAX handler class. Handler classes inherit from various classes provided by SAX, and override various methods that will then be called by the XML parser. For example, the **startElement()** and **endElement()** methods are called for every starting and end tag encountered by the parser, the **characters()** method is called for every chunk of character data, and so forth.

The advantage of the event-driven approach is that the whole document doesn't have to be resident in memory at any one time, which matters if you are processing really huge documents. However, writing the SAX handler class can get very complicated if you're trying to modify the document structure in some elaborate way.

For example, this little example program defines a handler that prints a message for every starting and ending tag, and then parses the file `hamlet.xml` using it:

```

from xml import sax

class SimpleHandler(sax.ContentHandler):
    def startElement(self, name, attrs):
        print 'Start of element:', name, attrs.keys()

    def endElement(self, name):
        print 'End of element:', name

# Create a parser object
parser = sax.make_parser()

# Tell it what handler to use
handler = SimpleHandler()
parser.setContentHandler( handler )

# Parse a file!
parser.parse( 'hamlet.xml' )

```

For more information, consult the Python documentation, or the XML HOWTO at <https://pyxml.sourceforge.net/topics/howto/xml-howto.html>.

## DOM Support

The Document Object Model is a tree-based representation for an XML document. A top-level **Document** instance is the root of the tree, and has a single child which is the top-level **Element** instance. This **Element** has children nodes representing character data and any sub-elements, which may have further children of their own, and so forth. Using the DOM you can traverse the resulting tree any way you like, access element and attribute values, insert and delete nodes, and convert the tree back into XML.

The DOM is useful for modifying XML documents, because you can create a DOM tree, modify it by adding new nodes or rearranging subtrees, and then produce a new XML document as output. You can also construct a DOM tree manually and convert it to XML, which can be a more flexible way of producing XML output than

simply writing `<tag1>...</tag1>` to a file.

The DOM implementation included with Python lives in the `xml.dom.minidom` module. It's a lightweight implementation of the Level 1 DOM with support for XML namespaces. The `parse()` and `parseString()` convenience functions are provided for generating a DOM tree:

```
from xml.dom import minidom
doc = minidom.parse('hamlet.xml')
```

`doc` is a **Document** instance. **Document**, like all the other DOM classes such as **Element** and **Text**, is a subclass of the **Node** base class. All the nodes in a DOM tree therefore support certain common methods, such as `toxml()` which returns a string containing the XML representation of the node and its children. Each class also has special methods of its own; for example, **Element** and **Document** instances have a method to find all child elements with a given tag name. Continuing from the previous 2-line example:

```
perslist = doc.getElementsByTagName( 'PERSONA' )
print perslist[0].toxml()
print perslist[1].toxml()
```

For the *Hamlet* XML file, the above few lines output:

```
<PERSONA>CLAUDIUS, king of Denmark. </PERSONA>
<PERSONA>HAMLET, son to the late, and nephew to the pres
```

The root element of the document is available as `doc.documentElement`, and its children can be easily modified by deleting, adding, or removing nodes:

```
root = doc.documentElement

# Remove the first child
root.removeChild( root.childNodes[0] )

# Move the new first child to the end
root.appendChild( root.childNodes[0] )
```

```
# Insert the new first child (originally,  
# the third child) before the 20th child.  
root.insertBefore( root.childNodes[0], root.childNodes[20])
```

Again, I will refer you to the Python documentation for a complete listing of the different **Node** classes and their various methods.

## Relationship to PyXML

The XML Special Interest Group has been working on XML-related Python code for a while. Its code distribution, called PyXML, is available from the SIG's web pages at <https://www.python.org/community/sigs/current/xml-sig>. The PyXML distribution also used the package name `xml`. If you've written programs that used PyXML, you're probably wondering about its compatibility with the 2.0 `xml` package.

The answer is that Python 2.0's `xml` package isn't compatible with PyXML, but can be made compatible by installing a recent version PyXML. Many applications can get by with the XML support that is included with Python 2.0, but more complicated applications will require that the full PyXML package will be installed. When installed, PyXML versions 0.6.0 or greater will replace the `xml` package shipped with Python, and will be a strict superset of the standard package, adding a bunch of additional features. Some of the additional features in PyXML include:

- 4DOM, a full DOM implementation from FourThought, Inc.
- The `xmlproc` validating parser, written by Lars Marius Garshol.
- The `sgmlop` parser accelerator module, written by Fredrik Lundh.

## Module changes

Lots of improvements and bugfixes were made to Python's extensive standard library; some of the affected modules include `readline`, `ConfigParser`, `cgi`, `calendar`, `posix`, `readline`, `xmllib`, `aifc`, `chunk`, `wave`, `random`, `shelve`, and `nntplib`. Consult

the CVS logs for the exact patch-by-patch details.

Brian Gallew contributed OpenSSL support for the **socket** module. OpenSSL is an implementation of the Secure Socket Layer, which encrypts the data being sent over a socket. When compiling Python, you can edit `Modules/Setup` to include SSL support, which adds an additional function to the **socket** module: `socket.ssl(socket, keyfile, certfile)`, which takes a socket object and returns an SSL socket. The **httplib** and **urllib** modules were also changed to support `https://` URLs, though no one has implemented FTP or SMTP over SSL.

The **httplib** module has been rewritten by Greg Stein to support HTTP/1.1. Backward compatibility with the 1.5 version of **httplib** is provided, though using HTTP/1.1 features such as pipelining will require rewriting code to use a different set of interfaces.

The **Tkinter** module now supports Tcl/Tk version 8.1, 8.2, or 8.3, and support for the older 7.x versions has been dropped. The Tkinter module now supports displaying Unicode strings in Tk widgets. Also, Fredrik Lundh contributed an optimization which makes operations like `create_line` and `create_polygon` much faster, especially when using lots of coordinates.

The **curses** module has been greatly extended, starting from Oliver Andrich's enhanced version, to provide many additional functions from ncurses and SYSV curses, such as colour, alternative character set support, pads, and mouse support. This means the module is no longer compatible with operating systems that only have BSD curses, but there don't seem to be any currently maintained OSes that fall into this category.

As mentioned in the earlier discussion of 2.0's Unicode support, the underlying implementation of the regular expressions provided by the **re** module has been changed. SRE, a new regular expression engine written by Fredrik Lundh and partially funded by Hewlett Packard, supports matching against both 8-bit strings and Unicode strings.

# New modules

A number of new modules were added. We'll simply list them with brief descriptions; consult the 2.0 documentation for the details of a particular module.

- **atexit**: For registering functions to be called before the Python interpreter exits. Code that currently sets `sys.exitfunc` directly should be changed to use the **atexit** module instead, importing **atexit** and calling **atexit.register()** with the function to be called on exit. (Contributed by Skip Montanaro.)
- **codecs**, **encodings**, **unicodedata**: Added as part of the new Unicode support.
- **filecmp**: Supersedes the old **cmp**, **cmpcache** and **dircmp** modules, which have now become deprecated. (Contributed by Gordon MacMillan and Moshe Zadka.)
- **gettext**: This module provides internationalization (I18N) and localization (L10N) support for Python programs by providing an interface to the GNU gettext message catalog library. (Integrated by Barry Warsaw, from separate contributions by Martin von Löwis, Peter Funk, and James Henstridge.)
- **linuxaudiodev**: Support for the `/dev/audio` device on Linux, a twin to the existing **sunaudiodev** module. (Contributed by Peter Bosch, with fixes by Jeremy Hylton.)
- **mmap**: An interface to memory-mapped files on both Windows and Unix. A file's contents can be mapped directly into memory, at which point it behaves like a mutable string, so its contents can be read and modified. They can even be passed to functions that expect ordinary strings, such as the **re** module. (Contributed by Sam Rushing, with some extensions by A.M. Kuchling.)
- **pyexpat**: An interface to the Expat XML parser. (Contributed by Paul Prescod.)
- **robotparser**: Parse a `robots.txt` file, which is used for writing web spiders that politely avoid certain areas of a web site. The parser accepts the contents of a `robots.txt` file, builds a set of rules from it, and can then answer questions about the fetchability of a given URL. (Contributed by Skip

Montanaro.)

- **tabnanny**: A module/script to check Python source code for ambiguous indentation. (Contributed by Tim Peters.)
- **UserString**: A base class useful for deriving objects that behave like strings.
- **webbrowser**: A module that provides a platform independent way to launch a web browser on a specific URL. For each platform, various browsers are tried in a specific order. The user can alter which browser is launched by setting the *BROWSER* environment variable. (Originally inspired by Eric S. Raymond's patch to **urllib** which added similar functionality, but the final module comes from code originally implemented by Fred Drake as `Tools/idle/BrowserControl.py`, and adapted for the standard library by Fred.)
- **\_winreg**: An interface to the Windows registry. **\_winreg** is an adaptation of functions that have been part of PythonWin since 1995, but has now been added to the core distribution, and enhanced to support Unicode. **\_winreg** was written by Bill Tutt and Mark Hammond.
- **zipfile**: A module for reading and writing ZIP-format archives. These are archives produced by **PKZIP** on DOS/Windows or **zip** on Unix, not to be confused with **gzip**-format files (which are supported by the **gzip** module) (Contributed by James C. Ahlstrom.)
- **imputil**: A module that provides a simpler way for writing customized import hooks, in comparison to the existing **ihooks** module. (Implemented by Greg Stein, with much discussion on python-dev along the way.)

## IDLE Improvements

IDLE is the official Python cross-platform IDE, written using Tkinter. Python 2.0 includes IDLE 0.6, which adds a number of new features and improvements. A partial list:

- UI improvements and optimizations, especially in the area of syntax highlighting and auto-indentation.
- The class browser now shows more information, such as the top level functions in a module.

- Tab width is now a user settable option. When opening an existing Python file, IDLE automatically detects the indentation conventions, and adapts.
- There is now support for calling browsers on various platforms, used to open the Python documentation in a browser.
- IDLE now has a command line, which is largely similar to the vanilla Python interpreter.
- Call tips were added in many places.
- IDLE can now be installed as a package.
- In the editor window, there is now a line/column bar at the bottom.
- Three new keystroke commands: Check module (`Alt-F5`), Import module (`F5`) and Run script (`Ctrl-F5`).

## Deleted and Deprecated Modules

A few modules have been dropped because they're obsolete, or because there are now better ways to do the same thing. The **stdwin** module is gone; it was for a platform-independent windowing toolkit that's no longer developed.

A number of modules have been moved to the `lib-old` subdirectory: **cmp**, **cmpcache**, **dircmp**, **dump**, **find**, **grep**, **packmail**, **poly**, **util**, **whatsound**, **zmod**. If you have code which relies on a module that's been moved to `lib-old`, you can simply add that directory to `sys.path` to get them back, but you're encouraged to update any code that uses these modules.

## Acknowledgements

The authors would like to thank the following people for offering suggestions on various drafts of this article: David Bolen, Mark Hammond, Gregg Hauser, Jeremy Hylton, Fredrik Lundh, Detlef Lannert, Aahz Maruch, Skip Montanaro, Vladimir Marangozov, Tobias Polzin, Guido van Rossum, Neil Schemenauer, and Russ Schmidt.

# Changelog

## Python next

Release date: XXXX-XX-XX

### Core and Builtins

- [gh-105979](https://github.com/python/cpython/issues/105979) [https://github.com/python/cpython/issues/105979]: Fix crash in `_imp.get_frozen_object()` due to improper exception handling.
- [gh-105840](https://github.com/python/cpython/issues/105840) [https://github.com/python/cpython/issues/105840]: Fix possible crashes when specializing function calls with too many `__defaults__`.
- [gh-105588](https://github.com/python/cpython/issues/105588) [https://github.com/python/cpython/issues/105588]: Fix an issue that could result in crashes when compiling malformed `ast` nodes.
- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix bugs in the `builtins` module where exceptions could end up being overwritten.
- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix bug in the compiler where an exception could end up being overwritten.
- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Improve error handling in `PyUnicode_BuildEncodingMap()` where an exception could end up being overwritten.
- [gh-101006](https://github.com/python/cpython/issues/101006) [https://github.com/python/cpython/issues/101006]: Improve error handling when read `marshal` data.

### Library

- [gh-102541](https://github.com/python/cpython/issues/102541) [https://github.com/python/cpython/issues/102541]: Make `pydoc.doc` catch bad module `ImportError` when output stream is not `None`.

- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix a bug in `_Unpickler_SetInputStream()` where an exception could end up being overwritten in case of failure.
- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix bugs in `sys` where exceptions could end up being overwritten because of deferred error handling.
- [gh-105605](https://github.com/python/cpython/issues/105605) [https://github.com/python/cpython/issues/105605]: Harden `pyexpat` error handling during module initialisation to prevent exceptions from possibly being overwritten, and objects from being dereferenced twice.
- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix bug in `decimal` where an exception could end up being overwritten.
- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix bugs in `_datetime` where exceptions could be overwritten in case of module initialisation failure.
- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix bugs in `_ssl` initialisation which could lead to leaked references and overwritten exceptions.
- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix a bug in `array.array` where an exception could end up being overwritten.
- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix bugs in `_ctypes` where exceptions could end up being overwritten.
- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix a bug in the `posix` module where an exception could be overwritten.
- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix bugs in `_elementtree` where exceptions could be overwritten.
- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix bugs in `zoneinfo` where exceptions could be overwritten.
- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix bugs in `pickle` where exceptions could be overwritten.
- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix bugs in `pickle` where exceptions could be overwritten.
- [gh-103171](https://github.com/python/cpython/issues/103171) [https://github.com/python/cpython/issues/103171]: Revert undocumented behaviour change with runtime-checkable protocols decorated with `typing.final()` in Python 3.11.

The behaviour change had meant that objects would not be considered instances of these protocols at runtime unless they had a `__final__` attribute. Patch by Alex Waygood.

- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix a bug in `sqlite3` where an exception could be overwritten in the `collation` callback.
- [gh-105332](https://github.com/python/cpython/issues/105332) [https://github.com/python/cpython/issues/105332]: Revert pickling method from by-name back to by-value.
- [gh-102541](https://github.com/python/cpython/issues/102541) [https://github.com/python/cpython/issues/102541]: Hide traceback in `help()` prompt, when import failed.

## Tests

- [gh-101634](https://github.com/python/cpython/issues/101634) [https://github.com/python/cpython/issues/101634]: When running the Python test suite with `-jN` option, if a worker stdout cannot be decoded from the locale encoding report a failed testn so the exitcode is non-zero. Patch by Victor Stinner.

## Build

- [gh-100340](https://github.com/python/cpython/issues/100340) [https://github.com/python/cpython/issues/100340]: Allows `-Wno-int-conversion` for `wasm-sdk` 17 and onwards, thus enables building WASI builds once against the latest sdk.

## Windows

- [gh-105436](https://github.com/python/cpython/issues/105436) [https://github.com/python/cpython/issues/105436]: Ensure that an empty environment block is terminated by two null characters, as is required by Windows.

## C API

- [gh-105375](https://github.com/python/cpython/issues/105375) [https://github.com/python/cpython/issues/105375]: Fix a bug in `PyErr_WarnExplicit()` where an exception could end up being overwritten if the API failed internally.

# Python 3.11.4 final

Release date: 2023-06-06

## Security

- [gh-103142](https://github.com/python/cpython/issues/103142) [https://github.com/python/cpython/issues/103142]: The version of OpenSSL used in our binary builds has been upgraded to 1.1.1u to address several CVEs.
- [gh-99889](https://github.com/python/cpython/issues/99889) [https://github.com/python/cpython/issues/99889]: Fixed a security in flaw in `uu.decode()` that could allow for directory traversal based on the input if no `out_file` was specified.
- [gh-104049](https://github.com/python/cpython/issues/104049) [https://github.com/python/cpython/issues/104049]: Do not expose the local on-disk location in directory indexes produced by `http.client.SimpleHTTPRequestHandler`.
- [gh-102153](https://github.com/python/cpython/issues/102153) [https://github.com/python/cpython/issues/102153]: `urllib.parse.urlsplit()` now strips leading C0 control and space characters following the specification for URLs defined by WHATWG in response to CVE-2023-24329. Patch by Illia Volochii.

## Core and Builtins

- [gh-105164](https://github.com/python/cpython/issues/105164) [https://github.com/python/cpython/issues/105164]: Ensure annotations are set up correctly if the only annotation in a block is within a `match` block. Patch by Jelle Zijlstra.
- [gh-104615](https://github.com/python/cpython/issues/104615) [https://github.com/python/cpython/issues/104615]: Fix wrong ordering of assignments in code like `a, a = x, y`. Contributed by Carl Meyer.
- [gh-104482](https://github.com/python/cpython/issues/104482) [https://github.com/python/cpython/issues/104482]: Fix three error handling bugs in `ast.c`'s validation of pattern matching statements.
- [gh-102818](https://github.com/python/cpython/issues/102818) [https://github.com/python/cpython/issues/102818]: Do not add a frame to the traceback in the `sys.setprofile` and `sys.settrace` trampoline functions. This ensures that frames are not duplicated if an exception is raised in the callback function, and ensures that frames are not omitted if a C callback is used and that does not add the frame.
- [gh-104405](https://github.com/python/cpython/issues/104405) [https://github.com/python/cpython/issues/104405]: Fix an issue where some `bytecode` instructions could ignore [PEP 523](#)

[<https://peps.python.org/pep-0523/>] when “inlining” calls.

- [gh-104018](https://github.com/python/cpython/issues/104018) [<https://github.com/python/cpython/issues/104018>]: Disallow the “z” format specifier in %-format of bytes objects.
- [gh-103971](https://github.com/python/cpython/issues/103971) [<https://github.com/python/cpython/issues/103971>]: Fix an issue where incorrect locations numbers could be assigned to code following `case` blocks.
- [gh-102310](https://github.com/python/cpython/issues/102310) [<https://github.com/python/cpython/issues/102310>]: Change the error range for invalid bytes literals.
- [gh-103590](https://github.com/python/cpython/issues/103590) [<https://github.com/python/cpython/issues/103590>]: Do not wrap a single exception raised from a `try-except*` construct in an `ExceptionGroup`.
- [gh-101517](https://github.com/python/cpython/issues/101517) [<https://github.com/python/cpython/issues/101517>]: Fix bug in line numbers of instructions emitted for `except*`.
- [gh-103242](https://github.com/python/cpython/issues/103242) [<https://github.com/python/cpython/issues/103242>]: Migrate `set_ecdh_curve()` method not to use deprecated OpenSSL APIs. Patch by Dong-hee Na.
- [gh-102700](https://github.com/python/cpython/issues/102700) [<https://github.com/python/cpython/issues/102700>]: Allow built-in modules to be submodules. This allows submodules to be statically linked into a CPython binary.
- [gh-101857](https://github.com/python/cpython/issues/101857) [<https://github.com/python/cpython/issues/101857>]: Fix xattr support detection on Linux systems by widening the check to linux, not just glibc. This fixes support for musl.
- [gh-99184](https://github.com/python/cpython/issues/99184) [<https://github.com/python/cpython/issues/99184>]: Bypass instance attribute access of `__name__` in `repr` of `weakref.ref`.
- [gh-96670](https://github.com/python/cpython/issues/96670) [<https://github.com/python/cpython/issues/96670>]: The parser now raises `SyntaxError` when parsing source code containing null bytes. Backported from `aab01e3`. Patch by Pablo Galindo
- [bpo-31821](https://bugs.python.org/issue?@action=redirect&bpo=31821) [<https://bugs.python.org/issue?@action=redirect&bpo=31821>]: Fix `pause_reading()` to work when called from `connection_made()` in `asyncio`.

## Library

- [gh-105080](https://github.com/python/cpython/issues/105080) [<https://github.com/python/cpython/issues/105080>]: Fixed inconsistent signature on derived classes for `inspect.signature()`
- [gh-104874](https://github.com/python/cpython/issues/104874) [<https://github.com/python/cpython/issues/104874>]: Document the `__name__` and `__supertype__` attributes

of `typing.NewType`. Patch by Jelle Zijlstra.

- [gh-104340](https://github.com/python/cpython/issues/104340) [https://github.com/python/cpython/issues/104340]: When an `asyncio` pipe protocol loses its connection due to an error, and the caller doesn't await `wait_closed()` on the corresponding `StreamWriter`, don't log a warning about an exception that was never retrieved. After all, according to the `StreamWriter.close()` docs, the `wait_closed()` call is optional ("not mandatory").
- [gh-104372](https://github.com/python/cpython/issues/104372) [https://github.com/python/cpython/issues/104372]: Refactored the `_posixsubprocess` internals to avoid Python C API usage between fork and exec when marking `pass_fds=` file descriptors inheritable.
- [gh-75367](https://github.com/python/cpython/issues/75367) [https://github.com/python/cpython/issues/75367]: Fix data descriptor detection in `inspect.getattr_static()`.
- [gh-104536](https://github.com/python/cpython/issues/104536) [https://github.com/python/cpython/issues/104536]: Fix a race condition in the internal `multiprocessing.process` cleanup logic that could manifest as an unintended `AttributeError` when calling `process.close()`.
- [gh-104399](https://github.com/python/cpython/issues/104399) [https://github.com/python/cpython/issues/104399]: Prepare the `_tkinter` module for building with Tcl 9.0 and future libtommath by replacing usage of deprecated functions `mp_to_unsigned_bin_n()` and `mp_unsigned_bin_size()` when necessary.
- [gh-104307](https://github.com/python/cpython/issues/104307) [https://github.com/python/cpython/issues/104307]: `socket.getnameinfo()` now releases the GIL while contacting the DNS server
- [gh-87695](https://github.com/python/cpython/issues/87695) [https://github.com/python/cpython/issues/87695]: Fix issue where `pathlib.Path.glob()` raised `OSError` when it encountered a symlink to an overly long path.
- [gh-104265](https://github.com/python/cpython/issues/104265) [https://github.com/python/cpython/issues/104265]: Prevent possible crash by disallowing instantiation of the `_csv.Reader` and `_csv.Writer` types. The regression was introduced in 3.10.0a4 with PR 23224 ([bpo-14935](https://bugs.python.org/issue?@action=redirect&bpo=14935) [https://bugs.python.org/issue?@action=redirect&bpo=14935]). Patch by Radislav Chugunov.
- [gh-104035](https://github.com/python/cpython/issues/104035) [https://github.com/python/cpython/issues/104035]: Do not ignore user-defined `__getstate__` and `__setstate__` methods for slotted frozen dataclasses.
- [gh-103987](https://github.com/python/cpython/issues/103987) [https://github.com/python/cpython/issues/103987]: In `mmap`, fix several bugs that could lead to access to memory-

mapped files after they have been invalidated.

- [gh-103935](https://github.com/python/cpython/issues/103935) [https://github.com/python/cpython/issues/103935]: Use `io.open_code()` for files to be executed instead of raw `open()`
- [gh-100370](https://github.com/python/cpython/issues/100370) [https://github.com/python/cpython/issues/100370]: Fix potential `OverflowError` in `sqlite3.Connection.blobopen()` for 32-bit builds. Patch by Erlend E. Aasland.
- [gh-103848](https://github.com/python/cpython/issues/103848) [https://github.com/python/cpython/issues/103848]: Add checks to ensure that [ bracketed ] hosts found by `urllib.parse.urlsplit()` are of IPv6 or IPvFuture format.
- [gh-103872](https://github.com/python/cpython/issues/103872) [https://github.com/python/cpython/issues/103872]: Update the bundled copy of pip to version 23.1.2.
- [gh-103861](https://github.com/python/cpython/issues/103861) [https://github.com/python/cpython/issues/103861]: Fix `zipfile.Zipfile` creating invalid zip files when `force_zip64` was used to add files to them. Patch by Carey Metcalfe.
- [gh-103685](https://github.com/python/cpython/issues/103685) [https://github.com/python/cpython/issues/103685]: Prepare `tkinter.Menu.index()` for Tk 8.7 so that it does not raise `TclError: expected integer but got ""` when it should return `None`.
- [gh-81403](https://github.com/python/cpython/issues/81403) [https://github.com/python/cpython/issues/81403]: `urllib.request.CacheFTPHandler` no longer raises `URLError` if a cached FTP instance is reused. `ftplib`'s `endtransfer` method calls `voidresp` to drain the connection to handle FTP instance reuse properly.
- [gh-103578](https://github.com/python/cpython/issues/103578) [https://github.com/python/cpython/issues/103578]: Fixed a bug where `pdb` crashes when reading source file with different encoding by replacing `io.open()` with `io.open_code()`. The new method would also call into the hook set by `PyFile_SetOpenCodeHook()`.
- [gh-103556](https://github.com/python/cpython/issues/103556) [https://github.com/python/cpython/issues/103556]: Now creating `inspect.Signature` objects with positional-only parameter with a default followed by a positional-or-keyword parameter without one is impossible.
- [gh-103559](https://github.com/python/cpython/issues/103559) [https://github.com/python/cpython/issues/103559]: Update the bundled copy of pip to version 23.1.1.
- [gh-103365](https://github.com/python/cpython/issues/103365) [https://github.com/python/cpython/issues/103365]: Set default `Flag` boundary to `STRICT` and fix bitwise operations.

- [gh-103472](https://github.com/python/cpython/issues/103472) [https://github.com/python/cpython/issues/103472]: Avoid a potential `ResourceWarning` in `http.client.HTTPConnection` by closing the proxy / tunnel's CONNECT response explicitly.
- [gh-103449](https://github.com/python/cpython/issues/103449) [https://github.com/python/cpython/issues/103449]: Fix a bug in doc string generation in `dataclasses.dataclass()`.
- [gh-103256](https://github.com/python/cpython/issues/103256) [https://github.com/python/cpython/issues/103256]: Fixed a bug that caused `hmac` to raise an exception when the requested hash algorithm was not available in OpenSSL despite being available separately as part of `hashlib` itself. It now falls back properly to the built-in. This could happen when, for example, your OpenSSL does not include SHA3 support and you want to compute `hmac.digest(b'K', b'M', 'sha3_256')`.
- [gh-103225](https://github.com/python/cpython/issues/103225) [https://github.com/python/cpython/issues/103225]: Fix a bug in `pdb` when displaying line numbers of module-level source code.
- [gh-93910](https://github.com/python/cpython/issues/93910) [https://github.com/python/cpython/issues/93910]: Remove deprecation of `enum member.member` access.
- [gh-102978](https://github.com/python/cpython/issues/102978) [https://github.com/python/cpython/issues/102978]: Fixes `unittest.mock.patch()` not enforcing function signatures for methods decorated with `@classmethod` or `@staticmethod` when `patch` is called with `autospec=True`.
- [gh-103204](https://github.com/python/cpython/issues/103204) [https://github.com/python/cpython/issues/103204]: Fixes `http.server` accepting HTTP requests with HTTP version numbers preceded by '+', or '-', or with digit-separating '\_' characters. The length of the version numbers is also constrained.
- [gh-102953](https://github.com/python/cpython/issues/102953) [https://github.com/python/cpython/issues/102953]: The extraction methods in `tarfile`, and `shutil.unpack_archive()`, have a new *filter* argument that allows limiting tar features than may be surprising or dangerous, such as creating files outside the destination directory. See [Extraction filters](#) for details.
- [gh-101640](https://github.com/python/cpython/issues/101640) [https://github.com/python/cpython/issues/101640]: `argparse.ArgumentParser` now catches errors when writing messages, such as when `sys.stderr` is `None`. Patch by Oleg Iarygin.

- [gh-96522](https://github.com/python/cpython/issues/96522) [https://github.com/python/cpython/issues/96522]: Fix potential deadlock in `pty.spawn()`
- [gh-87474](https://github.com/python/cpython/issues/87474) [https://github.com/python/cpython/issues/87474]: Fix potential file descriptor leaks in `subprocess.Popen`.

## Documentation

- [gh-89455](https://github.com/python/cpython/issues/89455) [https://github.com/python/cpython/issues/89455]: Add missing documentation for the `max_group_depth` and `max_group_width` parameters and the `exceptions` attribute of the `traceback.TracebackException` class.
- [gh-89412](https://github.com/python/cpython/issues/89412) [https://github.com/python/cpython/issues/89412]: Add missing documentation for the `end_lineno` and `end_offset` attributes of the `traceback.TracebackException` class.
- [gh-104943](https://github.com/python/cpython/issues/104943) [https://github.com/python/cpython/issues/104943]: Remove mentions of old Python versions in `typing.NamedTuple`.
- [gh-67056](https://github.com/python/cpython/issues/67056) [https://github.com/python/cpython/issues/67056]: Document that the effect of registering or unregistering an `atexit` cleanup function from within a registered cleanup function is undefined.
- [gh-48241](https://github.com/python/cpython/issues/48241) [https://github.com/python/cpython/issues/48241]: Clarifying documentation about the `url` parameter to `urllib.request.urlopen` and `urllib.request.Request` needing to be encoded properly.

## Tests

- [gh-104494](https://github.com/python/cpython/issues/104494) [https://github.com/python/cpython/issues/104494]: Update `test_pack_configure_in` and `test_place_configure_in` for changes to error message formatting in Tk 8.7.
- [gh-104461](https://github.com/python/cpython/issues/104461) [https://github.com/python/cpython/issues/104461]: Run `test_configure_screen` on X11 only, since the `DISPLAY` environment variable and `-screen` option for `toplevels` are not useful on Tk for Win32 or Aqua.
- [gh-103329](https://github.com/python/cpython/issues/103329) [https://github.com/python/cpython/issues/103329]: Regression tests for the behaviour of `unittest.mock.PropertyMock` were added.

- [gh-85984](https://github.com/python/cpython/issues/85984) [https://github.com/python/cpython/issues/85984]: Utilize new “winsize” functions from `termios` in `pty` tests.
- [gh-75729](https://github.com/python/cpython/issues/75729) [https://github.com/python/cpython/issues/75729]: Fix the `os.spawn*` tests failing on Windows when the working directory or interpreter path contains spaces.

## Build

- [gh-90005](https://github.com/python/cpython/issues/90005) [https://github.com/python/cpython/issues/90005]: Fix a regression in `configure` where we could end up unintentionally linking with `libbsd`.
- [gh-104106](https://github.com/python/cpython/issues/104106) [https://github.com/python/cpython/issues/104106]: Add gcc fallback of `mkfinfoat/mknodat` for macOS. Patch by Dong-hee Na.
- [gh-99069](https://github.com/python/cpython/issues/99069) [https://github.com/python/cpython/issues/99069]: Extended workaround defining `static_assert` when missing from the `libc` headers to all clang and gcc builds. In particular, this fixes building on macOS  $\leq 10.10$ .

## Windows

- [gh-105146](https://github.com/python/cpython/issues/105146) [https://github.com/python/cpython/issues/105146]: Updated the links at the end of the installer to point to Discourse rather than the mailing lists.
- [gh-104623](https://github.com/python/cpython/issues/104623) [https://github.com/python/cpython/issues/104623]: Update Windows installer to use SQLite 3.42.0.
- [gh-102997](https://github.com/python/cpython/issues/102997) [https://github.com/python/cpython/issues/102997]: Update Windows installer to use SQLite 3.41.2.
- [gh-88013](https://github.com/python/cpython/issues/88013) [https://github.com/python/cpython/issues/88013]: Fixed a bug where `TypeError` was raised when calling `ntpath.realpath()` with a bytes parameter in some cases.

## macOS

- [gh-103142](https://github.com/python/cpython/issues/103142) [https://github.com/python/cpython/issues/103142]: Update macOS installer to use OpenSSL 1.1.1u.
- [gh-104623](https://github.com/python/cpython/issues/104623) [https://github.com/python/cpython/issues/104623]: Update macOS installer to SQLite 3.42.0.
- [gh-102997](https://github.com/python/cpython/issues/102997) [https://github.com/python/cpython/issues/102997]: Update macOS installer to SQLite 3.41.2.

## IDLE

- [gh-104719](https://github.com/python/cpython/issues/104719) [https://github.com/python/cpython/issues/104719]: Remove IDLE's modification of `tokenize.tabsize` and test other uses of `tokenize` data and methods.
- [gh-104499](https://github.com/python/cpython/issues/104499) [https://github.com/python/cpython/issues/104499]: Fix completions for Tk Aqua 8.7 (currently blank).
- [gh-104496](https://github.com/python/cpython/issues/104496) [https://github.com/python/cpython/issues/104496]: About prints both tcl and tk versions if different (expected someday).
- [gh-88496](https://github.com/python/cpython/issues/88496) [https://github.com/python/cpython/issues/88496]: Fix IDLE test hang on macOS.

## Python 3.11.3 final

*Release date: 2023-04-04*

### Security

- [gh-101727](https://github.com/python/cpython/issues/101727) [https://github.com/python/cpython/issues/101727]: Updated the OpenSSL version used in Windows and macOS binary release builds to 1.1.1t to address CVE-2023-0286, CVE-2022-4303, and CVE-2022-4303 per [the OpenSSL 2023-02-07 security advisory](https://www.openssl.org/news/secadv/20230207.txt) [https://www.openssl.org/news/secadv/20230207.txt].
- [gh-101283](https://github.com/python/cpython/issues/101283) [https://github.com/python/cpython/issues/101283]: `subprocess.Popen` now uses a safer approach to find `cmd.exe` when launching with `shell=True`. Patch by Eryk Sun, based on a patch by Oleg Iarygin.

### Core and Builtins

- [gh-101975](https://github.com/python/cpython/issues/101975) [https://github.com/python/cpython/issues/101975]: Fixed `stacktop` value on tracing entries to avoid corruption on garbage collection.
- [gh-102701](https://github.com/python/cpython/issues/102701) [https://github.com/python/cpython/issues/102701]: Fix overflow when creating very large dict.
- [gh-102416](https://github.com/python/cpython/issues/102416) [https://github.com/python/cpython/issues/102416]: Do not memoize incorrectly automatically generated loop rules

in the parser. Patch by Pablo Galindo.

- [gh-102356](https://github.com/python/cpython/issues/102356) [https://github.com/python/cpython/issues/102356]: Fix a bug that caused a crash when deallocating deeply nested filter objects. Patch by Marta Gómez Macías.
- [gh-102397](https://github.com/python/cpython/issues/102397) [https://github.com/python/cpython/issues/102397]: Fix segfault from race condition in signal handling during garbage collection. Patch by Kumar Aditya.
- [gh-102281](https://github.com/python/cpython/issues/102281) [https://github.com/python/cpython/issues/102281]: Fix potential nullptr dereference and use of uninitialized memory in fileutils. Patch by Max Bachmann.
- [gh-102126](https://github.com/python/cpython/issues/102126) [https://github.com/python/cpython/issues/102126]: Fix deadlock at shutdown when clearing thread states if any finalizer tries to acquire the runtime head lock. Patch by Kumar Aditya.
- [gh-102027](https://github.com/python/cpython/issues/102027) [https://github.com/python/cpython/issues/102027]: Fix SSE2 and SSE3 detection in `_blake2` internal module. Patch by Max Bachmann.
- [gh-101967](https://github.com/python/cpython/issues/101967) [https://github.com/python/cpython/issues/101967]: Fix possible segfault in `positional_only_passed_as_keyword` function, when new list created.
- [gh-101765](https://github.com/python/cpython/issues/101765) [https://github.com/python/cpython/issues/101765]: Fix `SystemError` / segmentation fault in iter `__reduce__` when internal access of `builtins.__dict__` keys mutates the iter object.
- [gh-101696](https://github.com/python/cpython/issues/101696) [https://github.com/python/cpython/issues/101696]: Invalidate type version tag in `_PyStaticType_Dealloc` for static types, avoiding bug where a false cache hit could crash the interpreter. Patch by Kumar Aditya.

## Library

- [gh-102549](https://github.com/python/cpython/issues/102549) [https://github.com/python/cpython/issues/102549]: Don't ignore exceptions in member type creation.
- [gh-102947](https://github.com/python/cpython/issues/102947) [https://github.com/python/cpython/issues/102947]: Improve traceback when `dataclasses.fields()` is called on a non-dataclass. Patch by Alex Waygood
- [gh-102780](https://github.com/python/cpython/issues/102780) [https://github.com/python/cpython/issues/102780]: The

`asyncio.Timeout` context manager now works reliably even when performing cleanup due to task cancellation. Previously it could raise a `CancelledError` instead of an `TimeoutError` in such cases.

- [gh-88965](https://github.com/python/cpython/issues/88965) [https://github.com/python/cpython/issues/88965]: `typing:` Fix a bug relating to substitution in custom classes generic over a `ParamSpec`. Previously, if the `ParamSpec` was substituted with a parameters list that itself contained a `TypeVar`, the `TypeVar` in the parameters list could not be subsequently substituted. This is now fixed.

Patch by Nikita Sobolev.

- [gh-101979](https://github.com/python/cpython/issues/101979) [https://github.com/python/cpython/issues/101979]: Fix a bug where parentheses in the `metavar` argument to `argparse.ArgumentParser.add_argument()` were dropped. Patch by Yeojin Kim.
- [gh-102179](https://github.com/python/cpython/issues/102179) [https://github.com/python/cpython/issues/102179]: Fix `os.dup2()` error message for negative fds.
- [gh-101961](https://github.com/python/cpython/issues/101961) [https://github.com/python/cpython/issues/101961]: For the binary mode, `fileinput.hookcompressed()` doesn't set the encoding value even if the value is `None`. Patch by Gihwan Kim.
- [gh-101936](https://github.com/python/cpython/issues/101936) [https://github.com/python/cpython/issues/101936]: The default value of `fp` becomes `io.BytesIO` if `HTTPError` is initialized without a designated `fp` parameter. Patch by Long Vo.
- [gh-102069](https://github.com/python/cpython/issues/102069) [https://github.com/python/cpython/issues/102069]: Fix `__weakref__` descriptor generation for custom dataclasses.
- [gh-101566](https://github.com/python/cpython/issues/101566) [https://github.com/python/cpython/issues/101566]: In zipfile, apply fix for `extractall` on the underlying zipfile after being wrapped in `Path`.
- [gh-101892](https://github.com/python/cpython/issues/101892) [https://github.com/python/cpython/issues/101892]: Callable iterators no longer raise `SystemError` when the

callable object exhausts the iterator but forgets to either return a sentinel value or raise **StopIteration**.

- [gh-97786](https://github.com/python/cpython/issues/97786) [https://github.com/python/cpython/issues/97786]: Fix potential undefined behaviour in corner cases of floating-point-to-time conversions.
- [gh-101517](https://github.com/python/cpython/issues/101517) [https://github.com/python/cpython/issues/101517]: Fixed bug where **bdb** looks up the source line with **linecache** with a `lineno=None`, which causes it to fail with an unhandled exception.
- [gh-101673](https://github.com/python/cpython/issues/101673) [https://github.com/python/cpython/issues/101673]: Fix a **pdb** bug where `ll` clears the changes to local variables.
- [gh-96931](https://github.com/python/cpython/issues/96931) [https://github.com/python/cpython/issues/96931]: Fix incorrect results from **ssl.SSLSocket.shared\_ciphers()**
- [gh-88233](https://github.com/python/cpython/issues/88233) [https://github.com/python/cpython/issues/88233]: Correctly preserve “extra” fields in `zipfile` regardless of their ordering relative to a zip64 “extra.”
- [gh-96127](https://github.com/python/cpython/issues/96127) [https://github.com/python/cpython/issues/96127]: `inspect.signature` was raising `TypeError` on call with mock objects. Now it correctly returns `(*args, **kwargs)` as inferred signature.
- [gh-95495](https://github.com/python/cpython/issues/95495) [https://github.com/python/cpython/issues/95495]: When built against OpenSSL 3.0, the **ssl** module had a bug where it reported unauthenticated EOFs (i.e. without `close_notify`) as a clean TLS-level EOF. It now raises **SSLEOFError**, matching the behavior in previous versions of OpenSSL. The **options** attribute on **SSLContext** also no longer includes **OP\_IGNORE\_UNEXPECTED\_EOF** by default. This option may be set to specify the previous OpenSSL 3.0 behavior.
- [gh-94440](https://github.com/python/cpython/issues/94440) [https://github.com/python/cpython/issues/94440]: Fix a **concurrent.futures.process** bug where `ProcessPoolExecutor` shutdown could hang after a future has been quickly submitted and canceled.

## Documentation

- [gh-103112](https://github.com/python/cpython/issues/103112) [https://github.com/python/cpython/issues/103112]: Add docstring to `http.client.HTTPResponse.read()` to fix pydoc output.
- [gh-85417](https://github.com/python/cpython/issues/85417) [https://github.com/python/cpython/issues/85417]: Update `cmath` documentation to clarify behaviour on branch cuts.
- [gh-97725](https://github.com/python/cpython/issues/97725) [https://github.com/python/cpython/issues/97725]: Fix `asyncio.Task.print_stack()` description for `file=None`. Patch by Oleg Iarygin.

## Tests

- [gh-102980](https://github.com/python/cpython/issues/102980) [https://github.com/python/cpython/issues/102980]: Improve test coverage on `pdb`.
- [gh-102537](https://github.com/python/cpython/issues/102537) [https://github.com/python/cpython/issues/102537]: Adjust the error handling strategy in `test_zoneinfo.TzPathTest.python_tzpath_context`. Patch by Paul Ganssle.
- [gh-89792](https://github.com/python/cpython/issues/89792) [https://github.com/python/cpython/issues/89792]: `test_tools` now copies up to 10x less source data to a temporary directory during the `freeze` test by ignoring git metadata and other artifacts. It also limits its python build parallelism based on `os.cpu_count` instead of hard coding it as 8 cores.
- [gh-101377](https://github.com/python/cpython/issues/101377) [https://github.com/python/cpython/issues/101377]: Improved `test_locale_calendar_formatweekday` of `calendar`.

## Build

- [gh-102711](https://github.com/python/cpython/issues/102711) [https://github.com/python/cpython/issues/102711]: Fix `Wstrict-prototypes` compiler warnings.

## Windows

- [gh-101849](https://github.com/python/cpython/issues/101849) [https://github.com/python/cpython/issues/101849]: Ensures installer will correctly upgrade existing `py.exe` launcher installs.
- [gh-101763](https://github.com/python/cpython/issues/101763) [https://github.com/python/cpython/issues/101763]:

Updates copy of libffi bundled with Windows installs to 3.4.4.

- [gh-101759](https://github.com/python/cpython/issues/101759) [https://github.com/python/cpython/issues/101759]: Update Windows installer to SQLite 3.40.1.
- [gh-101614](https://github.com/python/cpython/issues/101614) [https://github.com/python/cpython/issues/101614]: Correctly handle extensions built against debug binaries that reference `python3_d.dll`.

## macOS

- [gh-103207](https://github.com/python/cpython/issues/103207) [https://github.com/python/cpython/issues/103207]: Add instructions to the macOS installer welcome display on how to workaroud the macOS 13 Ventura “The installer encountered an error” failure.
- [gh-101759](https://github.com/python/cpython/issues/101759) [https://github.com/python/cpython/issues/101759]: Update macOS installer to SQLite 3.40.1.

## Python 3.11.2 final

*Release date: 2023-02-07*

### Core and Builtins

- [gh-92173](https://github.com/python/cpython/issues/92173) [https://github.com/python/cpython/issues/92173]: Fix the `defs` and `kwdefs` arguments to `PyEval_EvalCodeEx()` and a reference leak in that function.
- [gh-101400](https://github.com/python/cpython/issues/101400) [https://github.com/python/cpython/issues/101400]: Fix wrong lineno in exception message on `continue` or `break` which are not in a loop. Patch by Dong-hee Na.
- [gh-101372](https://github.com/python/cpython/issues/101372) [https://github.com/python/cpython/issues/101372]: Fix `is_normalized()` to properly handle the UCD 3.2.0 cases. Patch by Dong-hee Na.
- [gh-101046](https://github.com/python/cpython/issues/101046) [https://github.com/python/cpython/issues/101046]: Fix a possible memory leak in the parser when raising `MemoryError`. Patch by Pablo Galindo
- [gh-101037](https://github.com/python/cpython/issues/101037) [https://github.com/python/cpython/issues/101037]: Fix potential memory underallocation issue for instances of `int` subclasses with value zero.
- [gh-100942](https://github.com/python/cpython/issues/100942) [https://github.com/python/cpython/issues/100942]: Fixed segfault in property.getter/setter/deleter that occurred when

a property subclass overrode the `__new__` method to return a non-property instance.

- [gh-100892](https://github.com/python/cpython/issues/100892) [https://github.com/python/cpython/issues/100892]: Fix race while iterating over thread states in clearing `threading.local`. Patch by Kumar Aditya.
- [gh-100776](https://github.com/python/cpython/issues/100776) [https://github.com/python/cpython/issues/100776]: Fix misleading default value in `input()`'s `__text_signature__`.
- [gh-100637](https://github.com/python/cpython/issues/100637) [https://github.com/python/cpython/issues/100637]: Fix `int.__sizeof__()` calculation to include the 1 element `ob_digit` array for 0 and False.
- [gh-100649](https://github.com/python/cpython/issues/100649) [https://github.com/python/cpython/issues/100649]: Update the `native_thread_id` field of `PyThreadState` after fork.
- [gh-100374](https://github.com/python/cpython/issues/100374) [https://github.com/python/cpython/issues/100374]: Fix incorrect result and delay in `socket.getfqdn()`. Patch by Dominic Socular.
- [gh-99110](https://github.com/python/cpython/issues/99110) [https://github.com/python/cpython/issues/99110]: Initialize frame->previous in `frameobject.c` to fix a segmentation fault when accessing frames created by `PyFrame_New()`.
- [gh-100050](https://github.com/python/cpython/issues/100050) [https://github.com/python/cpython/issues/100050]: Honor existing errors obtained when searching for mismatching parentheses in the tokenizer. Patch by Pablo Galindo
- [bpo-32782](https://bugs.python.org/issue?@action=redirect&bpo=32782) [https://bugs.python.org/issue?@action=redirect&bpo=32782]: `ctypes` arrays of length 0 now report a correct `itemsize` when a `memoryview` is constructed from them, rather than always giving a value of 0.

## Library

- [gh-101541](https://github.com/python/cpython/issues/101541) [https://github.com/python/cpython/issues/101541]: [Enum] - fix psuedo-flag creation
- [gh-101326](https://github.com/python/cpython/issues/101326) [https://github.com/python/cpython/issues/101326]: Fix regression when passing `None` as second or third argument to `FutureIter.throw`.
- [gh-100795](https://github.com/python/cpython/issues/100795) [https://github.com/python/cpython/issues/100795]: Avoid potential unexpected `freeaddrinfo` call (double free) in `socket` when when a `libc getaddrinfo()` implementation leaves garbage in an output pointer when returning an error. Original patch by Sergey G. Brester.
- [gh-101143](https://github.com/python/cpython/issues/101143) [https://github.com/python/cpython/issues/101143]:

Remove unused references to `TimerHandle` in `asyncio.base_events.BaseEventLoop._add_callback`.

- [gh-101144](https://github.com/python/cpython/issues/101144) [https://github.com/python/cpython/issues/101144]: Make `zipfile.Path.open()` and `zipfile.Path.read_text()` also accept `encoding` as a positional argument. This was the behavior in Python 3.9 and earlier. 3.10 introduced a regression where supplying it as a positional argument would lead to a `TypeError`.
- [gh-101015](https://github.com/python/cpython/issues/101015) [https://github.com/python/cpython/issues/101015]: Fix `typing.get_type_hints()` on `'*tuple[...]'` and `*tuple[...]`. It must not drop the `Unpack` part.
- [gh-100573](https://github.com/python/cpython/issues/100573) [https://github.com/python/cpython/issues/100573]: Fix a Windows `asyncio` bug with named pipes where a client doing `os.stat()` on the pipe would cause an error in the server that disabled serving future requests.
- [gh-100805](https://github.com/python/cpython/issues/100805) [https://github.com/python/cpython/issues/100805]: Modify `random.choice()` implementation to once again work with NumPy arrays.
- [gh-90104](https://github.com/python/cpython/issues/90104) [https://github.com/python/cpython/issues/90104]: Avoid `RecursionError` on `repr` if a dataclass field definition has a cyclic reference.
- [gh-100750](https://github.com/python/cpython/issues/100750) [https://github.com/python/cpython/issues/100750]: pass `encoding` kwarg to `subprocess` in `platform`
- [gh-100689](https://github.com/python/cpython/issues/100689) [https://github.com/python/cpython/issues/100689]: Fix crash in `pyexpat` by statically allocating `PyExpat_CAPI` capsule.
- [gh-100740](https://github.com/python/cpython/issues/100740) [https://github.com/python/cpython/issues/100740]: Fix `unittest.mock.Mock` not respecting the spec for attribute names prefixed with `assert`.
- [gh-86508](https://github.com/python/cpython/issues/86508) [https://github.com/python/cpython/issues/86508]: Fix `asyncio.open_connection()` to skip binding to local addresses of different family. Patch by Kumar Aditya.
- [gh-100287](https://github.com/python/cpython/issues/100287) [https://github.com/python/cpython/issues/100287]: Fix the interaction of `unittest.mock.seal()` with `unittest.mock.AsyncMock`.
- [gh-100474](https://github.com/python/cpython/issues/100474) [https://github.com/python/cpython/issues/100474]: `http.server` now checks that an index page is actually a regular file before trying to serve it. This avoids issues with directories named `index.html`.
- [gh-100160](https://github.com/python/cpython/issues/100160) [https://github.com/python/cpython/issues/100160]:

Remove any deprecation warnings in

`asyncio.get_event_loop()`. They are deferred to Python 3.12.

- [gh-96290](https://github.com/python/cpython/issues/96290) [https://github.com/python/cpython/issues/96290]: Fix handling of partial and invalid UNC drives in `ntpath.splitdrive()`, and in `ntpath.normpath()` on non-Windows systems. Paths such as `\server` and `\` are now considered by `splitdrive()` to contain only a drive, and consequently are not modified by `normpath()` on non-Windows systems. The behaviour of `normpath()` on Windows systems is unaffected, as native OS APIs are used. Patch by Eryk Sun, with contributions by Barney Gale.
- [gh-78878](https://github.com/python/cpython/issues/78878) [https://github.com/python/cpython/issues/78878]: Fix crash when creating an instance of `_ctypes.CField`.
- [gh-99952](https://github.com/python/cpython/issues/99952) [https://github.com/python/cpython/issues/99952]: Fix a reference undercounting issue in `ctypes.Structure` with `from_param()` results larger than a C pointer.
- [gh-100133](https://github.com/python/cpython/issues/100133) [https://github.com/python/cpython/issues/100133]: Fix regression in `asyncio` where a subprocess would sometimes lose data received from pipe.
- [gh-100098](https://github.com/python/cpython/issues/100098) [https://github.com/python/cpython/issues/100098]: Fix tuple subclasses being cast to `tuple` when used as enum values.
- [gh-98778](https://github.com/python/cpython/issues/98778) [https://github.com/python/cpython/issues/98778]: Update `HTTPError` to be initialized properly, even if the `fp` is `None`. Patch by Dong-hee Na.
- [gh-83035](https://github.com/python/cpython/issues/83035) [https://github.com/python/cpython/issues/83035]: Fix `inspect.getsource()` handling of decorator calls with nested parentheses.
- [gh-99576](https://github.com/python/cpython/issues/99576) [https://github.com/python/cpython/issues/99576]: Fix `.save()` method for `LWPCookieJar` and `MozillaCookieJar`: saved file was not truncated on repeated save.
- [gh-99433](https://github.com/python/cpython/issues/99433) [https://github.com/python/cpython/issues/99433]: Fix `doctest` failure on `types.MethodWrapperType` in modules.
- [gh-99240](https://github.com/python/cpython/issues/99240) [https://github.com/python/cpython/issues/99240]: Fix double-free bug in Argument Clinic `str_converter` by extracting memory clean up to a new `post_parsing` section.

- [gh-64490](https://github.com/python/cpython/issues/64490) [https://github.com/python/cpython/issues/64490]: Fix refcount error when arguments are packed to tuple in Argument Clinic.
- [gh-85267](https://github.com/python/cpython/issues/85267) [https://github.com/python/cpython/issues/85267]: Several improvements to `inspect.signature()`'s handling of `__text_signature`. - Fixes a case where `inspect.signature()` dropped parameters - Fixes a case where `inspect.signature()` raised `tokenize.TokenError` - Allows `inspect.signature()` to understand defaults involving binary operations of constants - `inspect.signature()` is documented as only raising `TypeError` or `ValueError`, but sometimes raised `RuntimeError`. These cases now raise `ValueError` - Removed a dead code path
- [gh-95882](https://github.com/python/cpython/issues/95882) [https://github.com/python/cpython/issues/95882]: Fix a 3.11 regression in `asynccontextmanager()`, which caused it to propagate exceptions with incorrect tracebacks and fix a 3.11 regression in `contextmanager()`, which caused it to propagate exceptions with incorrect tracebacks for `StopIteration`.
- [bpo-44817](https://bugs.python.org/issue?@action=redirect&bpo=44817) [https://bugs.python.org/issue?@action=redirect&bpo=44817]: Ignore `WinError 53` (`ERROR_BAD_NETPATH`), 65 (`ERROR_NETWORK_ACCESS_DENIED`) and 161 (`ERROR_BAD_PATHNAME`) when using `ntpath.realpath()`.
- [bpo-40447](https://bugs.python.org/issue?@action=redirect&bpo=40447) [https://bugs.python.org/issue?@action=redirect&bpo=40447]: Accept `os.PathLike` (such as `pathlib.Path`) in the `stripdir` arguments of `compileall.compile_file()` and `compileall.compile_dir()`.
- [bpo-36880](https://bugs.python.org/issue?@action=redirect&bpo=36880) [https://bugs.python.org/issue?@action=redirect&bpo=36880]: Fix a reference counting issue when a `ctypes` callback with return type `py_object` returns `None`, which could cause crashes.

## Documentation

- [gh-100616](https://github.com/python/cpython/issues/100616) [https://github.com/python/cpython/issues/100616]: Document existing `attr` parameter to `curses.window.vline()` function in `curses`.

- [gh-100472](https://github.com/python/cpython/issues/100472) [https://github.com/python/cpython/issues/100472]: Remove claim in documentation that the `stripdir`, `prependdir` and `limit_sl_dest` parameters of `compileall.compile_dir()` and `compileall.compile_file()` could be `bytes`.
- [gh-99931](https://github.com/python/cpython/issues/99931) [https://github.com/python/cpython/issues/99931]: Use [sphinxext-opengraph](https://sphinxext-opengraph.readthedocs.io/) [https://sphinxext-opengraph.readthedocs.io/] to generate [OpenGraph metadata](https://ogp.me/) [https://ogp.me/].

## Tests

- [gh-101334](https://github.com/python/cpython/issues/101334) [https://github.com/python/cpython/issues/101334]: `test_tarfile` has been updated to pass when run as a high UID.
- [gh-100454](https://github.com/python/cpython/issues/100454) [https://github.com/python/cpython/issues/100454]: Start running SSL tests with OpenSSL 3.1.0-beta1.
- [gh-96002](https://github.com/python/cpython/issues/96002) [https://github.com/python/cpython/issues/96002]: Add functional test for Argument Clinic.

## Build

- [gh-101522](https://github.com/python/cpython/issues/101522) [https://github.com/python/cpython/issues/101522]: Allow overriding Windows dependencies versions and paths using MSBuild properties.

## Windows

- [gh-101543](https://github.com/python/cpython/issues/101543) [https://github.com/python/cpython/issues/101543]: Ensure the install path in the registry is only used when the standard library hasn't been located in any other way.
- [gh-101467](https://github.com/python/cpython/issues/101467) [https://github.com/python/cpython/issues/101467]: The `py.exe` launcher now correctly filters when only a single runtime is installed. It also correctly handles prefix matches on tags so that `-3.1` does not match `3.11`, but would still match `3.1-32`.
- [gh-101135](https://github.com/python/cpython/issues/101135) [https://github.com/python/cpython/issues/101135]: Restore ability to launch older 32-bit versions from the `py.exe` launcher when both 32-bit and 64-bit installs of the same version are available.
- [gh-82052](https://github.com/python/cpython/issues/82052) [https://github.com/python/cpython/issues/82052]: Fixed an

issue where writing more than 32K of Unicode output to the console screen in one go can result in mojibake.

- [gh-100320](https://github.com/python/cpython/issues/100320) [https://github.com/python/cpython/issues/100320]: Ensures the `PythonPath` registry key from an install is used when launching from a different copy of Python that relies on an existing install to provide a copy of its modules and standard library.
- [gh-100247](https://github.com/python/cpython/issues/100247) [https://github.com/python/cpython/issues/100247]: Restores support for the `py.exe` launcher finding shebang commands in its configuration file using the full command name.
- [gh-100180](https://github.com/python/cpython/issues/100180) [https://github.com/python/cpython/issues/100180]: Update Windows installer to OpenSSL 1.1.1s
- [bpo-43984](https://bugs.python.org/issue?@action=redirect&bpo=43984) [https://bugs.python.org/issue?@action=redirect&bpo=43984]: `winreg.SetValueEx()` now leaves the target value untouched in the case of conversion errors. Previously, `-1` would be written in case of such errors.

## macOS

- [gh-100180](https://github.com/python/cpython/issues/100180) [https://github.com/python/cpython/issues/100180]: Update macOS installer to OpenSSL 1.1.1s

## Tools/Demos

- [bpo-45256](https://bugs.python.org/issue?@action=redirect&bpo=45256) [https://bugs.python.org/issue?@action=redirect&bpo=45256]: Fix a bug that caused an `AttributeError` to be raised in `python-gdb.py` when `py-locals` is used without a frame.
- [gh-100342](https://github.com/python/cpython/issues/100342) [https://github.com/python/cpython/issues/100342]: Add missing `NULL` check for possible allocation failure in `*args` parsing in Argument Clinic.
- [gh-64490](https://github.com/python/cpython/issues/64490) [https://github.com/python/cpython/issues/64490]: Argument Clinic varargs bugfixes
  - Fix out-of-bounds error in `_PyArg_UnpackKeywordsWithVararg()`.
  - Fix incorrect check which allowed more than one varargs in `clinic.py`.
  - Fix miscalculation of `noptargs` in generated code.

- Do not generate `noptargs` when there is a `vararg` argument and no optional argument.

## C API

- [gh-99240](https://github.com/python/cpython/issues/99240) [https://github.com/python/cpython/issues/99240]: In argument parsing, after deallocating newly allocated memory, reset its pointer to `NULL`.

## Python 3.11.1 final

*Release date: 2022-12-06*

### Security

- [gh-100001](https://github.com/python/cpython/issues/100001) [https://github.com/python/cpython/issues/100001]: `python -m http.server` no longer allows terminal control characters sent within a garbage request to be printed to the `stderr` server log.

This is done by changing the `http.server.BaseHTTPRequestHandler.log_message` method to replace control characters with a `\xHH` hex escape before printing.

- [gh-87604](https://github.com/python/cpython/issues/87604) [https://github.com/python/cpython/issues/87604]: Avoid publishing list of active per-interpreter audit hooks via the `gc` module
- [gh-98433](https://github.com/python/cpython/issues/98433) [https://github.com/python/cpython/issues/98433]: The IDNA codec decoder used on DNS hostnames by `socket` or `asyncio` related name resolution functions no longer involves a quadratic algorithm. This prevents a potential CPU denial of service if an out-of-spec excessive length hostname involving bidirectional characters were decoded. Some protocols such as `urllib3` `http 3xx` redirects potentially allow for an attacker to supply such a name.
- [gh-98739](https://github.com/python/cpython/issues/98739) [https://github.com/python/cpython/issues/98739]: Update bundled `libexpat` to 2.5.0

- [gh-97612](https://github.com/python/cpython/issues/97612) [https://github.com/python/cpython/issues/97612]: Fix a shell code injection vulnerability in the `get-remote-certificate.py` example script. The script no longer uses a shell to run `openssl` commands. Issue reported and initial fix by Caleb Shortt. Patch by Victor Stinner.

## Core and Builtins

- [gh-99886](https://github.com/python/cpython/issues/99886) [https://github.com/python/cpython/issues/99886]: Fix a crash when an object which does not have a dictionary frees its instance values.
- [gh-99891](https://github.com/python/cpython/issues/99891) [https://github.com/python/cpython/issues/99891]: Fix a bug in the tokenizer that could cause infinite recursion when showing syntax warnings that happen in the first line of the source. Patch by Pablo Galindo
- [gh-99729](https://github.com/python/cpython/issues/99729) [https://github.com/python/cpython/issues/99729]: Fix an issue that could cause frames to be visible to Python code as they are being torn down, possibly leading to memory corruption or hard crashes of the interpreter.
- [gh-99578](https://github.com/python/cpython/issues/99578) [https://github.com/python/cpython/issues/99578]: Fix a reference bug in `_imp.create_builtin()` after the creation of the first sub-interpreter for modules `builtins` and `sys`. Patch by Victor Stinner.
- [gh-99581](https://github.com/python/cpython/issues/99581) [https://github.com/python/cpython/issues/99581]: Fixed a bug that was causing a buffer overflow if the tokenizer copies a line missing the newline character from a file that is as long as the available tokenizer buffer. Patch by Pablo galindo
- [gh-99553](https://github.com/python/cpython/issues/99553) [https://github.com/python/cpython/issues/99553]: Fix bug where an `ExceptionGroup` subclass can wrap a `BaseException`.
- [gh-99370](https://github.com/python/cpython/issues/99370) [https://github.com/python/cpython/issues/99370]: Fix zip path for venv created from a non-installed python on POSIX platforms.
- [gh-99298](https://github.com/python/cpython/issues/99298) [https://github.com/python/cpython/issues/99298]: Fix an issue that could potentially cause incorrect error handling for some bytecode instructions.
- [gh-99205](https://github.com/python/cpython/issues/99205) [https://github.com/python/cpython/issues/99205]: Fix an issue that prevented `PyThreadState` and `PyInterpreterState` memory from being freed properly.
- [gh-99181](https://github.com/python/cpython/issues/99181) [https://github.com/python/cpython/issues/99181]: Fix

failure in `except*` with unhashable exceptions.

- [gh-99204](https://github.com/python/cpython/issues/99204) [https://github.com/python/cpython/issues/99204]: Fix calculation of `sys._base_executable` when inside a POSIX virtual environment using copies of the python binary when the base installation does not provide the executable name used by the venv. Calculation will fall back to alternative names (“python<MAJOR>”, “python<MAJOR>.<MINOR>”).
- [gh-96055](https://github.com/python/cpython/issues/96055) [https://github.com/python/cpython/issues/96055]: Update `faulthandler` to emit an error message with the proper unexpected signal number. Patch by Dong-hee Na.
- [gh-99153](https://github.com/python/cpython/issues/99153) [https://github.com/python/cpython/issues/99153]: Fix location of `SyntaxError` for a `try` block with both `except` and `except*`.
- [gh-99103](https://github.com/python/cpython/issues/99103) [https://github.com/python/cpython/issues/99103]: Fix the error reporting positions of specialized traceback anchors when the source line contains Unicode characters.
- [gh-98852](https://github.com/python/cpython/issues/98852) [https://github.com/python/cpython/issues/98852]: Fix subscription of type aliases containing bare generic types or types like `TypeVar`: for example `tuple[A, T][int]` and `tuple[TypeVar, T][int]`, where `A` is a generic type, and `T` is a type variable.
- [gh-98925](https://github.com/python/cpython/issues/98925) [https://github.com/python/cpython/issues/98925]: Lower the recursion depth for marshal on WASI to support wasmtime 2.0/main.
- [gh-98783](https://github.com/python/cpython/issues/98783) [https://github.com/python/cpython/issues/98783]: Fix multiple crashes in debug mode when `str` subclasses are used instead of `str` itself.
- [gh-99257](https://github.com/python/cpython/issues/99257) [https://github.com/python/cpython/issues/99257]: Fix an issue where member descriptors (such as those for `__slots__`) could behave incorrectly or crash instead of raising a `TypeError` when accessed via an instance of an invalid type.
- [gh-98374](https://github.com/python/cpython/issues/98374) [https://github.com/python/cpython/issues/98374]: Suppress `ImportError` for invalid query for `help()` command. Patch by Dong-hee Na.
- [gh-98415](https://github.com/python/cpython/issues/98415) [https://github.com/python/cpython/issues/98415]: Fix detection of MAC addresses for `uuid` on certain OSs. Patch by Chaim Sanders
- [gh-92119](https://github.com/python/cpython/issues/92119) [https://github.com/python/cpython/issues/92119]: Print

exception class name instead of its string representation when raising errors from `ctypes` calls.

- [gh-96078](https://github.com/python/cpython/issues/96078) [https://github.com/python/cpython/issues/96078]: `os.sched_yield()` now release the GIL while calling `sched_yield(2)`. Patch by Dong-hee Na.
- [gh-93354](https://github.com/python/cpython/issues/93354) [https://github.com/python/cpython/issues/93354]: Fix an issue that could delay the specialization of `PRECALL` instructions.
- [gh-97943](https://github.com/python/cpython/issues/97943) [https://github.com/python/cpython/issues/97943]: Bugfix: `PyFunction_GetAnnotations()` should return a borrowed reference. It was returning a new reference.
- [gh-97779](https://github.com/python/cpython/issues/97779) [https://github.com/python/cpython/issues/97779]: Ensure that all Python frame objects are backed by “complete” frames.
- [gh-97591](https://github.com/python/cpython/issues/97591) [https://github.com/python/cpython/issues/97591]: Fixed a missing `incref/decreef` pair in `Exception.__setstate__()`. Patch by Ofey Chan.
- [gh-94526](https://github.com/python/cpython/issues/94526) [https://github.com/python/cpython/issues/94526]: Fix the Python path configuration used to initialize `sys.path` at Python startup. Paths are no longer encoded to UTF-8/strict to avoid encoding errors if it contains surrogate characters (bytes paths are decoded with the `surrogateescape` error handler). Patch by Victor Stinner.
- [gh-95921](https://github.com/python/cpython/issues/95921) [https://github.com/python/cpython/issues/95921]: Fix overly-broad source position information for chained comparisons used as branching conditions.
- [gh-96387](https://github.com/python/cpython/issues/96387) [https://github.com/python/cpython/issues/96387]: At Python exit, sometimes a thread holding the GIL can wait forever for a thread (usually a daemon thread) which requested to drop the GIL, whereas the thread already exited. To fix the race condition, the thread which requested the GIL drop now resets its request before exiting. Issue discovered and analyzed by Mingliang ZHAO. Patch by Victor Stinner.
- [gh-96864](https://github.com/python/cpython/issues/96864) [https://github.com/python/cpython/issues/96864]: Fix a possible assertion failure, fatal error, or `SystemError` if a line tracing event raises an exception while opcode tracing is enabled.
- [gh-96678](https://github.com/python/cpython/issues/96678) [https://github.com/python/cpython/issues/96678]: Fix undefined behaviour in C code of null pointer arithmetic.
- [gh-96754](https://github.com/python/cpython/issues/96754) [https://github.com/python/cpython/issues/96754]: Make

sure that all frame objects created are created from valid interpreter frames. Prevents the possibility of invalid frames in backtraces and signal handlers.

- [gh-95196](https://github.com/python/cpython/issues/95196) [https://github.com/python/cpython/issues/95196]: Disable incorrect pickling of the C implemented classmethod descriptors.
- [gh-96005](https://github.com/python/cpython/issues/96005) [https://github.com/python/cpython/issues/96005]: On WASI **ENOTCAPABLE** is now mapped to **PermissionError**. The **errno** module exposes the new error number. `getpath.py` now ignores **PermissionError** when it cannot open landmark files `pybuilddir.txt` and `pyenv.cfg`.
- [gh-93696](https://github.com/python/cpython/issues/93696) [https://github.com/python/cpython/issues/93696]: Allow **pdb** to locate source for frozen modules in the standard library.
- [bpo-31718](https://bugs.python.org/issue?@action=redirect&bpo=31718) [https://bugs.python.org/issue?@action=redirect&bpo=31718]: Raise **ValueError** instead of **SystemError** when methods of uninitialized **io.IncrementalNewlineDecoder** objects are called. Patch by Oren Milman.
- [bpo-38031](https://bugs.python.org/issue?@action=redirect&bpo=38031) [https://bugs.python.org/issue?@action=redirect&bpo=38031]: Fix a possible assertion failure in **io.FileIO** when the opener returns an invalid file descriptor.

## Library

- [gh-100001](https://github.com/python/cpython/issues/100001) [https://github.com/python/cpython/issues/100001]: Also escape `s` in the `http.server.BaseHTTPRequestHandler.log_message` so that it is technically possible to parse the line and reconstruct what the original data was. Without this a `xHH` is ambiguous as to if it is a hex replacement we put in or the characters `r"x` came through in the original request line.
- [gh-93453](https://github.com/python/cpython/issues/93453) [https://github.com/python/cpython/issues/93453]: **asyncio.get\_event\_loop()** now only emits a deprecation warning when a new event loop was created implicitly. It no longer emits a deprecation warning if the current event loop was set.

- [gh-51524](https://github.com/python/cpython/issues/51524) [https://github.com/python/cpython/issues/51524]: Fix bug when calling `trace.CoverageResults` with valid infile.
- [gh-99645](https://github.com/python/cpython/issues/99645) [https://github.com/python/cpython/issues/99645]: Fix a bug in handling class cleanups in `unittest.TestCase`. Now `addClassCleanup()` uses separate lists for different `TestCase` subclasses, and `doClassCleanups()` only cleans up the particular class.
